1. First Solar (FSLR)

Full investment review | November 4, 2026 | Framework 8.0 | Nasdaq common shares | U.S. dollar reporting.

The Q4 2027 calculated ceiling is USD 487.32 per share. The earnings window is Q4 2027 through Q3 2028. The original 20x forward operating-profit method is preserved.

Analytical score: 39/60, equivalent to 65/100. Protected Excel Base: 67. Classification: temporal domestic-manufacturing and contracting advantage.

Quarterly financial tables use USD millions; share counts use millions; module volumes use GW; prices use USD per watt. Actuals, management guidance and selected model assumptions have separate labels.

Dated market reference: November 4, 2026 close of USD 194.51. Point-in-time outstanding shares were 107.481151 million on October 23, 2026. The share-price reference supports the modeled repurchase cost; the quarterly valuation uses its explicit diluted-share schedule.

2. The business and the investment boundary

First Solar manufactures cadmium telluride photovoltaic modules for utility-scale generation. Its economic position combines thin-film process intellectual property, a qualified manufacturing footprint and long-term customer contracts. The current classification is a temporal manufacturing and regulatory advantage within a competitive power market.

Customers purchase watts that can be delivered, installed and financed. The operating model therefore starts with sold module volume by production route, realized price per watt and the cost of making and delivering those watts. Data-center power demand supports the opportunity, while contracted projects and manufacturing capacity determine First Solar's capture.

The model separates fully integrated U.S. modules, Vietnam-origin work in process finished in South Carolina, India deliveries and a conditional Malaysia restart. Vietnam and South Carolina form one integrated production route. Counting both as separate finished-module sales would duplicate the same watts.

3. Supercycle, S-curve and expansion lens

Electricity demand from data centers, electrification and manufacturing reshoring expands the market for utility-scale solar. Project interconnection, permitting, storage economics, customer financing and module procurement each influence the conversion schedule. A large electricity forecast cannot be inserted directly as First Solar revenue.

The established business is scaling manufacturing and improving product performance. CuRe deployment changes factory sequencing and technology value. The Ohio perovskite pilot is a development milestone expected to reach operational readiness in the first half of 2027; field validation and manufacturing evidence are needed before assigning commercial-scale sales.

The near-term model gives full thematic relevance to contracted utility projects. Adjacent power demand carries the framework's 50% thematic weight, and more distant technology applications carry 20%. These assessment weights are distinct from the financial probabilities applied to specific outcomes.

4. Thesis score and five risk classes

The analytical score is 39/60, or 65/100. The protected Excel Base remains 67. The analytical assessment uses 16 points for core thesis, 7 for cycle stage, 7 for TAM expansion, 4 for catalysts, 8 for macro and 2 for information advantage, followed by five risk deductions.

The risk deductions cover policy and eligibility; manufacturing and technology execution; customer and project conversion; competition and pricing; and legal and tax uncertainty. Domestic manufacturing is valuable, while its durability depends on customer economics, performance and the evolving competitive supply base.

5. Analytical scorecard

Category	Points	Evidence
Core thesis	16	Thin-film process IP, manufacturing integration and domestic content
Cycle stage	7	2027 finishing ramp and CuRe conversion
TAM expansion	7	Growing electricity demand with project/capacity constraints
Catalysts	4	South Carolina, India CuRe, pricing, monetization
Macro	8	Load growth and domestic manufacturing incentives
Alpha	2	Widely covered; edge in credit/cash and unit economics
Risks	-5	Five independent classes described in the report
Total	39/60 = 65%	Protected Excel Base remains 67

6. Latest earnings and guidance anchor

The latest completed reporting period is the third quarter ended September 30, 2026, released October 29. The preserved management calls are October 29 and July 30, including the complete displayed question-and-answer sessions through their closing statements.

Third-quarter revenue was $1,230.936 million, gross profit $713.060 million and operating profit $546.108 million. Net income was $571.063 million and diluted shares averaged 107.702 million. Production was 4.3 GW and sales were 4.1 GW. Historical Excel forecasts remain frozen in their original vintage; these actuals are shown as a separate reported bridge.

Management's revised 2026 ranges are $4.6-4.9 billion revenue, $2.4-2.6 billion gross profit and $610-635 million operating expense. The current fourth-quarter model uses the residual to the midpoint of each range after nine-month actuals. Management previewed 4.3-5.3 GW of Q4 sales, including 3.4-4.3 GW of U.S. manufacturing volume.

The lower revenue outlook mainly reflects reduced India, international Series 6 and U.S. finishing volumes. The fully domestic sales range and annual gross-profit range were retained. This mix distinction matters when translating sales into earnings.

7. Reported financial bridge

Period	Revenue	Gross profit	OP	Net income	Status
Q1 2026	1,044.244	486.132	345.304	346.619	Reported
Q2 2026	1,056.189	605.003	450.385	422.569	Reported
Q3 2026	1,230.936	713.060	546.108	571.063	Reported
9M 2026	3,331.369	1,804.195	1,341.797	1,340.251	Reported

8. Issuer guidance and Q4 preview

Original First Solar Q3 2026 presentation, page 9. Ranges are company guidance; model allocations appear separately.

9. Q4 model calibration

Metric	Selected Q4 model	Anchor
Revenue	1,418.631	FY midpoint less 9M reported
Gross profit	695.805	FY midpoint less 9M reported
Operating expense	160.102	FY midpoint less 9M reported
Operating profit	535.703	GP less operating expense
Sold volume GW	4.800	Inside company 4.3-5.3 GW preview
45X proxy	639.500	Calibrated credit split; source total grants broader
Available cash	1,772.089	Model cash roll-forward
Issuer-defined net cash	1,735.192	Distinct restricted-cash convention

