AIXA.DE - Aixtron SE

Full investment research | Model assumptions and source evidence

Framework 8 | Full current investment artifact | Evidence and analytical rescore:19 October 2026

Classification: Compound-semiconductor equipment bottleneck, subject to qualified delivery and acceptance. **Excel Base 83 protected; analytical 50/60=83.** Active Q4 2027 ceiling: about EUR 100 per share, up less than 1% from the same prior quarter. Existing 25x forward-four-quarter operating profit and economic diluted shares remain.

Optical-tool scarcity creates a plausible new-order price opportunity. The model already carries a strong optical ramp, so only a limited residual pool receives an added premium. Our 20% probability, bounded pricing, overlap reserve and incremental cost allowances are model judgments. No fixed-price backlog or named Lumentum order is repriced, and no extra tool quantity is added.

The October 15 preliminary earnings were processed and reported on October 16. They remain the starting anchors and are not applied again. Q3 preliminary revenue EUR 184 million, gross profit EUR 87 million and operating profit EUR 57 million remain approximate until the October 29 statement; full-year guidance remains unchanged. Rounded disclosed gross-profit amounts imply about 47% margin versus the issuer's approximately 48%, a retained reconciliation gap.

The inherited operating case retains factor 1. The new price increment alone is probability weighted. Both analytical scoring and protected Excel Base remain 83 after a full canonical review. Public figures are whole-number approximations; exact company calculations and shares are retained in the linked model.

1. Thesis, products and competitive position

Deposition is upstream of the optical device

AIXTRON supplies deposition equipment used to grow compound-semiconductor layers. Its optoelectronic, GaN, SiC, LED/research and after-sales exposure spans different customer investment cycles. InP-related laser demand can tighten a qualified process or tool supply chain while power-device customers are still absorbing prior investment.

The original G10 platform map links AsP equipment to relevant optoelectronics, GaN to power/RF applications and SiC to power devices. CW, EML and DFB lasers, EV/grid devices, microLED and other applications have different process requirements. Neither every compound semiconductor nor every InP laser is necessarily produced using AIXTRON equipment; Veeco, AMEC and alternative deposition routes require product-specific competitive analysis.

Turning device demand into equipment revenue

A photonics systems TAM is not a deposition-equipment TAM. A defensible bridge needs device demand, wafer output, usable reactor throughput, customer installed capacity, equipment allocation, ASP and acceptance timing. Tool delivery creates potential capacity; customer installation and qualification determine when that capacity produces saleable devices. The original 12-18 month lag is a planning observation, not a universal schedule.

The current optoelectronic order inflection is therefore a useful leading indicator for laser suppliers, subject to who placed the order and which process is being expanded. GaN/SiC power, microLED, LiDAR, defense and quantum-related applications broaden the technological opportunity without guaranteeing simultaneous revenue ramps. The five-vector model and current convertible denominator below are the sole numerical operating case.

Research provenance: the product and competitive analysis in this section synthesizes the supplied original research. Dated market-share, process and channel claims retain their original evidence status; this integration is not a new independent verification of those claims. Current earnings and model assumptions are set out below.

Named optical orders connect the tool thesis to a customer

The March article links laser-capacity investment to epitaxy equipment. A stronger later source names the customer: on May 19 AIXTRON disclosed multiple **Lumentum G10-AsP orders** for InP optical production. The platform supports 6-inch processing and manufacturing controls intended to improve repeatability and handling. This confirms a commercial equipment relationship; the release does not disclose reactor count, contract value or customer-acceptance dates. AIXTRON's Lumentum release.

The conversion chain is customer device demand, required good epitaxial wafers, installed reactor throughput, tool orders, delivery and acceptance. A 6-inch wafer or new reactor does not by itself establish qualified good-laser output: recipe uniformity, defect density, wafer handling, process cycle time and device qualification determine the saleable result. NVIDIA funding received by optical customers is not automatically spent on AIXTRON tools, and customer laser sales cannot be counted again as equipment sales.

Probability and model treatment: assign an 85% research probability that some of the announced tools are accepted by the end of 2027. The conditional amount is undisclosed. The active model already assumes optical MOCVD revenue of **€780 million in 2027 and EUR 1,120 million in 2028**, with 49% gross margin. We allocate the named order evidence inside that existing customer-expansion thesis (100% overlap for this review), retaining a zero additional revenue/OP increment. This is an analytical inclusion judgment rather than a quantified customer-order reconciliation. The inherited optical gross profit is €382 million/€549 million before common opex; delivery, installation, service and manufacturing costs remain in the current margins and expense schedule. No new pricing premium is inferred from the funding headline or product launch.

