Global Unichip

3443.TW | TWSE | 2026-10-11

Q4 2027 model ceiling: TWD 2,657.03

Analytical Base 41/60 = 68 | Growth business, but no positive modeled upside at the current quote; Upside Driver unavailable

20x fully expensed forward-four-quarter operating profit less net financial claims, using end-window diluted shares. Ordinary leases are normalized to full cash rent in operating costs and are not deducted a second time. Financial claims use the dated June balance, excluding TWD5bn of operational cash. Future accumulated cash is not added. Deposits, license payments and capex are tested in separate funding schedules; the advance-loss stress can breach the desired reserve without exhausting cash.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: TWD 8,360.00 per share (2026-10-08 13:30 Asia/Taipei regular close; October 9 exchange holiday); 134.012 million common shares (2026-06-30); estimated equity capitalization TWD 1,120,339.6 million. Exact 134,011,911 common shares from issuer financial overview; last available exchange close is October 8. Taiwan local ordinary shares, no ADR conversion or artificial split. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: no positive modeled upside at the dated 2026-10-08 13:30 Asia/Taipei regular close; October 9 exchange holiday price of TWD 8,360.00, so the Upside Driver split is unavailable.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	17,598.6	20x	134.488	2,657.03

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated GUC revenue only, including foundry and packaging costs in turnkey COGS. No customer system revenue, partner sales or TSMC earnings are added.. 20x fully expensed forward-four-quarter operating profit less net financial claims, using end-window diluted shares. Ordinary leases are normalized to full cash rent in operating costs and are not deducted a second time. Financial claims use the dated June balance, excluding TWD5bn of operational cash. Future accumulated cash is not added. Deposits, license payments and capex are tested in separate funding schedules; the advance-loss stress can breach the desired reserve without exhausting cash.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use TWD m unless a different unit is stated.

Thesis

Global Unichip is participating in a real production ramp. September sales reached TWD7.15bn, and the July-September monthly total was TWD18.75bn. Those are reported sales, not a forecast of an AI opportunity. The investment question is how much of that invoice GUC retains after paying for wafers, packaging, engineers and the working capital that supports delivery.

The model values fully expensed operating profit at 20x and produces a Q4 2027 ceiling of TWD2,657 per ordinary share. The last exchange close was TWD8,360 on October 8, 2026. The result therefore does not support positive forward upside at the current quotation. GUC can be an excellent growth business and still require substantially stronger economics than this model can support. The analytical Base is 68, separate from valuation and independent of whether the owner holds the stock.

All financial amounts below are TWD millions unless explicitly marked otherwise. Calendar quarters and local ordinary shares are used throughout. This is the adopted research model; coverage does not establish a holding.

