SAMSUNG ELECTRONICS

005930.KS | Memory, contracts and capital returns | Q3 2026 earnings deep dive

KRW trillions for financial schedules, billions for economic shares and KRW per share for ceilings. Calendar quarters. Future quarters are modeled.

Analytical Base	Protected Excel Base	Active ceiling quarter	KRW per share
83/100	90/100	Q4 2027	677,267.70

The selected ceiling uses 958.000T of forward-four-quarter OP, a 4.500x multiple and 6.365281583B economic shares.

Sources and estimates are dated. Dividends have their own cash schedule. The latest actual-input bridge is separate from preserved historical forecast displays.

1. Pre-analysis: where Samsung sits in the memory cycle

Samsung supplies the framework's DB6 memory supercycle through HBM, server DRAM and enterprise NAND. AI training, longer-context inference, agent memory and dedicated user environments increase memory content across several tiers. Qualified wafer output, advanced packaging and cleanroom lead times limit the response. Conventional memory remains exposed to pricing cycles, customer inventories and investment returns.

The investment thesis sits in a continuing demand ramp with exceptionally high current scarcity profits. A precise percentage of eventual peak demand remains unmeasured. HBM4 is in commercial ramp; HBM4E is approaching its next qualification and volume phase; enterprise QLC and TLC cache workloads are expanding. Foundry and consumer devices have separate utilization and demand curves. The forecast therefore carries different physical, price and margin paths for each business.

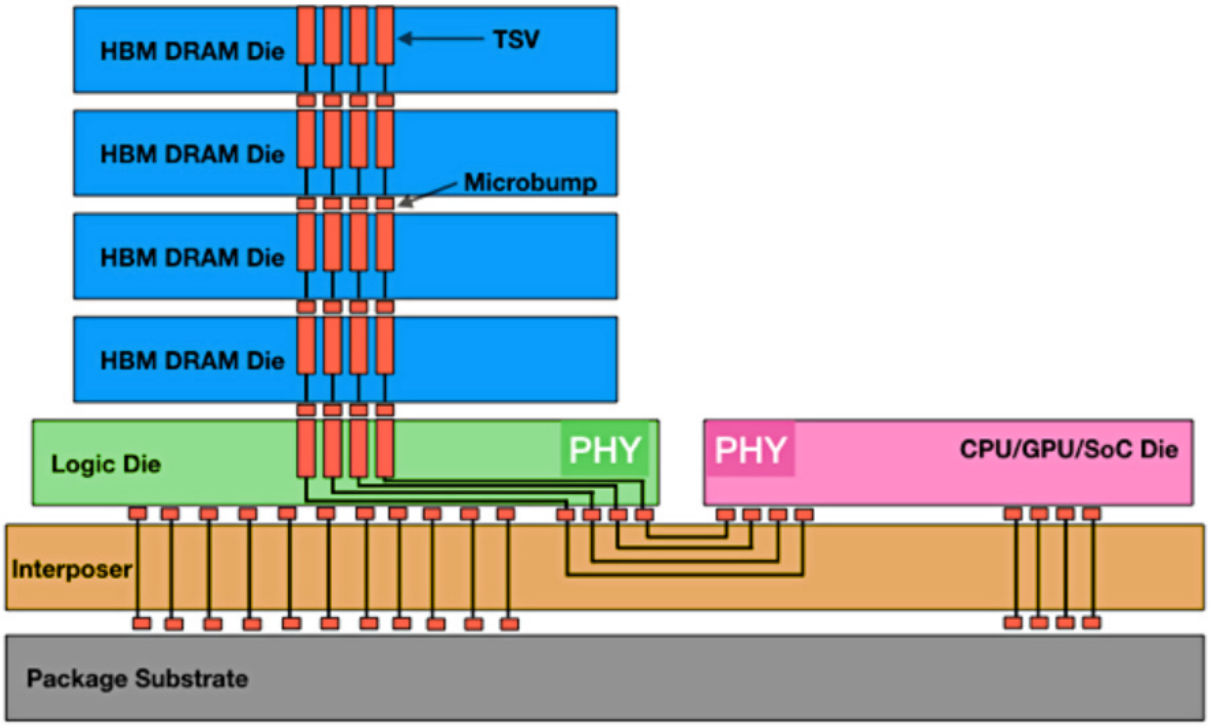

Samsung's size concentrates the question on consolidated earnings capture. HBM co-design, foundry options and device AI strengthen its product reach. Memory dominates the modeled profit pool, while component inflation pressures devices and process investment consumes cash. The next 12-16 months have stronger evidence than the 2029-2030 trajectory. The model makes later supply growth, price normalization and HBM premium fade visible.

2. Products, moat and whole-company economics

Samsung combines memory process scale, packaging, logic base dies, a broad customer base and a large balance sheet. Its HBM4 product uses 1c DRAM and a 4nm logic base die; its HBM4E program extends the custom-memory opportunity. Accepted shipments, package yield, controller compatibility and manufacturing cost determine the economic benefit of this integration.

The segment build uses Memory inside DS, a separate System LSI/Foundry pool, DX and SDC/Harman. Intersegment sales are removed before consolidated revenue. Product-level HBM, conventional DRAM and NAND revenues and costs are analytical allocations because the company discloses neither a complete product income statement nor standalone Memory OP.

Common and preferred shareholders both participate in group economics. The forecast preserves the sanctioned common-plus-preferred economic share convention and the owner's absolute earnings-multiple schedule. A manufacturing advantage earns value through accepted output, cost and cash conversion in that same model.

HBM base-die, DRAM stack and interposer structure reproduced in the owner-supplied IA article. The diagram identifies production steps for the co-design hypothesis.

3. Latest results, guidance and management calls

Samsung reported Q3 2026 revenue of 195.3T and operating profit 107.4T in its October 29 Seoul release. The event began at 10:00 KST, corresponding to October 28 at 21:00 in Toronto. The issuer presentation carries its external-review qualification. The separate latest-actual input bridge supports the prospective forecast; published earlier-quarter forecast vintages remain preserved.

Memory revenue 140.7T is part of DS revenue 147.1T. DS OP106.5T includes its other semiconductor activities. DX revenue 52.1T and OP-0.8T, SDC revenue 8.0T and OP1.1T, and Harman revenue 4.3T and OP0.6T reconcile group OP. Gross segment sales 211.5T require 16.2T of eliminations to reach group sales 195.3T.

Management described Q3 DRAM bit growth in the low-to-mid-single digits with ASP growth around 20%; NAND bits grew in the mid-single digits and ASP in the high teens. Q4 bit guidance is mid-to-high teens for DRAM and mid-teens for NAND. Numerical Q4 ASP guidance remains undisclosed. The selected price path is an explicit analytical assumption.

HBM4 sales increased more than threefold sequentially and reached 60% of HBM sales. Samsung says 2027 HBM supply is sold out at agreed target prices. HBM4E samples were supplied in May; mass production is planned for the first half of 2027 with the larger ramp in the second half. The latest and preceding full management-call texts provide prepared remarks and Q&A. Spoken audio remains unreviewed.

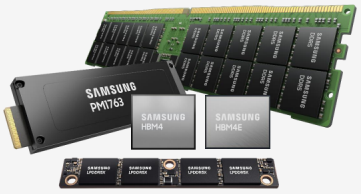

SAMSUNG

Memory

Results

3Q 2026 Results

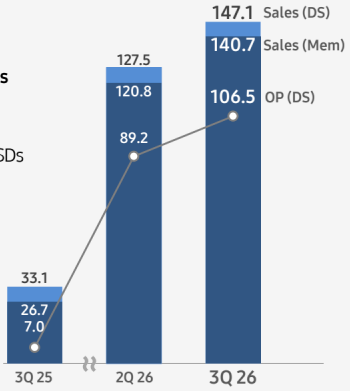

- **Another record-breaking quarterly revenue and operating profit**
  - Managed product-mix with focus on AI products amid limited capacity constraints
  - Market price increased across all applications, led by strong demand momentum for servers
- **Continued robust demand driven by AI applications**
  - Significantly scaled up HBM4 sales backed by industry-leading product competitiveness
  - Proactively addressed growing demand for server SSDs