Bounded allocation check: to test the size of the opportunity without inventing a reactor count or selling price, use a 5-10% slice of the existing 2027 optical-revenue pool. This is an analyst-selected sensitivity range, not an estimate of Lumentum's undisclosed contract value or share. It gives €39-78 million conditional revenue, or €33-66 million at the 85% timing weight. Apply the existing 49% optical gross margin and use the existing 2027 company opex/revenue ratio of 16% only as a transparent allocation proxy. The resulting weighted OP attribution is €11-22 million before overlap. Assigning that slice entirely inside the already forecast optical ramp removes it from the incremental column. It leaves zero additional revenue, cost, OP or valuation. A true customer-level allocation may differ; delivered reactors, acceptance dates and net contract prices would replace this diagnostic.

2027 sensitivity, EUR M unless stated	Low slice	High slice
Share of existing €780 million optical pool	5%	10%
Conditional revenue attribution	39	78
Timing probability	85%	85%
Weighted revenue attribution	33	66
COGS attribution, 51%	17	34
Gross profit attribution, 49%	16	32
Opex allocation proxy, 16%	5	11
Operating profit attribution	11	22

2027 sensitivity, EUR M unless stated	Low slice	High slice
Overlap with existing optical forecast	100%	100%
Net incremental revenue and OP	0	0

This evidence supports the optical vector while leaving GaN/SiC customer cycles separate. Reactor count, order value, acceptance dates and qualified throughput are the remaining bridge gaps. The **25x OP** basis, exact economic diluted-share denominator and both Base scores 83 remain unchanged. The separate October 19 price branch is shown below. The old artifact's Base text was stale; this update does not change the actual Excel Base. Active Q4 2027 target remains **€100**; the later Q1 2028 target remains **€108**.

2. Earnings, guidance and operating assumptions

Preliminary Q3 results and retained guidance

H1 actual revenue EUR 175 million, gross profit EUR 58 million and EBIT negative EUR 8 million. Q2 orders were EUR 215 million; equipment backlog was EUR 457 million. Customer advances support production funding. Latest financial source.

FY2026 guidance remains revenue EUR 560 million plus or minus EUR 30 million, gross margin about 42% and EBIT margin 17-20%. Q3 preliminary group revenue 184, gross profit 87 and EBIT 57 replace the old forecast. The retained full-year midpoint implies Q4 model revenue 202, gross profit 91, operating expense 36 and EBIT 54. Q4 is an ASTRA residual, not new issuer quarterly guidance. Full-year gross profit 235, H2 operating expense 66 and full-year EBIT 104 are unchanged. The October 16 preliminary reconciliation retained all 2027-and-later inputs. The October 19 review adds only the separate price branch below.

Model and evidence

The EUR 275 million order intake is not added directly to sales or backlog without the issuer reconciliation. Favorable Q3 mix does not establish a permanent 31% EBIT margin, new reactor pricing or an incremental optical sales tranche. Existing optical volumes, customer qualification and financing assumptions remain. The new price branch carries its own manufacturing, depreciation and support costs.

Retained annual controls and the Q4 residual

EUR millions	H1 actual	Q3 preliminary	Q4 residual	Full year
Revenue	175	184	202	560
Gross profit	58	87	91	235
Operating profit	-8	57	54	104

Rounded columns can differ from the displayed annual total. Exact controls reconcile in the saved model. H2 opex remains about EUR 66 million, allocated about EUR 30 million to Q3 and EUR 36 million to Q4.

Five product vectors distinguish optical MOCVD, power, LED, research tools and after-sales. Q3 preliminary group totals are reported; its five-vector split is a LOW-confidence imputation. Q4 is a guidance residual with an imputed split. The allocation scales each old product revenue proportionately and shifts product margins together to reconcile group gross profit. No product split or margin is presented as reported. The H2 gross-profit bridge equals full-year revenue times 42% less H1

gross profit. Quarterly product GMs allocate that guide; they are not disclosed GMs. H2 opex of EUR 66 million yields full-year EBIT within guidance. Beyond 2026 the retained optical production ramp, slower power recovery and new price realization are LOW-confidence assumptions. The exact retained economic-share denominator assumes full initial-price conversion of the existing bond, without treating conversion as completed. Exact conversion terms remain in the model and source record.

