Q4 2027 model ceiling: KRW 574,602.23

Analytical Base 40/60 = 67 | Watch; growth and recovery with capital-allocation conditions

20x parent-attributable forward-four-quarter fully expensed operating profit, less end-window net financial/lease claims and plus discounted non-operating investments, divided by participating shares. Quarter plus next three; common and preferred participate equally in modeled earnings.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in KRW million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: KRW 569,000.00 per share (2026-10-08 15:30 Asia/Seoul regular close; Oct9 local holiday); 77.254 million common shares (June30,2026ex-treasury; no laterissuanceidentified); estimated equity capitalization KRW 43,957,605.1 million. 1.439496m participating preferred not includedincommonmarketcap; includedineconomicdenominator This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: 100% growth under the owner's sequential-percentage heuristic (0% re-rating / 100% growth). Uses the dated 2026-10-08 15:30 Asia/Seoul regular close; Oct9 local holiday price, Q4 2026 ceiling and Q4 2027 ceiling at the artifact's own valuation basis. This compares two percentage moves with different denominators; it is not an additive return attribution or a measurement of actual P/E expansion. The classification changes with price and forecasts.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	2,345,017.6	20x	78.694	574,602.23

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Fully expensed consolidated Energy and Electronic Materials operations, including ordinary R&D, D&A and SBC. Production credits are separate negative costs; the nonrecurring tariff refund is excluded. Minority OP is deducted once using effective subsidiary ownership and bounded earnings allocations. Retained investments receive a separate haircut; no associate profit or book minority equity is capitalized. Common and participating preferred shares share the modeled earnings denominator.. 20x parent-attributable forward-four-quarter fully expensed operating profit, less end-window net financial/lease claims and plus discounted non-operating investments, divided by participating shares. Quarter plus next three; common and preferred participate equally in modeled earnings.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use KRW million unless a different unit is stated.

Thesis

Research snapshot: 11 October 2026. KRX 006400 common shares, KRW. Last verified regular-session close was KRW 569,000 on 8 October at 15:30 KST; 9 October was a Korean market holiday. Covered candidate, with no holding established. The adopted analytical Base is 67/100, a watch classification. Initial coverage authorized by the owner.

Decision

Samsung SDI offers direct exposure to high-output lithium-ion cells used in rack battery backup units and data-center UPS systems. It is not a pure BBU business. EV batteries, utility-scale ESS, professional-tool cells and electronic materials remain material, while cash commitments and minority ownership influence what reaches the common shareholder.

The adopted 20 x parent-attributable, fully-expensed forward-four-quarter operating-profit model produces a Q4 2027 ceiling ofKRW574,602.2345. The relevant window is Q4 2027 throughQ32028. The first displayed Q4 2026 ceiling isKRW253,056.8007. Using the owner's sequential Upside Driver method at the snapshot price, this is 100% Growth: the first target is below the share price and the forward target is above it. This label is a model heuristic, not a claim that actual P/E expansion contributes nothing. The forward target represents about 1.01 x the snapshot price, or roughly 1% upside. The displayed quarterly path and exact calculations belong in the accompanying model tables; no bank target is used.

