November 2026
Source and financial review

Research vintage: 7 November 2026 | Framework 8.0 | USD per share

Q4 2027 calculated ceiling $453.88 | Analytical Base 82 | Excel Base 82

The calculated Q4 2027 operating-profit ceiling is USD 453.88 per share, compared with the previously published USD 455.01. The model values Q4 2027 through Q3 2028 at 20 times consolidated GAAP operating profit, using the retained 24.285 billion starting-quarter diluted-share proxy.

The review retains the five-product revenue forecast and adds explicit memory, customer-support and conditional acquisition costs. It also builds complete cash, procurement, paid-capital, lease, debt, tax and physical-share bridges. Analytical Base and Excel Base remain 82. All future amounts below are model estimates unless identified as reported results or management guidance.

USD billions; shares in billions. Prices are USD per share.

1. Investment thesis and the operating-profit ceiling

NVIDIA combines accelerator compute, networking, CPUs, systems and software into an AI infrastructure platform. Customers benefit when the complete deployed system delivers useful work within their power, memory, network and engineering budgets. NVIDIA captures that value through its own accepted component and system invoices.

The investment case depends on qualified supply converting into shipments, customer funding supporting continued deployment, and product performance sustaining the selected revenue and margin paths. The new review makes these operating and funding dependencies explicit. The valuation continues to use operating profit; modeled liquidity supplies a separate check on financing and capital-return capacity.

2. What changed in this review

The active four-quarter operating-profit reduction is USD 1.3687 billion. It comprises USD 0.1736 billion of additional memory manufacturing cost, USD 0.6068 billion of conditional contract support, USD 0.0905 billion each of Hugging Face ordinary support and one-time integration, and USD 0.4073 billion of acquisition-intangible amortization.

Applying the preserved 20 times operating-profit multiple and 24.285 billion share denominator reduces the active ceiling by USD 1.13, or approximately 0.25%. The reference revenue, ordinary cost budget and prior accelerator-forecast overlap remain intact. The modest target change accompanies a much more complete view of the cash and contingent claims required to support that revenue.

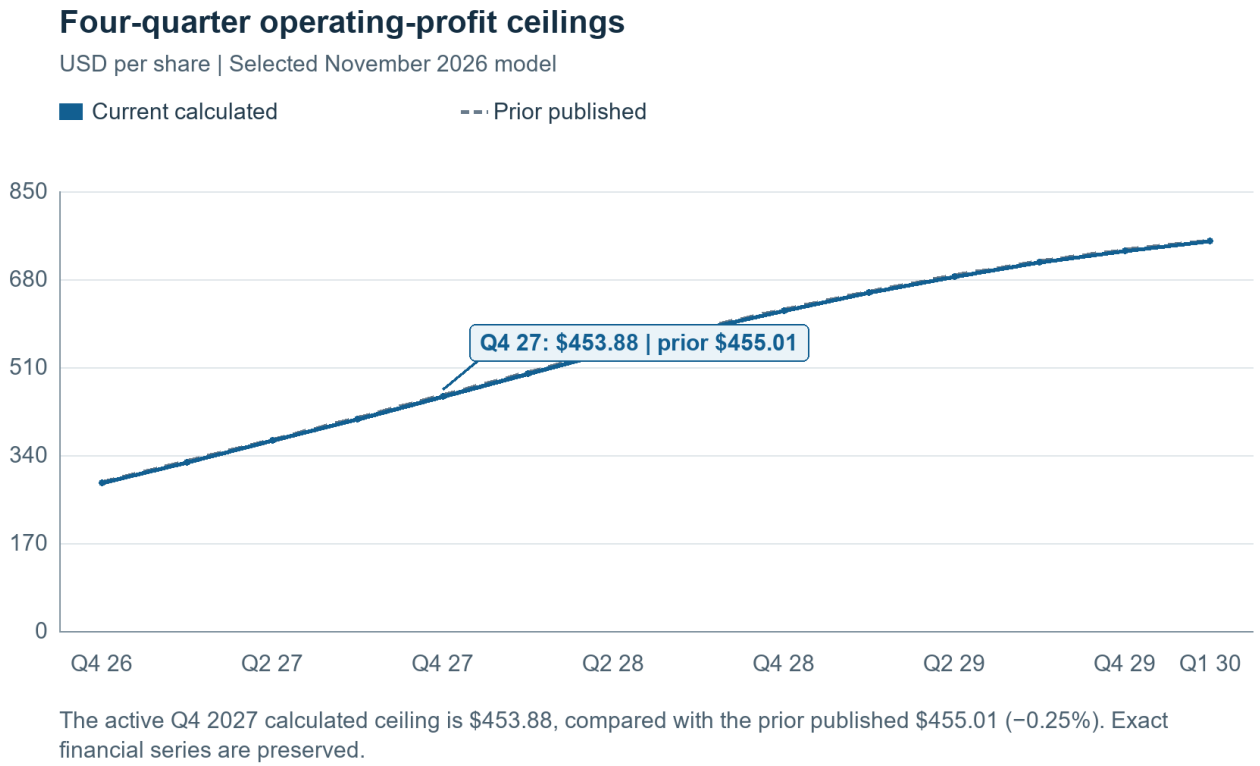

Active-window revision bridge

OP reduction USD billions; target effect USD per share

Incremental cost	F4 OP reduction	Target effect, USD
Additional memory manufacturing cost	0.1736	-0.1430
Conditional contract support	0.6068	-0.4997
HF ordinary cash support	0.0905	-0.0745
HF one-time integration	0.0905	-0.0745
HF PPA amortization	0.4073	-0.3354
Total	1.37	-1.13

The retained revenue, original GAAP cost reference and 20x/24.285B method stay fixed. The five selected cost components explain the full active-ceiling revision. The integration amount appears only in its conditional closing quarter.

Four-quarter operating-profit ceilings

The active Q4 2027 calculated ceiling is $453.88, compared with the prior published $455.01 (−0.25%). Exact financial series are preserved.

ASTRA model estimates, 7 November 2026. USD per share.

3. Products, platform economics and the invoice boundary

The model separates Data Center GPU compute, Data Center networking, CPU, Gaming, and the combined professional-visualization, automotive and OEM vector. Each vector has its own revenue and reference gross-margin allocation. Their dollar gross profits aggregate into the company operating model.

A cloud rental price, total OEM rack price, customer revenue per megawatt and NVIDIA net product invoice have different economic perimeters. The source review preserves those distinctions. An additional seller-revenue increment requires an identified product, customer allocation, shipment date and realized NVIDIA price after existing forecast overlap.

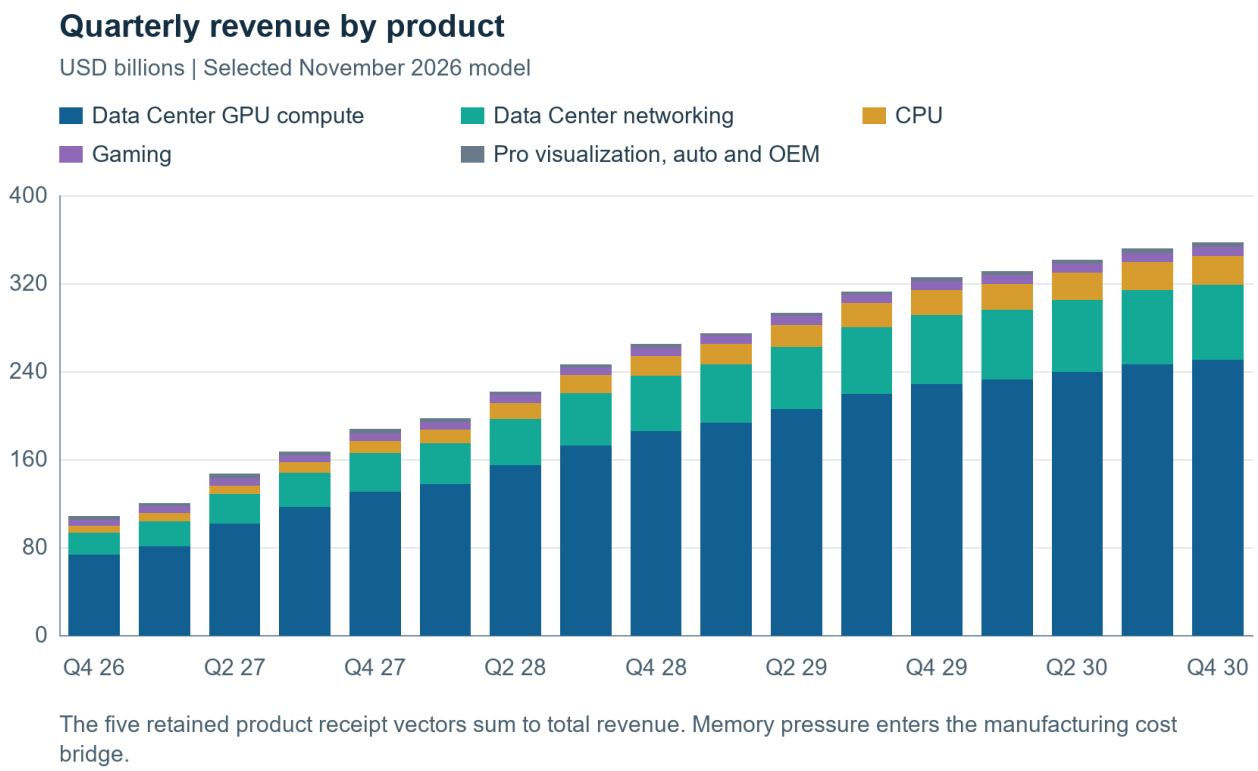

Quarterly revenue by product

USD billions; shares in billions where identified

Quarter	Data Center GPU compute	Data Center networking	CPU	Gaming	Pro visualization, auto and OEM
Q4 2026	73.60	19.90	6.00	6.00	2.50
Q1 2027	81.20	22.30	8.00	6.00	2.50
Q2 2027	101.64	26.90	7.50	7.00	3.50
Q3 2027	116.66	31.10	9.50	6.50	3.00
Q4 2027	130.98	35.00	11.00	7.00	3.00
Q1 2028	137.60	37.10	12.50	7.00	2.50
Q2 2028	154.95	42.10	14.50	7.50	2.00
Q3 2028	173.08	47.10	16.50	7.00	2.50
Q4 2028	185.66	50.60	18.00	7.50	2.50

Q3 2029	219.97	60.20	22.00	7.50	2.50
Q4 2029	228.57	62.60	23.00	8.00	3.00
Q1 2030	232.47	63.70	23.50	8.00	3.00
Q2 2030	239.47	65.70	24.50	8.50	3.00
Q3 2030	246.47	67.70	25.50	8.00	3.50
Q4 2030	250.37	68.80	26.00	8.50	3.50

Exact retained product receipt paths. Existing accelerator-branch overlap is already embedded. The new review adds bounded costs and cash claims without a second capacity or market-size revenue layer.

Quarterly revenue by product

The five retained product receipt vectors sum to total revenue. Memory pressure enters the manufacturing cost bridge.

ASTRA model estimates, 7 November 2026. USD billions.

4. Software, networking and competitive architecture

Software optimization, memory capacity and fabric design can materially change useful output per system. The current evidence includes workload-specific Hopper kernel improvements, Rubin AgentX results, AMD competitive cost curves, mixed Rubin specification revisions and an attributed Kyber rack-design claim. Each observation retains its workload, precision, topology, pricing date and metric denominator.

The selected forecast retains its existing platform and competitive-risk assessment after considering this evidence. A benchmark improvement can support customer economics while its effect on new hardware purchases depends on deployment scale and demand elasticity. Engineering research also supplies execution counterevidence. Displaced NVIDIA receipts, realized price changes and incremental support costs remain unmeasured in these observations.

5. Latest reported quarter and historical cash

The latest reported quarter used here is Q2 FY2027, ended July 26, 2026. Revenue was USD 96.221 billion, gross profit USD 72.142 billion and operating expenses USD 8.408 billion, producing USD 63.734 billion of operating profit. Research and development was USD 7.054 billion and selling, general and administrative expense was USD 1.354 billion. [S1, S2]

Net income of USD 59.688 billion includes other-income effects, including USD 7.771 billion of equity securities gains. The historical cash reconciliation separately preserves those noncash adjustments and working-capital movements. Q2 CFO was USD 24.077 billion and issuer free cash flow was USD 21.341 billion. The selected opening liquid pool is USD 56.586 billion of cash and marketable debt securities. Equity investment values remain separately recorded.