Preliminary group amounts remain approximate until the October 29 statement. HIGH denotes the source status of disclosed amounts or guidance, not certainty about a future outcome or a reported product split. MEDIUM denotes sourced extrapolation. Forward product splits, margins, recognition schedules and long-term growth not specifically guided are LOW confidence.

3. New evidence, probability and cost bridge

P Equity Research published the supplied expert call on October 19. The anonymous speaker says downstream InP MOCVD equipment has long lead times because Aixtron capacity cannot meet demand. The report gives no tool-specific order-to-acceptance duration, customer allocation, contract premium or cost schedule. The original speaker's identity and recording are unavailable. The statement is an attributed check, with current tool pricing still unknown.

Issuer H1 material corroborates strong optical demand and a planned production ramp to meet requested delivery dates. That evidence supports physical plausibility while providing a counter to an automatic shortage-duration assumption. Scarce qualified slots can make earlier delivery valuable to laser customers; the vendor must realize that value in new commercial terms and customer acceptance.

has built a 30-ton line, with current monthly output of about 300–500 kg, and capacity is still ramping. In addition, Guizhou Jinding and Wuhan Tuocai also have small outputs. Because Japanese suppliers are tight, and a UK InP polycrystal supplier has halted production for being unable to buy electronic-grade phosphorus, some domestic high-purity phosphorus products have entered InP polycrystal supply chains for validation.

Q14. On the equipment side, are there supply bottlenecks in crystal growth furnaces and MOCVD equipment?

There is no supply bottleneck in crystal growth furnaces. VGF equipment is relatively simple in structure; the core lies in each manufacturer's process parameter tuning rather than the equipment itself. Delivery lead time for domestic furnaces is only one to two months. By comparison, the VB process demands more of equipment. The main problem facing the industry now is raw material supply cutoff, not furnace equipment. In the downstream epitaxy step, **MOCVD equipment lead times are indeed long, mainly because Aixtron's capacity cannot meet market demand.**

Q15. What is the latest progress in InP substrate cutting technology, and how is diamond wire cutting being adopted?

The industry is currently transitioning from traditional slurry wire cutting to diamond wire cutting. In the past, InP cutting was mainly dominated by slurry wire cutting equipment from two Japanese companies, Yasunaga and Takatori. Now the industry is generally introducing diamond wire cutting, but it is still at an early stage. Many new entrants usually first buy one or two slurry wire cutters to ensure normal production and product shipment, and also buy one diamond wire cutter for process tuning and development. Although slurry wire cutting is still the mainstay, the shift to diamond wire has become an industry consensus, because diamond wire is thinner and can cut more wafers from the same ingot, raising output. By 2027, diamond wire adoption is

Original expert call page13, published19October2026. Anonymous source; MOCVD scarcity check and limits retained.

Defined outcome: a limited pool of residual new or repriceable optical tools is accepted at a net price above the inherited forecast during 2027-28. **Probability 20%.** This is an upper-end starting judgment for an identifiable publisher carrying an unverified expert check. Optical order strength does not independently prove the exact premium.

The conditional pool is 20% of existing optical receipts after excluding fixed commitments, with a 3% net price increment. Both are analyst proxies; a 10-30% pool and 2-5% premium test the range. Remove 50% for overlap with the existing 49% optical gross margin and favorable mix already embedded. The named Lumentum orders remain 100% inside the old ramp. This pool is not a disclosed contract census: if fixed commitments consume it, set it to zero.

Incremental manufacturing and delivery consume 20% of the weighted premium; added depreciation consumes 5%; qualification and support opex consume 5%. Net incremental OP retains 70%. Existing unit COGS and common opex remain in the baseline, with no extra utilization or volume bonus. The allowance for added depreciation funds no assumed new factory or equity raise; material new capital would require its own cash/share bridge.

Recognition phase is zero through Q1 2027, half Q2 2027, full Q3 2027 through Q4 2028, half 2029 andzero 2030. Longer delivery delays can move acceptance to another quarter and remove the affected current-period premium. Baseline production quantities, all nonoptical businesses, 25x method and shares remain unchanged.