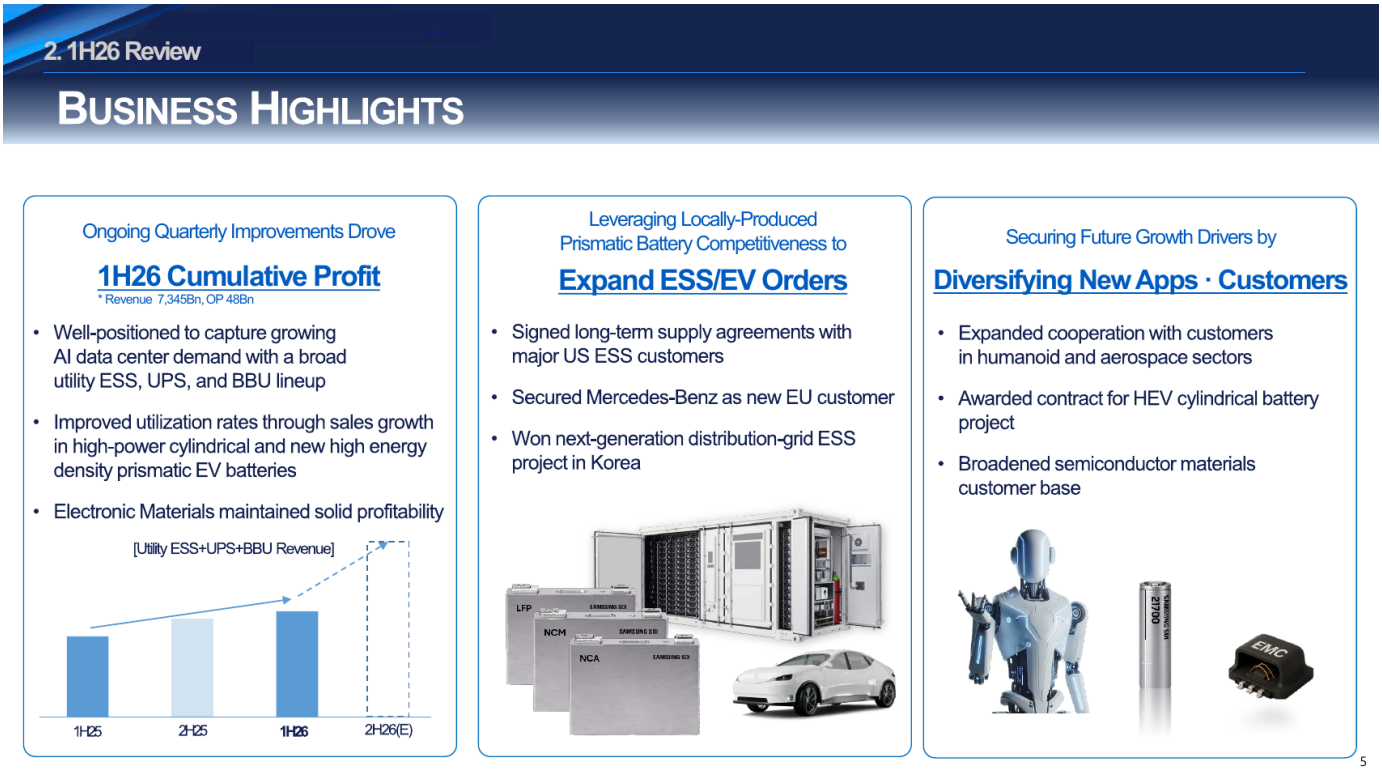

What the company sells

SDI's rack BBU exposure is primarily the cell, rather than the entire shelf of batteries, controllers, enclosure and power electronics. It also sells high-output cells for UPS installations, utility ESS batteries and complete ESS systems, EV batteries, cylindrical tool batteries, and semiconductor/display materials. Its owned component can capture attractive economics even when the final system vendor is someone else.

Three denominators must remain separate. The Goldman September 24 report estimates a roughly$50 bn 2030 BBU system opportunity. Management described an approximately$800 m 2026 BBU **cell** market in its April call. Management's July 40-50% share description relates to each of the UPS and BBU battery markets, not half of the entire future BBU system market. Neither system market share nor the cell fraction of a module's bill of materials establishes SDI's share of the complete system price.

The economic bottleneck is safe, qualified high-pulse cells that can discharge power reliably in a small rack footprint. AI workloads can change electrical demand rapidly. An energy-capacity number alone does not establish

that a cell handles the required pulse, temperature, cycle life or safety envelope. Tabless construction and manufacturing quality can be valuable when they improve those characteristics. Customer qualification, validation history and high-output manufacturing capacity provide the moat; publicity around AI does not replace those tests.

Samsung SDI official July 30, 2026 earnings presentation, slide 5 | Issuer H1 business highlights: utilityESS,UPS andBBU are distinct applications

Two management calls and the earnings bridge

The April 28 call framed 2026 BBU cell demand at approximately$800 m, more than 70% growth, and expected SDI to outgrow the market. It also described growth in professional tools and a tabless mix shift. US ESS demand and data-center ESS were discussed inGWh; those figures must not be relabeled as rack BBU revenue. The company anticipated roughly 70% Hungary utilization in the second half as vehicle launches and line conversions progressed.