Latest reported income and balance-sheet anchors

USD billions; shares in billions where identified

Scope	Metric	Value
Q2 FY2027	Revenue	96.22
Q2 FY2027	Gross profit	72.14
Q2 FY2027	GAAP operating expenses	8.41
Q2 FY2027	Operating profit	63.73
Q2 FY2027	Research and development	7.05
Q2 FY2027	Selling, general and administrative	1.35
Q2 FY2027	Other income, net	7.77
Q2 FY2027	Equity securities gains	7.77
Q2 FY2027	Pretax income	71.51
Q2 FY2027	Book tax	11.82
Q2 FY2027	Net income	59.69
Q2 FY2027	Diluted weighted-average shares	24.285
July 26, 2026	Cash	22.44
July 26, 2026	Marketable debt securities	34.14
July 26, 2026	Liquid cash plus debt securities	56.59
July 26, 2026	Marketable equity securities	42.78
July 26, 2026	Nonmarketable equity securities	51.16
July 26, 2026	Accounts receivable	63.06
July 26, 2026	Inventory	31.57
July 26, 2026	Accounts payable	15.06
July 26, 2026	PPE, net	14.29
July 26, 2026	Operating lease assets	5.39
July 26, 2026	Current tax payable	5.21
July 26, 2026	Noncurrent tax payable	5.60

Reported quarter ended July 26, 2026. Equity investments remain outside the selected opening liquid-cash pool. The recurring valuation uses GAAP operating profit.

Historical cash reconciliation

USD billions; shares in billions where identified

Metric	Q2 FY2027	First half FY2027
Net income	59.69	118.01
Stock compensation	2.03	3.95
Depreciation and amortization	1.13	2.12
Deferred tax	-0.6020	0.9820
Equity gain reversal	-7.77	-23.71
Other noncash adjustments	0.3150	0.2220
Receivables change	-22.35	-24.59
Inventory change	-5.78	-10.20
Prepaids and other current assets	-5.50	-6.48
Accounts payable change	1.92	4.12
Accrued current liabilities	0.2520	8.02
Other long-term balances	0.7530	1.97
Cash from operations	24.08	74.42
Issuer free cash flow	21.34	69.89
Opening cash	13.24	Blank
Investing cash flow	-8.70	Blank
Financing cash flow	-6.18	Blank
Closing cash	22.44	Blank

CFO includes source-reported working-capital and noncash adjustments. Issuer FCF deducts cash PPE/intangible purchases and related principal repayments. Missing cells identify an unavailable comparison in this table.

6. Management guidance and the newest two calls

The review uses the complete issuer-hosted May 20 and August 26 management-call transcripts, including prepared remarks and questions and answers. The August call guides FQ3 FY2027 revenue to USD 108 billion, plus or minus 2%, with GAAP and non-GAAP gross margin of 74%, plus or minus 50 basis points. GAAP operating expenses are guided to approximately USD 9.2 billion. [S2, S3]

Management expects gross margins to bottom at 71% to 72% in FQ4, then reach 72% to 73% in FY2028 as executed price increases take effect. Its preliminary FY2028 revenue-growth expectation is approximately 70%, with supply remaining a bottleneck through at least that fiscal year-end. Those dated statements anchor the existing model; the later source review evaluates the remaining cost and timing exposure. Independent audio verification is incomplete.

Management guidance and production timing

USD billions; shares in billions where identified

Item	Source period	Amount or range
Revenue	FQ3 FY2027	108
Revenue tolerance	FQ3 FY2027	Plus or minus 2%
GAAP and non-GAAP gross margin	FQ3 FY2027	74%, plus or minus 50 basis points
GAAP operating expenses	FQ3 FY2027	9.20
Non-GAAP operating expenses	FQ3 FY2027	9.00
Gross-margin trough	FQ4 FY2027	71% to 72%
Later gross margin	FY2028	72% to 73%
Preliminary revenue growth	FY2028	Approximately 70%
Rubin share of Data Center revenue	FQ3 FY2027	Approximately 20%
Supply constraint	Through at least end FY2028	Management expectation
Production shipments began	August 2026	Management statement
OCI general availability	October 27, 2026	Vera Rubin NVL72 and Vera CPU

Guidance comes from the August 26 call and CFO commentary. The October availability announcement establishes availability; accepted volumes and the broader expansion remain separate measurements.

7. Five-product revenue and margin forecast

The five retained product receipt paths already include the earlier accelerator-demand branch and its reference subtraction. The current review preserves those inputs. The published reference product margins are analyst allocations that reconcile company gross profit; product-level GAAP margin disclosure remains limited.

The selected memory branch changes manufacturing costs inside each joint outcome. Ordinary operating support, leases, depreciation and stock compensation remain attached to the revenue. This structure makes a higher revenue path dependent on the capacity, support and cash needed to deliver it.

Reference product gross-margin allocations

Ratios; 1.0 equals 100%

Quarter	Data Center GPU compute	Data Center networking	CPU	Gaming	Pro visualization, auto and OEM
Q4 2026	0.7746	0.7160	0.6050	0.5980	0.5780

Q2 2030	341.17	252.44	26.40	226.04	9.67	40.07	195.63
Q3 2030	351.17	259.86	27.07	232.80	11.38	41.51	202.67
Q4 2030	357.17	264.60	27.42	237.18	12.97	42.53	207.63

Probability-weighted results after each of the 36 states runs its complete financial and cash laws. Other income includes interest and conditional guarantee losses.

8. Manufacturing, qualified capacity and source overlap

The October 21 issuer announcement describes substrate, interposer, testing and optical-engine expansion across the manufacturing chain. These steps support supply already required by the retained product forecast. Their stated capacity multipliers have different baselines, units and readiness dates. Absolute usable output, yields and company invoice conversion remain incompletely disclosed. [S5]

The model retains zero separate capacity-driven revenue on top of that forecast. The KYEC reservation payment receives a conditional cash and asset treatment. Existing customer commitments, wafer or package capacity, optical content and accepted system shipments share parts of the same production chain, so the review keeps their economic overlap explicit.

Manufacturing and cash-eligible cost bridge

USD billions; shares in billions where identified

Quarter	Gross COGS	Manufacturing DA	Manufacturing SBC	Cash-eligible COGS	Extra memory cost	Retained cost residual
Q4 2026	28.08	0.4524	0.0797	27.55	0.00	27.55
Q1 2027	34.20	0.5399	0.0885	33.57	0.00	33.57
Q2 2027	40.25	0.6105	0.1081	39.53	0.00	39.53
Q3 2027	45.81	0.7124	0.1231	44.98	0.00	44.98

Q1 2028	54.05	0.9585	0.1451	52.95	0.00	52.95
Q2 2028	59.13	1.08	0.1631	57.88	0.0628	57.82
Q3 2028	65.49	1.23	0.1817	64.08	0.1108	63.97
Q4 2028	70.05	1.40	0.1950	68.45	0.1469	68.30
Q1 2029	72.20	1.59	0.2024	70.41	0.1352	70.28
Q2 2029	76.71	1.77	0.2160	74.72	0.00	74.72
Q3 2029	81.70	1.97	0.2303	79.49	0.00	79.49
Q4 2029	84.87	2.19	0.2399	82.44	0.00	82.44
Q1 2030	86.26	2.41	0.2440	83.60	0.00	83.60
Q2 2030	88.73	2.64	0.2517	85.84	0.00	85.84
Q3 2030	91.31	2.88	0.2591	88.17	0.00	88.17
Q4 2030	92.57	2.78	0.2636	89.52	0.00	89.52

Manufacturing DA is 40% of finite group DA. COGS SBC scales the reported 0.071/96.221 revenue ratio. The residual is held fixed across useful-life tests.

9. Memory cost, pass-through and margin reserves

The anonymous OEM source reports a 40% memory-and-storage cost increase and a shift in B300 versus GB300 revenue mix. Its rack receipts belong to that OEM. The selected bridge applies a 10% OEM memory reference to a 70% NVIDIA-invoice proxy, then a 40% conditional price shock and 75% pass-through. All of these conversion inputs are analyst estimates. [S9]

The bridge deducts 50% of the retained company gross-margin reserve below a 75% benchmark before adding a positive excess. It then applies 50% invoice eligibility, exact calendar-2027/2028 month overlap and a 40% probability once through the state tree. The resulting cost changes inventory, supplier purchases, advances, AP, earnings and tax in that state. The source customer mix receives zero extra central receipts because NVIDIA-specific unit exposure and realized prices remain unresolved. The separate October 15 expert takeaways retain their rack-memory and invoice-scope context. [S13]

Conditional memory-cost and reserve bridge

USD billions; shares in billions where identified

Quarter	GPU receipts	After pass-through	Allocated reserve	Conditional excess	Weighted extra COGS
Q4 2026	73.60	1.05	0.5400	0.00	0.00
Q1 2027	81.20	1.16	2.10	0.00	0.00
Q2 2027	101.64	1.45	1.81	0.00	0.00
Q3 2027	116.66	1.67	2.06	0.00	0.00
Q4 2027	130.98	1.87	2.31	0.00	0.00
Q1 2028	137.60	1.97	2.44	0.00	0.00
Q2 2028	154.95	2.21	1.90	0.1571	0.0628
Q3 2028	173.08	2.47	1.92	0.2770	0.1108
Q4 2028	185.66	2.65	1.92	0.3673	0.1469
Q1 2029	193.47	2.76	1.75	0.3380	0.1352
Q2 2029	205.87	2.94	1.77	0.00	0.00
Q3 2029	219.97	3.14	1.83	0.00	0.00
Q4 2029	228.57	3.27	1.79	0.00	0.00
Q1 2030	232.47	3.32	1.80	0.00	0.00
Q2 2030	239.47	3.42	1.72	0.00	0.00
Q3 2030	246.47	3.52	1.76	0.00	0.00
Q4 2030	250.37	3.58	1.64	0.00	0.00

Conditional excess includes 50% invoice eligibility and exact calendar-2027/2028 month overlap. The 40% probability is applied once through the joint state tree. Extra memory cost receives no second price or capacity uplift.

10. Research, operating support and recurring costs

The retained GAAP operating budget is recomposed into finite DA, source-anchored SBC, internal cloud costs, selected operating lease expense and a remaining ordinary cost pool. The remaining pool stays fixed when useful lives or commissioning lags change. A shorter asset life therefore changes operating profit explicitly. The operating-expense reconciliation uses group DA and SBC after their manufacturing allocations, then adds the named operating costs and selected acquisition costs.

The model adds conditional AI capacity shortfalls, assignment rent and acquisition support once. The forward R&D and SG&A split follows the latest actual allocation and serves as a presentation proxy. Full company operating costs remain the controlling amount. The new technical evidence informs the software and execution assessment without establishing a separate measured engineering-cost increment.

Complete quarterly operating-expense reconciliation - panel 1 of 3

Opex DA equals group DA less manufacturing DA; opex SBC equals group SBC less manufacturing SBC. All nine cost components reconcile to selected operating expenses in every quarter. The selected HF existing-cost overlap is zero. The three panels repeat Quarter and retain both the component sum and selected company opex.

11. Rubin timing, benchmarks and customer economics

The attributed roadmap crop describes a one-to-two-month VR200 rack-ramp slip into calendar Q4 2026, with components including midplane PCB cited. The original roadmap date and originally planned month are unavailable. The August call already places initial production shipments in August and a larger hyperscale ramp in the following fiscal quarter; Oracle announced OCI general availability on October 27. [S2, S6, S12]

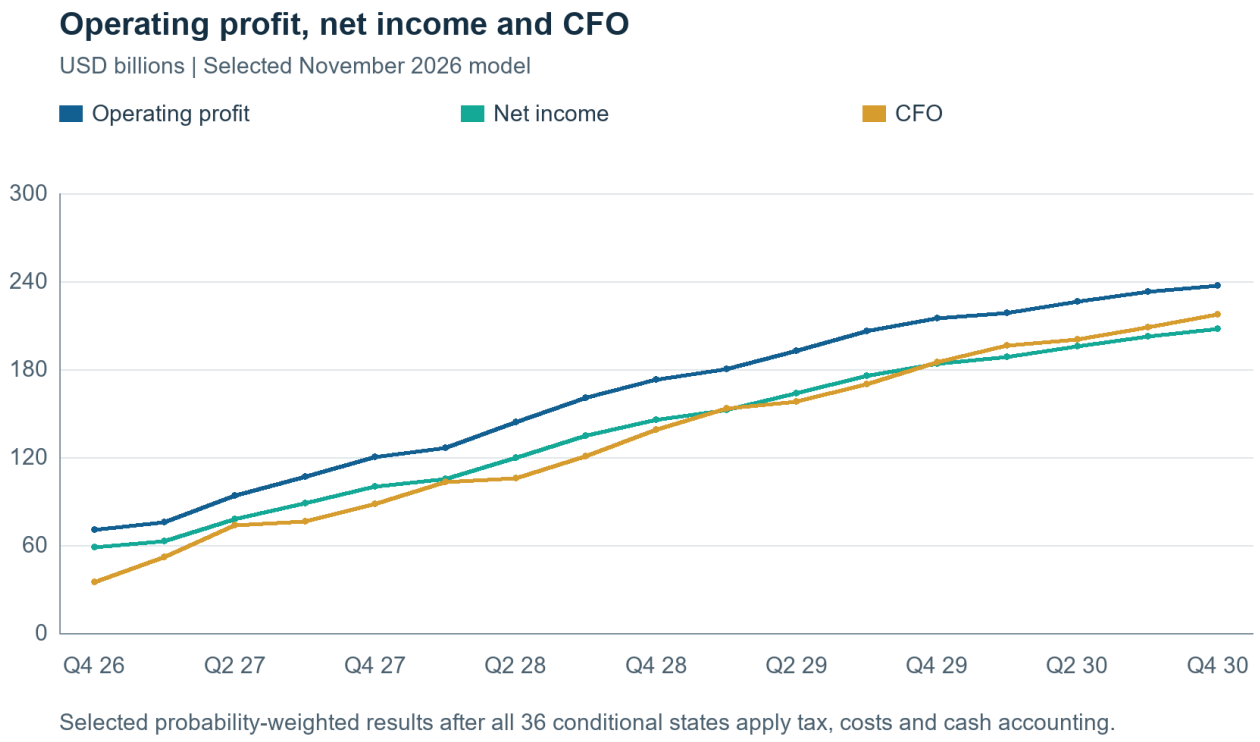

The selected case treats the reported destination as fully overlapping that retained ramp and adds zero prospective delay. A separate extra month-shift proposal remains unselected. The component-execution risk is retained. The source's 81,000 to 82,000 and 90,000 to 91,000 NVL72-equivalent rack forecasts for calendar 2026 and 2027 keep their own unidentified configuration and vintage, alongside the separate older Jeff Pu estimates. The linked-only roadmap image was unavailable for a fresh local visual check.