Parameter	Current assumption
Outcome probability	20%
Residual new/repriceable optical pool	20%; sensitivity 10-30%
Conditional net price premium	3%; sensitivity 2-5%
Overlap with inherited favorable economics	50%
Manufacturing/delivery cost of weighted premium	20%
Added depreciation	5%
Added qualification/support opex	5%
Incremental OP retention	70%
Fixed backlog and named Lumentum order increment	0

Q3 2030	0	0	0	0	0	0
Q4 2030	0	0	0	0	0	0

This pricing table uses whole EUR, not millions. The active Q4 2027 four-quarter branch contributes EUR 630,000 receipts and EUR 441,000 OP after manufacturing, delivery, depreciation and support. The target rises by less than EUR 1 per share. Exact weights and calculations remain in the model.

Eligible receipts	Conditional premium	Active OP increment, EUR	Active ceiling, EUR
10%	2%	147,000	100
10%	3%	220,500	100
10%	5%	367,500	100
20%	2%	294,000	100
20%	3%	441,000	100
20%	5%	735,000	100
30%	2%	441,000	100
30%	3%	661,500	100
30%	5%	1,102,500	100
Null eligible cohort	3%	0	100
Zero probability	3%	0	100

Sensitivity holds probability 20%, overlap 50%, cost retention 70%, the Q4 2027 window, 25x multiple and economic diluted shares constant. Null cohort or zero probability returns the exact pre-October 19 ceiling. Whole-number ceilings can match despite different exact model values.

Canonical analytical score

Category	Points	Maximum	Current evidence
Core Thesis	18	20	Qualified compound-semiconductor deposition is upstream of optical devices; process competition remains.
Cycle Stage	9	10	Optical ordering and preliminary conversion support an early ramp; GaN/SiC remain a different cycle.
TAM Expansion	9	10	Higher-speed optical production, power and future applications; only equipment wallet captured.
Catalysts	5	5	October 29 final statement, accepted tool delivery and customer capacity conversion.
Macro	9	10	AI optics investment supports demand, with export and capex cyclicality.
Alpha	3	5	Process and new-order pricing analysis adds information; scarcity is already public.
Risks	-3	0	Acceptance/qualification -1; optical normalization/power recovery -1; competition/export/dilution -1.