※ Image : Samsung HBM4/E, DDR5 RDIMM, SOCAMM2, V9 eSSD

DS Results

Unit: KRW trillion

Outlook

4Q 2026

- **AI infrastructure investment to continue backed by industry-wide competition for AI leadership**
  - Further memory demand growth centered on products for new CPU/GPU platforms
  - Surging QLC SSD demand linked to the expansion of personal AI Agent services
- **Maintain AI application focused sales strategy**
  - Further increase sales of HBM, Server DRAM and SSDs
  - Increase supply of high-speed Server DDR5 and QLC

2027

- **AI infra CapEx to accelerate as AI ecosystem expands**
  - Surging AI-driven demand likely to further tighten supply shortages compared with CY26
- **Solidify competitiveness via technology leadership and P-Mix optimization aligned with market trends and VoC**
  - Lead high-end market & sharpen AI server driven portfolio
  - Build a stable sales base through long-term contracts and ensure timely readiness of new products tailored to requirements for AI applications

* Sales and operating profit of each business stated above reflect the organizational structure as of December 2021 and the sales of business units include intersegment sales.
* The DX Division provides earnings call materials based on the business structure before the reorganization to prevent confusion and to improve understanding among investors.
* DX: Device eXperience MX: Mobile eXperience DS: Device Solutions
* Sales and operating profit of VD/DA include the results of Health & Medical Equipment business.
* Harman's sales and operating profit figures are based on Samsung Electronics' fiscal year and acquisition related expenses are reflected.

Samsung Q3 2026 issuer segment results. DS includes Memory and System LSI/Foundry; consolidated sales require intersegment eliminations.

Latest actual input	KRW T	Definition
Group revenue	195.300	Consolidated K-IFRS
Group OP	107.400	Reported group operating profit
Memory sales	140.700	Inside DS

Latest actual input	KRW T	Definition
DS revenue / OP	147.100 / 106.500	Includes LSI and Foundry
DX revenue / OP	52.100 / -0.800	Device cost pressure
SDC + Harman revenue / OP	12.300 / 1.700	Reported segment sums
Revenue eliminations	16.200	Gross segments less consolidated revenue

4. Saleable output, price, manufacturing and operating costs

The current input bridge starts with reported Memory sales and DS profit. HBM exposure retains the dated 33.8T annual calibration and the embedded 49% ASP-growth reference. Conventional DRAM and NAND divide the remaining Memory revenue using the retained allocation ratio. I model standalone Memory OP of 107.0T using reported DS OP of 106.5T and a -0.5T other-DS OP proxy. The quarterly Memory opex anchor is a 9.0T proxy, which implies 24.7T manufacturing COGS within reported Memory sales of 140.7T. Samsung's standalone Memory OP, product costs and divisional opex remain undisclosed. These analytical allocations reconcile to the selected group and DS totals.

For Q4, total DRAM output is calibrated to the selected 17% midpoint. A 4% HBM physical-bit-share proxy and 30% HBM output ramp imply the residual conventional-DRAM growth. NAND output uses 15%. These physical proxies describe different products; their index paths remain visible in the numerical schedules. Subsequent output comes from the quarterly and annual volume assumptions. The annual accepted-output normalization uses total DRAM growth of 22% in 2027 and 2028 and NAND growth of 20% in both years. HBM grows 57% in 2027 and 25% in 2028 within the DRAM pool. These later annual values are industry and analyst capacity proxies for Samsung; company bit guidance covers Q4 2026. Seasonal weights distribute the annual units across quarters. Annual sums control the growth calculation.

The physical capacity check uses a 4% HBM bit-share proxy and a 4x HBM wafer trade ratio. The accepted-output path implies wafer-load growth of 25.6906% in 2027 and 22.3951% in 2028. With the assumed 18% annual productivity improvement, required wafer starts rise 6.5175% and 3.7247%, respectively: required starts factor equals wafer-load factor divided by 1.18. Actual node productivity, yield and wafer starts remain undisclosed. This check tests the existing accepted-output forecast and adds zero revenue.

The conventional-DRAM pricing branch has a flat Q3 ASP reference through 2028 and 60% realization of its conditional price path. For Q4 2026,20% conditional appreciation produces 12% weighted appreciation. The probability control scales future deviations from the reference. A separate supply-normalization path applies from 2029. The NAND benchmark uses the owner's selected path with its own control.

Revenue equals the calibrated product revenue multiplied by the saleable-output index and ASP index. Product COGS equals calibrated manufacturing cost multiplied by output and the unit-cost index. Memory gross profit then absorbs the HBM, LTA and currency bridges; Memory opex includes its retained expense growth and incremental HBM support/R&D burden. Group OP adds the other businesses.

HBM manufacturing uses 65% front-end and 35% packaging cost exposure. The conditional branch applies 10% and 20% cost stresses and a 95%-to 90% yield stress at fixed saleable output. The manufacturing factor is 1.19806 before the selected probability and premium fade. Incremental opex equals 5% of added HBM sales. These yield and product-cost parameters are analytical proxies. Actual Samsung yield distributions and standalone margins remain undisclosed.

Cash capital spending follows a separate funding schedule. Depreciation enters OP and is added back in the cash bridge; cash investment consumes liquidity. The schedules keep each flow in its appropriate place.

The Q2 call described a booked first-half performance-incentive accrual of approximately 10.5% of first-half OP, with part capitalized in work-in-progress and expensed as inventory is sold from Q3. The Q3 cost anchor contains the amount recognized by September 30. The capitalized remainder and future program terms remain unquantified. I use the 0.99 HBM and 0.98 conventional-memory unit-cost factors as net all-in cost assumptions. I add zero separate charge for the historical accrual and retain its remaining-cost coverage as an assumption. The source supplies no recurring 10.5%-of-future-OP formula. A 20% manufacturing-cost stress gives a Q4 2027 ceiling of KRW658,032.16, 2.84% below the selected path; it does not isolate the capitalized remainder.

Current actual-input anchor and analytical product allocation

Q3 2026 source Memory revenue is 140.7T. HBM 8.604797781T, conventional DRAM 91.298057341T and NAND 40.797144878T are the model's allocation within that source total. Standalone Memory OP 107.0T and quarterly opex 9.0T are proxies, implying COGS 24.7T and GP 116.0T. This current reconstruction remains separate from historical forecast displays.

Product COGS allocation =24.7T ×product revenue ×relative cost weight ÷sum of all three weighted revenues. The relative weights are 2.0 for HBM,1.0 for conventional DRAM and1.25 for NAND. The table shows the allocation before future physical, price, yield and support-cost changes.

Product	Proxy revenue T	Cost weight	Allocated COGS T	Proxy GP T
HBM	8.604797781	2.00	2.664991389	5.939806392
Conventional DRAM	91.298057341	1.00	14.137957849	77.160099492
NAND	40.797144878	1.25	7.897050762	32.900094116

Anchor	KRW T	Evidence status
Memory revenue	140.700000	Reported source total
Memory OP	107.000000	Analytical allocation within DS
Memory opex	9.000000	Analytical quarterly proxy
Memory COGS	24.700000	Revenue−OP−opex
Memory GP	116.000000	Revenue−COGS

Annual accepted-output normalization

Output units are index-quarter units: each product's Q3 2026 accepted bits equal1. Annual sums retain these within-product units. Total DRAM units use 0.04 ×HBM units +0.96 ×conventional-DRAM units. These physical-share and annual-output inputs are analytical proxies.

Annual target units =prior-calendar annual units ×(1+selected annual growth). Conventional-DRAM annual units =(total DRAM target-0.04 ×annual HBM units)÷0.96. Each quarter receives the annual product target ×its seasonal/ramp weight÷the annual weight sum. The annual sum therefore controls growth. Calendar2027/2028 total DRAM growth is 22% and NAND 20%; HBM accepted-output growth is 57%/25%.

The 2026 normalization denominators are3.998847481 DRAM index-quarter units and4.027022654 NAND units. Their reported-range midpoint reconstruction supplies a current comparison basis.