12. Operating profit, other income and book earnings

Selected GAAP operating profit includes ordinary manufacturing and support costs, finite asset depreciation, SBC, lease expense, the memory branch and conditional acquisition costs. Interest income follows opening liquid cash. Debt book interest includes finite discount and issuance-cost amortization; conditional guarantee losses enter other income.

Book earnings and cash are calculated within each of the 36 outcomes before weighting. This preserves the interaction of operating costs, interest, tax, discretionary buybacks and liquidity. The operating-profit valuation uses its preserved denominator independently of the physical share bridge.

Operating profit, net income and CFO

ASTRA model estimates, 7 November 2026. USD billions.

13. Working capital, procurement and supplier advances

Cash-eligible manufacturing cost subtracts allocated manufacturing DA and source-anchored manufacturing SBC from total COGS. Source cash COGS of USD 23.5572 billion calibrates trade AP to approximately 58.172 days. Book inventory retains its gross-COGS intensity of approximately 119.329 days. The selected central cash proxy funds the full book-inventory movement in both procurement and CFO.

Dated supplier commitment floors can create finite prepaid balances, and later qualifying purchases consume those balances. The model applies those credits once. Sensitivities compare 0%, 40% and 100% manufacturing DA allocations, the prior gross-cost procurement approximation, and 97.833% versus 100% inventory cash content. A growing noncash inventory component makes the full-book cash proxy conservative; a drawdown can reverse that direction. Original capitalization vintages and overhead detail remain unavailable.

Working capital and supplier cash

Q3 2030	231.54	119.73	56.37	3.38	91.55	91.55	0.00
Q4 2030	235.50	121.39	57.23	1.65	91.18	91.18	0.00

The selected cash proxy funds the full book-inventory change. The same inventory movement drives procurement and CFO. Trade AP is calibrated to cash-eligible source COGS. The 14-week FQ4 FY2027 uses 98 days.

14. Capital spending, commissioning and finite depreciation

Cash capital purchases use the higher of the dated commitment floor and the latest source purchase intensity. New purchases enter construction in progress and become depreciable after a one-quarter readiness lag. The central useful life is 16 quarters. The 12/16/20-quarter life and 1/2/4-quarter lag cases show the corresponding profit, tax, cash and asset consequences.

Opening net PPE of USD 14.285 billion and existing intangibles of USD 2.998 billion retain finite runoff. The opening USD 1.2 billion unpaid-capital principal pool is paid separately. Those principal payments create zero additional asset. The full remaining capital and amortization ledgers continue beyond the selected company forecast.

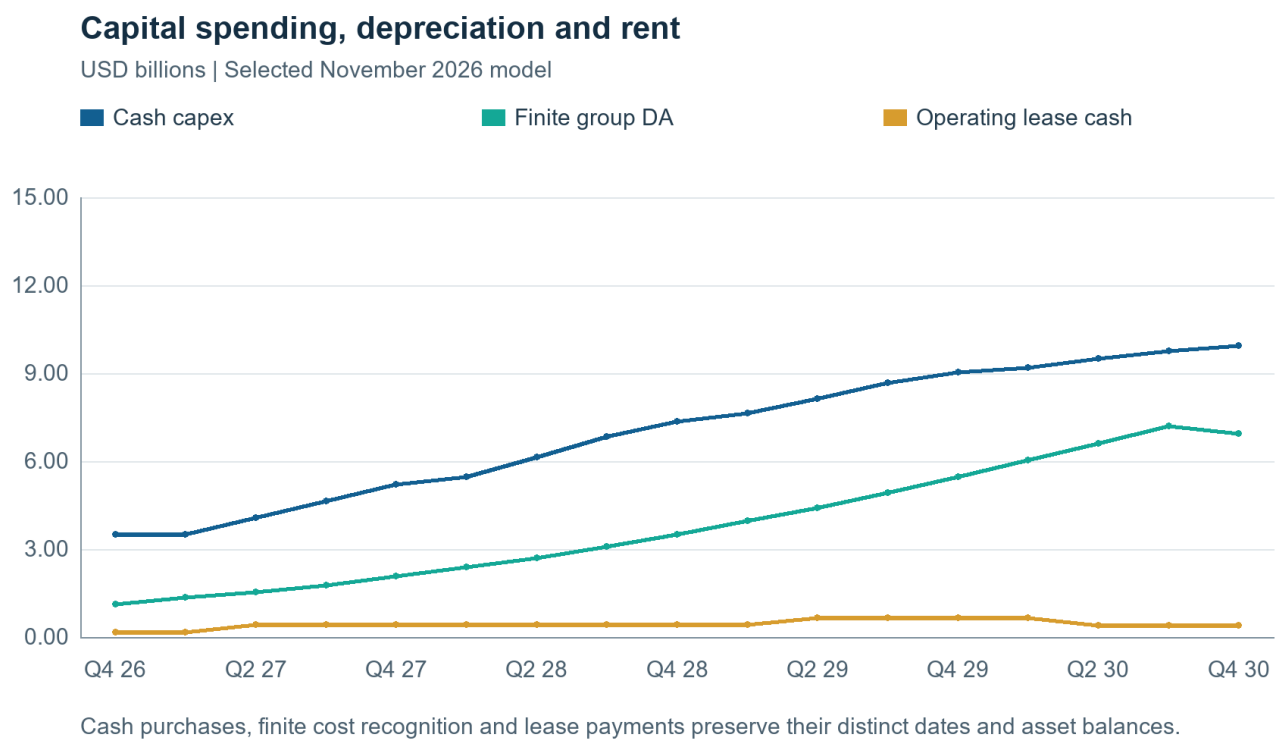

Paid capital and finite asset balances

USD billions; shares in billions where identified

Quarter	Cash capex	Group DA	Legacy PPE	Legacy intangibles	New CIP	New PPE, net
Q4 2026	3.50	1.13	13.40	2.76	3.50	0.00

Q4 2030	9.94	6.96	0.00	0.2000	9.94	60.66

New capex uses a 16-quarter life and one-quarter commissioning lag. Tests cover 12/16/20 quarters and 1/2/4-quarter readiness lags. Opening principal payments create zero second asset.

Capital spending, depreciation and rent

ASTRA model estimates, 7 November 2026. USD billions.

15. Recognized and future operating leases

The recognized lease bridge begins with USD 5.390 billion of ROU assets and USD 5.494 billion of liabilities, reconciling USD 7.207 billion of disclosed undiscounted rent. A 4.69% annual discount proxy and a source-calibrated aggregate cash-tail mixture reproduce those balances. The original 10.9-year weighted term and lease expirations through FY2075 remain disclosed source context; the individual original lease mix is unreconstructed. [S4]

The new internal lease schedule preserves all USD 25 billion of source cash, including USD 20 billion in FY2032 and later. Selected commencement cohorts and the 40% early-tail allocation are explicit proxies within the source's timing and up-to-20-year term limits. At commencement, PV and ROU additions are noncash. Expense enters the ordinary cost model once, while rent supplies the operating cash payment.

Operating lease accounting and cash

USD billions; shares in billions where identified

Quarter	Existing ROU	Existing liability	New internal ROU	New liability	Lease expense	Rent cash
Q4 2026	4.73	5.38	8.94	9.11	0.8868	0.1770
Q1 2027	4.24	5.27	8.89	9.21	0.7131	0.1770
Q2 2027	3.84	5.15	8.83	9.07	0.6263	0.4295

Q4 2028	2.27	4.42	8.47	8.18	0.4118	0.4288
Q1 2029	2.09	4.29	8.40	8.03	0.3923	0.4288
Q2 2029	1.93	4.18	8.34	7.62	0.3747	0.6620
Q3 2029	1.78	4.06	8.26	7.21	0.3602	0.6620
Q4 2029	1.65	3.95	8.18	6.80	0.3469	0.6620
Q1 2030	1.52	3.83	8.10	6.38	0.3347	0.6620
Q2 2030	1.41	3.73	8.01	6.20	0.3233	0.3965
Q3 2030	1.30	3.63	7.92	6.02	0.3137	0.3965
Q4 2030	1.20	3.53	7.83	5.84	0.3047	0.3965

The source-calibrated recognized runoff and new 25B internal lease cohorts retain their full tails. PV/ROU commencement is noncash. The original lease-by-lease mix remains undisclosed.

16. Commitments, customer funding and guarantees

Disclosed supply, internal cloud, lease, investment and capex obligations retain their separate schedules. The USD 36 billion AI cloud agreements and USD 20 billion third-party uncommenced leases have a different customer-funding perimeter. The selected performance, strain and severe contract states carry probabilities of 80%, 15% and 5%.

The strain case assumes 25% AI shortfall, four quarters of assignment delay, a 20% call on the old guarantee and a 10% call on PORTS, with 50% recovery. The severe case uses 75%, eight quarters, 100%, 30% and 20%, respectively. These are bounded analyst scenarios. The old stress cap uses the precise USD 3.529 billion source notional; Note 10's rounded USD 3.5 billion remains recorded. The separate PORTS gross cap is USD 105 billion. Nine equal eligibility cohorts and quarterly call timing are stress proxies. [S4]

Disclosed contractual cash schedules

USD billions; shares in billions where identified

Source scope	Remaining FY2027	FY2028	FY2029	FY2030	FY2031	FY2032+
Supply and capacity	92	87	88	6	5	1
Internal cloud	3	8	7	6	4	1
Internal uncommenced leases	0	1	1	2	1	20
Equity investments	18	3	2	2	0	0
Capex commitments	7	1	0	0	0	0
AI cloud agreements	0	6	8	7	6	9
Third-party uncommenced leases	0	0	1	1	1	17

Gross source schedules retain their own perimeters. Internal cost commitments, investment payments, assignment rent and conditional guarantees have distinct cash/expense treatment. The table is a source obligation inventory.

Conditional guarantees and finite recoveries

Q3 2029	0.1416	0.2866	0.1866	0.1001	0.4001	0.0656
Q4 2029	0.1416	0.2866	0.1866	0.1001	0.4000	0.0656
Q1 2030	0.1416	0.2866	0.1866	0.1001	0.3999	0.0656
Q2 2030	0.1125	0.2938	0.1909	0.1000	0.4027	0.0563
Q3 2030	0.1125	0.00	0.00	0.1000	0.3028	0.00
Q4 2030	0.1125	0.00	0.00	0.1000	0.2028	0.00

Joint performance/strain/severe probabilities are 80%/15%/5%. The selected old-guarantee stress cap is 3.529; the separate source Note 10 rounded amount is 3.5. PORTS has a 105 gross cap. These are conditional exposures.

17. KYEC, META and the conditional Hugging Face acquisition

The selected completion distribution is 70% for all three events, 10% for KYEC and META only, and 20% for none. Conditional cash dates place the USD 1.1 billion KYEC reservation in Q4 2026, the USD 3 billion META investment in Q1 2027 and USD 12.9303 billion Hugging Face consideration in Q4 2027. Dates, security details and cash percentages remain analyst assumptions where source terms are incomplete. [S5, S7, S8]

The Hugging Face branch uses cash consideration, a 30% identifiable-intangible proxy, 20-quarter amortization after a one-quarter lag, annual support at 1% of consideration and one-time integration at 1%. The remaining acquisition asset stays unallocated pending PPA. Hypothetical overlapping-cost cases preserve full asset amortization and cash-tax treatment. Hypothetical old-equity credits arise only when matching event cash occurs; current and later scheduled obligations consume them, with unused balances retained.