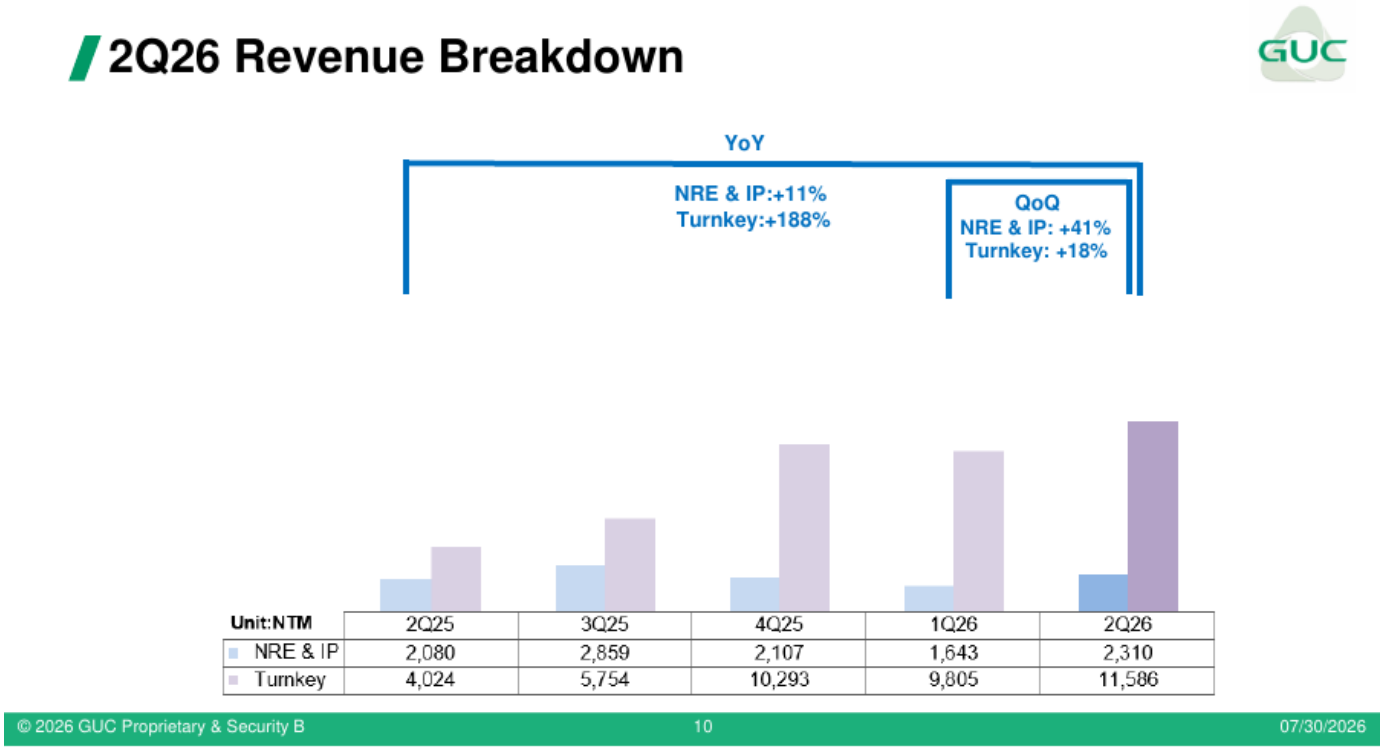

NRE is the design ticket; turnkey is the production stream

GUC helps customers turn a chip architecture into silicon. It supplies design implementation, verification, interface IP, package integration and production services. Its attraction rises when a chip needs advanced manufacturing nodes, HBM connections, chiplets and complicated packaging to work together. Replacing the implementation partner after a design is mature can require substantial engineering and requalification.

The business has two different revenue streams. Non-recurring engineering and IP earn money during design, milestones and implementation. Turnkey production follows when a customer orders manufactured chips through GUC. The latter includes material foundry and packaging costs. A larger or more advanced chip can therefore increase GUC's reported sales much faster than its retained profit.

Q2 NRE was 2,310.470 and turnkey sales were 11,586.087. Turnkey represented 83% of the total. Compared with the prior year, NRE grew 11% while turnkey grew 188%. GUC's revenue acceleration is principally an expansion in the production stream, not a sudden conversion of the whole business into a high-margin IP license model.

The relationship with TSMC provides process access and implementation capability, but it does not transfer TSMC's economics to GUC. The financial notes identify substantial purchases from TSMC entities. Those purchases remain in cost of goods sold. No foundry earnings, hyperscaler rack sales or partner revenue is added to the model.

Global Unichip | GUC July 30, 2026 deck, page 10: Q2 turnkey grew 188% year over year while NRE grew 11%. Production content dominates the revenue acceleration.