Calendar year	HBM units	Conv.DRAM units	Total DRAM units	NAND units	DRAM YoY	NAND YoY
2027	6.167025	4.824909	4.878594	4.832427	22.00%	20.00%

Calendar year	HBM units	Conv.DRAM units	Total DRAM units	NAND units	DRAM YoY	NAND YoY
2028	7.708781	5.878681	5.951885	5.798913	22.00%	20.00%
2029	8.865098	6.760483	6.844667	6.668750	15.00%	15.00%
2030	9.928910	7.785636	7.871367	7.669062	15.00%	15.00%

5. HBM pricing, qualification and Rule16b realization

The retained Mirae sizing inputs imply reference 2027 HBM revenue of 33.8 ×1.57 ×1.49 =79.06834T. TrendForce's 121% blended-price hypothesis implies conditional revenue of 33.8 ×1.57 ×2.21 =117.27586T on that same calibrated output. I weight the incremental outcome at 60%. The agreed 2027 target-price and sold-out commentary, together with actual HBM4 sales mix, support this judgment. Exact contract resets, stack capacities and comparable per-bit prices remain uncertain. The 121% conditional blended endpoint remains an industry forecast with unresolved comparable-unit definitions.

The conditional ASP denominator includes product mix. A lower stack count can increase cube and base-die requirements at a fixed bit quantity. The model adds one blended-price/mix outcome with explicit manufacturing and support costs. The premium persists through 2028, halves in 2029 and is removed in 2030 under the selected timing assumption.

KB's October 1 owner-supplied note projects HBM4's revenue mix rising from 40% to 80% and HBM ASP growth above 100% in 2027. Its company-attributed wafer-allocation discussion helps frame conventional DRAM scarcity. Its dated 555T total-company 2027 OP estimate is a useful external scale cross-check. The current issuer sources and product build determine this report's forecasts.

Increase the realization weight when comparable-unit contracts, accepted shipments and yields establish the targeted economics. Reduce it after price concessions, qualification delays, unfavorable stack mix or higher cost. New evidence can alter the operating distribution before revenue recognition.

Samsung Electronics (005930)

Prolongation of DRAM Supply Shortage

Commodity DRAM shortage not surprising

— At Korea Premium Week 2026, SEC projected that HBM will account for more than a third of global DRAM wafer production capacity by 2027. With a new product category emerging and consuming 30% of total wafer capacity in just 2-3 years, the company noted that a commodity DRAM shortage is unsurprising under the current supply structure. Accordingly, the share of commodity DRAM (minus HBM) is expected to gradually decline from 73% in 2025 to 65% in 2026E and 59% in 2027E.

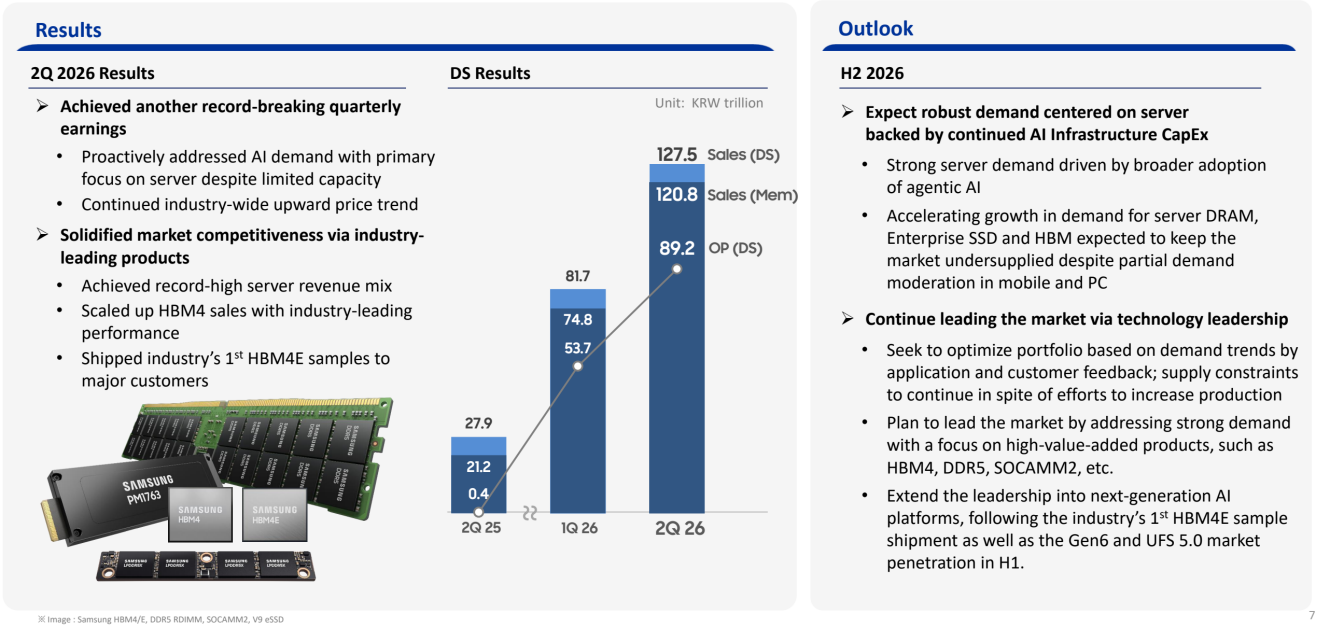

HBM ASP to rise more than 100% in 2027E

— Even if the three DRAM makers (incl. SEC) allocate 30% of total DRAM wafer capacity to HBM by end-2027, HBM is expected to account for only 13% of total supplied DRAM storage capacity as HBM requires more than 3x as much wafer input as commodity DRAM. This means that expanding HBM output substantially erodes commodity DRAM output capacity. HBM4 is expected to account for 80% of SEC's 2027E HBM revenue (vs. 40% in 2026E), leading us to believe that HBM ASP will rise more than 100% YoY in 2027.

Expectations for share retirement and higher dividends

— Assuming SEC has KRW110tn remaining for its 2024-26 shareholder return program, we expect the company to allocate KRW70tn to cash dividends (KRW30tn in 3Q26E, KRW40tn in 4Q26E), and KRW40tn to share buyback/retirement. Given the criteria for separate taxation of dividend income and the 25% payout ratio requirement, we believe the company will be able to increase its dividend payout to KRW40tn in 4Q26E after paying KRW30tn in 3Q26E, leaving enough funding to buy back and retire shares. We expect SEC to average quarterly OP of more than KRW100tn in 2H26E, and forecast 2026E OP of KRW368tn and 2027E OP of KRW555tn. Assuming the next 3y program also commits 50% of FCF to shareholder return, we expect total 3y shareholder returns to increase 4x from KRW140tn under the current 3y program to KRW600tn under the next.

KB Securities owner-supplied October1,2026 note by Jeff Kim and Changmin Lee. Company-attributed allocation commentary and analyst HBM pricing/mix forecasts retain their respective source status.

Samsung Q2 2026 earnings presentation, memory page. The current Q3 source beside this exhibit supplies the updated reported figures.

6. NAND, inference memory and adjacent addressable markets

Agentic inference creates a hierarchy of fast local memory, reusable context storage and high-capacity persistent data. Samsung cites TLC demand for KV-cache storage and high-density QLC for dedicated virtual environments and personal agents. Its V10 TLC was production-ready in Q3 and the 256TB V9 QLC drive is scheduled for early 2027. These are product and timing signals; customer awards and incremental dollars remain undisclosed.

The forward NAND price bridge uses the owner-selected 20% increase in calendar Q4 2026 and 15% in Q1 2027. The fresh Q3 actual anchor is Samsung's reported high-teens ASP growth, alongside its current Memory revenue and product-allocation bridge. Each selected future price change is applied once. The later ASP normalization path remains explicit in the schedule. Earlier published forecast vintages retain their separate historical values.

Ten signed LTAs, compared with five previously, demonstrate contract progress. Ten additional major accounts remain in discussions. The 60%-70% medium-to-long-term capacity objective is unchanged. Capacity targets, signed volumes, deposits and price formulas require separate measurements. A greater signed-contract count supports an incremental contract branch within the uncovered conventional-memory slice; the overlap adjustment prevents a second charge for scarcity already embedded in ASP.

Custom HBM base dies, advanced packaging, foundry process wins, device AI and robotics provide adjacent opportunities. Internal supply enters group economics through consolidation. The forecast contains its foundry/system semiconductor and device recovery assumptions. Exact incremental awards, yield and utilization economics remain the tests for enlarging that path.

The company forecast is a capture model across overlapping markets. Sector TAM multiplied by plausible capture, product mix, realized price and production capacity must reconcile to the quarterly revenue and profit path. Later-year margins are demanding and remain a prominent falsification test.