By July 30, management said both UPS and BBU sales were growing more than 70% year over year and described 40-50% share in the respective battery markets. High-power capacity was fully utilized and expansion was planned. This is stronger evidence than a broad market forecast, although it does not prove that every SDI battery plant is full or that every adopted future line is qualified.

The reportedQ2 recovery needs adjustment. Revenue wasKRW3,768.808 bn, gross profit 937.298 bn, reported operating profit 203.775 bn and AMPC107.667 bn. R&D of 423.787 bn was included in total selling and administrative costs of 841.190 bn. Management explained that excluding the tariff refund, operating profit was only slightly positive. The model therefore does not annualizeQ2's reported profit or repeat the refund. Korean filings also showH1 cash from operations of 109.386 bn versus 1,125.910 bn of cash PP&E purchases and 18.160 bn of intangible purchases. Reported profitability was not yet evidence of abundant free cash flow.

The model fully expenses R&D, SBC and ordinary depreciation. D&A is added back only in the funding calculation. Production credits are shown separately as a negative operating cost, rather than hidden inside reported customer revenue. Annual gross pre-phase-down credit assumptions areKRW700 bn/1,250 bn/1,650

bn/1,900 bn/1,950 bn forCY2026-30. A separate 20% customer-sharing reserve applies to the portion allocated to StarPlus; no such contract term is claimed as reported. These are analytical capacity and eligible-production assumptions. The 2030 value is multiplied by 75%, consistent with the IRS instructions. Domestic production, eligible sales, foreign-entity restrictions, supply-chain tests and contractual allocation remain necessary; an announced non-FEOC supply chain does not prove all future credits.

Samsung SDI official April 28, 2026 earnings presentation, slide 6 | April management outlook before the July improvement

Qualification and capacity

Management targeted October 2026 US prismatic LFP cell production and year-end SBB2.0 deliveries. Secured ESS business covered a substantial portion of capacity through 2029. Comments that prospective additional awards could exceed capacity from 2028 were conditional, not a statement of wholly non-cancellable backlog. The model distinguishes orders, qualified lines, production, shipments and cash receipts.

The August 11 company release confirms acquisition of GM's 49.99% interest in the Indiana venture, producing a wholly owned plant. The transaction supports an ESS-first use while retaining future joint next-generation EV development. An empty building or converted line is not yet good-unit output. Actual purchase consideration was not disclosed in the evidence reviewed; the model'sKRW280 bn cash proxy is an assumption, bounded at 0-600 bn, not the price paid.

Solid-state battery comments targeted possible early humanoid commercialization inH22027. They do not establish mass EV shipments, product price, yield, margin or funded expansion. A small analytical revenue trial is contained inside the other-small-battery growth reserve; no separate solid-state value is added.

Samsung SDI official July 30, 2026 earnings presentation, slide 6 | Issuer H2 production and product roadmap

Product model and Rule 16 b

The reference model separately forecasts EV batteries, utility/commercial ESS excluding UPS/BBU, UPS cells, BBU cells, other small batteries/tools, and electronic materials. The issuer does not publish this complete six-way financial split. These are explicit analytical allocations inside the reported Energy and Materials segments. Reference annual BBU cell revenue isKRW500 bn/650 bn/800 bn/1,000 bn/1,200 bn acrossCY2026-30. Other reference growth already incorporates US ESS, LFP lines and utilization recovery. Those announcements receive no second revenue addition.

The incremental BBU case has a 60% probability. Conditional cell-market revenue isUSD0.8 bn/1.4 bn/2.4 bn/4.0 bn/6.0 bn acrossCY2026-30; only the 2026 anchor comes from management. A45% SDI share andKRW1,400/USD conversion produce conditional SDI revenue. The full reference BBU revenue is removed first, then 10% of the remaining excess is reserved for additional overlap and execution slippage. Calendar-quarter recognition uses 22%/24%/26%/28%. The probability is applied once.