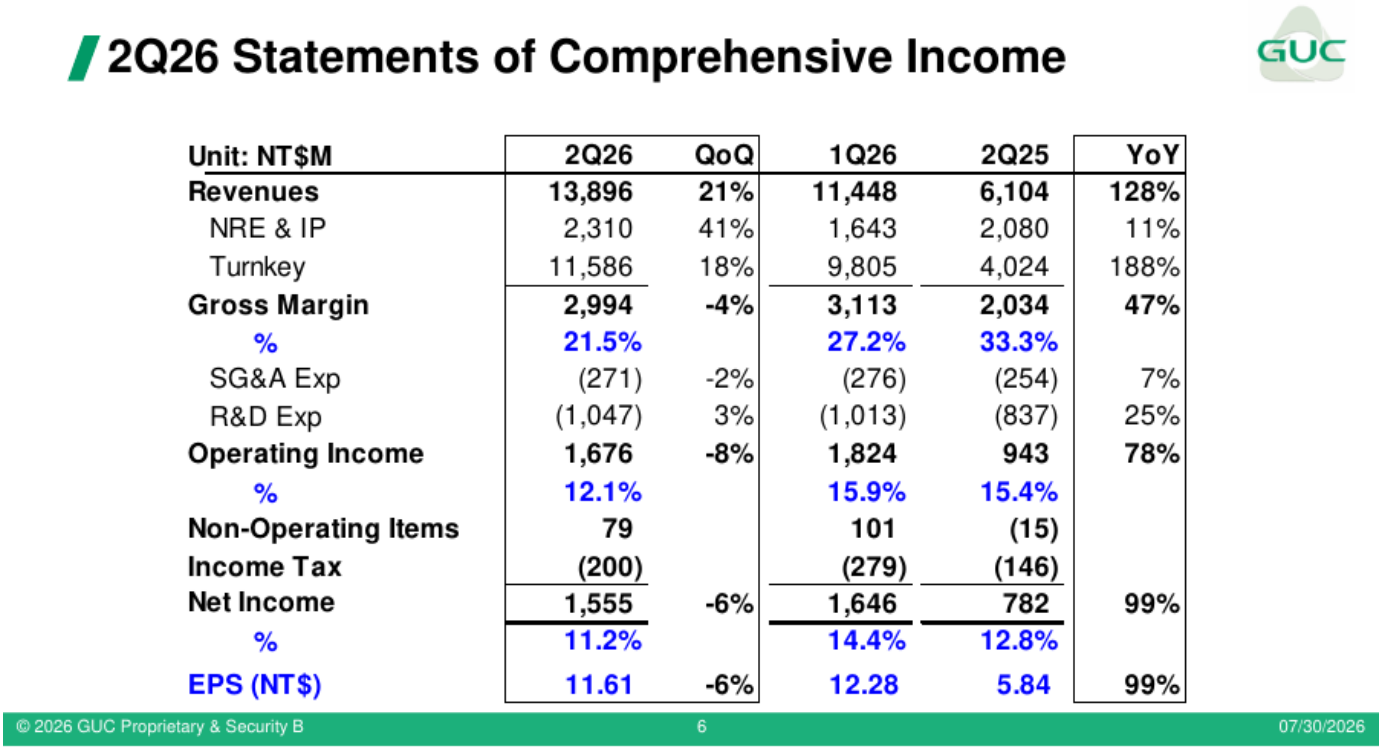

A bigger invoice can produce a smaller profit

Q1 revenue was 11,447.812, gross profit 3,113.307 and operating profit 1,824.178. Q2 revenue increased to 13,896.557, but gross profit fell to 2,994.017 and operating profit declined to 1,676.346. The respective gross margins were 27.2% and 21.5%. The July management report explicitly attributes lower NRE and turnkey gross margins to product mix.

This is the central counter-evidence to a simple revenue-times-margin extrapolation. More advanced-node sales did not automatically improve the blended margin in the latest reported quarter. NRE recognition, chip mix, wafer cost, customer commercial terms and engineering effort all matter.

The source deck's financial table is internally consistent with the statutory filing. The short management release contains several evident copy errors, including describing the quarter as ending on its July publication date. The model uses the statutory June 30 period, not those typographical labels. A third-party article that described the current Q2 gross margin as 33.3% appears to have picked up the prior-year comparator; that value is not used.

