ALAB - Astera Labs | Full investment artifact

Full investment research | Model assumptions and source evidence

Full rescore - 20 October 2026

The active Q4 2027 ceiling remains USD 211.047884. The analytical Base remains 78 and protected Excel Base remains 78. The full review preserves operating inputs, valuation method, share conventions and claims. A zero financial revision follows the documented overlap and bounded cost bridge; commercial probability remains positive.

Current evidence and source identity

The three owner-supplied pages are an analyst meeting recap headed "US Semiconductors / Takeaways from 2026 SEMICON West and OCP Global Summit." Publisher, author and original report date are not visible. The text is attributed secondary evidence; independently dated issuer announcements are distinguished below.

ultimately deploys the GWs of capacity it has discussed this week. Ultimately, we sense investors are less likely to use the $30 EPS as the base case, but we see increasing evidence that scale-out can do most of the heavy lifting on interconnect, leaving more room for scale-up and the custom business to deliver upside to buy-side estimates

- **ALAB Meeting:** We are seeing ALAB increasingly focused on broadening the story beyond PCIe retimers, though we think a lot of these newer opportunities still need to be proven from both an execution and share perspective. The most tangible new piece is Orion, the compute-agnostic rack-scale reference architecture ALAB just announced at OCP, targeted primarily at neoclouds and enterprises that are looking for the flexibility to deploy whatever accelerator they can get. ALAB is not trying to sell the rack, but rather the boards/reference designs together with the Scorpio-based fabric and fabric/rack management software, which should help customers get heterogeneous systems deployed faster, with Orion targeted for 1Q27. Management talked about ~50% better performance and ~25% memory offload, and we think the broader concept is interesting as it potentially gives ALAB more content around heterogeneous AI infrastructure. Scale-up could add another leg over time, with Orion PCIe-based today but ALAB looking at NVLink Fusion and UALink and discussing a bridge chip that could effectively translate an accelerator into the scale-up fabric. This bridge chip would not be a small chip and could potentially be one per XPU, so the content opportunity could be meaningful, although ALAB clearly still needs to demonstrate it can win share here (against vendors like MRVL). We are also seeing some progress in optics - although it is further out. ALAB announced Aries 7 moving into optics including optical drivers and TIAs alongside Gen7 retimers/ redrivers/cable modules - the optical products aimed at NPO and LPO and marking the formal entry of ALAB's portfolio into the optics realm. ALAB views NPO as the stepping stone to CPO and pointed to ~3-4x better density and roughly $200 of potential content per rack with NPO, potentially moving toward ~$1,000 with CPO, although attach rates are still a moving target. CXL is broadening as well, with KV cache and HBM offload becoming interesting AI applications. Ultimately, we like the direction ALAB is moving as it broadens the portfolio across PCIe, scale-up, CXL and optics, but a lot of this is still early and we need to see better execution and sustained share gains outside of retimers before giving the company full credit for the broader content-per-rack opportunity.
- **Read to Intel - Crescent Island GPU now D-Series GPU.** After significant re-work of its data center GPU roadmap, Intel is taking a more targeted approach to re-entering the accelerator market, with Crescent Island focused specifically on inference and emphasizing memory capacity/power efficiency. At OCP, the company renamed Crescent Island the GPU D-series and disclosed 1.3 PFLOPS FP8 performance, 1.5TB/s memory bandwidth and up to 480GB LPDDR5X at 350W, with customer sampling now underway but no broad availability date disclosed. While we see this as an encouraging first step, we think is still quite early in the substantial re-work of Intel's GPU roadmap and would look for evidence of production ramp/customer adoption before assigning meaningful relevance to the franchise.

Original analyst excerpt: the ALAB meeting follows the end of the Marvell paragraph; Intel D-series discussion is a separate issuer. Literal NPO/CPO dollar amounts are not rescaled.

Orion is a compute-agnostic rack-scale reference architecture. Astera's October 12 announcement identifies partner offerings from Q1 2027, while OEM/ODM partners manufacture and sell complete racks or subsystems. Astera's board and silicon content therefore needs its own revenue boundary. The meeting's roughly 50% performance and 25% memory-offload claims lack a defined comparator, workload and denominator. They are not interchangeable with the different September Leo benchmark.