7. Co-design and optical-memory architecture

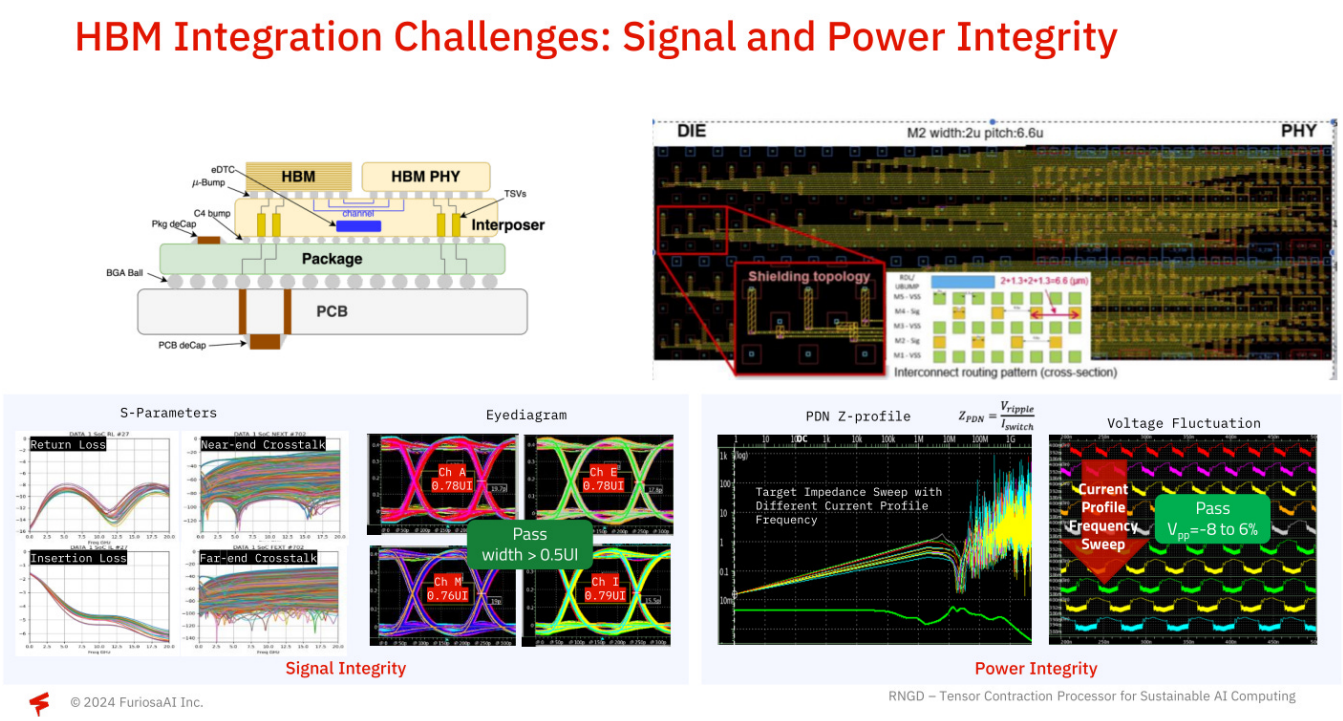

The supplied IA article illustrates HBM package and signal-integrity challenges and proposes optical access to pooled DRAM. Samsung's co-design can improve channel engineering, packaging and qualification. The Furiosa exhibit measures a specific ASIC-to-base-die package path. Samsung's internal stack parasitics and qualification distributions remain undisclosed.

The NVIDIA ISSCC link comparison shows 256Gb/s per fiber,0.8Tb/s/mm bidirectional shoreline density and total link-energy estimates of 2.59/2.51pJ per bit. Its footnotes specify 10% fiber-coupled laser efficiency, thermal assumptions and a one-data-lane/one-clock-lane PRBS7 measurement. Memory-access latency, controller cost, utilization and delivered application bandwidth require further system evidence.

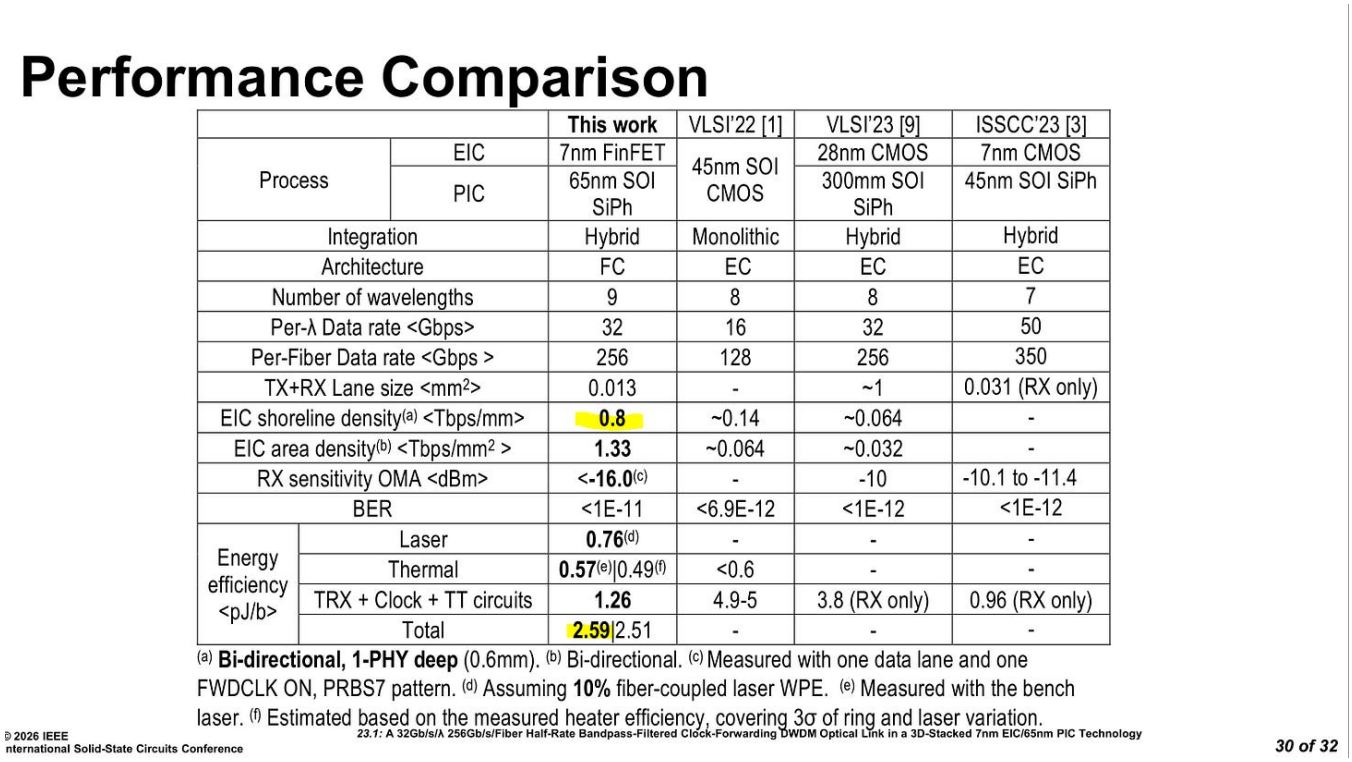

The retained architecture ledger assigns 25% probability to at least one material optical-attached DRAM program by end 2029. The bounded economic bridge considers displaced HBM sales, Samsung-captured replacement DRAM, avoided HBM manufacturing, replacement interface cost and incremental qualification opex. An attempted 0%-100% affected-HBM envelope lacks a defensible named cohort and can reverse the sign of the outcome. Its overlap with existing heterogeneous-memory growth leaves zero incremental revenue and OP in the active path.

The separate 20% probability assigned to the author's 90% peak-HBM decline by 2033-2036 describes the distant endpoint of the same substitution mechanism. Its forecast endpoint falls beyond 2030, and the active earnings contribution is zero. These correlated architecture observations receive a common overlap treatment. A qualified named cohort, comparable system economics and a credible deployment schedule can change the ledger.

The package/co-design hypothesis also contributes zero separate revenue or OP beyond the HBM production and pricing branch. Existing cost and yield stresses already cover that mechanism, and internal foundry transfers reconcile within group profit.