Residual sales carry 34% gross profit less 13% incremental R&D, qualification, selling and support expense, giving 21% incremental operating profit. Ordinary D&A is included in cost of goods sold. The funding calculation additionally requires 25% of incremental revenue in capex and 20% in working capital;6% incremental depreciation is a cash addback. This translates the cell opportunity into costs and shareholder claims rather than importing the system TAM.

The 60% weight reflects established share, actual rapid sales growth and constrained qualified high-power capacity. It is below certainty because future rack architecture, non-NCM chemistries, hyperscaler procurement, competitors' capacity and SDI's manufacturing yields can alter the outcome. Sensitivities should cover 40-75% probability,35-50% share, a 2030 cell market of$4-7 bn and 15-25% incremental operating margin. These sensitivities require a full funding rebuild.

There is no separate lead-time pricing addition. A bounded case of a 5% premium on half of eligible new BBU volume would increase corresponding BBU revenue by 2.5% before incremental costs. However, the reference 32-36% BBU gross margins and incremental 34% margin already price in premium high-output/tabless mix. An additional like-for-like premium cannot currently be separated from that mix. The zero increment is an overlap decision, not refusal to act before official confirmation.

Balance sheet, claims and shares

The June 30 balance sheet hadKRW1.5055 tn cash and 12.1109 tn gross borrowings. Lease liabilities were 172.075 bn, separately classified in payables. Both debt and lease financing matter; H1 lease principal payments are included in the funding cash path. A1.5 tn minimum operating cash reserve is retained rather than automatically credited to shareholder value.

The August 21 DART disclosure specified sale of 13,088,235 Samsung Display shares atKRW340,000 each, a grossKRW4.4499999 tn, with settlement scheduled forAugust 27. The remaining 26,768,419 shares represented 10.22%. The model matches the sale proceeds and retained share count, reserves 250 bn for transaction/tax uncertainty and does not add the sold stake again. It does not capitalize Samsung Display associate income within operating profit. Final closing receipts and tax remain next-filing checks.

The retained stake is valued from that same transaction price and then discounted 25% for illiquidity, tax and realization risk. Other June investments receive a 50% haircut. Total adopted nonoperating asset credit isKRW8.0055 tn. These are valuation assumptions, not quoted prices or guaranteed proceeds. The shareholder cannot spend those assets without an actual realization event.

Consolidated operations include minority-owned ventures. The Korean June filing reports effective ownership of 51% in StarPlus,91.7% in SDIA,78% in TSDI,65% in SAPB,80% in SDITB and 50.1% in Novaled. These effective percentages already incorporate holding-company layers. GM becomes wholly owned after the August transaction. SDIHK and investment-fund income are not charged again on top of the operating subsidiaries. Standalone subsidiary net income is not treated as operating profit, and its revenue is not added to consolidated sales a second time.

The model allocates part of the existing product forecasts to these businesses and deducts the minority owners' normalized operating profit once, before applying 20 x. It makes no book-value NCI deduction. The source'sH1 subsidiary sales anchor that allocation; an 85% external-revenue reserve adjusts the smaller subsidiaries for unquantified consolidation eliminations. Their forward pre-credit operating margins are 5% for SDIA,6% for TSDI,5% for SAPB,7% for SDITB and 30% for Novaled. These are analyst assumptions, not separately reported margins. StarPlus allocated annual customer revenue rises from anH1 annualizedKRW1.77 tn to 3.0 tn/4.5 tn/6.0 tn/7.0 tn inCY2027-30, inside the existing EV/ESS vector. Its pre-credit operating margin is 7%/9%/10%/10% over those years. Gross group production-credit allocation to StarPlus is 75%/65%/55%/50%;20% of that allocation is reserved for customer sharing. The remaining credit belongs 51% to SDI and 49% to Stellantis. This treatment exposes both the ramp assumptions and who receives the profit.