10. Backlog, delivery and customer conversion

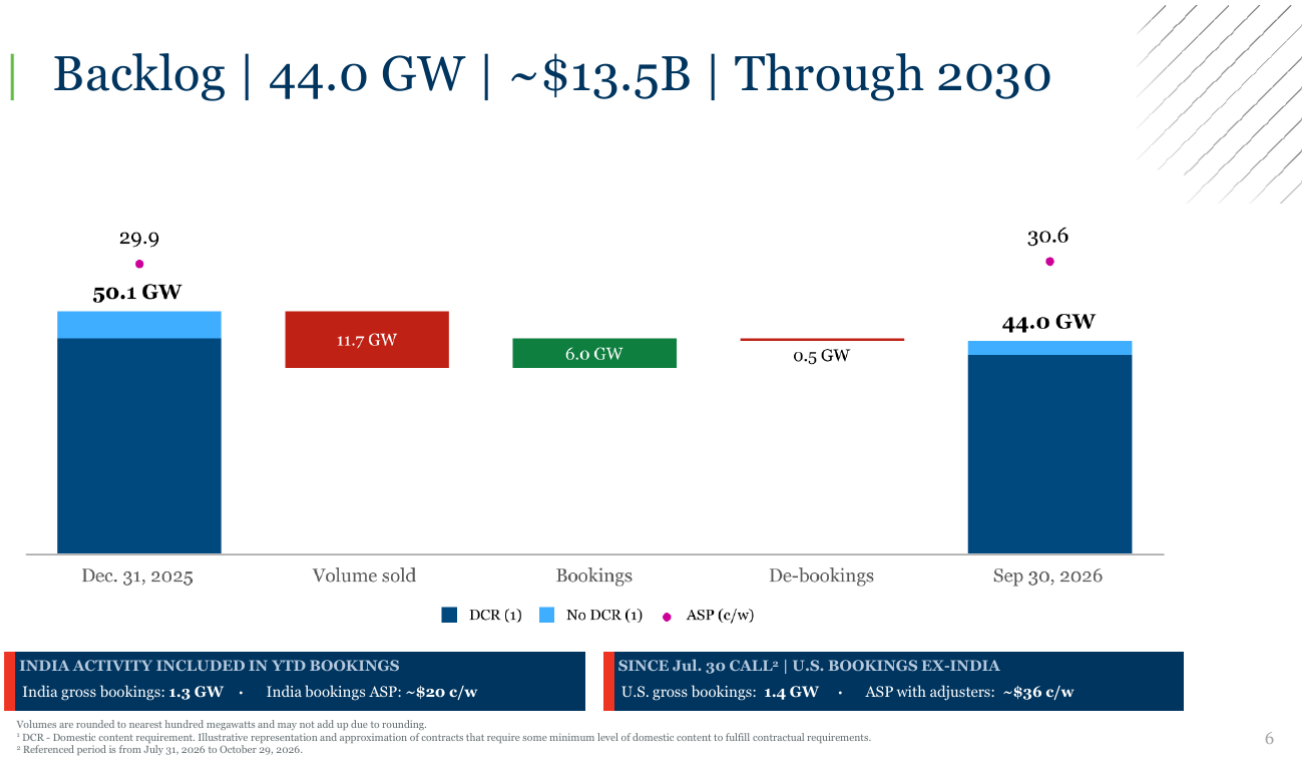

At September 30, contracted backlog was 44.0 GW with approximately $13.5 billion of transaction value and deliveries extending through 2030. Its displayed average price was about 30.6 cents per watt. The backlog excludes some variable volumes and technology adjustments.

Since the July call, U.S. gross bookings were 1.4 GW at approximately 36 cents per watt including applicable technology adjustments. Most of this volume had pricing settled or advanced before the August Section 232 announcement. Recent bookings therefore do not establish an unlimited 36-cent price for every future delivery.

Approximately 4 GW of options sit outside contracted backlog. About half had decision dates within five months of the October call. These volumes become bookings when exercised. The new model tracks existing backlog, new bookings and shipments as a stock-and-flow bridge; booking growth does not create duplicate current-period revenue.

Management is emphasizing project-specific contracting, credit support and delivery schedules. Better schedule definition may reduce storage and working-capital costs. It also shortens the period covered by framework agreements. A 2 GW negotiation stopped after a state moratorium, illustrating how permitting can interrupt a prospective order.

11. Contracted backlog and booked prices

Original First Solar Q3 2026 presentation, page 6. Backlog is a dated contract stock and has a different scope from current revenue.

12. Manufacturing capacity and inventory

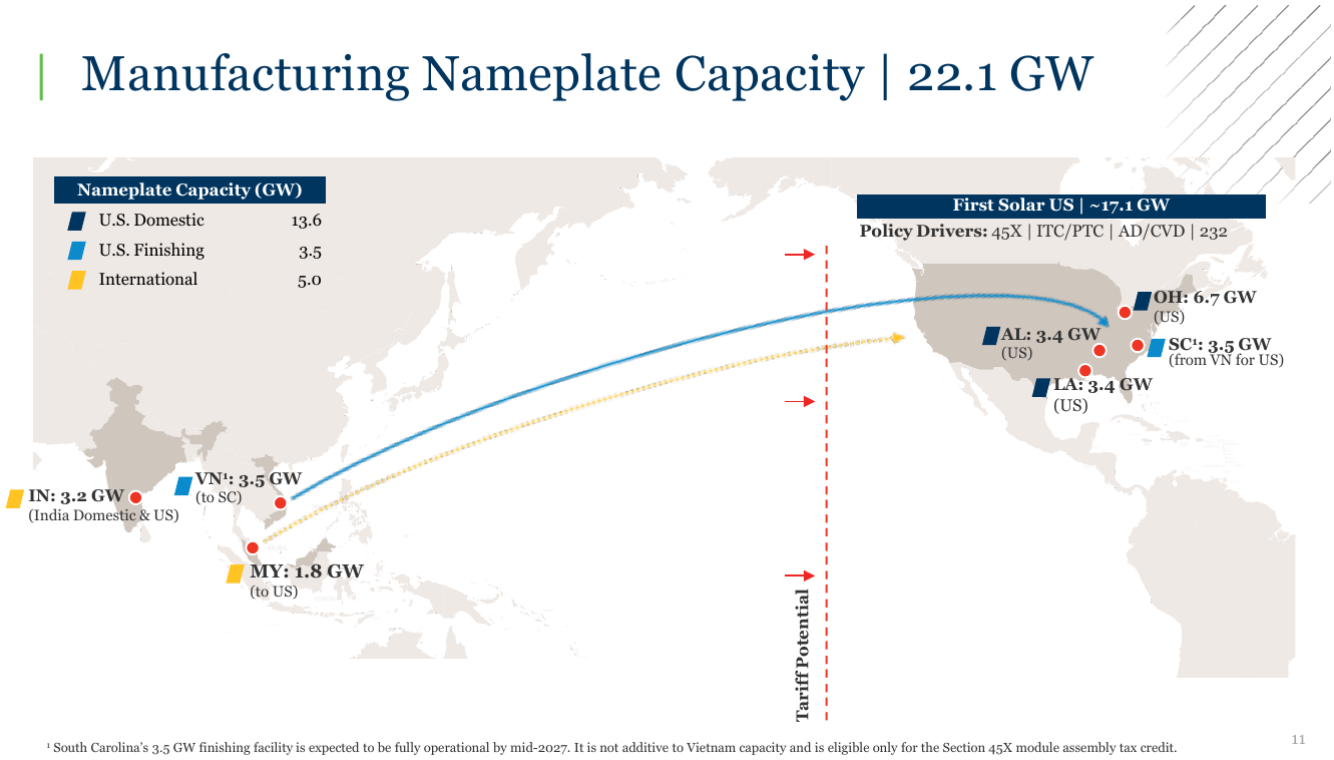

The issuer's capacity exhibit identifies approximately 13.6 GW of fully domestic capacity, 3.5 GW of U.S. finishing capacity and 5.0 GW of remaining international capacity. South Carolina finishing is non-additive to the Vietnam front end that supplies it. Malaysia is 1.8 GW; the much larger quantity in a source transcription is excluded.

South Carolina's first phase entered commercial production in September 2026. The second phase is expected in mid-2027 after incorporating CuRe. Management expects 2.2-2.5 GW of South Carolina production in 2027. India is expected to produce 2.2-2.6 GW of finished modules during the same year, with its first Series 7 CuRe conversion beginning in Q1.

The forecast tracks production and sold watts separately. Seasonal deliveries can exceed a quarter's production only by drawing from available finished goods. Opening finished-goods buffers are explicitly labeled modeling allocations within reported inventory; they are not separately reported company volumes.

The Malaysia decision is expected in the first half of 2027. The model assigns 35% to a restart and 65% to shutdown. Management expects little difference in run-rate earnings between the outcomes. The restart contribution is therefore modest; the shutdown branch separately includes a bounded, noncash impairment proxy.