The first half produced revenue of 25,344.369 and operating profit of 3,500.524. Operating expenses included research and development of 2,059.611 and selling/administrative costs of 547.189. Employee compensation, director remuneration and software amortization remain expenses. There is no adjusted-profit shortcut that removes the people and tools needed to deliver the design wins.

Global Unichip | GUC July 30 deck, page 6: Q2 revenue increased 21% sequentially, while operating profit fell 8% as gross margin declined to 21.5%.

Where the growth is coming from

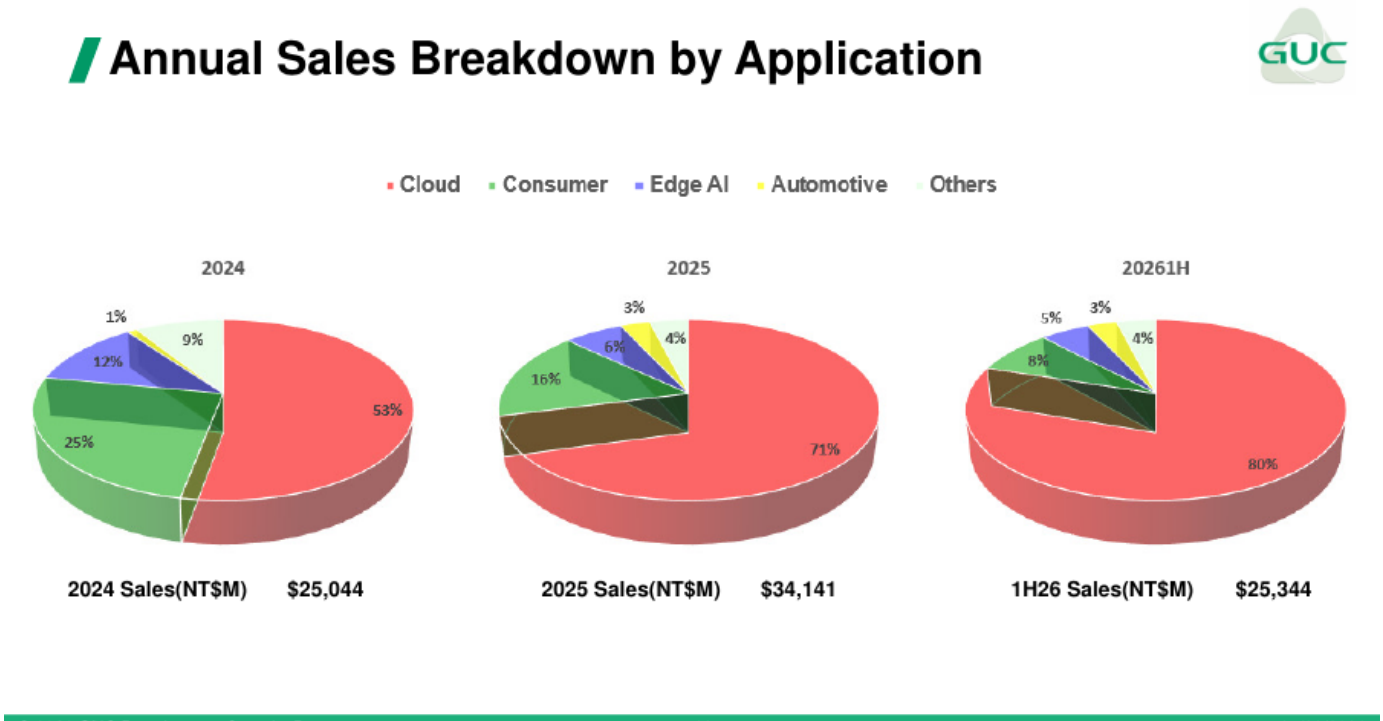

Cloud applications supplied 20,207.541 of first-half revenue, approximately 80% of the total. In Q2 alone they supplied 10,955.574, or 79%. Management describes CPU, AI accelerator and baseboard-management-controller projects within this category. An application label is not a customer identity.