Aries 7 was announced October 8 and reviewed previously. Its PCIe 7 signal-conditioning portfolio includes optical drivers and TIAs, with select-customer sampling expected in Q4 2026 and broader availability after qualification. That capability supports the existing optical trajectory. NVLink Fusion participation is also corroborated, while a bridge per XPU, realized price, qualification share and costs remain conditional. NPO content of about USD 200 per rack and potential CPO content of USD 1,000 are the literal amounts in the screenshot; the system boundary is unresolved. No thousands multiplier or per-accelerator substitution is made.

Probability, eligible invoices and operating costs

The Orion share-expansion hypothesis receives a 35% subjective probability. Its currently specified silicon and reference-design content is assigned 100% overlap with the existing Scorpio X/P, Leo, optical and custom NVLink pools. Existing weights for additional X conversion (70%), meaningful 2027 Leo scale (50%) and on-time NPO ramp (60%) remain embedded once. The current 2027 pools already contain USD 1,610 million Scorpio X, USD 470 million Scorpio P, USD 205 million Leo, USD 90 million optical and USD 85 million custom NVLink revenue.

Additional-invoice sensitivity; no active increment	USD million
Normalized accepted sales beyond replacement and existing pools	100.000
Manufacturing cost at 30%	30.000
Conditional gross profit at 70%	70.000
Incremental GAAP opex at existing 2027 ratio	37.105263
Conditional operating profit	32.894737
Expected OP at 35% if demonstrably incremental	11.513158
Adopted new active revenue / OP	0 / 0

The sensitivity retains manufacturing expense and the existing 2027 GAAP operating-expense ratio of 1,410/3,800, including stock compensation. No separate license stream, whole-rack invoice or repeated generational upgrade is added. The absence of a net new paid-system cohort after overlap prevents an additional active amount; it does not assign zero probability to adoption.

Precise follow-up gaps

Track Orion systems accepted by customers, Astera content per system after replacement, bridge attach and ASP, optical qualification and yield, customer-warrant offsets, support investment and diluted shares. Confirm the original analyst date and literal rack-content denominator. Performance ratios alone cannot determine stock upside.

Current score arithmetic

Score category	Points
Core	16
Cycle	10
TAM	10
Catalysts	5
Macro	8
Alpha	3
Risks	-5

Canonical sum: 16 + 10 + 10 + 5 + 8 + 3 + (-5) = 47/60. Rounded analytical Base 78; protected Excel Base 78. Both remain unchanged.

Exact current operating and valuation sums

All figures are exact saved-model outputs with display rounding only. Gross profit less fully expensed operating costs equals operating profit. Forecasts remain assumptions; no display rounding changes the workbook.

All 15 quarterly ceilings are derived below.

The current switch ramp supports a materially larger revenue path. Valuation now explicitly pays for stock compensation and ongoing product investment, so revenue growth does not translate one-for-one into per-share operating profit.

1. Supercycle, supply chain and durable advantage

AI accelerators require progressively larger low-latency fabrics, memory tiers and reliable links. Astera can capture more content per deployed accelerator through switch silicon, retimers and attached memory controllers. COSMOS integration, qualification and co-design create switching costs, but Broadcom, Marvell, Credo, Montage and proprietary architectures contest different sockets. No sole-source monopoly is assumed.

Accelerator deployment → fabric topology and ports → qualified switch/retimer/memory parts → system acceptance. Electrical and optical connectivity coexist; optical engine revenue counts only separately sold components, while switch silicon remains in X/P. Custom NVLink is incremental business after subtracting any substituted standard-fabric content.

Business / curve	Stage	Evidence and next inflection
Aries	Established commercial scale	Higher PCIe generations raise qualification needs, while pricing and substitution remain constraints.
Scorpio	Rapid commercial ramp	Scale-up and scale-out are separate wallets.
Leo / optical / custom	Sampling to early adoption	Model ramps require production acceptance and no duplicated sockets.