13. Manufacturing footprint and non-additive routes

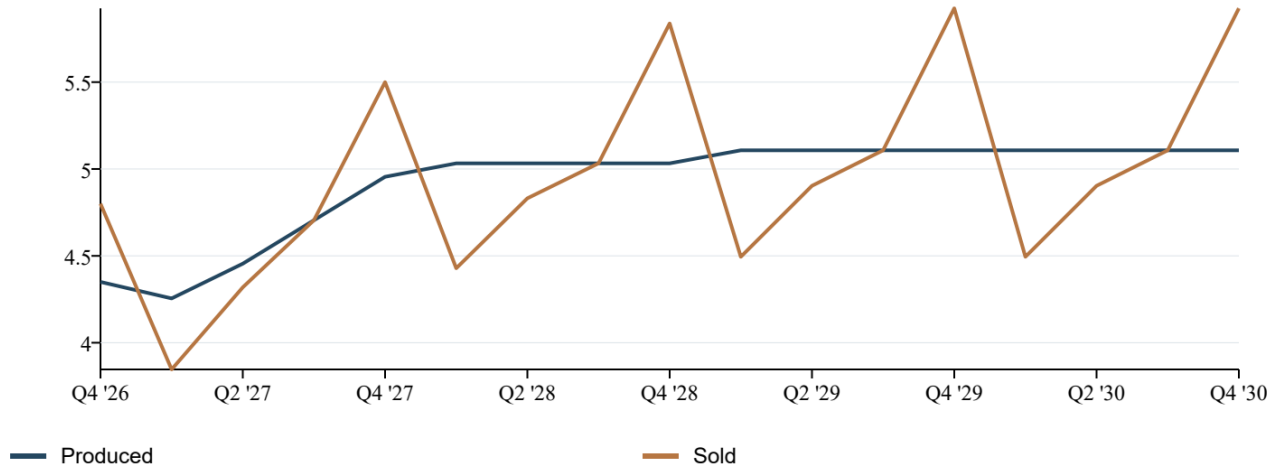

Original First Solar Q3 2026 presentation, page 11. Vietnam front end and U.S. finishing form one route; Malaysia nameplate is 1.8 GW.

14. Capacity And Sales

Physical output and delivered module volume

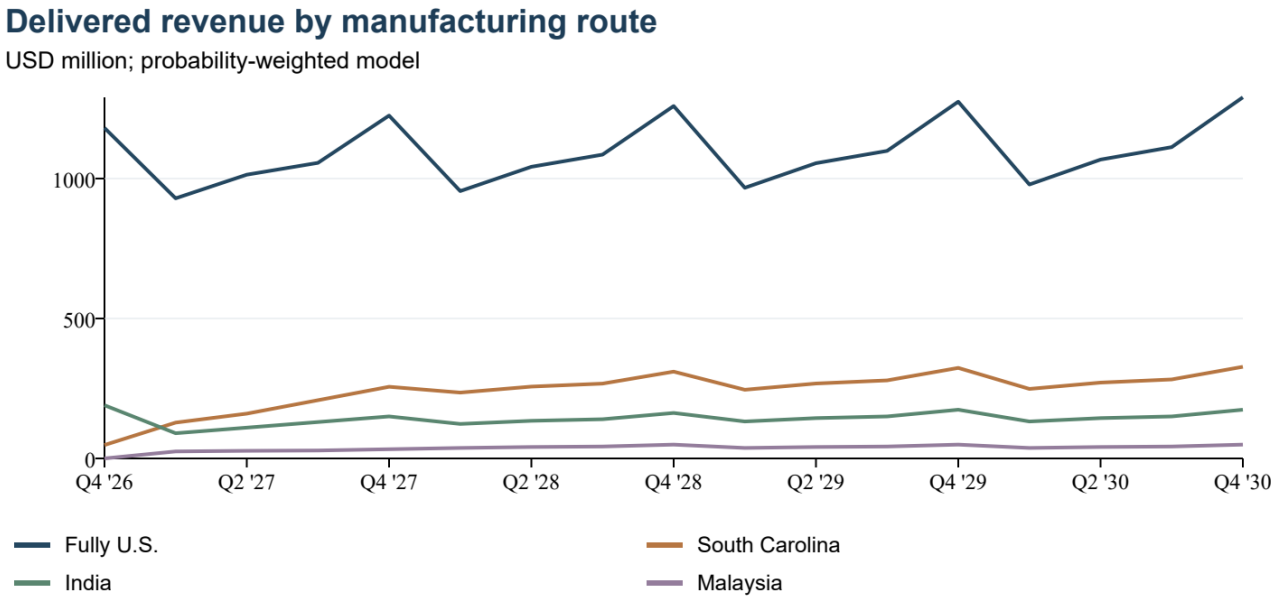

GW; probability-weighted model

Q3 2030	1,112.200	282.200	150.000	42.525
Q4 2030	1,290.152	327.352	174.000	49.329

16. Pricing, technology adders and overlap

Legacy module prices and new-contract prices have different timing and evidence. New U.S. and South Carolina contracts receive a 50% probability of 36 cents per watt versus the 32-cent reference, applied only to the selected new-contract share. Those same units receive no separate legacy CuRe adder.

The existing eligible CuRe backlog has up to $500 million of potential adjustments. The model assigns 50% realization. It allocates the unweighted opportunity 20% to 2027, 50% to 2028 and 30% to 2029, producing selected contributions of $50 million, $125 million and $75 million before other branch effects.

Only the approximately 20% association with 2027 deliveries is a management timing statement. The later split is an analytical assumption because management described the remainder as weighted to 2028 and beyond. Achievement of performance milestones, notifications, contract terms and deliveries controls realization.

These adders increase the price on eligible existing module volume. Pricing improvements already embedded in new-contract ASPs cannot be added again through the legacy adjustment pool.

17. Selected annual operating assumptions

Year	U.S. GW	SC GW	India GW	New share	CuRe USD M
2027	13.200	2.350	2.400	0.0%	50.000
2028	13.400	3.300	2.800	20.0%	125.000
2029	13.400	3.400	3.000	40.0%	75.000
2030	13.400	3.400	3.000	60.0%	0.000

18. Selected factory-cost and investment inputs

Future cost and investment amounts are selected assumptions. Production-cost improvements compound from the calibrated Q4 factory unit cost. Freight, tariff and underutilization remain explicit. Perovskite R&D and legal expense are included within their parent expense lines.

Year	Unit cost change	Freight $/W	Underutil.	Tariff	Capex
2027	-2.0%	0.020	40.000	60.000	800.000
2028	-1.0%	0.018	20.000	60.000	700.000
2029	-1.0%	0.018	10.000	60.000	600.000
2030	-1.0%	0.018	10.000	60.000	600.000

19. Annual overhead and included programs

Year	R&D	Included perovskite	SG&A	Included legal	Start-up
2027	340.000	150.000	275.000	25.000	40.000
2028	360.000	165.000	285.000	25.000	10.000
2029	380.000	180.000	295.000	25.000	0.000
2030	400.000	195.000	305.000	25.000	0.000

20. Cost, depreciation and operating expense

The model builds costs by production route. A Q4 factory-cost residual is calibrated after separately showing freight, tariff costs, normal warranty provision and underutilization. The residual is split into variable and fixed cash costs, with depreciation removed before the forward cash-cost extension.

Variable factory costs respond to sold-volume equivalents and the selected efficiency trajectory. Fixed cash costs remain explicit. Depreciation is then charged once in production costs and added back once in operating cash flow. The net-book-value depreciation rate is a modeling proxy, with alternative useful-life assumptions tested.