Furiosa AI Hot Chips 2024 package example reproduced in the owner-supplied IA article. ASIC-to-base-die signal integrity and Samsung stack qualification involve separate measurements.

Performance Comparison

NVIDIA ISSCC 2026 optical-link comparison reproduced in the owner-supplied IA article. Preserve its laser efficiency, thermal and test-pattern assumptions when assessing link metrics.

8. Analytical score and protected portfolio Base

The framework score remains 50/60, which rounds to an analytical Base of 83/100. The protected portfolio Excel Base is 90/100 under the owner override. The category table exposes the score arithmetic and existing four-point aggregate risk deduction.

Memory capacity, contracted visibility and HBM execution support the thesis, cycle and TAM categories. Broad coverage limits information asymmetry. Company-wide score improvements require evidence beyond an earnings increment already priced into the same case.

Category	Points	Maximum	Assessment
CoreThesis	17	20	Memory process scale and whole-company capture
CycleStage	10	10	AI-memory demand ramp and constrained qualified output
TAMExpansion	10	10	HBM, server DRAM, enterprise NAND and adjacent products
Catalysts	5	5	Qualification, pricing, contract execution and returns
Macro	10	10	AI infrastructure and capital intensity
Alpha	2	5	Native-language detail within a widely covered company
Risks	-4	0	Four existing classes at one point each

9. Quarterly operating build and economic transmission

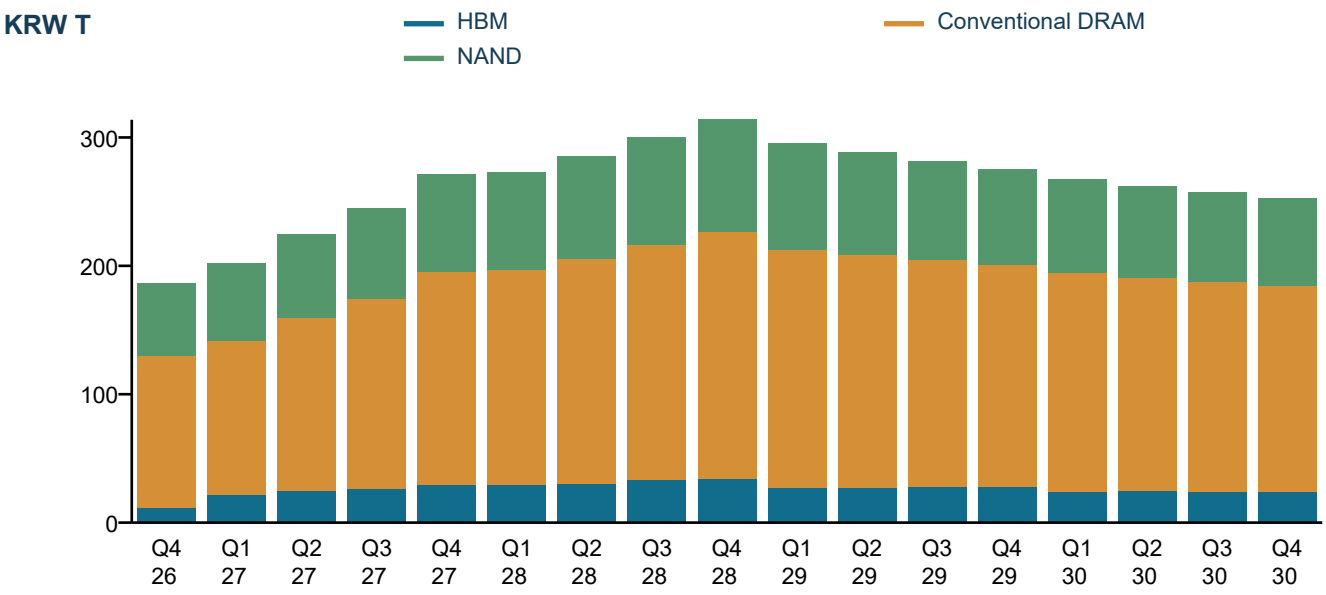

The following schedules cover all 17 modeled calendar quarters from Q4 2026 through Q4 2030. Product revenue, cost, expense and group consolidation use the same financial model as the charts. Each chart has its

numerical table immediately below it.

HBM conditional pricing, conventional-memory LTA realization, currency pressure and the device memory bill create separate incremental bridges. Negative device and FX contributions reduce group earnings alongside the favorable memory effects. The ledger specifies realization, overlap, cost and timing. The additional device-memory BOM assumption is 20% cost inflation, with 8% memory exposure,60% unrecovered cost and 80% realization. Currency models a 2% adverse memory-revenue effect at 35% probability and a 40% manufacturing-cost natural hedge. The company's approximate 10T operating FX effect and reported-9.5T finance line describe different accounting effects.

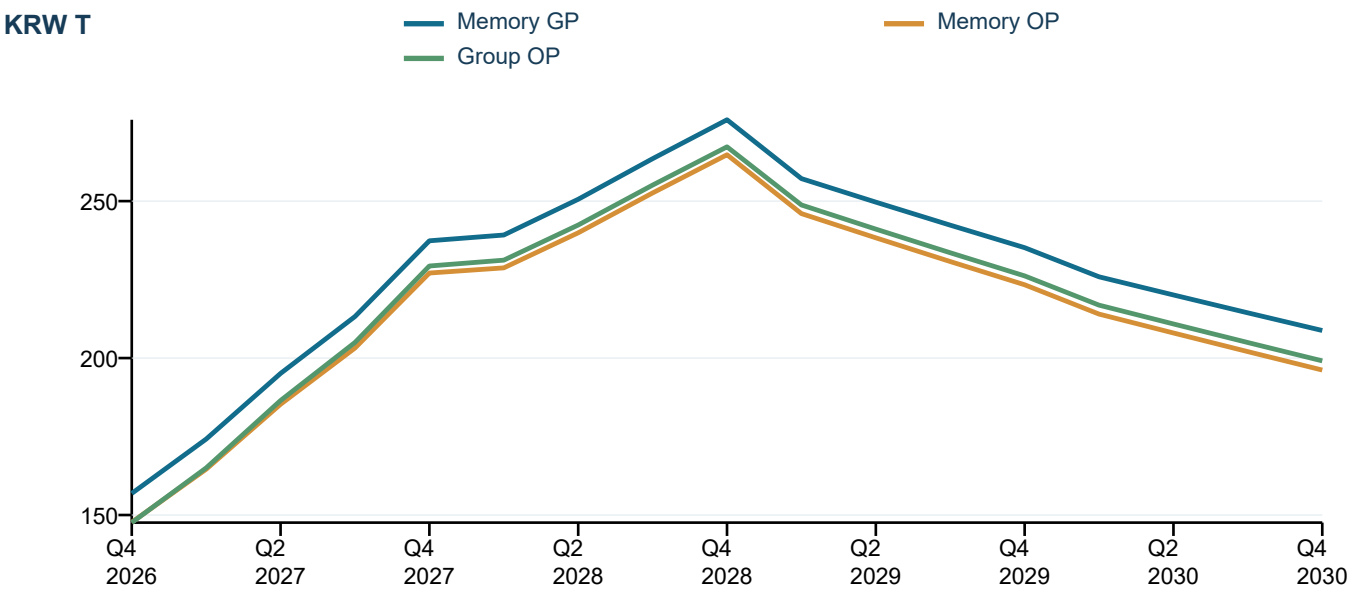

Reported source figures, analytical product allocations and future modeled values retain their labels. Display rounding leaves the full-precision model intact.