Stage percentages are qualitative framework bands relative to a possible mature opportunity, not measured market penetration. A current capacity constraint can coexist with a larger long-term TAM; qualification and economic capture decide how much reaches this company.

2. Forward TAM and the three-phase expansion lens

Phase	Engineering opportunity	Demand-to-company bridge
2026-27: deployed infrastructure	Management frames merchant scale-up as a20B opportunity [E3]; that is not current supplier revenue.	Analyst X market proxy8B in2027 ×20.125% capture=1.610B; all-customer deployment conversion drives recognition.
2028-29: wider fabrics	Analyst scale-up market12B then16B.	X sales3.0B then4.6B imply25% then28.75% capture; these are reviewable assumptions, not booked wins.
2030+: new memory and optical layers	X endpoint20B and Taurus endpoint4B from management opportunity framing [E3].	X6.0B=30% share; Taurus0.88B=22%. Leo1.41B=analyst10M controller-equivalent units×141 net ASP; optics0.94B=10M incremental endpoints×94; custom0.54B=0.9M incremental-equivalent attachments×600. These unit/ASP proxies are not disclosed shipments.

The 100% / 50% / 20% thematic weights guide thesis assessment. They are not blanket discounts to reported sales, contracts or all forecasts. Programme probabilities below govern only separately identified optionality. Current reported sales calibrate the starting point; they do not cap the future market.

3. Current earnings and management evidence

[E1] Q2 revenue was USD392.400M, GP287.567M and GAAP OP89.248M; Q1 revenue308.361M and OP61.833M. Q3 guidance is USD540-560M sales, 72% GM and USD232-236M GAAP opex. This model uses midpoints: 550×72%-234=162M OP. The non-GAAP equivalent is238M; the76M difference is retained as operating cost, not capitalized into a higher ceiling. Tax benefits and interest income are excluded.

Both the May5 and August4 earnings calls, including Q&A, were reviewed [E2,E3]. The progression is from initial PCIe6 adoption to a switch-led ramp. Management expects Scorpio to become its largest family in Q3; multiple design engagements still require production conversion. September9 commentary moves optical NPO revenue toward H2 2027 and reports high-teens Scorpio X engagements [E4]. September15 adds sampling memory controllers, not booked production revenue [E5].

Full transcripts are available for both latest earnings calls. Product-level quarterly revenue and gross margins are not disclosed. Customer capex cannot be mapped uniquely to Astera revenue; the local calibration packet makes that limitation explicit rather than claiming a precise customer-specific share.

4. Local evidence and calibration packet

Demand calibration: Amazon net Q2 capital spending53.076B [E8] is a publicly observed proxy for one large infrastructure buyer. ALAB total Q2 sales392.4M divided by this proxy is0.739317%-an index ratio, not Amazon content share, because numerator includes other customers and denominator includes non-AI assets. To avoid misattribution, the forecast uses a normalized multi-customer deployment index: Q2=100; X revenue60M/100=0.6M per index point. Q3 X200M needs index333.33 at unchanged content; later X growth requires both new platforms and content. The proxy validates spending direction, while the product SAM capture bridge determines the modeled endpoint. Exact customer capex allocation is unavailable; this is a disclosed limitation of the flow-through calibration, not evidence of signed orders.

5. Summing thesis score

Category	Points / maximum	Evidence
Core thesis	16/20	Qualification and software strengthen capture, but competing fabrics prevent monopoly economics.
Inflection / cycle	10/10	Current guidance validates acceleration, with switch mix turning commercial.
Forward TAM	10/10	Scale-up, external memory and optical paths enlarge the addressable wallet; forecasts remain conditional.
Catalysts	5/5	2026 switch ramps and 2027 memory/optical conversions are dated.
Macro / policy	8/10	AI investment supportive; export controls and concentrated spending constrain breadth.
Alpha / evidence	3/5	New product evidence is strong, but exact product economics remain undisclosed.
Risk deductions	-5	Five distinct risk classes below.