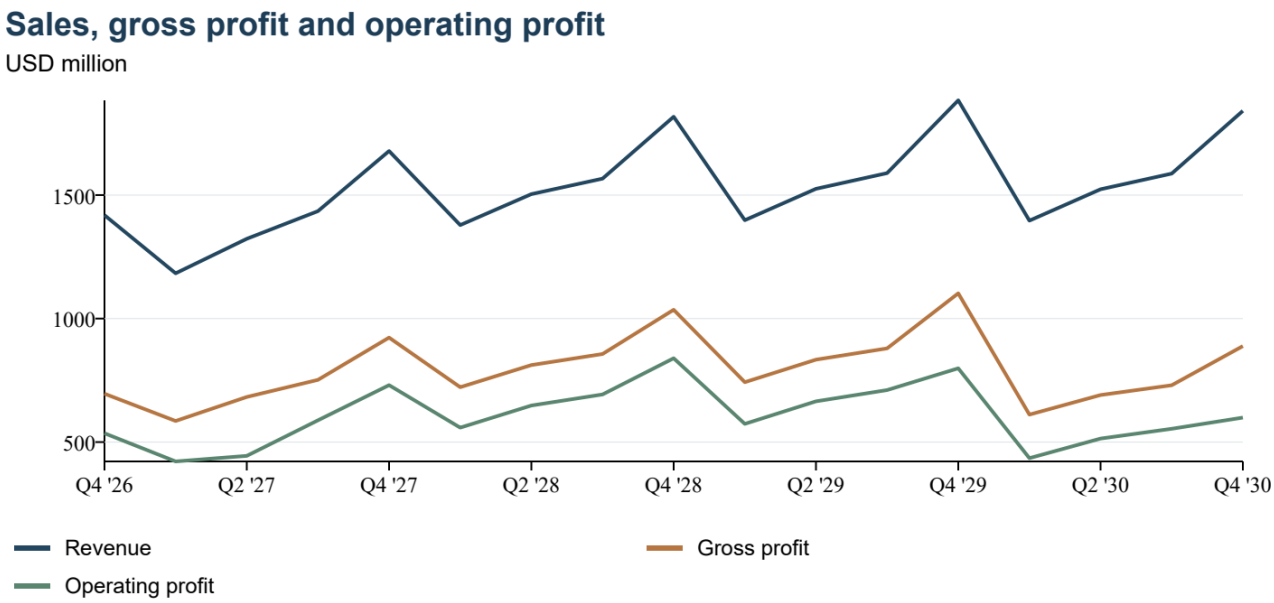

R&D includes the stated perovskite program and selected later increases. SG&A includes legal spending. Production start-up expense has its own schedule as South Carolina's later phase comes online. Those items are components of operating expense, so they do not receive a second deduction.

Future tariff allocations are low-confidence cost proxies anchored to management's $55-65 million 2026 net tariff range. The exact nine-month net amount is unavailable. A chosen Q4 allocation changes the calibrated factory residual, leaving the anchored total gross profit intact.

21. Factory calibration and physical allocation

Input	Selected assumption
Variable / fixed factory residual	80% / 20%, after separately identified costs
Cost-equivalent route weights	Fully U.S. 1.00; South Carolina 0.85; India 0.65
Q4 depreciation / opening PPE	150.000 / 5,633.874 million
Forward depreciation	10% of opening annual net PPE plus half of annual capital spending
Quarterly U.S. sales profile	22% / 24% / 25% / 29%; production spread evenly
2027 South Carolina quarterly GW	0.400 / 0.500 / 0.650 / 0.800
2027 India quarterly GW	0.450 / 0.550 / 0.650 / 0.750
Opening finished-goods buffers	0.300 GW U.S. and 0.150 GW India; allocations inside reported inventory
Malaysia conditional economics	0.27 USD/W; pre-depreciation cash contribution of 5.556 million per GW

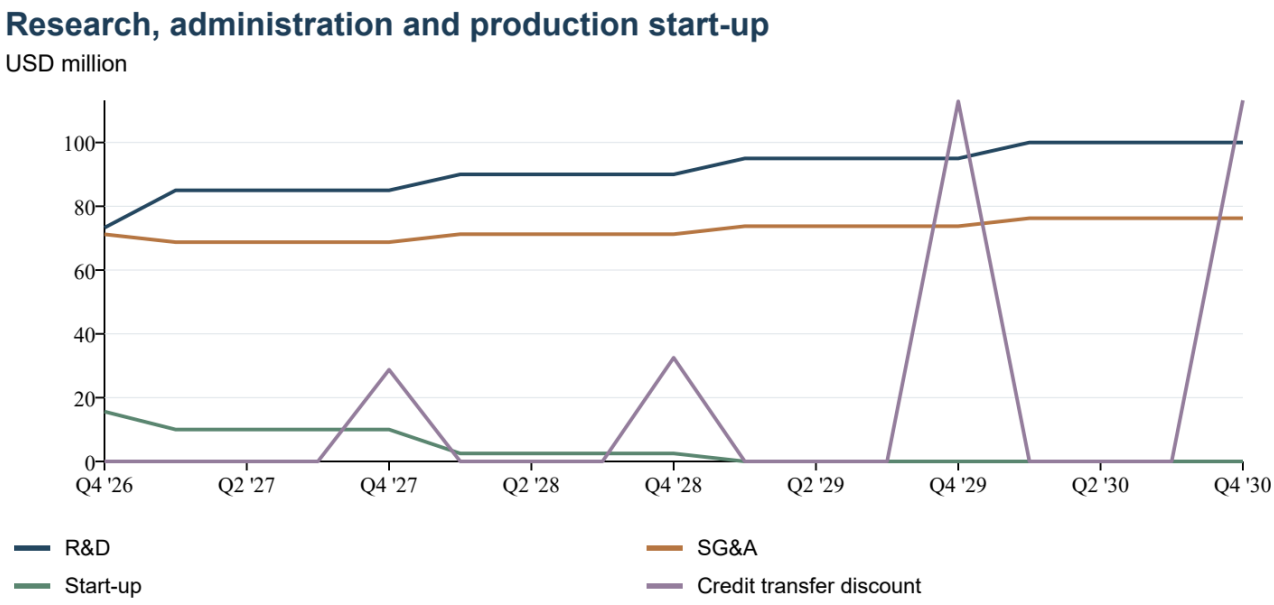

22. Profit

Selected model estimates. Full calculation precision is retained in the linked model.

Quarter	Revenue	Gross profit	Operating profit
Q4 2026	1,418.631	695.805	535.703
Q1 2027	1,183.228	585.442	421.692
Q2 2027	1,322.976	682.630	444.227
Q3 2027	1,434.850	751.817	588.067

Q4 2030	100.000	76.250	0.000	113.220

24. Manufacturing credits and government grants

First Solar recognizes qualifying production credits as a reduction of cost of sales when the modules are sold. Its current form factor supports approximately 17 cents per watt for fully U.S.-produced modules and approximately 7 cents for international work in process completed in the United States.

Reported nine-month income-related cost-of-sales grants were $1,500.486 million. That total includes more than the isolated Section 45X amount. The selected split between 45X and other grants is a labeled calibration that reconciles to the full-year 45X midpoint of $2.13 billion.

Credit recognition, the grant receivable and receipt of cash are separate events. The model tracks vintage balances and collections. It never treats the receivable as immediate spendable cash or records the same credit twice.

The current statutory schedule reduces the general eligible-component credit to 75% in 2030, 50% in 2031 and 25% in 2032. The forecast visibly includes the 2030 step. Post-2026 integrated-component and prohibited-foreign-entity rules require continued eligibility; the modeled rates are conditional on compliance.

25. Credit accounting and rates

In August 2022, the previous U.S. President signed into law the Inflation Reduction Act of 2022 (the "IRA"). Among other things, the IRA offers a tax credit, pursuant to Section 45X of the Internal Revenue Code (the "IRC"), for solar modules and solar module components manufactured in the United States and sold to third parties. Such credit may be refundable by the Internal Revenue Service (the "IRS") or transferable to a third party and is available from 2023 to 2032, subject to phase down beginning in 2030. For eligible components, the credit is equal to (i) $12 per square meter for a PV wafer, (ii) 4 cents multiplied by the capacity of a PV cell in watts, and (iii) 7 cents multiplied by the capacity of a PV module in watts. Based on the current form factor of our modules, we believe we qualify for a credit of up to approximately 17 cents per watt for each module fully produced in the United States and sold to a third party. For each module that is initiated by our international fleet and then completed in the United States, we expect to qualify for a credit of approximately 7 cents per watt. We recognize such credit as a reduction to "Cost of sales" in the period the modules are sold to customers. Such credit is also reflected on our condensed consolidated balance sheets within "Government grants receivable, net" and "Government grants receivable," depending on the expected timing of cash receipts.