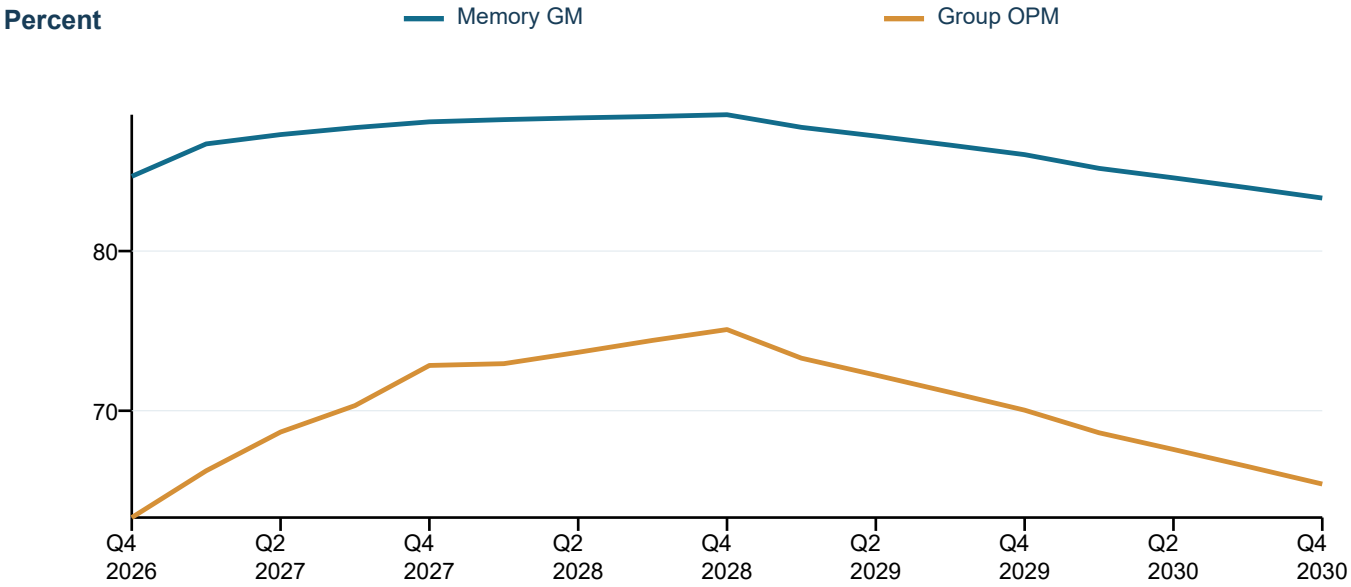

Signal	Probability / overlap	Conditional economics	Timing and disposition
HBM pricing/mix	60% realization	Fixed output;121% conditional versus49% embedded ASP growth. Explicit manufacturing and5% opex burden.	2027-28 full;2029 half premium;2030 zero
DRAM pricing	60% realization	Flat Q3 ASP reference;Q4 conditional20% gives weighted12%. Approved probability control scales future deviations.	2027-28 flat reference;separate2029-30 normalization

Wafer-load and starts dependency

The 4% HBM bit-share proxy and 4x wafer-trade assumption produce this capacity check. Required starts factor equals wafer-load factor divided by 1.18. Company node/yield/starts data remain undisclosed; the check adds zero revenue.

Year	Wafer-load growth	Productivity assumption	Required starts growth
2027	25.6906%	18.0000%	6.5175%
2028	22.3951%	18.0000%	3.7247%

Product gross margins before the currency bridge

These product gross margins are split-model proxies. Each equals the product GP above divided by that product's reference-plus-weighted incremental sales. Common Memory opex remains in the divisional bridge.

10. Four-quarter operating-profit valuation

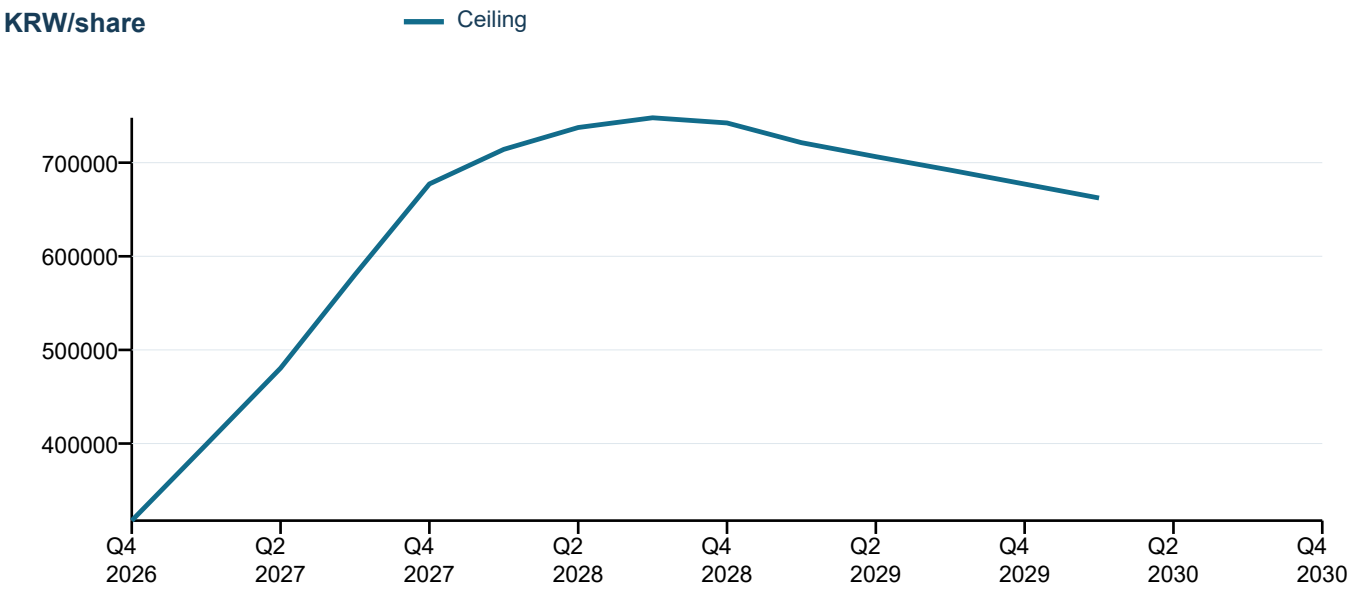

The owner-selected absolute curve is 3x in Q4 2026,3.375x in Q1 2027,3.75x in Q2 2027,4.125x in Q3 2027 and 4.5x from Q4 2027 onward. This is the already-reduced schedule. Its factor is 1.0 when applied to the operating forecast.

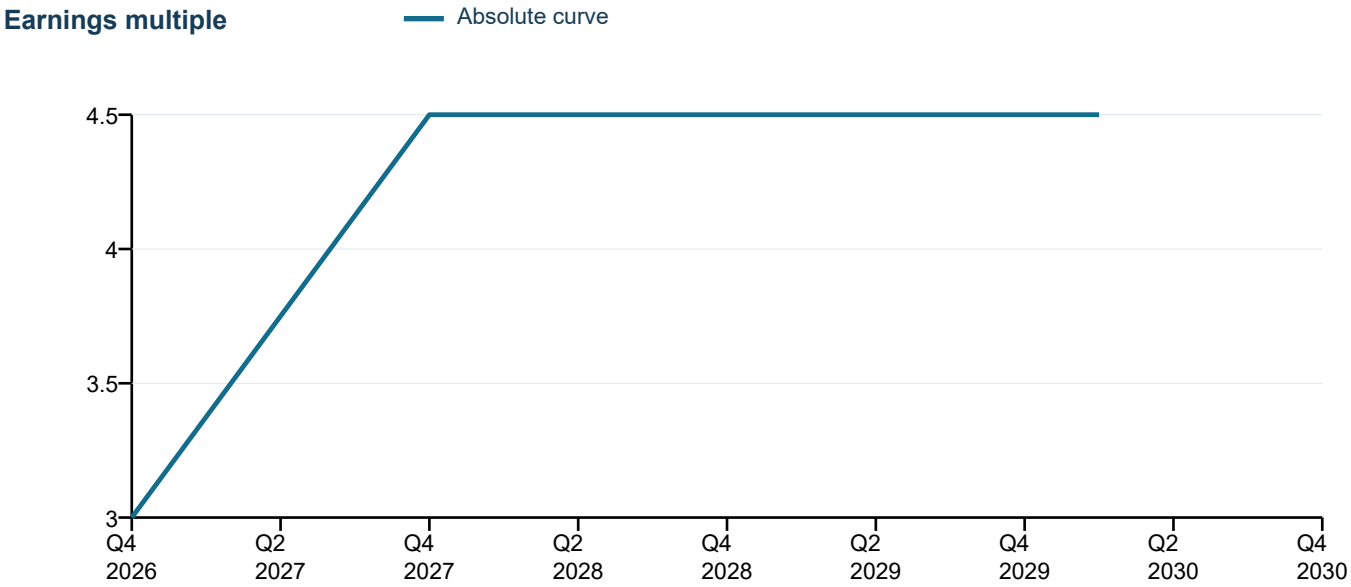

For each eligible quarter, OP equals group revenue multiplied by group operating margin. The price ceiling equals that quarter's OP plus the following three quarters' OP, multiplied by the absolute earnings multiple, divided by end-quarter common-plus-preferred economic shares, and multiplied by 1,000 to convert trillions per billion shares to KRW per share.