Sum: 47/60 × 100 = 78.333333%, conventionally rounded to 78%. This advisory thesis score does not replace any portfolio Base override. The separate risk classes below total the displayed deduction; holding status and classification do not waive that deduction.

6. Revenue sources, capture and product margins

Seven non-overlapping revenue vectors are shown. Q2 estimated mix is X60/P65/Aries215/Taurus42.4/Leo10=392.4M, a 0% total-revenue calibration error. This is an analyst decomposition, not disclosed product revenue. Q2 estimated GM of72%/75%/80.0265116%/40%/66% reproduces287.567M GP; subtract198.319M reported opex to reproduce89.248M OP. Q3 mix is constrained to550M and396M GP. Future factors encode explicit product capture; the underlying capacity/content assumptions are stated below. No forecast product split is presented as a reported fact.

Vector	Actual calibration / source	Forward demand and capture	Margin derivation / constraint
Scorpio X	Q2 estimated60M within reported total	Annual2027/28/29/30 sales1.61/3.0/4.6/6.0B versus8/12/16/20B modeled served market; quarterly factors are deployment cadence.	GM72.15%→70%; mix and warrants remain embedded.
Scorpio P	Q2 estimated65M	2027=0.470B;2030=1.410B, equivalent to analyst7.05M attach units×200. Separate scale-out wallet.	GM74%→70%; no extra software license stream.
Aries	Q2 estimated215M	2027=1.055B;2030=1.740B, analyst58M link-equivalent units×30. Mature content growth below X.	GM78%→75%; analyst silicon mix allocation.
Taurus	Q2 estimated42.4M	2027=0.285B;2030=0.880B. Copper remains relevant within racks.	GM40%→45%; module cost prevents software-like margins.
Leo	Q2 estimated10M	2027=0.205B;2030=1.410B including custom memory once. Sampling announcements have no separately added backlog.	GM66%→70% on yield and mix; future assumption.
Optical	10M scaling unit; historical anchor is zero	2027=90M;2030=940M. Early connector revenue then NPO; no sale of full rack counted.	GM50%→58%; new manufacturing costs included.
Custom NVLink	5M scaling unit; historical anchor is zero	2027=85M;2030=540M. Only incremental net content; same-rack replacement is excluded.	GM65%→70%; engineering expense remains in opex.

Confidence: reported historical totals are HIGH. Source-based forward extrapolations are MEDIUM only where the cited source sizes the relevant period; other product allocations, future capture and margin assumptions are LOW. A source for the historical anchor does not make an unsourced future factor management guidance. The detailed factors below are the single modeled base case, with uncertain assumptions exposed for review.

7. Operating-cost bridge and quarterly operating model

Q3 opex234M is the GAAP midpoint [E1]. Q4 analyst258M and subsequent displayed ratios include R&D, sales, administration and recurring SBC. As revenue scales, ratio declines toward30%, but absolute expense grows. This is an assumption requiring annual hiring/award-cost reconciliation; no non-GAAP margin is labeled GAAP. Product GM already reflects warrant contra-revenue, which is not deducted again.

Profit basis: GAAP-style operating profit, retaining recurring stock compensation and customer-warrant contra-revenue; excludes tax, interest and valuation gains. Amounts below are USD millions.

Quarter	Status	Revenue	GP / contribution	Opex %	Opex	OP margin	Operating profit	Main driver	Confidence
Q3 2026	Model	550.000	396.000	42.545%	234.000	29.455%	162.000	Guided switch ramp and GAAP cost midpoint	LOW model

OP = sum of product GP/contribution - explicit operating costs. OP margin = OP ÷ revenue. Displayed numbers are rounded for reading; the workbook calculates from unrounded inputs. Guidance assigned to a future quarter retains Model status because guidance is not an actual result.

8. Multiple, shares and recognition convention

Retain the company-specific20× operating-profit multiple from the original artifact. It prices qualified high-growth connectivity, with competition limiting monopoly treatment. This is a framework assumption, not a market P/E or a management-sanctioned valuation.