In December 2024, we entered into two agreements for the sale of $857.2 million of Section 45X tax credits we generated during 2024 for aggregate cash proceeds of $818.6 million. We received initial cash proceeds of $616.0 million in December 2024 and received the remaining cash proceeds of $202.6 million during the year ended December 31, 2025.

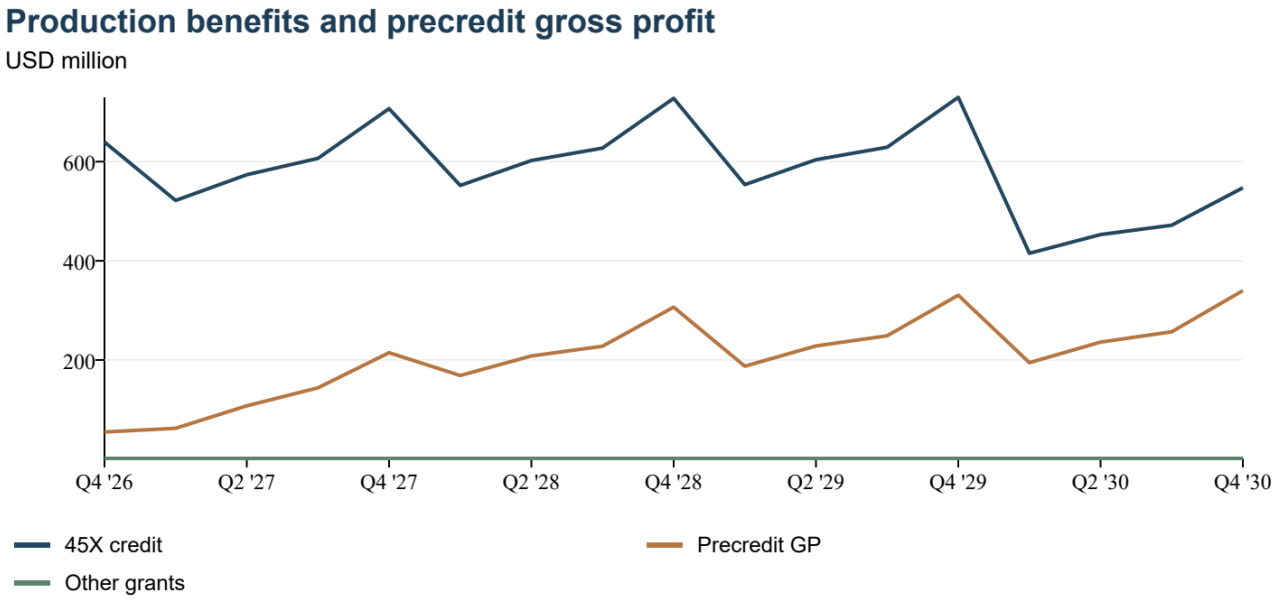

In June 2025 and July 2025, we entered into two agreements for the sale of $701.9 million of Section 45X tax credits we generated during 2025 for aggregate cash proceeds of $668.1 million. We received the full cash proceeds during the year ended December 31, 2025.

In October 2025, we entered into two agreements for the sale of $699.7 million of Section 45X tax credits we generated during 2025 for aggregate cash proceeds of $668.2 million. We received initial cash proceeds of $573.0 million during the year ended December 31, 2025 and received the remaining cash proceeds of $95.2 million during the nine months ended September 30, 2026.

During the nine months ended September 30, 2026, we received $117.6 million from the U.S. Department of the Treasury related to Section 45X tax credits generated during 2024.

Credit-section excerpt from the original Q3 2026 Form 10-Q, printed page 14. Production credits reduce cost of sales when modules are sold; credit sales and refunds have separate cash dates.

26. Credit Economics

Selected model estimates. Full calculation precision is retained in the linked model.

27. Tax reconciliation evidence

Our Vietnamese subsidiary has been granted a long-term tax incentive that generally provides a full exemption from Vietnamese income tax through 2023, followed by reduced annual tax rates of 5% through 2032 and 10% through 2036. Such long-term tax incentive is conditional upon our continued compliance with certain revenue and R&D spending thresholds. We are currently in compliance with such thresholds.

During the year ended December 31, 2025, we incurred losses in Malaysia and Vietnam. As a result, we did not benefit from the tax holiday and tax incentive in this year.

The following table presents the differences between the provision for income taxes and the amounts computed at the federal statutory tax rate, by amount and percent, for the year ended December 31, 2025 (in thousands) after the adoption of ASU 2023-09:

	2025	
	Tax	Percent
U.S. federal statutory tax rate	$ 331,992	21.0 %
State and local income taxes (1)	18,356	1.2 %
Foreign tax effects		
Malaysia

Q3 2030	51.752	51.752	0.000
Q4 2030	69.159	69.159	2,402.780

29. Book tax, cash tax and credit monetization

The 2025 annual tax reconciliation reports a $335.881 million Section 45X tax effect against $331.992 million at the 21% federal statutory rate. Nine-month 2026 book tax was $39.489 million, representing an effective rate of 2.9%. These disclosures support treating 45X book income separately from taxable core earnings.

The tax forecast starts with the annualized nine-month tax burden and applies the selected incremental rate to increases in precredit earnings. The transfer discount is added back when determining the taxable-core proxy, a conservative assumption whose deduction alternative is tested separately. The proxy retains Pillar Two and other tax costs. Actual tax-return treatment of the book discount remains undisclosed.

Opening tax payable is settled separately from forecast current taxes. The $110.067 million opening tax receivable has no assumed cash release in the selected case. Refund or tax-credit cash is recorded through one path, preventing duplicate collections.

The cash branches assign 70% to elective-pay timing for eligible 2026-2027 vintages and 30% to transfers at 95.5% of face. Later vintages use the selected transfer route. The actual facility election dates are undisclosed; final rules allow one five-year election per credit property. Cash receipt dates remain model assumptions, with delay stresses.

The IRS proposed a $720.6 million increase in taxable income for 2016-2021. That amount describes proposed taxable income. Any cash tax bill depends on the applicable tax years and adjustments. Year allocation, offsets, existing provisions, interest and penalties remain unresolved, so a separate principal-liquidity bracket and probability are disclosed.

30. Cash, funding and finite repurchases

At September 30, available cash and marketable securities totaled $1,624.075 million. Restricted cash and recycling securities are displayed separately. Government-grant receivables, customer advances, inventory, trade receivables and supplier payments explain the difference between accounting earnings and cash.

Share-based compensation remains included in GAAP operating expense. The cash-flow bridge adds back the noncash expense using the nine-month 2026 ratio of $22.904 million to $462.398 million of R&D, SG&A and start-up expense. Employee equity tax withholding is a separate financing cash outflow, calibrated to $0.945 million divided by $22.904 million of share-based compensation. These cash classifications preserve operating profit and the selected dilution schedule.

Management authorized a finite $500 million repurchase program with no expiration and no obligation to execute a specified amount. The model assigns 50% to conditional execution and 50% to deferral. A payment requires at least $1.5 billion of net cash at the current quarter end and throughout the next four modeled quarters after operating needs, credit collections, taxes, capital spending, debt and the foregone interest on repurchase cash.

The repurchase scenario uses a $500 million total company cash budget including 1% excise tax. It reduces shares only when purchases occur. The model uses a dated execution-price assumption for this cash-and-share bridge; the valuation multiple and operating forecast are not determined by the market quote.