The last three modeled quarters lack three additional quarters of earnings. Their forward-four-quarter ceilings remain blank. Published historical quarters retain their original forecasts, formula vintages, share conventions and then-effective four-quarter windows. The separate latest-actual bridge provides the present input anchor.

Buybacks affect per-share earnings through funded purchase and retirement cohorts. Cash distributions appear in a separate income schedule. Dividend income is excluded from price-target upside as instructed by the owner.

The published Q3 2026 roll check retains its original saved formula and display. Its reference range includes future quarters with a refreshed forecast, so recalculation can return CHECK. The archived prior-quarter cash reconstruction also has SUMIFS formulas that can inherit errors from invalid future inputs. Those historical saved displays remain preserved. Current-quarter roll checks, invalid-input tests and independent four-quarter derivations validate the active forecast. Microsoft Excel application testing remains unverified.

Model figure M5. Forward-four-quarter price ceiling and absolute multiple. Numerical table follows; all values use the model.

11. Cash conversion, shareholder returns and economic shares

The forecast starts at September 30 broad liquid funds 214.8229T, debt 17.1912T and limited operating NWC 161.4452T. The NWC definition is receivables plus inventory less trade payables. The source deck's broad-cash movement has an unresolved 14.6T instrument/FX/reclassification bridge; this gap remains explicit and receives no recurring inflow credit.

Normalized CFO equals OP less cash tax and cash interest, plus depreciation/amortization, less the increase in operating NWC. FCF then deducts cash capital investment and lease principal. The cash schedule separately states the tax, amortization, intangible purchase and cash-PPE proxies. Unmeasured SBC receives zero cash addback; future customer deposits contribute zero recurring funding. A prior tax-liability settlement is a separately exposed cash stress. Its selected incremental amount is zero; the sensitivity uses the September 30 current-tax liability.

The D&A proxy combines Q3 2026 reported depreciation of 11.9T with a Q2-derived quarterly amortization proxy of 0.894358T, divided by Q3 group revenue of 195.3T to establish the forecast ratio. Q4 cash capital investment equals (FY2026 management capex 84.4T -9M2026 management capex 56.9T) ×(Q3 cash PP&E 26.9T ÷Q3 management capex 29T) +0.862732T. The final term is a quarterly intangible-cash proxy derived from the H1 2026 cash-flow statement dated June 30. The Q3 observations cover the quarter ended September 30. The formula produces 26.371352689655T of Q4 cash investment.

Samsung estimates 90T-110T total 2026 shareholder returns, of which 35T was planned or completed, leaving 55T-75T. The approved midpoint assumption is 65.0T, allocated to the specified post-board catch-up cohort. Its dividend/buyback mix remains an analytical assumption pending the January 2027 board. From 2027, the owner interim policy allocates 50% of positive FCF, split 41% dividends and 59% buybacks.

The declared 4,601 KRW Q3 dividend totals 30.003T and is scheduled for November 27. Its record date was September 30; a purchase after that date does not acquire this declared distribution. The current source payment and the remaining 2026 return program are counted in their own dated cash cohorts.

Employee-compensation repurchases consume cash and receive zero cancellation credit in the economic denominator. The final purchase settlement derivation supports the remaining Q4 employee-cash input. The economic opening basis retains 6.648649811B issued common-plus-preferred claims under the sanctioned convention; treasury and grant details remain in the source bridge.

New shareholder-buyback cohorts spend 70% in the next quarter and 30% in the following quarter at the independent execution-price path. The model retires 90% of the whole cohort at the end of the quarter containing the final modeled purchase. Ordinary dividends pay one quarter after earning; Q4-earned dividends pay two quarters later. Legal execution, class allocation and eligibility can differ from these forecast timings.

Cash-return schedules show aggregate company cash in KRW trillions. The annual 1 KRW preferred premium remains inside the budget; per-share entitlement depends on issuer record dates. Personal tax, account-specific withholding and beneficial-ownership eligibility remain outside this gross distribution estimate.

The limited NWC measure omits accrued compensation and other operating liabilities. Their cash settlement and unmeasured SBC addbacks remain cash-conversion limitations. Zero extra SBC addback provides no

complete expense-to-liability reconciliation.

* Cash = Cash and cash equivalents short-term financial instruments short-term financial assets at amortized cost, etc.

Current State of Net Cash (Net Cash = Cash* - Debts)