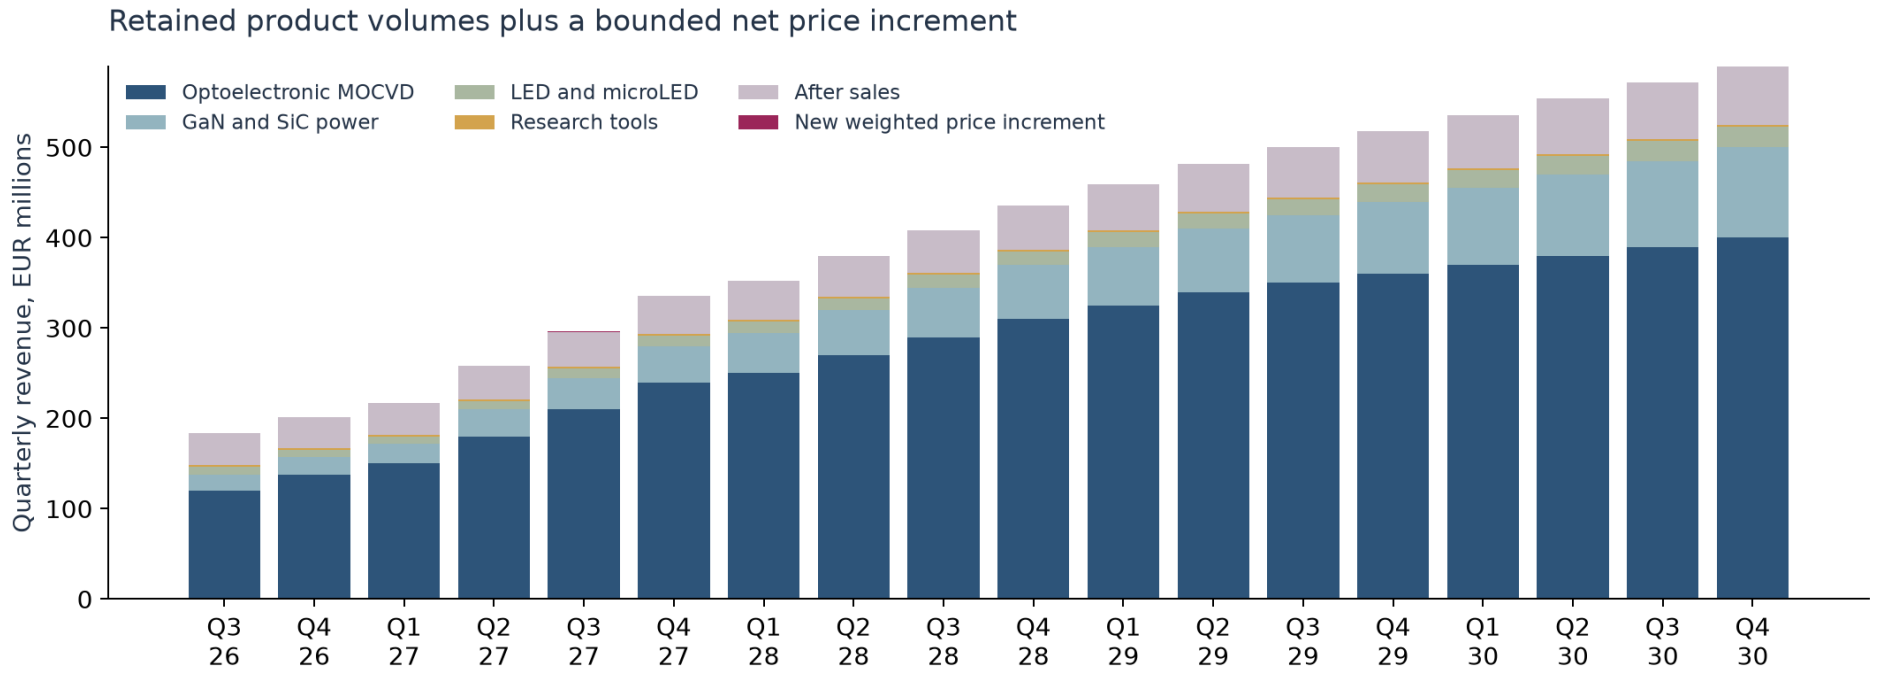

50/60=83. Excel Base 83 remains protected. Scarcity supports the current bottleneck thesis; no generic score bonus is added for the same price hypothesis.