Conditional investment and acquisition bridge

Q3 2030	0.00	0.00	0.00	1.22	6.34	0.00
Q4 2030	0.00	0.00	0.00	1.09	6.34	0.00

Selected completion states are 70% all events, 10% KYEC/META only and 20% none. Cash dates are analyst assumptions. Gross consideration, recurring support and asset amortization retain separate accounting.

18. Debt, interest and the cash funding bridge

Source note face amounts total USD 33.5 billion and opening carrying value is USD 33.366 billion. The USD 0.134 billion discount and issuance-cost balance amortizes finitely, alongside source coupons and a bounded maturity-quarter mapping. The source annual coupon proxy is USD 1.45125 billion. Each modeled quarterly cash coupon equals the applicable source annual coupon divided by four. This quarterly cash-timing proxy smooths the disclosed semiannual payment schedule; exact payment dates remain a timing gap.

The cash model applies a 3.5% annual yield to opening liquid cash and keeps the USD 25 billion undrawn commercial-paper capacity as source context. Automatic debt draws and new financing shares are zero. A USD 10 billion reserve constrains buybacks. The 36 selected cases have a minimum modeled liquidity balance of approximately USD 33.41 billion; their probability-weighted Q4 2030 closing balance is approximately USD 1,703.28 billion. These outputs depend on the full selected operating forecast and cash proxies.

Source face debt is 33.5 and opening discount/issuance costs are 0.134. Each quarterly cash coupon equals the applicable source annual coupon divided by four, providing a cash-timing proxy for disclosed semiannual payments. Maturity-quarter and effective-rate allocations are proxies; exact payment dates remain incomplete.

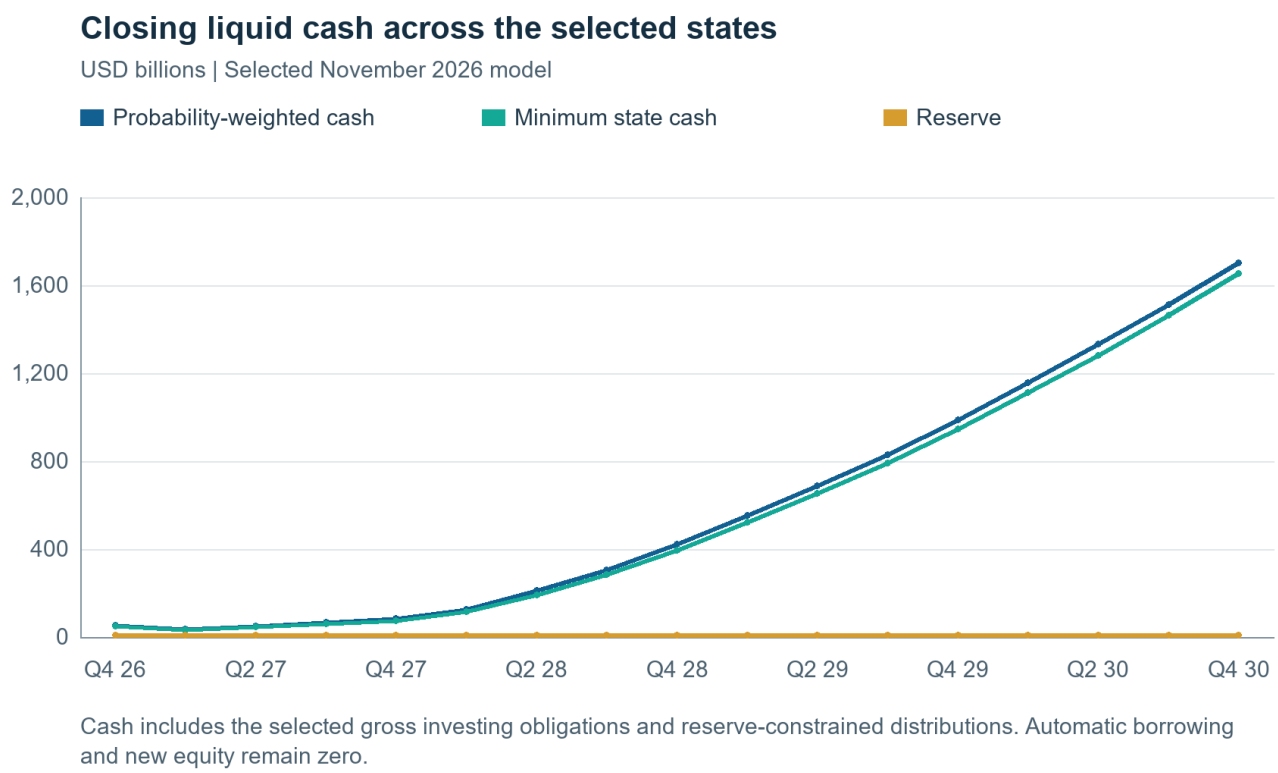

Complete quarterly cash bridge

Opening liquid cash is 56.586. FCF deducts cash capex and finite opening unpaid-capital principal. Equity/acquisition payments enter investing cash; withholding, debt and distributions enter financing cash. A 10 reserve constrains buybacks.

Closing liquid cash across the selected states

ASTRA model estimates, 7 November 2026. USD billions.

19. Book tax, cash tax and existing tax liabilities

The selected ordinary book and cash tax rates are both 17%, with distinct taxable bases. The cash calculation grants zero unverified relief for acquisition-intangible amortization and guarantee losses. Cash/book differences remain a reconciliation memo; the model creates zero additional recognized tax asset from that memo.

The opening USD 5.206 billion current tax payable is settled over the first two forecast quarters. A separate 80%/20% state distribution applies zero or USD 5 billion of cash against the existing noncurrent tax liability at the selected date. Paying those old liabilities consumes the balance and cash without creating a second book expense. Jurisdiction, asset tax basis and actual settlement timing remain source gaps.

Book and cash tax reconciliation

Q2 2029	33.52	33.57	0.00	0.00	4.60	0.3284
Q3 2029	35.95	36.00	0.00	0.00	4.60	0.3832
Q4 2029	37.69	37.74	0.00	0.00	4.60	0.4380
Q1 2030	38.57	38.62	0.00	0.00	4.60	0.4928
Q2 2030	40.07	40.12	0.00	0.00	4.60	0.5483
Q3 2030	41.51	41.53	0.00	0.00	4.60	0.5714
Q4 2030	42.53	42.55	0.00	0.00	4.60	0.5945

Both ordinary tax rates are 17%. The cash base grants zero unverified PPA or guarantee-loss relief. Old tax liabilities are consumed without a second expense; the cumulative difference creates no invented tax asset.

20. Physical shares, withholding and capital return

Physical common shares begin at 24.147 billion. Gross employee issuance scales the latest source 0.032 billion by revenue, with 37.5% withheld and related cash funded at an independent USD 250 execution-price proxy. Cash distributions and shares reconcile inside every state. Price sensitivities use USD 200, USD 250 and USD 400.

The forward buyback ceiling is USD 235 billion from September 28, allocated across the remaining 28/91 of the first fiscal quarter and five following quarters. Actual execution is constrained by cash and the reserve. The USD 14.3 billion interim authorization reduction has an unresolved cash identity and receives zero central debit; separate cash sensitivities preserve that uncertainty. The operating-profit valuation retains the existing flat 24.285 billion diluted proxy.

Physical shares and capital return

USD billions; shares in billions where identified

Quarter	Gross issuance	Withheld shares	Physical common	Buyback cash	Dividend cash	Valuation share proxy
Q4 2026	0.0359	0.0135	24.1150	13.62	6.03	24.2850

Q3 2029	0.1038	0.0389	23.7340	0.00	5.93	24.2850
Q4 2029	0.1081	0.0406	23.8016	0.00	5.94	24.2850
Q1 2030	0.1100	0.0412	23.8704	0.00	5.96	24.2850
Q2 2030	0.1135	0.0425	23.9413	0.00	5.98	24.2850
Q3 2030	0.1168	0.0438	24.0143	0.00	5.99	24.2850
Q4 2030	0.1188	0.0445	24.0885	0.00	6.01	24.2850

Employee issuance scales the source 0.032B per quarter by revenue; 37.5% is withheld. Execution uses an independent 250 USD price proxy. The sanctioned valuation denominator remains 24.285B; no new buyback benefit enters the target.

21. Joint probabilities and conditional outcomes

The selected model combines two memory outcomes, three correlated contract outcomes, three positively dependent event-completion outcomes and two tax outcomes, producing 36 joint states. These four categories are independently combined; the related risks inside each contract or completion state remain linked. Each state calculates manufacturing cost, profit, book and cash tax, investing payments, physical shares and liquidity before weighting.

The 40% memory probability is applied once to its eligible excess cost. The older accelerator probability and reference subtraction already sit within the retained product forecast. Newly reviewed roadmap, rental, benchmark and macro observations receive explicit source-scope and economic-overlap treatment. The prospective extra timing proposal stays outside the selected state space.

Categories are independently combined across the selected memory, contract, completion and tax distributions. Contract risk remains jointly correlated inside each contract state. Probabilities sum to one.

22. Complete valuation path and historical scope

Each complete ceiling sums operating profit in the target quarter and the next three modeled fiscal reporting buckets, applies 20 times and divides by the starting-quarter 24.285 billion diluted proxy. The current financial scope contains 17 quarters from Q4 2026 through Q4 2030, supporting 14 complete forward windows through Q1 2030.

The published Q3 2026 historical ceiling remains USD 250.33642822868725 with its original formula and source atoms. The original technical worksheet also contains Q1 2031 inputs in row 39 and a numeric Q2 2030 window in U36/Z36; those dated source outputs remain preserved separately. U37/Z37/U38/Z38 are original style-only blanks. The current selected model labels its own final three incomplete windows explicitly. The original report and all eight original images follow as a dated appendix.

Four-quarter operating-profit ceilings - panel 1 of 2

F4 OP USD billions; shares billions; price/change USD per share; multiple ×

Q4 2029	734.95	735.89	-0.9403
Q1 2030	753.31	754.22	-0.9163

Target-quarter operating profit plus the next three modeled fiscal reporting buckets, divided by the starting-quarter 24.285B diluted proxy. Prices are USD per share. Cash/debt stays within the separate financing analysis.

Finite model tails and undated source amounts

USD billions; shares in billions where identified

Scope	Amount	Timing/status
Remaining capital asset DA	70.80	Finite asset runoff
Remaining debt principal	22.75	Original maturity-quarter proxies
Remaining recognized/internal rent	24.58	Dated proxy cohorts
Annual HF support after forecast	0.1293	Conditional annual run-rate memo
Supply and capacity source FY2032+	1	Undated source bulk amount
Internal cloud source FY2032+	1	Undated source bulk amount
Internal uncommenced leases source FY2032+	20	Undated source bulk amount
Equity investments source FY2032+	0	Undated source bulk amount
Capex commitments source FY2032+	0	Undated source bulk amount
AI cloud agreements source FY2032+	9	Undated source bulk amount
Third-party uncommenced leases source FY2032+	17	Undated source bulk amount

The 17-quarter company forecast ends at Q4 2030. Finite assets, debt, recovery receivables and leases keep their remaining ledgers. Late source bulk commitments remain visible without an invented full company cash forecast.

23. Analytical score, risks and falsification tests

The score totals 49/60 and rounds to an analytical Base of 82/100, matching the protected Excel Base. The assessment retains 18 for the core thesis, 10 each for cycle and TAM, 5 for catalysts, 9 for macro, zero for alpha and a three-point risk deduction. The deduction covers competitive architecture, customer-credit/funding exposure and physical supply/execution.

The most useful tests are accepted Rubin shipments against the retained ramp, realized margins after repricing, funded customer usage, supplier-credit conversion and actual transaction settlement. A dated matched shipment deferral, demonstrable price or workload-share loss, incremental expediting/support cost, or deterioration in funding coverage can change the next financial review. Source diversity and scenario complexity supply no independent evidence of stronger outcomes.

Analytical scorecard

Score points

Category	Points	Maximum
Core thesis	18	20
Cycle	10	10
TAM	10	10
Catalysts	5	5
Macro	9	10
Alpha	0	5
Risks	-3	0
Total	49	60
Analytical Base	82	100
Excel Base	82	100

49/60 rounds to 82/100. The risk deduction covers competitive architecture, customer-credit/funding exposure and physical supply/execution.

24. Sensitivities, sources and completeness gaps

The bounded financial cases cover asset life and readiness, noncash manufacturing allocations, inventory cash content, execution price, interim buyback cash, contract overlap, escrow, recovery, event timing, acquisition cash/stock mix, PPA, support/integration costs and lease-tail allocation. They expose the cash and profit consequences of different explicit assumptions while preserving the selected central model.