For Q4 2027 throughQ32028, consolidated operating profit after the customer-credit-sharing reserve isKRW2.9918 tn. The modeled minority deduction isKRW646.7 bn, leavingKRW2.3450 tn attributable operating profit for capitalization. The same subsidiary bridge sends all modeled after-tax minority earnings out as cash distributions in each funding path; this deliberately avoids treating unpaid minority profit as parent cash. Existing consolidated debt is retained without guessing a minority debt credit. That convention is conservative for the parent and should be revisited when subsidiary net debt, contractual recourse and distributable cash can be matched.

At fixed consolidated forecasts, changing the allocation of pre-credit margins by 3 percentage points gives Q4 2027 targets ofKRW551,234-597,971; assigning 25% less/more of the group's relevant volume to StarPlus givesKRW563,053-586,152. These are attribution sensitivities, not a claim that a weak factory has no effect on total group sales: the fixed group total assumes another group site provides the offset. Customer credit retention is a genuine group earnings and cash sensitivity. With 50% retained rather than 80%, the target isKRW531,331; with 100% retained it isKRW603,421. Every case rebuilds taxes, minority distributions, debt and cash. The central target therefore offers little cushion to the snapshot price despite the attractive cell opportunity.

The denominator includes 77.254139 m common shares after treasury stock plus 1.439496 m participating preferred shares, totaling 78.693635 m. The preferred shares have an extraKRW50 annual dividend entitlement, small relative to the modeled economics. No 2025-27 cash dividend is planned; the model assumes no forecast dividends or buybacks. The 2025 rights issue is already in the June share count and is not added again. The common market-cap snapshot excludes preferred shares while the economic valuation denominator includes them.

Funding, counter-evidence and decision triggers

Two persistent cash paths test the reference case and conditional BBU expansion. They include interest, cash tax, capex, working-capital movement, lease payments, minority distributions, the display transaction and GM acquisition proxy. The displayed weighted debt and cash are derived from those paths. Existing debt rollover and an additional 4 tnborrowing limit are funding conditions, not proof of a committed new facility. The adopted paths retain the 1.5 tncash floor without exceeding that limit and assume no fresh equity. Any revised ramp, claim or capex input requires recalculation before adoption.

Counter-evidence is substantial. US EV demand remains weak, European recovery depends on specific launches, and a high-power cell constraint can coexist with idle capacity elsewhere. LFP or other chemistries can win where energy, price and safety tradeoffs favor them. Direct sourcing by hyperscalers can compress the supplier margin even while volume grows. Panasonic's integration can reduce merchant cell capture. ESS expansion may consume cash before it improves parent cash generation. Credits, tariffs and currency can obscure the underlying customer margin.

The analytical score is 40/60, rounded to 67/100: Core 15/20, Cycle 7/10, TAM8/10, Catalysts 4/5, Macro 7/10, Alpha 3/5, Risk-4. The qualified-cell moat and visible growth earn credit; unresolved capacity economics, group funding, subsidiary profit allocation and EV cyclicality prevent a high-conviction designation.

The next evidence priorities are Q3 results and cash settlement, LFP acceptance and SBB2.0 deliveries, dedicated BBU line capacity/yield, explicit cell revenue and margin, GM consideration, parent versus minority cash flows, and the next credit eligibility disclosures. The finding is a credible growth opportunity with a complicated capital structure, not a claim that all system growth accrues to SDI common shareholders.