4. Product economics and current quarterly operating model

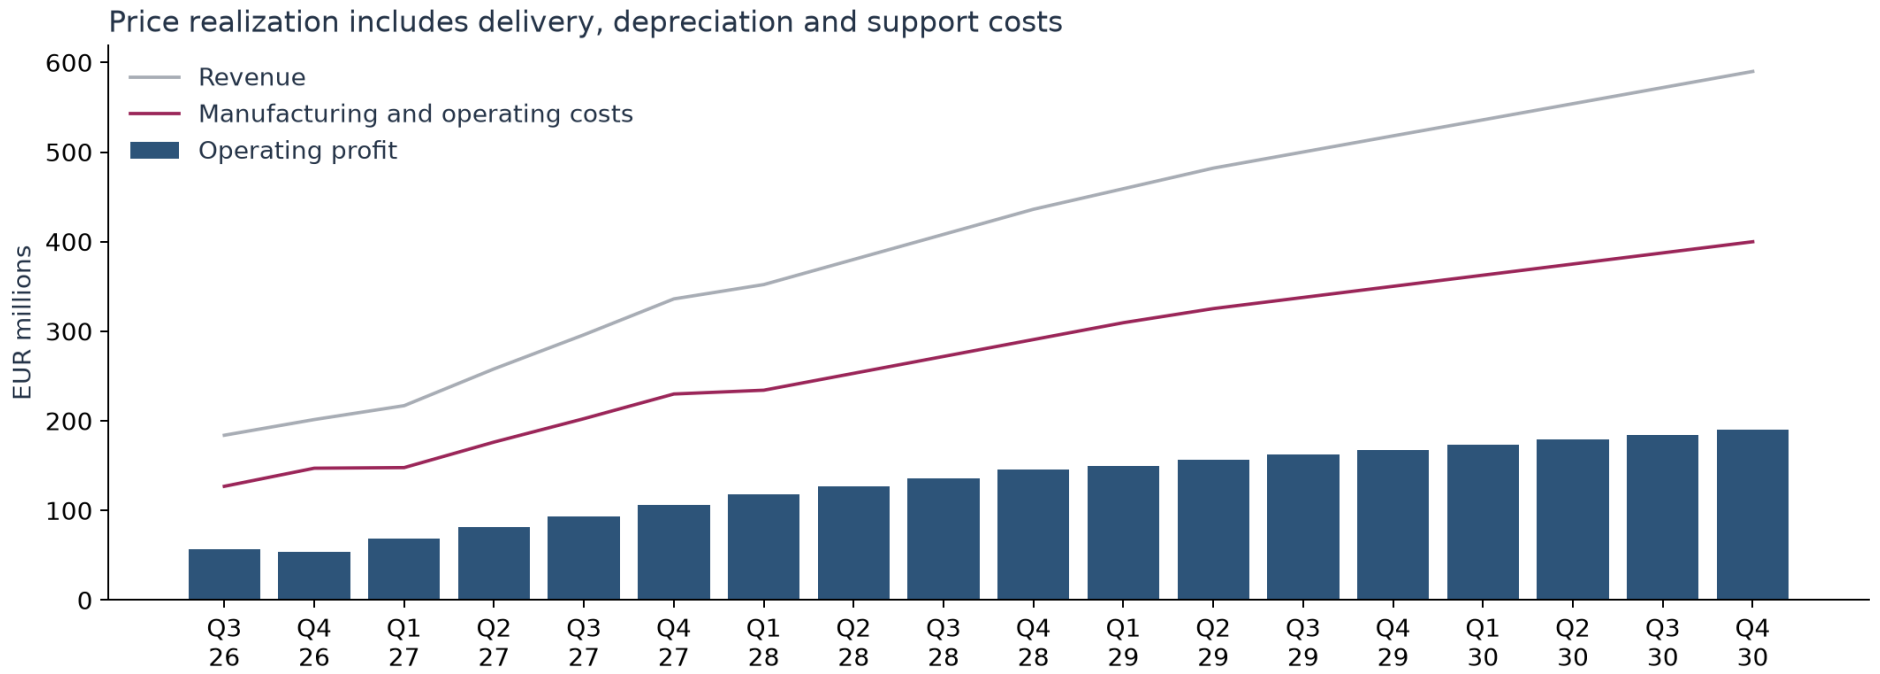

AmountsEURmillions; sharesmillions; ceilings EUR/share. Baseline product inputs are retained, followed by a separately labeled price line. Q3 group totals are preliminary and its product split is imputed; Q4 is a full-year guidance residual. Later product inputs remain LOW-confidence forecasts.

These five baseline tables exclude the separate price line. Add its 75% GPcontribution and 5% opex to reconcile the current total. The branch includes no separate revenue in power, LED, research or after-sales.

Annual trajectory cross-check

Year	Revenue	GP	Opex	OP	Included price OP
2027	1,107	528	177	351	<1
2028	1,577	747	221	527	<1
2029	1,959	911	274	636	<1
2030	2,252	1,042	315	727	0

5. Complete forward-four-quarter operating ceiling

Each ceiling uses the stated quarter plus the nextthreequarters of current OP times 25, divided by the same starting-quarter economic diluted shares. The denominator remains about 122 million; exact conversion terms and denominator are in the model. The convertible remains a scenario rather than completed conversion, with no separate bond cash credit.