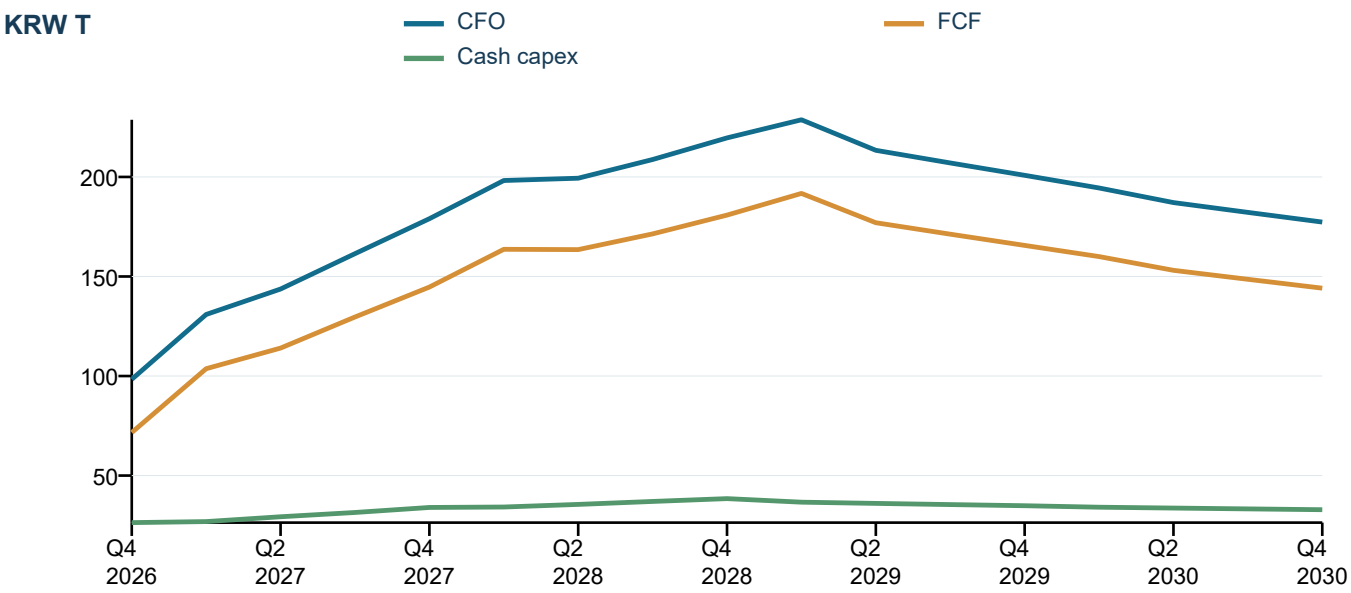

KRW trillion	30.Sep.25	30.Jun.26	30.Sep.26
Net Cash	**91.8**	**167.6**	**197.6**

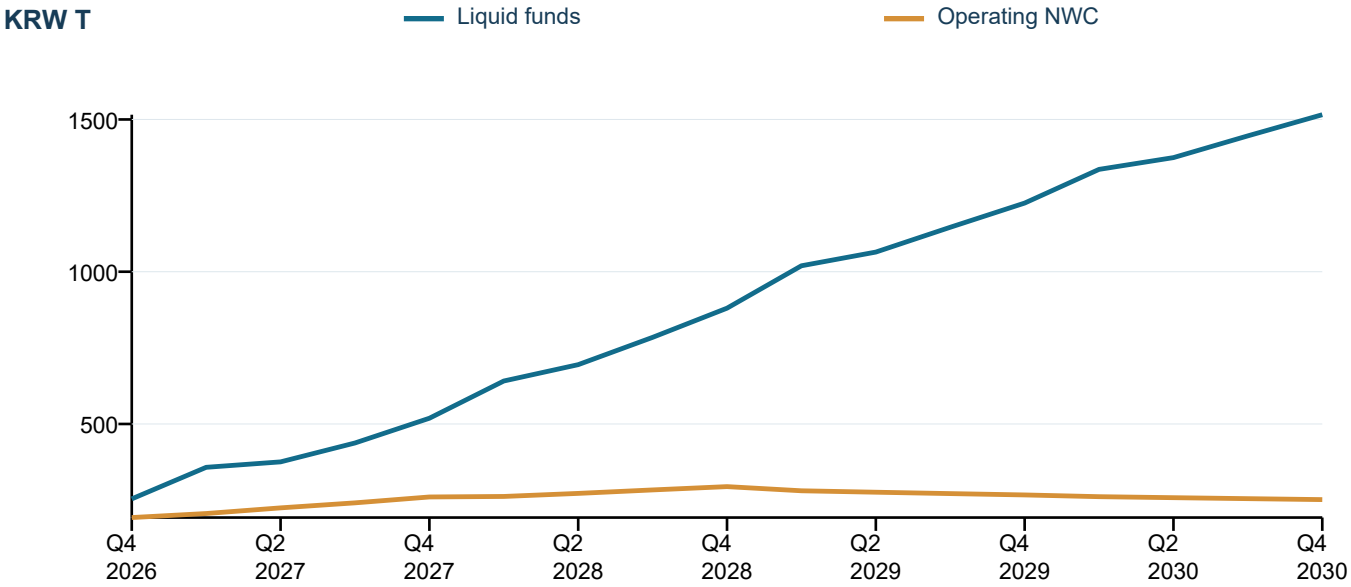

* Cash = Cash and cash equivalents short-term financial instruments short-term financial assets at amortized cost, etc.

Shareholder Return Update

- Total cash dividends for the third quarter amount to KRW 30 trillion (KRW 4,601 per common share and KRW 4,601 per preferred share)
- Of the estimated KRW 90~110 trillion in total shareholder returns for 2026, and with KRW 35 trillion already planned or completed, we anticipate the remaining funds to be KRW 55~75 trillion
- The return of the remaining funds will include a substantial share repurchase and cancellation program, along with cash dividends
- The Company recognizes the growing market interest in the price gap between common and preferred shares, and we are committed to actively considering and adjusting the proportion of preferred shares in our share repurchase and cancellation program based on market conditions
- The next shareholder return policy, along with the final amount of shareholder returns and the specific execution plans for the remaining funds for 2026, will be finalized at the Board meeting scheduled for late January 2027, with an announcement to follow

Samsung Q3 2026 issuer cash-flow presentation. Cash PP&E, current dividend payments and treasury acquisitions have distinct timing and purposes.

Gross dividend per-share scope and eligibility

Future distribution schedules show aggregate dividend cash. This model binding supplies no future gross-DPS series. The source-declared 4,601 KRW distribution belongs to September 30 eligible holders and its November 27 payment date. Future holder eligibility, preferred premiums and personal tax require their own confirmed

inputs.

12. Industry relationships and cross-book implications

SK hynix and Micron provide comparisons for HBM qualifications, accepted output, contract structure and conventional-memory allocation. Sandisk and Kioxia provide NAND pricing, enterprise SSD and supply-discipline evidence. Samsung's latest quarter and MU's fiscal guide overlap for only part of their periods; translate evidence through timing and product exposure.

Memory strength supports advanced packaging, test, substrates and equipment demand. Samsung-specific order capture is required to attribute profit to a supplier. LPKF's glass-processing opportunity remains a contingent equipment flow-through. Device and system vendors can experience higher component costs while memory manufacturers benefit from scarcity.

Foundry, packaging, memory and system demand overlap within Samsung and across suppliers. The company-level paths count each underlying demand pool and its economic capture once.

13. Catalysts, risks and falsification tests

Near-term catalysts are accepted HBM4 shipments, the 2027 HBM price reset, HBM4E qualification, enterprise TLC/QLC adoption, LTA execution and January 2027 capital-return decisions. Foundry utilization and 2nm customer ramp timing affect the non-memory recovery. Cash-return finalization and actual buyback execution remain separate dated milestones.

The principal risks are competitive supply and pricing; HBM/package/foundry execution; governance, cash allocation and share-class treatment; and customer/device demand. Each already contributes one point to the aggregate four-point score deduction.

Challenge the output path against productive wafers, accepted bits, cleanroom and equipment availability. Challenge price persistence against realized ASP, contract bands, renegotiations and customer financing. Challenge product costs against packaging intensity, base-die requirements, yield and incentives. Challenge cash conversion against tax settlements, NWC, capex, deposit repayments and compensation cash.

The 2029-2030 profit path remains sensitive to new supply and architectural change. The sensitivity table recomputes earnings, cash, funded retirement and shares through the same cash schedule. It identifies the assumptions with the greatest valuation effect.

14. Source inventory and completeness

The issuer Q3 presentation, local-language and global releases, dividend disclosure, listing and treasury notices provide primary financial and capital-return evidence. The saved original payloads, source dates, hashes, call originals and extraction derivatives are listed below.

The latest and prior complete Quartr call bodies provide management and Q&A coverage. Official replay wrappers are retained; spoken audio has not been listened to. Provider unit errors are checked against issuer financial tables. The deck was supplied before external review completed.

Product-level revenue and OP, exact HBM yield, Q4 ASP, contract price levels, recurring FCF adjustments, exact future cancellation/class allocation and the broad-cash bridge remain specific gaps. Owner-supplied KB, IA and TrendForce material retains its original attribution and limits. The original revised TrendForce NAND table has not been independently recovered.

The charts and quarterly tables use the financial model identified in the calculation appendix. The original input snapshot and validated workbook identities are recorded there.

Q3 earnings management call. Event: October 29, 2026 at 10:00 UTC+0900. Provider: Quartr via TradingView. Prepared remarks and Q&A coverage: End-to-end.

Q2 earnings management call. Event: July 30, 2026 at 10:00 UTC+0900. Provider: Quartr via TradingView; same-call publisher body reviewed. Prepared remarks and Q&A coverage: Full management and Q&A reviewed through publisher; Quartr original retained.

The latest earnings event corresponds to October 28, 2026 at 21:00 in Toronto.

Call completeness: Spoken audio not listened.

Call completeness: Official written transcript not found.

Call completeness: Provider unit/speaker errors exist; issuer deck/disclosures control financial units.

Call completeness: Publisher raw403 failures preserved; no access bypass used.

Samsung_Q3_2026_transcript_StockAnalysis.html	https://stockanalysis.com/quote/krx/005930/transcripts/718820-q3-2026/

Samsung does not disclose separate HBM, conventional-DRAM and NAND sales or standalone Memory operating profit. Product allocation and standalone Memory costs remain analytical proxies.

The issuer supplies qualitative pricing commentary; a numerical Q4 ASP guide was not disclosed.

A complete customer-deposit and recurring free-cash-flow reconciliation remains unavailable.

The broad-cash movement contains a KRW14.6T instrument, currency or classification bridge that the saved source set does not fully reconcile.

Exact September30 treasury inventory and any employee-share movements after October29 remain unconfirmed.

Customer-specific contract prices, floors and caps remain undisclosed.

The future common-versus-preferred retirement allocation remains unannounced. The forecast retains its common-share retirement convention.

Issuer Q3 figures were released before its external review completed; the saved source set does not establish completion.

Official replay audio has not been listened to; both full management-call texts were reviewed.

Dated inherited research

KB October1 owner note: company-attributed allocation comments and analyst HBM forecasts. TrendForce September29 blended-HBM ASP forecast: industry pricing/mix hypothesis. Mirae May7/September7 HBM sizing and price/output forecasts: calibration proxies. TrendForce owner-supplied revised NAND ranges and JeffPu/Jukan relay: original revised table remains unrecovered.

IA May31 owner-supplied article and reproduced Furiosa/NVIDIA research figures: architecture and signal-integrity evidence. Figure footnotes retain test conditions. Exact original exhibit hashes are preserved in the exhibit manifest.