GUC reported Q2 turnkey revenue of 6,858.737 from the 3nm category, about 59% of turnkey sales. NRE was more concentrated in 5nm that quarter, at 1,058.460. This supports a pipeline of overlapping generations rather than a model in which every design immediately becomes 2nm volume.

The September 22 release adds a credible forward breadcrumb. GUC says its HBM4E PHY and controller are design-ready, adopted in customer AI ASIC designs and taped out using TSMC N2P and CoWoS-L. The announced 16Gbps capability is a design and sign-off statement. It is not evidence that every customer has completed production qualification or achieved the modeled yield. GUC's earlier 12Gbps HBM4 platform provides a stronger starting point than an entirely untested design, but it does not eliminate the next qualification step.

A May collaboration with Wiwynn combines GUC's chip implementation with rack integration, cooling and optical interconnect work. This may shorten system development and help win projects. The revenue belonging to Wiwynn remains Wiwynn's. Similarly, the VSORA Jotunn8 collaboration demonstrates a real named AI implementation relationship, but the source does not disclose a large contracted production value. The model does not assign an invented order count to that announcement.

No primary source reviewed confirms a Tesla AI6 design award, share of wallet, production quantity, exclusivity or margin. The unnamed-customer opportunity is assessed through a bounded portfolio of possible design conversions. A second Tesla-specific revenue line would duplicate that opportunity while pretending to know details that have not been established.

Global Unichip | GUC July 30 deck, page 18: cloud applications were 80% of H1 revenue. This application category does not identify individual customers.

What is already actual, and what still has to happen

July, August and September sales were 5,769.170, 5,840.094 and 7,145.236. Their sum is 18,754.500. That total is treated as reported Q3 revenue. The NRE/turnkey split, Q3 margins and Q3 operating profit remain forecasts until the scheduled October 29 financial release.

The Q3 allocation assumes NRE of 2,500 and turnkey sales of 16,254.500. Its 58% NRE and 15% turnkey gross margins are explicit analytical estimates, not management disclosures. Research spending of 1,120, selling/administrative costs of 300 and a small cash-rent normalization reserve remain expensed. Q4 assumes 22,000 revenue, split 3,000 NRE and 19,000 turnkey.

The resulting 2026 reconciliation is exact: actual first-half revenue of 25,344.369 plus actual Q3 total sales of 18,754.500 plus Q4 modeled sales of 22,000 equals 66,098.869. Actual first-half operating profit plus the two modeled second-half profit figures equals 9,090.699. It is not a fully reported annual result.

For 2027-30, reference NRE is 12,000, 15,000, 18,000 and 21,000. Reference turnkey sales are 83,000, 115,000, 142,000 and 164,000. This already assumes substantial existing-program growth and advanced-node conversion.

Reference NRE gross margin gradually moves from 60% to 62%; turnkey gross margin moves from 15.5% to 17%. Those are favorable but bounded mix and execution assumptions, not an extrapolation of IP margins across a foundry invoice.

Reference research and development rises from 5,400 in 2027 to 8,800 in 2030; selling/administrative expense rises from 1,500 to 2,500. There is operating leverage, but engineering capacity and employee rewards do not become free as sales rise. A one-percentage-point change in 2028 turnkey gross margin changes annual reference gross profit by 1,150 before any probability branches. That sensitivity is more important than a minor quarterly revenue beat.

Incremental evidence enters once

The new-design branch assigns 60% probability to an additional program set. Its first-year gross proxy is two programs worth 500 each in NRE and 6,000 each in turnkey sales. Neither the number of programs nor those values is disclosed. The ranges are deliberately broad: first-year gross NRE of 500-1,500 and turnkey of 6,000-18,000, with probability of 40-75%.