Important gaps remain in exact invoice exposure, source engineering models and audio, the original roadmap image/date, acquisition PPA and security terms, statutory cash-flow classification of reservation payments, inventory capitalization, tax basis and actual lease cohorts. A full raw SEC filing download was unavailable; preserved primary browser notes and issuer statements supply the specific positions used. DOT endpoint and long-text coverage remain incomplete. Sources retain exact dates, units and repeated-source dependencies.

Full investment research | Model assumptions and source evidence

Framework 8.0 · Research/model update: 11 October 2026 · Earnings anchors retained: 6 September 2026

Status: Integrated original research and approved earnings model; evidence qualifications remain active.

Classification: MEGA-CAP COMPUTE PLATFORM - accelerated compute, networking and software ecosystem

Portfolio Excel Base: 82/100. Analytical recommendation: **82/100 (49/60)**, advisory only.

Active Q4 2027 price target: USD 455.01 per share. The separate Q1 2028 target is USD 498.80; both endpoints now include the October 11 operating-input revision, without a horizon roll. Financial amounts: USD billions unless stated otherwise. price targets: USD per share.

The price target is one conditional operating case. The October 11 incremental revenue branch is probability-weighted once. The existing model is not discounted again, and no further probability factor multiplies operating profit or the price target. Portfolio Base and the analytical category score are distinct; the latter does not overwrite the former.

October 11 accelerator forecast update: a small residual after overlap

The October 9 BofA Q3 Cloud Capex Preview projects calendar 2027/2028 NVIDIA accelerator revenue of $515.0B/$721.1B. It is an analyst forecast, not reported sales or company guidance. Its expanded capex tracker includes newly added neoclouds and leases; the spending headline is not converted directly into NVIDIA revenue. The table's accelerator scope is narrower and less clearly defined than this artifact's GPU/system residual, so an invoice-boundary reserve is necessary.

Calendar year	Existing GPU/system reference	BofA accelerator forecast	Conditional eligible residual at 50%	Weighted revenue increment at 25%
2027	461.666667	515.000000	26.666667	6.666667
2028	683.633333	721.100000	18.733333	4.683333

All amounts are USD B. **ASTRA assumptions:** 25% joint probability of incremental demand, supply and commercial execution (sensitivity 15-35%); only 50% of the residual is eligible after subtracting the entire existing product forecast (sensitivity 0-100%). The remaining half reserves scope, system content and invoice uncertainty. The weighted increment is probability × eligible fraction × positive residual. These are explicit judgments, not probabilities supplied by the bank. At fixed 50% eligibility, the probability range gives 2027 incremental revenue of $4.000-9.333B and 2028 $2.810-6.557B; zero eligibility gives zero, and full eligibility doubles the central increment. The 100% existing-revenue overlap is deducted before this calculation.

Fiscal years end in January: FY2028 runs approximately February 2027 through January 2028. The inherited displayed Q1 row contains November-January. Calendarization uses one third of Q1, all of Q2/Q3/Q4 and two thirds of the following Q1, assuming uniform months inside a fiscal quarter. That is a timing proxy, not a claim about actual monthly shipments. The 2027 increment is allocated only from February onward, retaining the current actual, next-quarter guide and the Q1 2027 trough row. Calendar 2028 uses all months. The $4.683333B annual increment is held flat in 2029 and 2030; no additional market-growth extrapolation is layered on. The final operating table ends in October 2030, so November-December 2030 lie beyond the existing row set.

Only GPU/system revenue changes. Networking, CPUs, gaming, other edge, share schedule and 20× operating-profit method remain fixed. Every added GPU dollar bears the existing product-specific cost of goods and existing quarterly opex ratio. Fiscal 2028 group revenue becomes $696.977001B, a small increase over the $690B reference; the conditional supply case is therefore a limited residual, not a replacement of the management-calibrated trajectory. It still needs memory, packaging, power and customer acceptance to arrive together. No second increment is attributed to HBM, optical components or total cloud capex.

The incremental calendar cost bridge is: CY2027 revenue +$6.666667B, cost of goods +$1.655266B, gross profit +$5.011401B, opex +$0.549362B and operating profit +$4.462038B. CY2028 revenue +$4.683333B, cost of goods +$1.130353B, gross profit +$3.552980B, opex +$0.372137B and operating profit +$3.180843B. This uses the same within-quarter month proxy as the revenue bridge; it is a modeled cost transmission, not issuer guidance.

Active Q4 2027 target: $451.736463 → $455.008436, **+0.7243%**. Excel Base 82 and analytical Base 82 are unchanged. The model already reflects the probability-weighted revenue; applying another probability factor to the target would count it twice. Costs, supply execution and invoice comparability remain the material unresolved assumptions.

Optical efficiency: the delivered system sets the economics

Optical-link efficiency depends on the complete light-delivery path. The NVIDIA/Lumentum 2026 ECTC paper studies a nine-wavelength DFB array with a dedicated SOA for each channel, common optical packaging and one thermoelectric cooler. Shared alignment can reduce assembly steps, but wavelength uniformity, device variation and rejection of an entire array can offset the saving. The prototype's reported 7.2% laser-module efficiency is a measured engineering point, not a qualified product-cost target. The paper models approximately 9-10% module efficiency as sufficient for particular energy budgets. That denominator includes passive/coupling losses and excludes TEC in the modeled subsection; it is not a universal bare-laser wall-plug-efficiency requirement. [IA 08 images 024-030, 032-033; P 01/P 02]

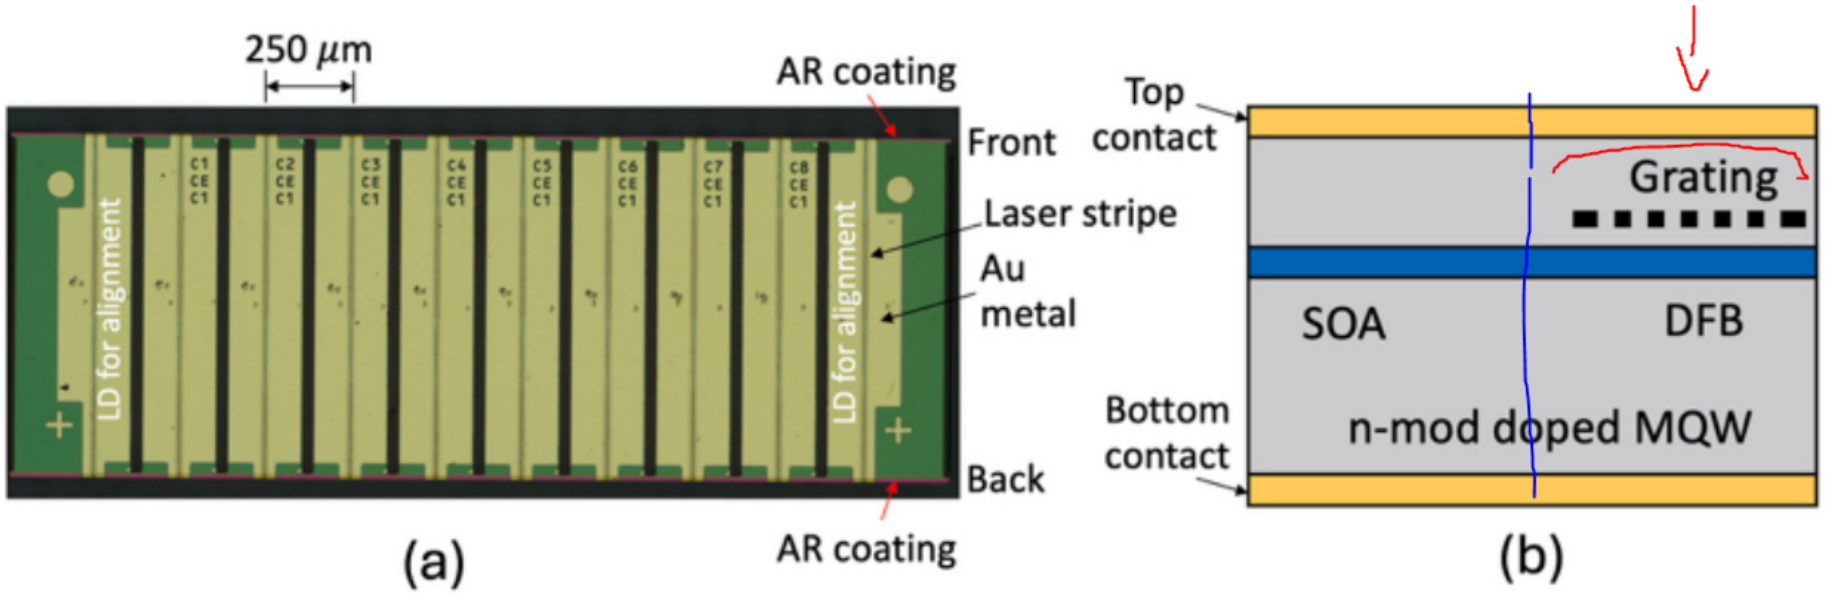

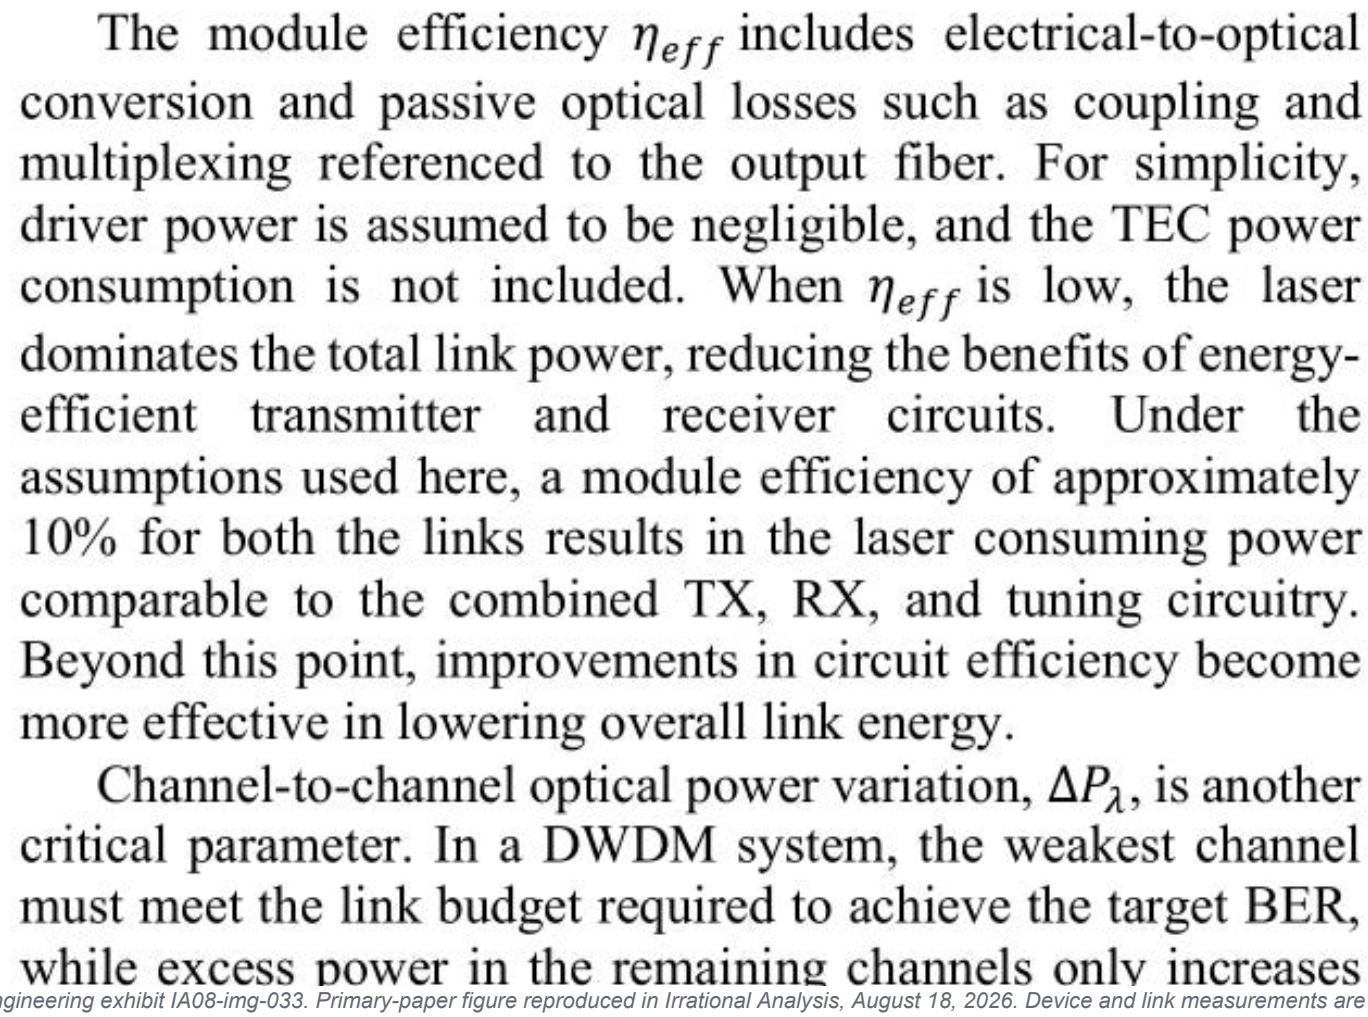

Figure 3: (a) Top view of DFB-array test-chip (b) Cross-section of the laser array.