The undrawn revolver is a funding resource with an explicit limit and cost. Borrowing covers genuine liquidity shortfalls. The repurchase test excludes future discretionary purchases and unannounced funding from its reserve projection. Amounts that would breach the reserve remain unspent. Every branch shows any residual funding need.

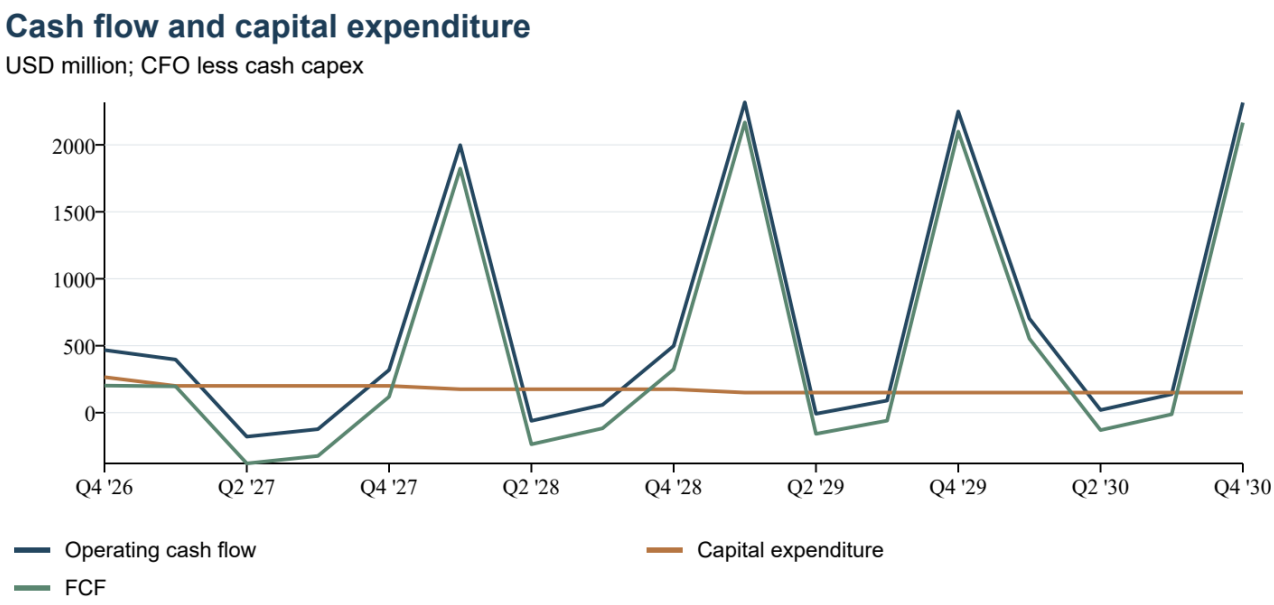

31. Cash reserve and financing scope

The current-quarter and forward-four-quarter USD 1.5 billion net-cash test governs discretionary repurchases. Operations can draw cash below that strategic reserve when no repurchase is made. The selected joint model has a minimum leaf cash balance of USD 554.990 million. Delayed-credit and legal liquidity stresses recalculate the available revolver and any residual financing gap.

32. Selected working-capital and financing inputs

Input	Selected assumption
Trade-receivable days	85 days in Q4 2026; 90 days thereafter
Q4 inventory / payables	1,200 / 350 million
Forward inventory	90 days of precredit production cost, including production depreciation
Forward trade payables	30 days of cash factory cost, excluding depreciation and warranty
New booking volumes	2 GW Q4 2026; 9 / 12 / 15 / 17 GW in 2027 / 2028 / 2029 / 2030
New booking price / cash advance	0.32 USD/W; 8% advance on new bookings
Legacy advance release	11.833133% of delivered revenue
Revolver limit / rate	1,500 million / 5.5%
Cash interest yield	3.5% annual
Existing debt repayment	53.834 million in each of Q4 2026 and Q1 2027
Opening U.S. prior-vintage credits	300 million; 150 collected Q4 2026 and 150 Q1 2027
Opening 2026 U.S. credit proxy	1,490.5 million
Opening India / other grant proxy	84.388 million; half collected during each of 2027 and 2028
Tax baseline / incremental rate	52.652 million annual baseline; 21% above a -147.680 million core-earnings reference
Opening tax payable settlement	54.285 million in four equal quarters Q4 2026 through Q3 2027

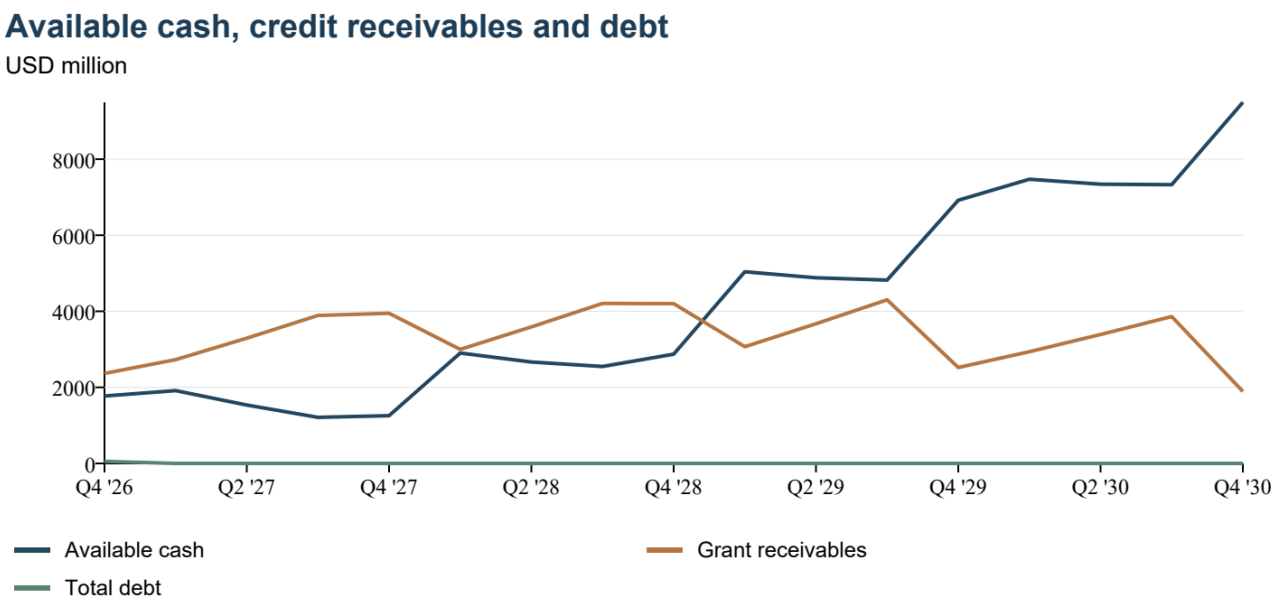

33. Cashflow

39. Legal outcomes and warranty obligations

The $71.903 million total warranty liability includes the $46 million specific Series 7 reserve. The model settles the opening liability once and separately accrues normal future warranty provisions. It assigns 25% probability to the $19 million difference between the disclosed upper loss range and the specific reserve.

Swift Current's complaint concerns Double Black Diamond, Harvest Gold and Tres Bahias. First Solar disputes the allegations and has a November 16 response deadline. Project module quantities, defect fractions and a total damages range remain undisclosed in the reviewed sources. A 20% adverse-outcome probability is disclosed, together with the missing variables and a separate shock stress.

The BP/Lightsource scenarios distinguish $323.6 million of remaining termination demands from $61 million previously recognized against advances. They use mutually exclusive no-recovery, partial-recovery and partial-counterclaim outcomes. The model assumes the selected partial amounts and Q4 2029 resolution timing.