Source audit

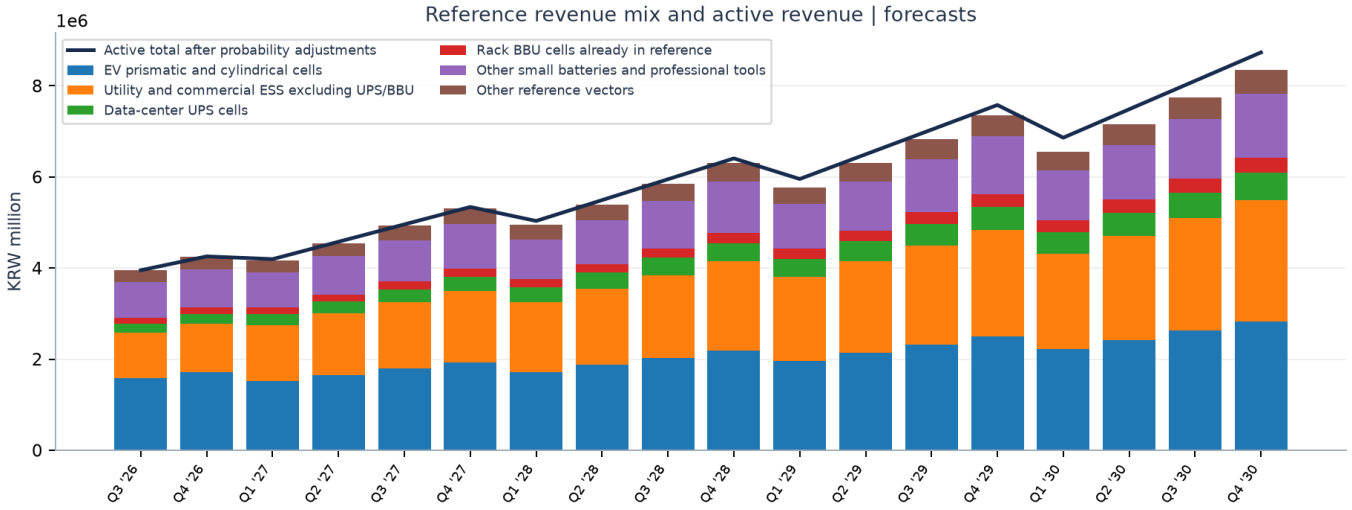

Primary sources: Korean June 30 interim filing datedAugust 14; official April 28 andJuly 30 earnings presentations and releases; issuer September 29 BBU product announcement; issuer August 11 GM announcement; August 21 DART share-disposal disclosure; official listing and regular-session price pages; IRS Form 7207 instructions. The two management calls were read through accessible full transcript reproductions and checked against issuer materials. Official audio was linked but not listened to. The GoldmanSeptember 24 BBU report is retained as attributed industry research and was previously reviewed with its charts; its targets and system denominator are not adopted. Original PDFs and HTML, hashes, extracted text and inspected slide images are retained in source/. This review does not assert every page of the 267-page Korean interim filing was substantively relevant or visually inspected.

The probability controls vary operating value while holding the adopted funding paths fixed. The cash bridge includes lease principal; replacement leases are assumed to maintain the separately stated lease balance. Both persistent financing paths retain positive common value throughout all displayed four-quarter windows, so weighting before or after valuation gives the same active result. Rebuild funding before adopting changed operating assumptions.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	15	Qualified high-pulse cells, safety and manufacturing track record; EV losses and competition dilute moat.
Cycle	7	BBU and UPS growth with high utilization, but ESS ramp and US EV reset still need funding.
TAM	8	Cell denominator anchored to management $800m2026 market; systems and cells kept separate.
Catalysts	4	October LFP/SBB deliveries, cylindrical expansion, next earnings split and GM plant schedule.
Macro	7	AI electrical resilience and non-China procurement support; policy and FX remain variable.
Alpha	3	Primary cell market, transaction-funded expansion and margin normalization distinguish the case.
Risk classes	-4	Four deductions for funding/claim uncertainty, chemistry/competition, qualification and EV cyclicality.
Total	40/60	Rounded Base 67. Both artifact and new workbook row use this score; this is not a manual override.