Engineering exhibit IA08-img-025. Primary-paper figure reproduced in Irrational Analysis, August 18, 2026. Device and link measurements are distinct from production yield and commercial qualification.

The same design illustrates why high optical power alone does not establish a usable link. Its measured RIN motivates additional noise reduction for particular 32 Gb/s-per-wavelength DWDM configurations. Per-channel amplification differs from passing multiple modulated wavelengths through one shared SOA. The relevant acceptance set is delivered power, wavelength error, RIN over a stated bandwidth, all-lane BER/timing margin and temperature-dependent cooling cost. NVIDIA's separate ISSCC demonstration of 0.47 UI at BER 1e-12 with all lanes active is a useful example of a system-level timing test. Neither study supplies commercial yields or a matched ranking of all suppliers. [IA 08 images 012, 029-030, 032-036; P 01/P 03]

The module efficiency η_{eff} includes electrical-to-optical conversion and passive optical losses such as coupling and multiplexing referenced to the output fiber. For simplicity, driver power is assumed to be negligible, and the TEC power consumption is not included. When η_{eff} is low, the laser dominates the total link power, reducing the benefits of energy-efficient transmitter and receiver circuits. Under the assumptions used here, a module efficiency of approximately 10% for both the links results in the laser consuming power comparable to the combined TX, RX, and tuning circuitry. Beyond this point, improvements in circuit efficiency become more effective in lowering overall link energy.

Channel-to-channel optical power variation, ΔP_{λ}, is another critical parameter. In a DWDM system, the weakest channel must meet the link budget required to achieve the target BER, while excess power in the remaining channels only increases

Engineering exhibit IA08-img-033. Primary-paper figure reproduced in Irrational Analysis, August 18, 2026. Device and link measurements are distinct from production yield and commercial qualification. Original exhibit, panel 1 of 2; read from top to bottom.

energy consumption. Figure 7(a) evaluates a worst-case condition where one channel operates at the minimum required power P_λ, while the remaining channels operate at $P_\lambda + \Delta P_\lambda$. The results show that maintaining ΔP_λ below approximately 1.6 dB prevents the laser from dominating the total link energy when the module efficiency is about 15%.

Finally, channel spacing (CS) accuracy also affects system performance. Errors in CS increase optical crosstalk between neighboring wavelengths and degrade BER. Statistical link simulations indicate that keeping the CS error within ~5% maintains negligible crosstalk. For a nominal spacing of 200 GHz, this corresponds to controlling wavelength placement within approximately ±10 GHz. As shown in Fig. 7(b) correcting for a 10% error in CS inside SiPh PIC will not contribute significantly (~0.016 pJ/b) to the overall link energy efficiency.

Engineering exhibit IA08-img-033. Primary-paper figure reproduced in Irrational Analysis, August 18, 2026. Device and link measurements are distinct from production yield and commercial qualification. Original exhibit, panel 2 of 2; read from top to bottom.

These measurements sharpen the existing physical-supply and input-cost risk. Scale-out CPO can replace a switch-side pluggable function, while optical scale-up can replace copper; the opportunities are related but have different component counts and timelines. NVIDIA's July 21 update says scale-out photonics switches are in volume manufacturing, which is incompatible with a universal claim that pluggables cannot be affected until 2029. The reference networking allocation is 20% of reference Data Center sales and GPU/systems is the residual. Optical modules, light sources and the same networking system are not an additional layer of NVIDIA revenue. Qualification, accepted systems and realized margins remain the financial tests. [P 12; existing NVDA sections 2, 4 and 7]

Model decision: no additional revenue, cost or operating-profit increment. The retained 20% networking allocation is part of Data Center revenue, not a probability; introducing a new probability discount on the whole company would change the sanctioned model. The papers refine supply and gross-margin risk without disclosing a new delivered system, realized price or cost distribution. The optical evidence itself adds no separate increment. The current active Q4 2027 price target, including the later October 11 accelerator branch, is **$455.01** (rounded), using the existing 20x forward operating-profit method and 24.285B diluted-share proxy. The separate Q1 2028 target and sensitivity retain their labeled period; neither replaces the active horizon. Analytical Base 82 and Excel Base 82 are unchanged.

Sources and limits, reviewed October 6, 2026: Irrational Analysis, August 18, full saved body and technical figures reviewed. P01: Design and Packaging of a DWDM CW-DFB Laser Array for Co-Integrated Optical Interconnects (2026-05-26 conference; IEEE added 2026-06-17). P02: NVIDIA research record of the DWDM laser-array paper (2026-05-26). P03: 32 Gb/s/lambda 256 Gb/s/fiber half-rate bandpass-filtered clock-forwarding DWDM optical link (2026-02-15). P12: NVIDIA Vera Rubin platform update (2026-07-21). Detailed paper figures were inspected in the user-supplied reproductions; full IEEE texts were not independently recovered. That access limitation is preserved rather than presented as a replicated experiment.

Groq and GPUs can cooperate within an inference system

The March 5 engineering article argues that deterministic Groq execution forces Groq into isolated clusters and rules out useful GPU collaboration. NVIDIA's later disclosures contradict that categorical conclusion. Its March 16 architecture discussion separates GPU attention and KV storage from LPX feed-forward work. Its August 24 follow-up describes several ways to pair the two, including a prefill/decode handoff, attention/feed-forward separation and speculative decoding. Communication overhead still matters; it does not make every cooperative configuration impossible. NVIDIA architecture discussion; NVIDIA August technical update.

GPU + LPX: partition work across the system

Illustrative attention / FFN mode from NVIDIA disclosures; other serving modes also exist

Architecture compatibility is established; qualified volumes, prices and margins remain separate questions.

Analytical schematic, October 6, 2026. Sources: NVIDIA technical blogs, March 16 and August 24, 2026.

Analytical schematic of one GPU/LPX serving mode, based on NVIDIA primary disclosures. It is not a shipment or performance forecast.

This matters to the investment case because a specialized low-latency processor can become a component of NVIDIA's system offering. It does not establish that SRAM eliminates the need for HBM, that all inference should use LPX, or that a vendor benchmark is a revenue forecast. The economic tests are accepted systems, useful work per unit of power and cost, net selling price and incremental support expense.

Probability and model treatment: assign a 70% research probability that GPU/LPX cooperation contributes commercially meaningful differentiated inference deployments during 2027. For a bounded overlap check only, attribute 1-2% of the existing calendar-labelled 2027 GPU/system pool of $425.2B to such configurations. That is $4.252-8.504B conditional, or $2.9764-5.9528B at the stated probability. This is wholly inside the current system/inference forecast; the overlap adjustment is 100%, leaving **zero additional revenue or OP**. The diagnostic is not a new active product input. The current residual product gross margins already incorporate components and manufacturing costs; packaging, memory, interconnect, depreciation, software support, R&D and stock compensation cannot be omitted to manufacture an extra profit stream. Separate LPX units, prices and costs are not disclosed sufficiently to support a new increment.

The existing 20× forward operating-profit method, 24.285B share proxy, analytical Base 82 and Excel Base 82 remain unchanged. Active Q4 2027 target after the separate October 11 accelerator branch is **$455.008436**. The correction removes an unsupported technical exclusion without counting a second sale for the same system. Next tests are deployment mix, customer acceptance and realized costs, not token-speed claims alone.

1. Thesis, products and competitive position

MACRO TRACKING INSTRUMENT / CAPACITY ENABLER. NVIDIA connects accelerated compute, networking, CPUs and software. It is a useful demand indicator for the wider portfolio, while its customers can also develop competing accelerators. Ecosystem reach supports the score; broad market awareness leaves little information alpha.

Platform demand and the production stack

NVIDIA combines accelerated processors, networking, CPUs, systems and software. Software tools and the installed developer ecosystem support customer adoption, while system integration and interconnect performance influence the amount of useful compute a customer obtains. The five product vectors preserve those economic distinctions instead of treating all AI spending as GPU revenue.

The original research uses power capacity and revenue per gigawatt as a physical reasonableness check. That relationship depends on system generation, configuration, networking content and delivery timing; third-party gigawatt estimates are not company revenue guidance. Installed power also need not equal commissioned, fully utilized compute in the same quarter.

Scale and dependencies

NVIDIA's scale and financial strength support the current Excel and analytical Base of 82. Its suppliers still constrain shipment timing: foundry output, HBM, advanced packaging, networking, power and cooling all have to align. A memory price increase can be passed through, absorbed or reflected in system mix; the outcome must be reconciled to gross profit rather than inferred from revenue alone.

Customer-designed accelerators are a competitive risk, with performance, software portability, workload economics and deployment capability determining substitution. Customer concentration and financial support arrangements also matter when evaluating whether demand represents durable, cash-generating deployment. The analytical score below measures the framework categories; it is recorded separately from the Excel Base.

Fiscal labels are especially important here. The approved workbook convention maps fiscal periods to its displayed quarter labels; the exact economic window is described below. The artifact uses the same 15 price target endpoints as the master, ending at Q1 2030.

Research provenance: the product and competitive analysis in this section synthesizes the supplied original research. Dated market-share, process and channel claims retain their original evidence status; this integration is not a new independent verification of those claims. Current earnings and model assumptions are set out below.

2. Earnings, guidance and operating assumptions

Latest earnings and two-call comparison

FQ2FY27 revenue is$96.221B, GP$72.142B, GAAP opex$8.408B and OP$63.734B. Diluted weighted-average shares are 24.285B. FQ3 guidance centers on$108B revenue, 74%GM and$9.2B GAAP opex. These exact aggregate anchors replace rounded estimates. NVIDIA now includes stock compensation in its non-GAAP presentation too; this review uses GAAP actual OP. Source: NVDA-1.

The August transcript verifies about 70% fiscal 2028 growth constrained by supply, a 71-72%GM trough in FQ4 and 72-73% in FY28, with CPU revenue expected to more than double. May provided the preceding standalone CPU and Rubin rollout discussion. Product quarterly sales and margins are not disclosed forecasts. Sources: NVDA-3,4.

Revenue decomposition and calendar discipline

Current reported Data Center revenue is$89.023B and Edge$7.198B. The CFO presentation recasts an ACIE customer into Hyperscale; unadjusted comparisons to the prior presentation would misstate segment growth. Source: NVDA-2.

The current product split is analytical: networking$17.7B, CPU$4B and GPU/systems residual$67.323B inside Data Center; gaming$5B and other edge$2.198B. The networking proxy uses the rounded May networking scale and August sequential growth. Gaming, CPU and product GM are estimates even in the actual aggregate quarter.

Forward networking retains 20% of reference DC sales. The incremental GPU branch does not automatically add networking revenue. CPU is$6B in FQ3 and$8B in FQ4; fiscal 2028 totals$40.5B. These are allocations inside group revenue, not additive revenue on top of it. GPU/systems is the residual, incorporating attached product content so that rack components are not counted twice.

The reference case was fiscal 2028 revenue $690B, approximately 70% above modeled fiscal 2027. The October 11 residual branch increases fiscal 2028 to $696.977001B; fiscal 2029 and 2030 become $1005.763277B and $1260.683333B. These increments and later years are analyst assumptions, not revised management guidance. The original fiscal 2031 $1,408B reference extends beyond the final operating row here. Quarterly seasonality is also an assumption. Fiscal 2029 and later are not management guidance. Fiscal labels in the workbook define the actual earnings windows.

Product gross profit and operating costs

The five revenue vectors carry distinct margins. The GPU/systems margin is calibrated as residual group GP after the other products, not a disclosed GPU margin. Current GP reproduces the actual. The guided next quarter uses 74%; FQ4 uses 71.5%; the reference fiscal 2028 aggregate used 72.5%, within the stated band. Incremental GPU revenue retains each original product margin, so the updated group margin changes slightly with mix. Later aggregate margin targets remain model estimates around 73.3-74.1%, implemented through the product-margin solve.

Q3FY27 GAAP opex is$9.2B. Later opex retains the existing revenue ratios, roughly 8.55% declining toward 7.58%; incremental sales therefore carry incremental expense; that operating leverage is unverified and must be checked against compute infrastructure and compensation spending. No equity investment gains, financing receipts or take-or-pay guarantees are counted in OP.

TAM and industry read-through

Management's roughly$40B NVIDIA content per GW is a platform-content reference, not a separate GPU, CPU and networking TAM to add three times. The updated $696.977001B fiscal 2028 group case implies approximately 17.42GW at that content rate as a rough diagnostic; product mix and edge revenue make it an approximation, not a proven installed-capacity schedule. Source: NVDA-3.