Because the reference already contains strong advanced-node and HBM growth, only 40% of the proposed NRE and 30% of the turnkey opportunity survive the overlap adjustment. NRE contributes 60% gross profit less 25% incremental engineering expense. Turnkey contributes its modeled product gross margin less 2.5% incremental operating support. Revenue and profit are weighted once, together.

Optical I/O receives a separate 35% probability only on a small residual outside that design-conversion case. Gross GUC revenue of 300, 1,500, 4,000 and 7,000 is reduced by 75% for existing model growth, design overlap and partner invoice ownership. The retained amount carries 28% gross margin and 10% incremental operating costs. It represents GUC's design and production services, not a full optical engine or rack bill of materials.

A 30% pricing branch tests a 3% premium on 25% of eligible NRE, then removes 50% for mix and overlap. The eligible base includes reference NRE plus weighted new NRE. Fixed-price orders and pass-through wafers are excluded. Incremental delivery and operating costs leave 65% of the price increase as operating profit. Scarce engineering and customer time-to-market can justify considering this case before a formal price announcement, but they do not prove the premium will be collected.

The downside branch assigns 30% probability to 15% of reference turnkey sales being delayed beyond the relevant year, together with 250 of annual additional qualification expense. It combines correlated customer timing, packaging yield and acceptance risks into one branch. The probability-weighted active 2027 sales of 93,705.020 are consequently slightly below the 95,000 reference, while active 2028 sales are 129,413.665. This is not a uniformly bullish scenario stack.

Capacity comes with cash obligations

The most concrete capacity evidence is in the financial notes. A long-term advanced-packaging agreement runs from July 2026 through December 2035 and requires US$37.5m of security deposits. GUC had paid US$12.5m by June 30. Refunds depend on annual contractual utilization. If a threshold is missed, the relevant deposit is not refunded.

The source does not disclose an annual wafer allocation, a specific customer's take-or-pay commitment or the refund threshold. A third-party claim about 60,000 CoWoS wafers cannot be treated as verified saleable capacity. The agreement is useful evidence of access and commitment, but it also creates utilization risk and a need to fund the remaining US$25m.

The liquidity model reserves 800 for that remaining amount, using an explicit TWD32/US$1 assumption rather than presenting an unsupported current exchange quote. A 31-35 FX range changes this commitment to 775-875. Existing paid deposits are not deducted a second time and are not credited as freely available cash. Potential forfeiture is monitored separately; a full additional earnings charge is not stacked on top of an already conservative cash restriction without identifying the actual loss.

June cash was 10,034.146, with another 337.520 in unrestricted time deposits. Pledged deposits of 53.219 are excluded. Contract liabilities were much larger, at 13,214.722. First-half cash from operations of 5,223.546 included a 5,875.835 increase in contract liabilities. Customer advances helped finance inventory and purchases; they are not a recurring windfall that can be capitalized as operating profit.

Core operating working capital was 3,084.740: receivables plus inventory and purchase prepayments, less trade payables and contract liabilities. The funding test scales that requirement to 30% of quarterly revenue, retains cash taxes, research costs, capital expenditure and software payments, and tests a further loss of 25% of current advance funding. It also pays the remaining deposit, license payables and identified construction balance before subsequent cash generation. This is a conservative timing assumption, not the actual disclosed payment calendar.

All 16 binary branch combinations remain cash-positive in that test. The weakest cash point is about 8,080 before the advance-funding shock and 4,777 afterward. The latter falls slightly below the desired 5,000 operating buffer. Dividends are an adjustable assumption, and the next filing must confirm advances and inventory conversion before treating that buffer as excess distributable cash. No financing equity is inserted solely to preserve an arbitrary cash buffer while material cash remains available.