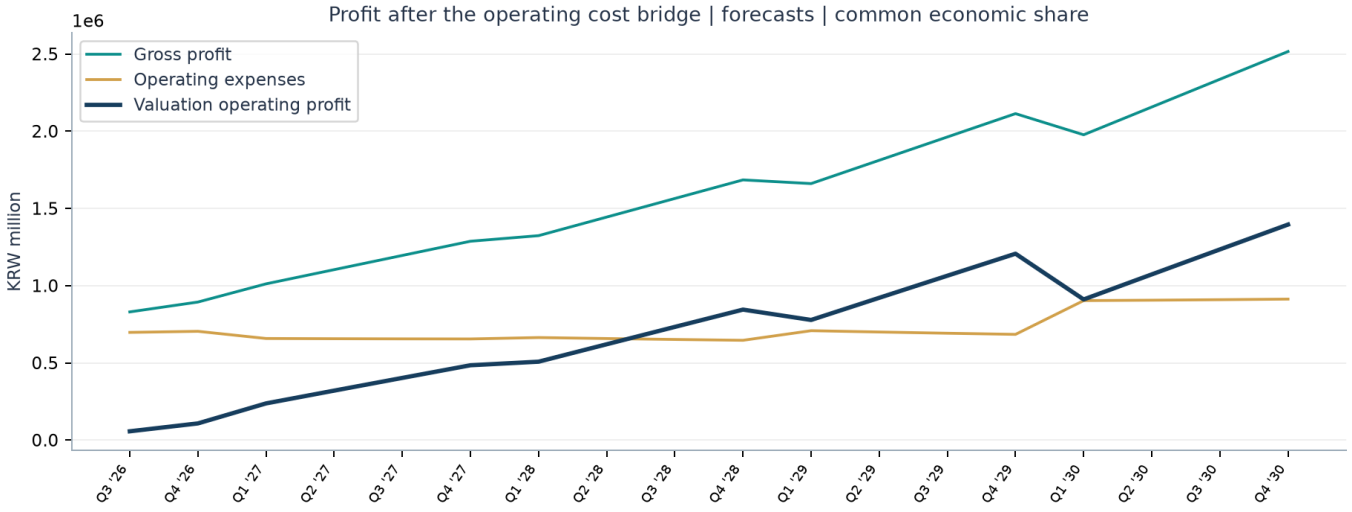

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	3,952,000.0	561.6	3,952,561.6

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Reference BBU cell revenue, KRW millions	Status

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	EV prismatic and cylindrical cells	1,586,000.0	14.0%	222,040.0
Q3 2026	Utility and commercial ESS excluding UPS/BBU	988,000.0	24.5%	242,060.0
Q3 2026	Data-center UPS cells	208,000.0	32.0%	66,560.0
Q3 2026	Rack BBU cells already in reference	130,000.0	32.0%	41,600.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Subsidiary ownership and common operating profit

The preceding weighted OP is after branch-specific minority earnings. Reference and conditional subsidiary profit are allocated within consolidated sales and costs, never added as a second revenue source. Ownership is reported; future subsidiary margins, volume and credit sharing are labeled assumptions.

Active horizon minority earnings allocation

Q4 2027 through Q3 2028; KRW million. These are the forecast earnings assigned to outside owners, using effective ownership once.

Subsidiary	Parent ownership	Allocated minority OP
STARPLUS	51.0%	577,298.4
SDIA	91.7%	1,110.4
TSDI	78.0%	13,683.2
SAPB	65.0%	15,307.1
SDITB	80.0%	23,847.9
NOVALED	50.1%	15,491.2

Adopted funding and financial claims

This saved funding scenario includes cash taxes, interest, capital investment, working capital, distributions and any separately specified closure cash. New borrowing is a modeled requirement, not confirmed lending. Probability controls hold this schedule fixed; an adopted operating revision must rebuild funding. Financial claims equal debt plus separately stated lease liabilities, less cash above the KRW1.5tn operating reserve, less discounted retained investments. Investment below is net of display-sale proceeds and the GM acquisition proxy. The lease liability is held constant assuming replacement leases offset principal repayments. No extra minority book claim is deducted. Funding schedules are fixed for valuation sensitivities and must be rebuilt for a substantive operating change.

Quarter	Operating cash	Investment	New borrowing	Debt repaid	End debt	End cash

Common operating claim

Minority operating earnings are allocated within existing consolidated group profit and deducted once before valuation. These normalized allocations are model proxies. The lease column includes only claims outside gross debt, avoiding a second deduction for leases already in debt.