Memory inflation supports supplier pricing while reducing the buyer's gross margin. The August NVHBM announcement integrates a custom controller in the HBM base die and describes implementation through multiple memory suppliers. This strengthens the need to track qualification and content by supplier; it does not establish one memory company's exclusive share or long-term contract prices. Source: NVDA-6.

A new September 3 agreement to acquire Hugging Face for$12.9303B broadens ecosystem exposure. NVIDIA says the platform will remain open to other clouds and accelerators. Undisclosed acquired earnings, financing structure and synergies receive no separate model credit. Source: NVDA-5.

Capital return and optical supply evidence

On September 28 NVIDIA authorized an additional USD 150B of repurchases, taking remaining authorization to USD 235B, with execution expected through fiscal 2028. Authorization is not completed repurchasing. The existing 24.285B diluted-share proxy remains explicit: execution prices, quarterly pacing and offsetting employee/acquisition issuance are not established by this announcement. No cash authorization is added to operating profit or equity value. [NVDA-8]

Serenity's September 29 digest relays a Barclays channel check that NVIDIA has secured about half of Lumentum's Greensboro laser capacity. The underlying note and original post date/link were not supplied. Treat that allocation as an attributed check. It reinforces supply-security and concentration monitoring; it does not establish incremental NVIDIA shipments, an exclusive supply agreement or a USD 5B purchase order.

3. Analytical score

The category arithmetic gives **49/60 = 82/100** after the existing -3-point risk deduction. The portfolio Excel Base remains **82/100**. Risk-class detail appears in section 7.

Category	Points	Maximum	Basis
Core thesis	18	20	CUDA and integrated systems create a durable ecosystem; custom silicon and customer concentration limit exclusivity.
Cycle stage	10	10	Latest reported growth and supply-supported expansion remain strong.
TAM expansion	10	10	Agentic workloads, standalone CPUs and wider enterprise deployment expand addressable demand.
Catalysts	5	5	Rubin ramp, CPU adoption and latest ecosystem agreements.
Macro	9	10	AI investment supports demand, but does not guarantee supplier share.
Alpha	0	5	Macro tracking instrument with little undiscovered information advantage.
Risks	-3	0	Custom silicon; supported-customer credit and concentration; physical supply and input-cost execution.

4. Product economics and quarterly operating model

Forecasts distinguish reported anchors from guidance and analyst assumptions. Where the model uses segment OP or an adjusted profit proxy rather than product GP less opex, the stated basis applies; do not treat those proxies as a newly disclosed GAAP decomposition.

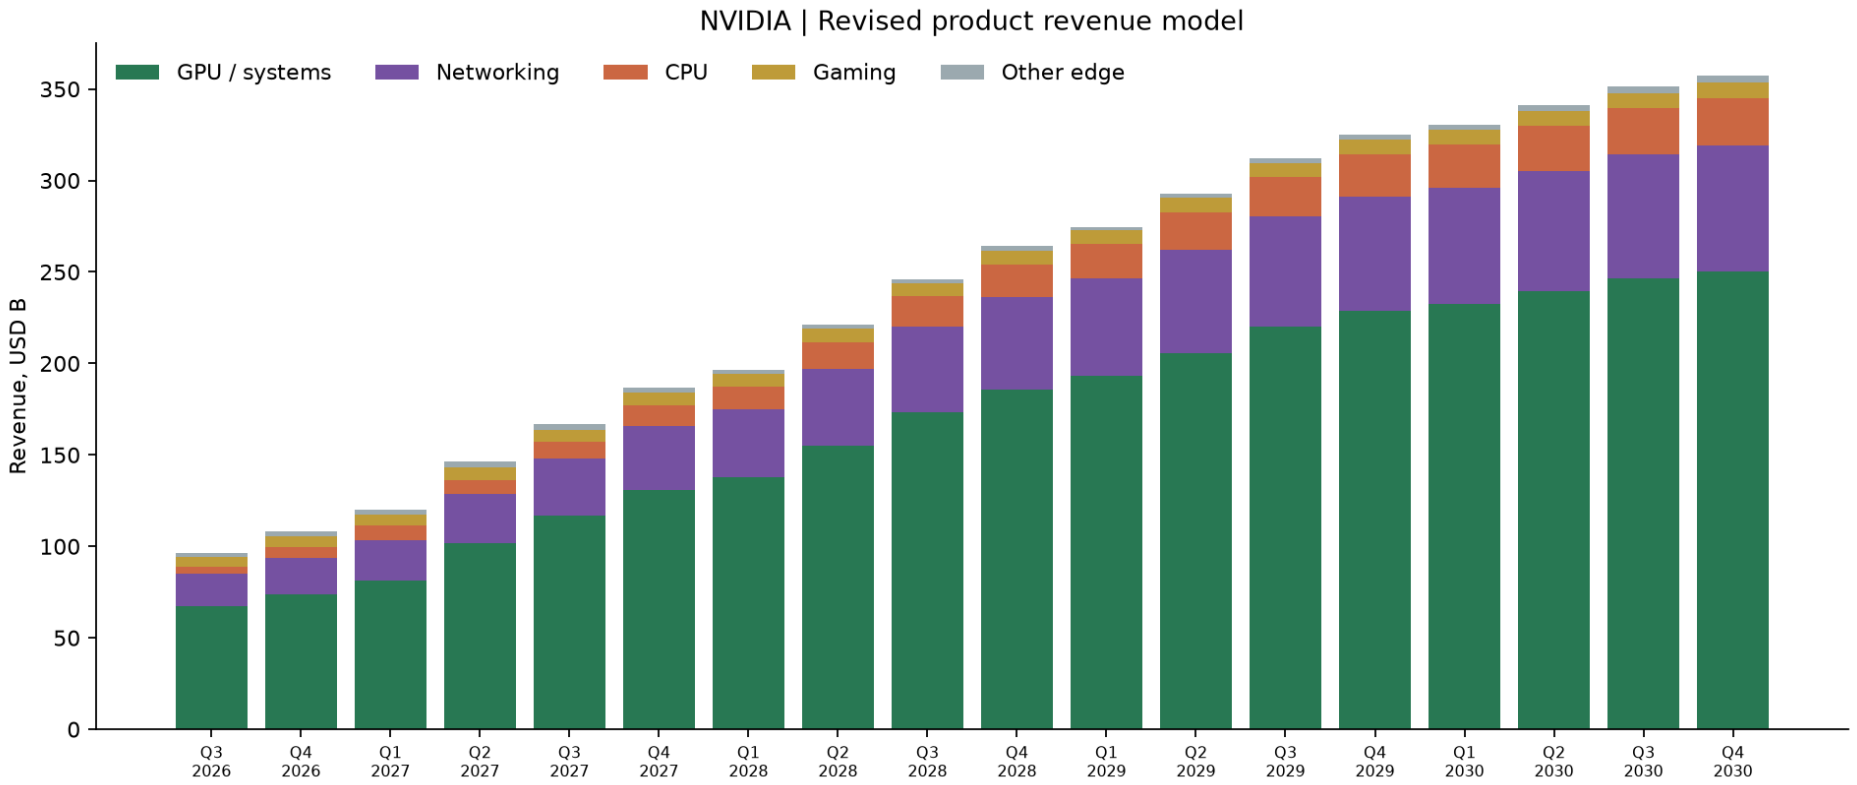

Vector evidence

Vector	Source / derivation	Confidence
DC GPU / systems	Residual after modeled networking and CPU inside total Data Center; margin solved to aggregate actual or target	LOW split; HIGH actual aggregate
DC networking	Q1 call roughly 15B and Q2 sequential growth 18% imply roughly 17.7B anchor; forward 20%DC mix is estimate	MEDIUM rounded anchor; LOW forecast
CPU	Q1 standalone opportunity and Q2 more-than-double FY28 direction; modeled 4/6/8B near-quarter allocation	LOW realized mix and timing
Gaming / other edge	Combined 7.198B exact current edge total; internal split and all product margins estimated	HIGH combined actual; LOW split

2030	1,380.18	915.81	66.4%

5. Forward four-quarter operating price target

Fiscal year ends in late January. The approved quarter labels are used: Q3 2026 represents FQ2FY27, and Q1 2028 represents FQ4FY28. Thus its four-quarter price target window is FQ4FY28-FQ3FY29, not four exact Gregorian quarters. Each price target uses current plus next three fiscal quarters of OP×20 /24.285B diluted-share proxy; no additional valuation probability factor.

Quarter	Exact earnings window	Forward four-quarter basis	Multiple	Share denominator (B)	price target per share
Q3 2026	Q3 2026 → Q2 2027	303.97	20.00	24.285	250.34
Q4 2026	Q4 2026 → Q3 2027	347.38	20.00	24.285	286.09
Q1 2027	Q1 2027 → Q4 2027	396.97	20.00	24.285	326.93
Q2 2027	Q2 2027 → Q1 2028	448.15	20.00	24.285	369.07

Q4 2027	Q4 2027 → Q3 2028	552.49	20.00	24.285	455.01
Q1 2028	Q1 2028 → Q4 2028	605.66	20.00	24.285	498.80
Q2 2028	Q2 2028 → Q1 2029	659.62	20.00	24.285	543.23
Q3 2028	Q3 2028 → Q2 2029	708.49	20.00	24.285	583.48
Q4 2028	Q4 2028 → Q3 2029	753.54	20.00	24.285	620.58
Q1 2029	Q1 2029 → Q4 2029	795.26	20.00	24.285	654.94
Q2 2029	Q2 2029 → Q1 2030	833.57	20.00	24.285	686.49
Q3 2029	Q3 2029 → Q2 2030	866.74	20.00	24.285	713.81
Q4 2029	Q4 2029 → Q3 2030	893.56	20.00	24.285	735.89
Q1 2030	Q1 2030 → Q4 2030	915.81	20.00	24.285	754.22

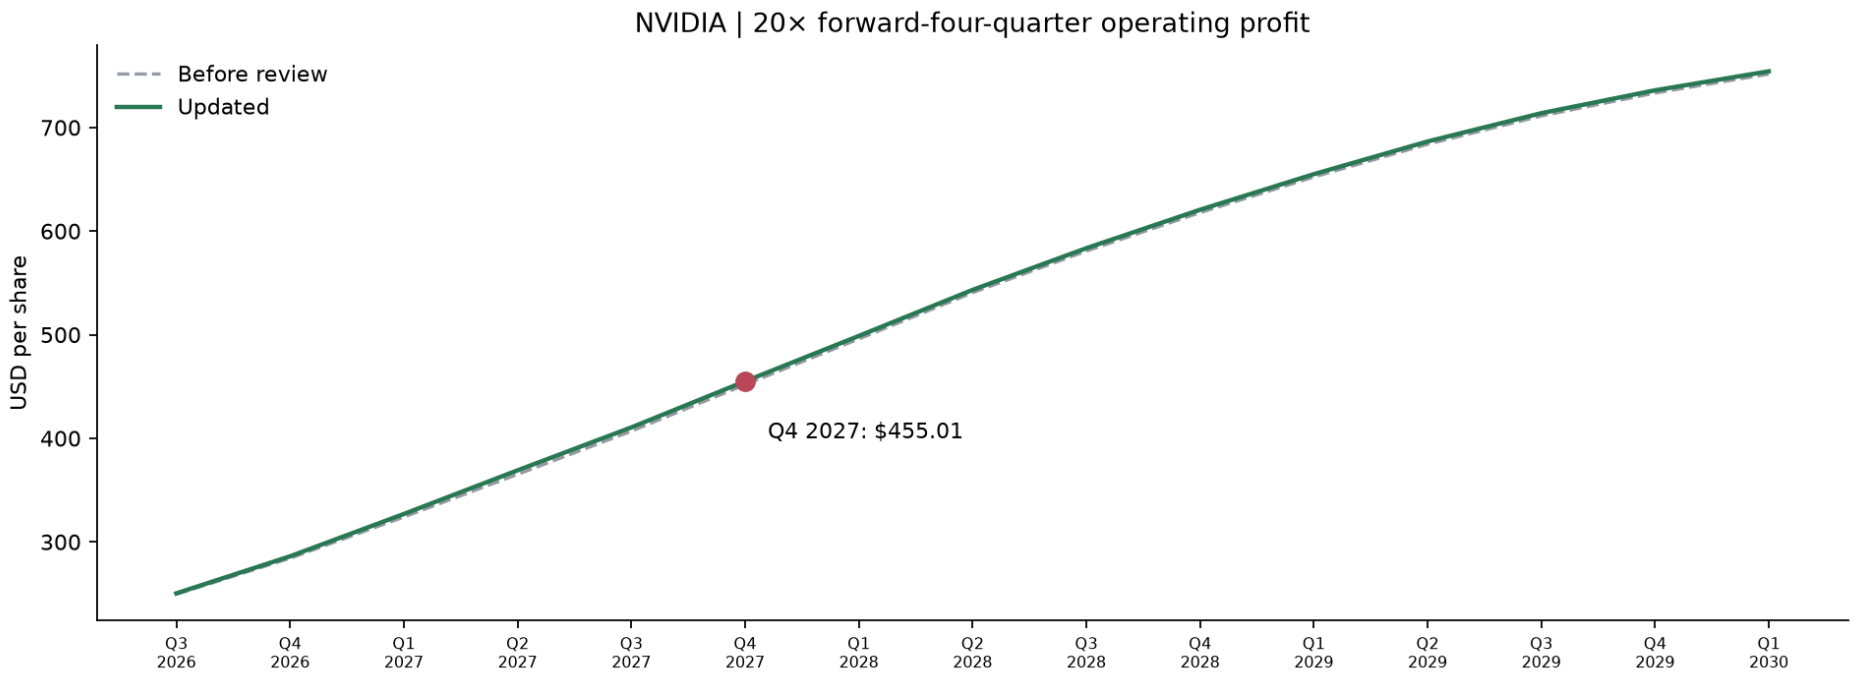

Mechanical share sensitivity

Holding the updated Q1 2028 operating case, attribution and currency assumptions fixed:

Economic denominator	USD price target per share
Approved denominator	498.80
5% more shares	475.04
10% more shares	453.45

This is a denominator sensitivity, not a second operating scenario or a forecast of issuance.