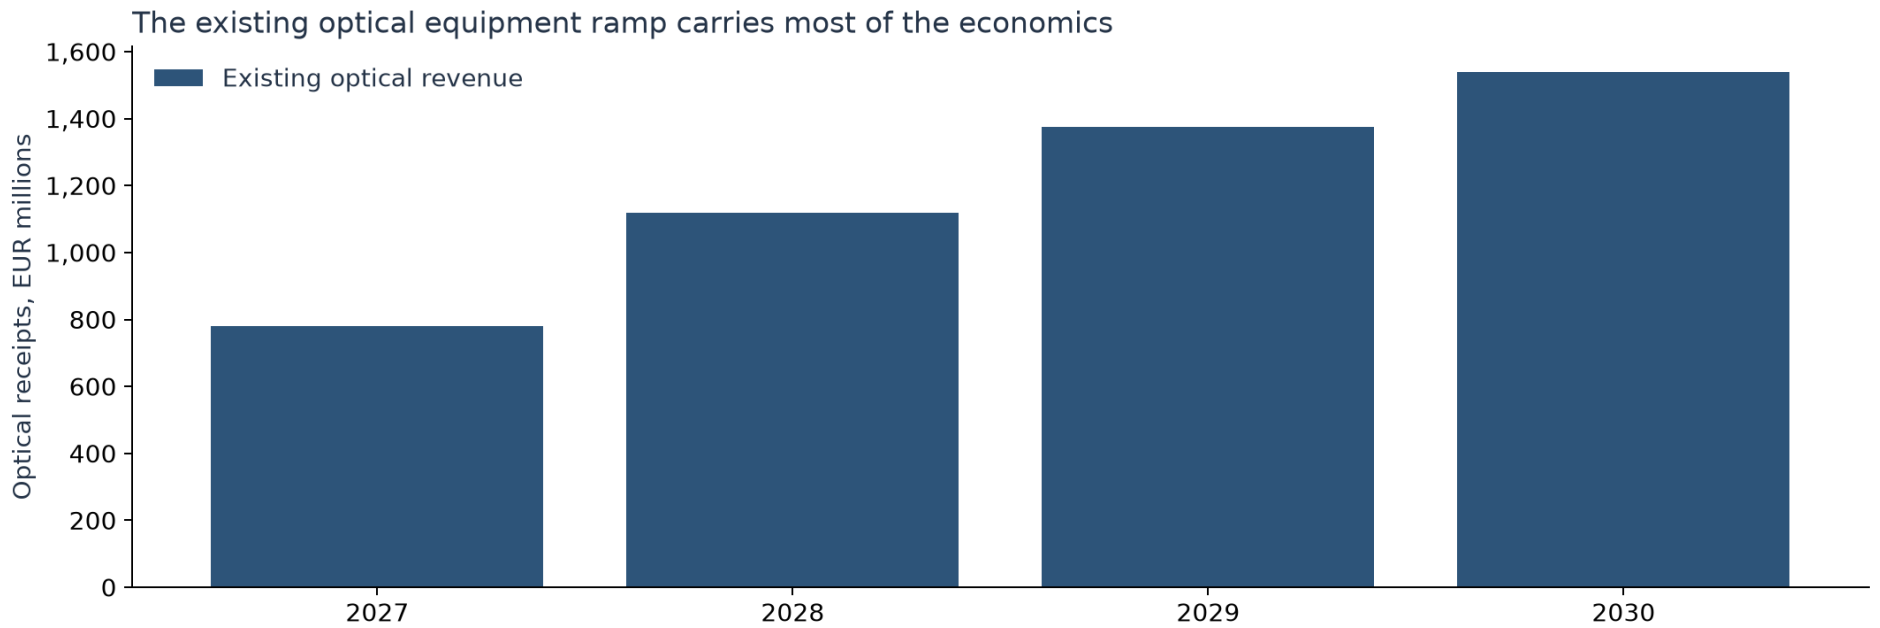

Approved current versus pre-October19 full ceiling path. EURper share; same horizon,currency and share basis.

Quarter	Window end	Prior OP	Current OP	Multiple	Shares M	Prior ceiling	Current ceiling	Change
Q3 2026	Q2 2027	262	262	25x	122	54	54	Up less than 1%

Quarter	Window end	Prior OP	Current OP	Multiple	Shares M	Prior ceiling	Current ceiling	Change
Q4 2026	Q3 2027	299	299	25x	122	61	61	Up less than 1%
Q1 2027	Q4 2027	350	351	25x	122	72	72	Up less than 1%
Q2 2027	Q1 2028	399	399	25x	122	82	82	Up less than 1%
Q3 2027	Q2 2028	444	445	25x	122	91	91	Up less than 1%
Q4 2027	Q3 2028	487	487	25x	122	100	100	Up less than 1%
Q1 2028	Q4 2028	526	527	25x	122	108	108	Up less than 1%
Q2 2028	Q1 2029	558	558	25x	122	114	114	Up less than 1%
Q3 2028	Q2 2029	588	588	25x	122	120	121	Up less than 1%
Q4 2028	Q3 2029	614	614	25x	122	126	126	Up less than 1%
Q1 2029	Q4 2029	636	636	25x	122	130	130	Up less than 1%
Q2 2029	Q1 2030	660	660	25x	122	135	135	Up less than 1%
Q3 2029	Q2 2030	682	683	25x	122	140	140	Up less than 1%
Q4 2029	Q3 2030	705	705	25x	122	144	144	Up less than 1%
Q1 2030	Q4 2030	727	727	25x	122	149	149	Unchanged

Share sensitivity, same Q4 2027 case	Ceiling, EUR
Unchanged shares	100
5% more shares	95
10% more shares	91

Existing optical receipts by year. EURmillions. The small new pricing residual is shown separately above.

6. Industry relationships and read-throughs

Industry learning and read-through

LITE and COHR capacity investment is an equipment-demand signal, not guaranteed AIXTRON revenue. Growth in 800 G / 1,600 G optics should be translated into deposition capacity and acceptance dates; tools are not interchangeable with substrates or finished lasers.