Q3 guidance185M diluted shares [E1] anchors the denominator. Add1.5M per quarter to210.5M by Q4 2030 as an explicit future award/warrant provision. June outstanding plus potential awards cannot simply be added to an already diluted EPS denominator. The2026 Amazon warrant maximum3.262299M [E7] is therefore not added twice; exercise/vesting and treasury-stock effects require future reconciliation.

The valuation denominator is the ceiling quarter’s diluted-share proxy. It is not a historical EPS weighted-average assumption disguised as a fully known future capitalization. Unit factor: 1; this converts the model units to USD per share. No cash balance, enterprise-value adjustment or after-tax earnings substitution is added to the operating-profit ceiling.

9. Complete rolling four-quarter ceiling derivation

Ceiling quarter	Exact earnings window	Forward 4Q OP	Multiple	Diluted shares M	Ceiling USD	Key inflection
Q3 2026	Q3 2026 → Q2 2027	876.694412	20×	185.000000	94.777774	Guided switch ramp and GAAP cost midpoint

- **Q2 2029:** (839.611765 + 915.141176 + 992.464706 + 1,050.613235) × 20 × 1 ÷ 201.500000 = **376.955919 USD/share**. Window: Q2 2029-Q1 2030.
- **Q3 2029:** (915.141176 + 992.464706 + 1,050.613235 + 1,161.179412) × 20 × 1 ÷ 203.000000 = **405.852072 USD/share**. Window: Q3 2029-Q2 2030.
- **Q4 2029:** (992.464706 + 1,050.613235 + 1,161.179412 + 1,281.475000) × 20 × 1 ÷ 204.500000 = **438.702431 USD/share**. Window: Q4 2029-Q3 2030.
- **Q1 2030:** (1,050.613235 + 1,161.179412 + 1,281.475000 + 1,389.250000) × 20 × 1 ÷ 206.000000 = **474.030840 USD/share**. Window: Q1 2030-Q4 2030.

10. Annual trajectory cross-check

Calendar year	Revenue	GP / contribution	Opex	OP	OP margin
2027	3,800.000	2,671.365	1,410.000	1,261.365	33.194%
2028	6,645.000	4,586.206	2,270.900	2,315.306	34.843%
2029	9,680.000	6,630.374	3,117.300	3,513.074	36.292%
2030	12,920.000	8,802.068	3,919.550	4,882.518	37.790%

These are calendar-year sums of the quarterly path, not extra revenue and not the live valuation method. For non-December fiscal reporters, fiscal guidance and these calendar totals must be aligned using the period mapping above; a four-quarter run rate is not automatically the same fiscal year. Outer-year outputs are conditional TAM/capture trajectories, not verified management sales targets.

The annual product totals must be checked against the SAM/units above, not against an assumed perpetual sequential growth rate. Expansion to the2030 endpoint requires multiple high-volume programmes; a broad engagement list alone cannot establish that outcome.

11. Dilution sensitivity - same operating case

Denominator sensitivity	Q3 2027 shares M	Q3 2027 ceiling USD	Effect on ceiling
-5% shares	181.450000	193.625500	+5.26%
+0% shares	191.000000	183.944225	+0.00%
+5% shares	200.550000	175.184977	-4.76%
+10% shares	210.100000	167.222023	-9.09%

This isolates denominator uncertainty; it is not a second bull/bear operating case or permission to remove known dilution. The base case remains the explicit share path in the rolling table.

12. Programme and probability ledger

Programme / signal	Source and probability	Amount / unit base	Treatment in this model	Escalation / recognition
Lead Scorpio deployments	Reported commercial ramp;100% evidence of current programme, future volume uncertain	Current guided total550M	Contained in X/P, not a new backlog addition	Reconcile actual sales and design breadth each quarter
Additional X engagements	Management reports engagement; analyst70% conversion probability	No disclosed contract size	No value per design win is fabricated; capture assumption remains explicit	Raise capture only on qualified volume evidence
Leo new family	Sampling confirmed; analyst50% meaningful2027 scale probability	No disclosed purchase commitment	Memory vector is already probability-weighted analyst revenue; no extra multiplication	Qualification, delivery and customer payment
NPO optical	Management targets H2 2027; analyst60% on-time meaningful ramp	2027 modeled90M optics including connectors	Already included; no duplicative TAM revenue	Verified production timing and yields
Amazon warrant purchases	Executed agreement; not unconditional sales	Up to6.5B vesting purchase threshold	No6.5B backlog addition	Revenue when earned; contra-revenue and dilution retained