Financial view 3. Complete updated valuation path

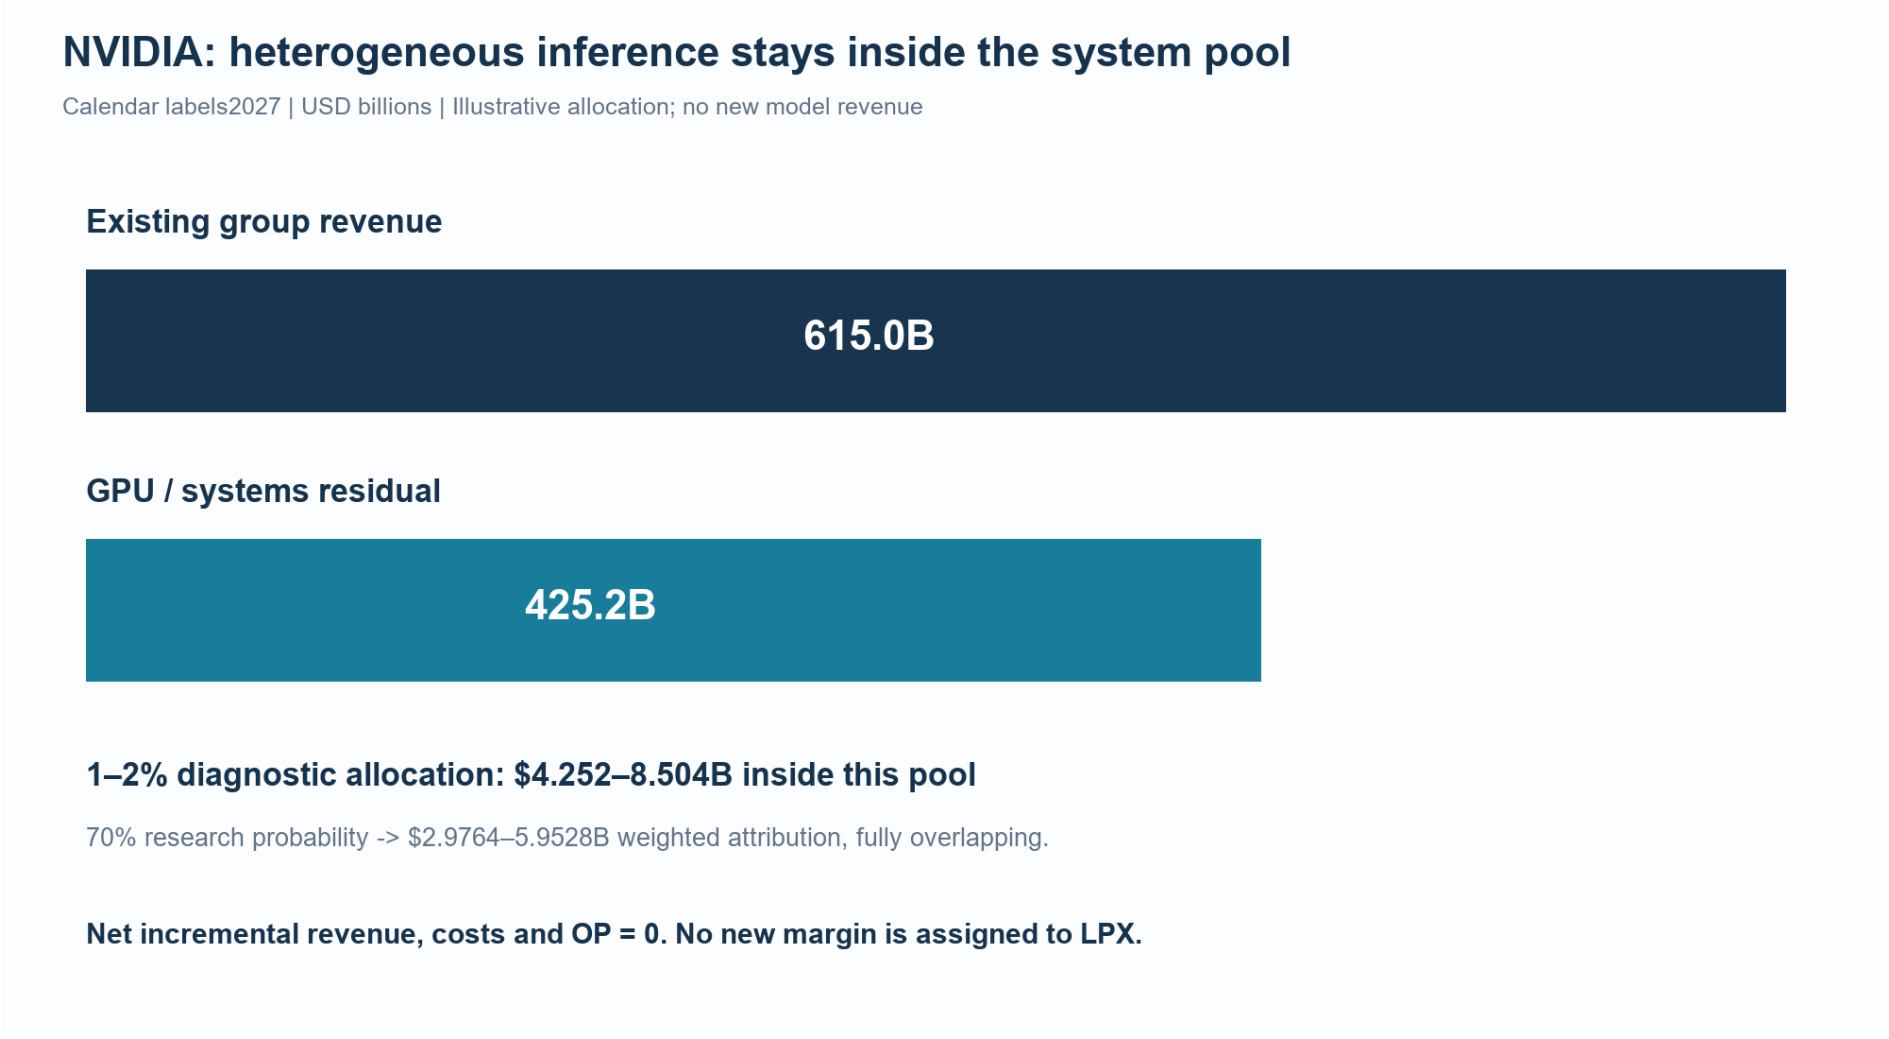

Existing NVDA forward-four-quarter targets; active Q4 2027 highlighted.

The active horizon is Q4 2027. The first quarter in each row plus the following three quarters forms the window. Shares are billions; profit is USD B. Multiple and share path are unchanged. Probability is applied once within the incremental revenue bridge, not again at valuation.

Quarter	Window end	4Q OP	Multiple	Shares	Target

Q1 2030	Q4 2030	915.813354	20	24.285000	754.221415

Financial view 4. Historical LPX overlap diagnostic, before the October 11 update

NVIDIA existing GPU/system pool and bounded LPX allocation diagnostic, not a separate forecast.

This diagnostic retains the dated pre-October 11 reference ($425.2B in displayed 2027 fiscal buckets), not the updated calendar revenue. The 1-2% diagnostic is an explicit bounded research assumption, not guidance or a newly inserted product estimate. A 70% commercial-use probability gives $2.9764-5.9528B of weighted attribution inside the existing $425.2B pool. Applying 100% overlap leaves zero incremental revenue, cost or OP. Existing residual product margins, component costs and group opex remain unchanged; no invented LPX margin or vendor benchmark becomes profit.

Diagnostic input / result	Value	Scope
2027-labelled group revenue	615.000	USD B; existing model
GPU/system pool	425.200	USD B; existing residual
Conditional allocation	1-2%	Research diagnostic, not active input
Conditional revenue attribution	4.252-8.504	USD B, inside the pool
Commercial-use probability	70%	Research judgment
Weighted attribution	2.9764-5.9528	USD B, before overlap
Overlap	100%	Same existing system/inference pool
Incremental revenue / OP	0 / 0	USD B; no model change

6. Industry relationships and read-throughs

NVIDIA demand informs HBM, packaging, optical interconnect, power equipment and system integrators. Translate platform orders into supplier-specific content and recognition dates. More NVIDIA system revenue does not establish the same growth rate for every component supplier.

7. Risks and falsification tests

The following ledger makes the existing aggregate risk deduction explicit. It does not introduce another deduction or change the analytical score.

Risk class	Existing deduction
Customer-designed silicon and ecosystem competition	-1
Customer credit, support arrangements and concentration	-1
Physical supply, systems execution and input costs	-1
Total	**-3**

Capital, score and watch points

The current 24.285B diluted weighted-average denominator is held flat as a transparent proxy. Future repurchases and employee issuance are not silently netted against one another. Each complete four-quarter OP window is valued at 20x. CFO disclosures distinguish$279B supply/capacity commitments from cloud agreements and guarantees. Customer support can help deployment while increasing credit exposure; it is not all a cash loan or all current revenue. The$105B PORTS-Pike guarantee cap is phased and conditional, with first effectiveness expected in fiscal 2029. Source: NVDA-2.

Track realized product margins, power and hardware acceptance, financed-customer cash conversion, independent compute demand and custom-accelerator economics. For other portfolio names, supplier demand visibility does not remove execution, working-capital or depreciation costs.

Numbered monitoring tests

#	Checkpoint	Evidence supporting the operating case	Counter-test / failure signal
1	Platform conversion	Reconcile product revenue, shipment mix and gross profit to guidance.	Revenue growth driven by expensive inputs alone does not prove greater margin capture.
2	Physical deployment	Cross-check accepted systems with power, memory and packaging availability.	Announced gigawatts without commissioned systems do not establish current sales.
3	Competition	Track customer workloads deployed on alternatives and software migration.	A chip announcement without qualified deployments is not equivalent displacement.
4	Demand quality	Track customer concentration, collections and financing support.	Support-dependent orders with weak customer economics require closer demand scrutiny.

8. Sources, evidence gaps and model snapshot

Sources below are those documented in the supplied earnings review. LOW-confidence product allocations, future margins, capacity bridges and incomplete management-call records remain unresolved where stated. Integrating the original research does not itself establish full Framework 6.0 evidentiary certification.

- **NVDA-1** · 2026-08-26 · Issuer Q2FY27 results. Exact actuals, guidance and 24.285B diluted shares.
- **NVDA-2** · 2026-08-26 · CFO commentary. Reported market-platform totals, restated customer classification and financing commitments.
- **NVDA-3** · 2026-08-26 · Issuer-hosted Q2 management transcript. 70%FY28 growth, 72-73%GM, CPU direction, memory cost and 40B/GW content.
- **NVDA-4** · 2026-05-20 · Issuer-hosted Q1 management transcript. Prior product ramp, networking scale and standalone CPU opportunity.
- **NVDA-5** · 2026-09-03 · NVIDIA agreement to acquire Hugging Face. Announced acquisition and commitment to an open, multi-accelerator platform.
- **NVDA-6** · 2026-08-26 · NVHBM and NVLink Fusion announcement. Custom HBM base-die controller and multi-supplier implementation; Amazon first collaborator.
- **NVDA-7** · 2026-09-01 · Supplied model and artifact - User upload: NVDA_Q_Model; NVDA_NVIDIA_DeepDive.md. Sanctioned 20xOP multiple and retained aggregate long-term revenue/opex assumptions.
- **NVDA-8** · 2026-09-28 · Issuer repurchase authorization. Official release retrieved in full on September 29. Amount authorized and intended execution period; no transaction-level execution forecast.