Lumentum, Coherent, Sivers and other laser/device suppliers can provide customer-capex evidence. Riber's MBE and oxide routes are distinct from AIXTRON's MOCVD opportunity. A new reactor is not equivalent to a substrate sale, a qualified laser shipment or an optical module sale.

7. Risks and falsification tests

The following ledger makes the existing aggregate risk deduction explicit. It does not introduce another deduction or change the analytical score.

Risk class	Existing deduction
Tool delivery, customer acceptance and qualification	-1
Optical-cycle normalization and power-market recovery	-1
Competition, export restrictions and convertible dilution	-1
Total	**-3**

Risks and next tests

1. Customer acceptance slips from the guided H2 delivery window.
2. Optical orders normalize before power markets recover.
3. Competition, export rules and convertible dilution constrain captured value.

On October 29 reconcile the preliminary group amounts, gross-margin rounding difference, order book, product mix, customer acceptance and full-year outlook. Change only the affected product, cost, timing or share input. Current review leaves the source gaps explicit. The price branch below has no added tool units; it reverses if the eligible contract pool or premium fails.

Numbered monitoring tests

#	Checkpoint	Evidence supporting the operating case	Counter-test / failure signal
1	H2 conversion	Reconcile backlog to accepted deliveries and the guided full-year profit bridge.	Delivery without acceptance or a timing slip invalidates the affected quarter.
2	Capacity bridge	Translate named customer investment into reactor demand and allocation.	The full photonics TAM cannot be treated as AIXTRON equipment sales.
3	Cycle separation	Track optoelectronic orders separately from GaN/SiC recovery.	Strength in one product does not prove simultaneous recovery in another.
4	Competition and capital	Monitor process wins, export conditions and conversion terms.	A competitor qualification or different economic dilution changes captured value.

8. Sources, evidence gaps and model snapshot

- Beyond 2026, product revenue and margins are LOW-confidence analyst ramps, not orders or company guidance. Customer-specific capex allocation is not disclosed; the proxy uses the company order book and recognition timing.

- 113 million legacy ordinary-share assumption plus full initial-price conversion of EUR 450 million bonds is a conservative economic denominator; conversion is not assumed completed. No cash value from the bond is added.

Both latest management prepared speeches and H1 guidance checked. Full Q&A transcripts are not reconciled.

Sources below retain the earlier research and earnings-review provenance, supplemented by the October 15 preliminary issuer announcement. LOW-confidence product allocations, future margins, capacity bridges and incomplete management-call records remain unresolved where stated. Integrating the original research does not resolve the explicitly retained evidentiary gaps.

- 2026-10-15: Preliminary Q3 order intake and operating profitability. Disclosed amounts are approximate; full statement scheduled October 29. The original issuer page is retained locally with its verified SHA256.
- 2026-07-30: H1 earnings and outlook.
- 2026-07-30: H1 management prepared remarks.
- 2026-04-30: Q1 management prepared remarks.
- 2026-04-15: Convertible terms.
- Numerical operating case: approved portfolio model; economic assumptions and evidence qualifications are stated in this artifact.

The unchanged original source document is retained separately for full research provenance. It is an archive, not an additional active valuation case. Superseded score/ceiling tables are not incorporated into this active artifact.

9. Current controls, counters and source completeness

The null eligible cohort and zero probability controls reproduce every pre-October 19 operating row and target. All eighteen quarterly rows reconcile baseline product revenue and GP plus the separate price line, explicit operating costs and the retained rolling windows. No preliminary earnings event, named tool order or customer photonics revenue is added again.

Raise the price probability only with matched new-order terms or acceptance evidence at the same SKU/process and a defensible cost bridge. Reduce or remove it if lead times normalize, competitors win the slot, contracts prove fixed, costs absorb the premium or acceptance slips. The source's lack of exact tool allocation remains a material assumption.

The October 29 statement should reconcile preliminary group amounts, margin rounding, product/order mix and acceptance. Source-date 19 October is publication date; the call date is not independently supplied. Relevant original page 13 is embedded above. Existing source documents and prior model charts remain recoverable; current charts use the approved model. Full Q&A transcripts remain unreconciled as recorded in the retained research.

Current model snapshot: active Q4 2027,25x OP, economic diluted shares unchanged, Excel 83 andanalytical 50/60=83. Current ceilingabout EUR 100, up less than 1%. The closer Q4 2026 reconciliationfromOctober 16 is historical and is not a new downgrade from this review.