A Malaysia shutdown can create an impairment even with limited run-rate earnings effect. The selected impairment is a fraction of the country's dated long-lived-asset balance, which includes more than plant equipment. It is labeled as a low-confidence allocation proxy, capped by modeled assets, and affects later depreciation and cash-flow reconciliation.

40. Policy and competitive response

The August 6 proclamation establishes minimum import prices and additional duties on covered polysilicon products from December 4. It also contains documentation, fixed-contract and onshoring provisions. The model treats higher attainable pricing as a probabilistic commercial outcome, while manufacturing credits and their eligibility are modeled separately.

First Solar's customer demand still depends on project returns, permitting, storage and interconnection. Higher module prices can coexist with slower procurement. A policy headline alone does not determine order timing or a company's realized selling price.

T1 Energy publicly described a limited-duration waiver for up to 1.725 GW of cell imports while its planned 2.1 GW first-phase cell factory is built. That disclosure supports a competitive supply response. The retained source does not establish a permanent tariff exemption or prove that First Solar lost an order.

CdTe technology and domestic production reduce some supply-chain exposures. Imported raw materials, glass, equipment, logistics and alternative module technologies remain relevant. TOPCon intellectual-property claims are contested; no royalty stream is inserted without a separate bounded commercial bridge.

41. Warranty reserve and known issue

number of affected modules, and projections of probable costs to remediate the issues, we believe a reasonable estimate of potential future losses will range from approximately $40 million to $65 million. Within that range, we recorded a specific warranty liability of $46 million as of September 30, 2026, which represents our best estimate of expected future losses related to the identified manufacturing issues. The ultimate loss we will incur will depend on the extent of the premature power loss that is experienced in relation to the obligations under our limited product warranties, as well as any potential additional commitments we may make to remediate the affected modules. As additional information becomes available to us, our estimate of the aggregate losses related to these manufacturing issues may change, and any change in estimate may also result in a change to our product warranty liability.

Indemnifications

In certain limited circumstances, we have provided indemnifications to customers or other parties under which we are contractually obligated to compensate such parties for losses they suffer resulting from a breach of a representation, warranty, or covenant; the resolution of specific matters associated with a solar project's development or construction; guarantees of a third party's payment or performance obligations; or any disallowance or lack of the right to claim all or any portion of certain tax credits. For contracts that have such indemnification provisions, we initially recognize a liability under ASC 460 for the estimated premium that would be required by a guarantor to issue the same indemnity in a standalone arm's-length transaction with an unrelated party. We may base these estimates on the cost of insurance or other instruments that cover the underlying risks being indemnified and may purchase such instruments to mitigate our exposure to potential indemnification payments. We subsequently measure such liabilities at the greater of the initially estimated premium or the contingent liability required to be recognized under ASC 450. We recognize any indemnification liabilities as a reduction of earnings associated with the related transaction.

After an indemnification liability is recorded, we derecognize such amount pursuant to ASC 460 depending on the nature of the indemnity, which derecognition typically occurs upon expiration or settlement of the arrangement, and any contingent aspects of the indemnity are accounted for in accordance with ASC 450. As of September 30, 2026 and December 31, 2025, we had no accrued indemnification liabilities. Our potential future payments under these indemnifications primarily relate to legislative changes that may adversely affect an entity's ability to benefit from previously transferred Section 45X tax credits.

Solar Module Collection and Recycling Liability

We previously established a module collection and recycling program, which has since been discontinued, to collect and recycle modules sold and covered under such program once the modules reach the end of their service lives. For legacy customer sales contracts that are covered under this program, we agreed to pay the costs for the collection and recycling of qualifying solar modules, and the end-users agreed to notify us, disassemble their solar power systems, package the solar modules for shipment, and revert ownership rights over the modules back to us at the end of the modules' service lives. Accordingly, we recorded any collection and recycling obligations within "Cost of sales" at the time of sale based on the estimated cost to collect and recycle the covered solar modules.

We estimate the cost of our collection and recycling obligations based on the present value of the expected future cost of collecting and recycling the solar modules, which includes estimates for the cost of packaging materials; the cost of freight from the solar module installation sites to a recycling center; material, labor, and capital costs; and by-product credits for certain materials recovered during the recycling process. We base these estimates on our experience collecting and recycling solar modules and on certain assumptions regarding costs at the time the solar modules will be collected and recycled. In the periods between the time of sale and the related settlement of the collection and recycling obligation, we accrete the carrying amount of the associated liability and classify the corresponding expense within "Selling, general and administrative" expense on our condensed consolidated statements of operations.

Original Q3 2026 Form 10-Q, printed page 24. The specific $46 million warranty liability is included within total warranty obligations.

42. Country asset evidence for the shutdown sensitivity

The following table presents net sales for the years ended December 31, 2025, 2024, and 2023 by geographic region, based on the customer country of invoicing (in thousands):

	2025	2024	2023
United States	$ 4,994,679	$ 3,904,844	$ 3,187,603
India	195,584	201,714	10,869
France	6,303	34,370	68,302
All other foreign countries	22,810	65,361	51,828
Net sales	$ 5,219,376	$ 4,206,289	$ 3,318,602

The following table presents long-lived assets, which include property, plant and equipment, lease assets, and project assets as of December 31, 2025 and 2024 by geographic region, based on the physical location of the assets (in thousands):

	2025	2024
United States	$ 4,392,571	$ 3,911,923
Malaysia	574,255	646,111
Vietnam	434,749	500,568
India	433,661	471,736
All other foreign countries	62,337	52,345
Long-lived assets	$ 5,897,573	$ 5,582,683

22. Concentrations of Risks

Customer Concentration Risk. The following customers each comprised 10% or more of our total net sales for the years ended December 31, 2025, 2024, and 2023:

	% of Net Sales		
	2025	2024	2023
Customer #1	11 %	*	*
Customer #2	10 %	*	*
Customer #3	*	*	10 %

* Net sales for these customers were less than 10% of our total net sales for the period.

Supplier Concentration Risk. Several of our key raw materials and components, in particular CdTe and substrate glass, and manufacturing equipment are either single-sourced or sourced from a limited number of suppliers. Failure of any of our key suppliers to perform could disrupt our supply chain and adversely impact our operations by impairing our ability to deliver solar modules to customers in the required quality and quantities and at a price that is profitable to us.

Production Concentration Risk. Shortages of essential components and equipment could occur due to increases in demand or interruptions of supply, which may be exacerbated by the availability of logistics services, thereby adversely affecting our ability to meet customer demand for our products. Our solar modules are currently produced at our facilities in the United States, Malaysia, Vietnam, and India. Damage to or disruption of these facilities could interrupt our business and adversely affect our ability to generate net sales.

Original 2025 annual report, printed page 125. Malaysia long-lived assets are a dated country total that includes PPE, lease assets and project assets.

43. Primary policy scope

Annex II

A. Effective with respect to goods entered for consumption, or withdrawn from warehouse for consumption, on or after 12:01 a.m. eastern time on December 4, 2026, subchapter III of chapter 99 of the Harmonized Tariff Schedule of the United States (HTSUS) is modified as follows:

1. The following new U.S. note 42 is inserted in numerical order:

"42. (a) Headings 9903.45.30–9903.45.36 provide the ordinary customs duty treatment of polysilicon and certain polysilicon derivative products. These products may be subject to both the applicable *ad valorem* rate of duty imposed by headings 9903.45.30–9903.45.32 and the applicable specific rate of duty imposed by headings 9903.45.33–9903.45.36. The rates of duty imposed by headings 9903.45.33–9903.45.36 will apply to products described in those headings if the importer of such products fails to submit documentation concerning the resale of those products in the United States to U.S. Customs and Border Protection (CBP) upon entry, or if the importer submits such documentation but CBP is required to adjust the customs duty assessed on those entries, as provided for in this proclamation.