Quarter	Consolidated OP	Minority OP	Common OP	Extra lease claim	Net financial claim
Q3 2026	132,657.9	75,888.5	56,769.4	172,075.1	553,296.6

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

SDI-BBU-QUALIFIED

p: 0.6

Conditional: BBU cell marketUSDm800/1400/2400/4000/6000 inCY2026-30;45%SDI share;KRW1400/USD. 2026is management market estimate; future values and share continuity are analyst assumptions.

overlap: Subtract complete reference BBU sales500/650/800/1000/1200bn KRW before further10%reserve. No separate addition for power tools, UPS or systemTAM.

cost bridge: Residual sales34%GP minus13%R&D/selling/qualification=21%OP; D&A included; capex25%,workingcapital20%; probability60%once.

probability reason: Management reports>70%salesgrowth,40-50%share and full high-powercapacity; dedicatedcapacity,yields,and chemistry still constrain2030delivery.

bounded sensitivity: p40-75%,cellshare35-50%,2030cellmarketUSD4-7bn,residualOP15-25%.

counter: LFP/sodium substitutes, Panasonic integration, no guaranteed rack architecture, qualification and yield ramp.

SDI-ESS-CAPACITY

p: 0.7

Conditional: Reference utilityESS sales3.8tnCY26 to9.5tnCY30 with risingAMPC and allocatedbasecosts.

overlap: 1

increment: 0

zero reason: Reference explicitly contains US LFP/ESS ramp and capacity expansion. Adding orders/GM factory or broad gridTAM again repeats the modeled economics.

cost bridge: UtilityESSGM24.5-30% before recurring AMPC, groupR&D/SG&A grow2.2%q, annualcapex2.8/4.0/4.2/3.5/3.3tn excludes incrementalBBU.

SDI-PRICING

p: 0.35

Conditional: A5%premium on half new/repriceable qualifiedBBU volume would addup to2.5%BBUsales; conditional contributionmargin70%, lessqualification/warranty.

overlap: 1

increment: 0

zero reason: Reference BBU32-36%GM and incremental34%GM already include premium high-power/tabless mix. Isolating an additionallike-for-like5%price rise cannot be justified apart from thatmix; retain explicitpremium sensitivity, no duplicateincrement.

counter: Cell costcurve, chemistry substitution and hyperscaler direct procurement constrain price.

SDI-SOLIDSTATE

p: 0.3

Conditional: H22027earlyhumanoid commercialization possible; no quantifiedmarket/revenues disclosed.

overlap: 1

increment: 0

zero reason: TrialKRW50bnCY28and150bnCY30 totalmarketproduction sales fit within other-smallbattery growth reserve; customerqualification andcommercial pricing unverified. No new stand-alonevalue beyondreference.

Remaining bounded uncertainties

- Display sale scheduledAug27, exact final closing and taxes awaitnextfiling; netcash4.2tn and retainedshares are matchedproforma.

- GMbuyoutconsideration undisclosed;280bnKRWproxy vs0-600bn sensitivity; never call reported purchaseprice.

- Minority OP is allocated by effective subsidiary ownership and normalized product margins, including StarPlus share of AMPC and an explicit20%customer-sharing reserve. Subsidiary OP, external revenue fractions and credit allocation are not separately reported; attribution sensitivities hold group forecasts fixed, while credit-sharing sensitivities change group OP/cash. No book NCI capital claim remains. Gross group debt is retained without a speculative minority debt credit; this conservatively burdens parent valuation.

- BBU product revenues, unitASP, dedicatedcapacity/yields and standaloneGM notdisclosed; source$800mcellmarket and40-50%share provide boundedproxy.

- Financing projection assumes existingdebtrolls and up to4tnadditionalborrowing capacity as analyticalfundingcondition, notcommittednewfacility. No automaticnewshares.

- AMPC production proxy before phase-down700/1250/1650/1900/1950bnKRWCY26-30;2030multipliedby75%underIRSForm7207instructions. Eligibility, prohibitedforeignentity tests, customercontractallocation andcreditmonetization remainconditions. No recurringtariffrefund.

- Nonoperatingassets haircut,subsidiaryoperatingattribution and fundingconditions mean this is a preliminaryconglomeratevaluation, notcleanpure-playBBU.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