Probabilities are analyst judgments under the framework signal hierarchy. Embedded revenue is not multiplied or added a second time. Where no defensible amount or unit base exists, the opportunity remains explicitly unquantified; confidence alone cannot create a revenue number. New evidence can enlarge the TAM, improve capture or move recognition earlier, but each requires an identifiable model input.

13. Scored risk classes

Risk class	Scored deduction	Mechanism and consequence
Customer / programme concentration	-1	A few end programmes can dominate demand despite multiple manufacturing customers.
Architecture / competition	-1	Native interconnect, competing switches or delayed UALink can displace sockets.
Execution / supply	-1	Qualification, packaging and foundry commitments can delay shipments.
Economic dilution	-1	Recurring stock awards and customer warrants reduce per-share capture.
Policy / geographic chain	-1	Export restrictions and Asian manufacturing dependence can impair delivery.

14. Dated catalysts, counters and escalation

1. **Q3 2026 report - Expected November2026, date unconfirmed** Test550M modeled revenue,72% GM and234M GAAP cost against results.
2. **Late2026 customer conversion - By2026 year-end** Qualified new platforms support capture; evaluation extensions would delay it.
3. **2027 memory / optical - Quarterly through2027** Volume revenue and qualification determine whether early-model ramps are achieved.
4. **Quarterly dilution / concentration - Every filing** Reconcile awards, warrants and customer concentration before raising per-share ceilings.

15. Cross-book monitoring

Compare architecture evidence across AVGO, MRVL, CRDO, NVDA, AMD and ARM; compare optical adoption with optical-component holdings. A larger total fabric wallet does not imply every supplier wins the same socket. No peer artifact or Base is changed by this update.

16. Source register and model limits

E1 - Astera Q2 results and Q3 guidance (2026-08-04). Reported starting point and GAAP/non-GAAP reconciliation.

E2 - Q1 management call and Q&A (2026-05-05). Management remarks hosted in a complete transcript; analyst questions are not guidance.

E3 - Q2 management call and Q&A (2026-08-04; transcript 2026-08-11). Switch timing, signal conditioning and new-business sequence.

E4 - Citi conference management discussion (2026-09-09). Later customer-engagement, margin and optical-timing clarification; it does not provide a new quarterly sales guide.

E5 - Leo memory-controller expansion (2026-09-15). New X/E/P devices support accelerator-attached memory, expansion and pooling. Sampling must precede revenue qualification.

E6 - Q2 Form10-Q (2026-08-05). Direct customers represented29%,25%,15%,13% of sales; some are manufacturing intermediaries. Q2 warrant contra-revenue10.2M and SBC63.992M.

E7 - Amazon warrant agreement8-K (2026-02-10). Up to3.262299M new warrant shares at142.82; vesting purchases up to6.5B are a condition, not a guaranteed backlog.

E8 - Amazon Q2 results (2026-07-30). Q2 PP&E54.208B less1.132B incentives implies53.076B net cash capital investment. Used as a demand-spending proxy, not an Astera customer-revenue disclosure.

Long-range product sales, shares and margins are analyst assumptions with LOW forecast confidence. Customer identities are not inferred from anonymous direct-customer percentages. Shipment destination is not end-use exposure. Unknown new design wins are not purchase commitments. Future share growth is a dilution provision, not an issuer share-count forecast.

Workbook: v3_2_master_portfolio.xlsx, model tab ALAB_Q_Model; active horizon Q4 2027. The original September scenario and historical Q3 2027 sensitivity are retained as dated history. Current original-named artifacts remain in the production Artifacts folder, with recoverable prior copies.