Headings 9903.45.33–9903.45.36 do not apply to products described in those headings if the product's entered value meets or exceeds the specific rate of duty provided in headings 9903.45.33–9903.45.36 for that product and:

1. the product will not be resold in the United States and any downstream product made from the product will be sold at or above the specific rate of duty provided in headings 9903.45.33–9903.45.36 for that downstream product;

2. the product will be resold in the United States at a price at or above the specific rate of duty provided in headings 9903.45.33–9903.45.36 for that product; or

3. the product will be resold in the United States pursuant to fixed terms in a time-limited contract entered into prior to August 6, 2026.

(b) For imported articles provided for in headings 9903.45.30–9903.45.36 that are eligible for special tariff treatment under any of the free trade agreements or preference programs listed in general note 3(c)(i) to the tariff schedule, the duties provided in these headings shall be collected in addition to any special rate of duty otherwise applicable under the appropriate tariff subheading. Goods for which entry is claimed under a provision of chapter 98 to the HTSUS and that are subject to the additional duties prescribed herein shall be eligible for and subject to the terms of such provision and applicable CBP regulations. No claim for entry or for any duty exemption or reduction shall be allowed under a provision of chapter 99 to the HTSUS that may set forth a lower rate of duty or provide duty-free treatment, taking into account information supplied by CBP. All

Original Federal Register, August 11, 2026, page 51984. Fixed-contract documentation and scope qualifications accompany the minimum-import-price rules.

56. Credit and grant cash roll-forward

Opening grant receivables plus earned 45X credits and other grants, less credit cash collections, other-grant cash collections and transfer discounts, equals closing grant receivables. Credit cash uses the actual discounted proceeds; the discount retires the remaining transferred face value.

Quarter	Opening	45X earned	Other earned	Credit cash	Other cash	Discount	Closing

60. Ceiling

Each nonhistorical value is the sum of leaf-level ceilings weighted by the selected joint probabilities. Each leaf first sums operating profit across the exact four-quarter window, applies 20x and divides by its own ceiling-quarter share count. The historical Q3 2026 display preserves its published vintage.

USD per share. Leaf endpoints describe conditional outcomes under the selected assumptions.

Quarter	Selected ceiling	Lowest leaf	Highest leaf
Q3 2026	404.568	404.568	404.568
Q4 2026	369.059	354.897	389.715

Q1 2030	393.417	351.496	436.302

61. Exact forward-four-quarter derivation

For every current window: weighted forward operating profit per share equals the sum across leaves of probability times that leaf's forward operating profit divided by that leaf's shares. The final ceiling equals that sum times 20. The table exposes that exact aggregation. Weighted operating profit and shares are reference measures and are not divided to produce the target. The historical Q3 2026 row retains its original single-vintage calculation.

Ceiling quarter	Earnings window	Weighted F4Q OP	Weighted OP/share	Multiple	Ceiling

Q4 2029	Q4 2029 to Q3 2030	2,301.667	21.543666	20.0	430.873
Q1 2030	Q1 2030 to Q4 2030	2,102.073	19.670859	20.0	393.417

62. Joint probability structure

The model combines six selected dimensions into 96 coherent leaves: Malaysia operating outcome, legacy CuRe realization, new-contract pricing, credit monetization, discretionary repurchases and the three BP legal outcomes. Independence is a modeling assumption among these dimensions. Shared product quantities and cash balances remain linked inside each leaf.

The known warranty tail is applied once as its expected incremental cost. Swift and the IRS notice carry explicit adverse probabilities and unresolved economic amounts; separate liquidity stresses identify their consequences without inventing an award or tax bill.

63. Numerical breadcrumb ledger

Signal / source	Probability	Conditional outcome / timing	Reference and overlap
Malaysia / SRC-007	35% restart	1.2 GW in 2027; 1.8 GW later. Modest pre-DA cash contribution.	Shutdown is complementary 65%; separate impairment and depreciation.
Legacy CuRe / SRC-010	50%	Up to $500M: 20% / 50% / 30% in 2027 / 2028 / 2029.	Only eligible legacy modules; no adder on newly repriced volume.
New pricing / SRC-009	50%	36 cents/W versus 32 cents/W on selected new contracts.	New-contract fractions 0% / 20% / 40% / 60%; remaining volume keeps reference pricing.
Credit cash / SRC-012	70% direct pay	2026-2027 vintages at face value in Q1 of year+2.	30% transfer branch at 95.5% face; later vintages use transfer.
Repurchases / SRC-014	50% execution	Finite $500M total budget including excise tax.	Requires current and forward four-quarter $1.5B net cash reserve.
Warranty / SRC-015	25%	A further $19M above the specific reserve; $4.75M expected.	Opening $46M is within $71.903M total and is settled once.
BP / SRC-016	50% / 25% / 25%	No incremental recovery / $161.8M recovery / $87.5M loss in Q4 2029.	Remaining claim excludes $61M already recognized; outcomes are mutually exclusive.
Swift / SRC-015	20% adverse	Amount unresolved; separate shock test.	Project watts, defect fraction, remedies and damage heads unavailable.
IRS / SRC-016	30% adverse	Gross tax-principal bracket $151.326-252.210M; net amount unresolved.	2016-2021 year mix, offsets and existing provisions remain undisclosed.

64. Quarterly operating breadcrumb contributions

These are active contributions in the selected model. Reference revenue is already included in the base production routes. A zero contribution can reflect timing or the absence of eligible new-contract volume.

66. Active contribution versus defined control

Each effect is measured against the stated control with the same horizon and share conventions. These effects interact; each control is evaluated separately.

Signal	Control comparison	USD per share
Malaysia restart	Selected less shutdown only	-0.131
Legacy CuRe realization	Selected less zero	19.134
New contract price realization	Selected less zero	8.761
Finite buyback execution	Selected less zero	0.000

70. Monitoring, triggers and source completeness

The next operating tests are Q4 deliveries and gross profit, the 2027 South Carolina ramp, the India CuRe conversion, customer notifications and technology-adjustment collections. Malaysia's first-half decision, credit monetization, new bookings and cash-funded capital returns also test the assumptions.

Pricing probability rises with executed higher-priced new contracts that carry clear delivery schedules. It falls when competing qualified supply, waived imports, customer postponements or cancellations weaken realization. The model revises costs and cash effects together with those changes.

The primary source set includes the October 29 Q3 release, 10-Q, presentation and quarterly data; the July 30 Q2 materials and full displayed management-call transcripts; the 2025 annual report; and relevant government trade and tax documents.

Both displayed call transcripts include prepared remarks and questions through the close. Original issuer audio and verified audio timestamps remain unavailable. Transcription errors are reconciled to issuer tables where possible. Unresolved fields stay labeled, including exact future ASP, credit-election dates, geographic asset values and contested legal outcomes.

71. Cross-book links and decision tests

First Solar and other utility-project suppliers share exposure to permitting, interconnection and financing schedules. Their revenues have different invoice boundaries. Each supplier earns revenue from its own product quantities, delivery terms and customer contracts.

Monitor sold GW, delivered price, credit eligibility, factory start-up cost, government-grant collections, inventory, customer advances and new bookings together. Reassess the operating probabilities when those measures diverge from the selected path. The original valuation method and protected Base remain governed by owner instructions.

73. Calculation and disclosure notes

All figures come from the linked structured model at full calculation precision. Tables round only for presentation. Historical Q3 2026 displays preserve the published vintage, while reported actuals remain separate. Open source gaps and model assumptions are recorded throughout the report.