30. PLEDGED OR MORTGAGED ASSETS

As of June 30, 2026, December 31, 2025 and June 30, 2025, the pledged time deposits provided as collateral by GUC were as follows:

	June 30, 2026	December 31, 2025	June 30, 2025
Customs clearance	$ 40,000	$ 20,000	$ 20,000
Natural gas purchase	11,019	-	-
Land lease in Hsinchu Science Park	2,200	2,200	2,200
	$ 53,219	$ 22,200	$ 22,200

31. SIGNIFICANT CONTINGENT LIABILITIES AND UNRECOGNIZED COMMITMENTS

Under the agreement, GUC shall pay at least US$1,500 thousand to the counterparty in the period from June 2022.

Under the agreements, GUC shall pay at least US$2,100 thousand to the counterparty in the period from December 2026 to December 2029.

GUC has entered into a long-term advanced packaging capacity agreement with the counterparty. The contract service period is from July 2026 to December 2035. GUC should pay US$37,500 thousand in installments as security deposits to ensure the advanced packaging capacity supply in accordance with the contract, and GUC has paid US$12,500 thousand as of June 30, 2026. The amount of the security deposits refund will be calculated based on the annual production capacity utilization rate with the contract. However, if the certain level of production capacity utilization rate will not be achieved, the security deposits will not be refunded.

GUC has entered into a construction contract and purchase order with a certain company for the data center in Zhunan, with a total payable amount of $263,000 thousand, and GUC has paid $184,100 thousand as of June 30, 2026.

32. EXCHANGE RATE INFORMATION OF FOREIGN-CURRENCY FINANCIAL ASSETS AND LIABILITIES

The following information was aggregated by the foreign currencies other than functional currencies of the consolidated entities. The significant foreign-currency financial assets and liabilities were as follows:

(Unit: Foreign Currency in Thousands)

	Foreign Currency	Exchange Rate (Note)	Carrying Amount
June 30, 2026			
Monetary item - financial assets			
USD	$ 349,852	31.85	$ 11,144,465
Monetary item - financial liabilities			
USD	229,704	31.85	7,315,904
JPY	280,869	0.1963	55,135
RMB	4,112	4.6900	19,287
VND	4,156,388	0.00120	4,988

(Continued)

- 36 -

Global Unichip | June 30 financial statements, page 36: the packaging agreement runs July 2026-December 2035; US$37.5m security deposits are utilization-dependent and US$12.5m had already been paid.

Share and claim discipline

The issuer reports 134,011,911 ordinary shares at June 30. Valuation adds 251,000 potential compensation shares using the first-half diluted-EPS disclosure, then 25,000 estimated future shares per quarter. Employee compensation remains expensed. The share estimate is conservative because bonuses may ultimately be paid in cash; no future repurchase is assumed.

There is no disclosed bank debt in the June balance sheet. The net-claims calculation credits cash and unrestricted time deposits only after a 5,000 operating reserve, and includes 4.321 of net pension liability. License payables and ordinary operating obligations are handled in the cash funding model rather than being indiscriminately labeled financing debt.

IFRS lease liabilities total 271.581. The operating model includes normalized cash rent, with a small additional reserve beyond depreciation-based expenses. Deducting the full lease liability again while retaining ordinary rent would charge the same occupation cost twice. The liability remains visible as a contractual cash obligation, but is not a second valuation claim.

The model does not add future retained earnings to the fixed June net-cash credit. Its cash-flow test is a sufficiency check, not an extra pile of cash added on top of earnings valuation.

What would change the conclusion

The quotation requires much more operating profit than the current 20x path supplies. At roughly 135m future diluted shares, TWD8,360 implies about TWD56bn of forward operating profit after the small net-cash adjustment. Active calendar 2028 profit here is 19.6bn. A much higher multiple, dramatically better retained turnkey margins or far larger production programs would be needed to close that gap. None is silently inserted to fit the share price.

The strongest upgrade evidence would be identified advanced-node programs converting into accepted production with durable margins; NRE growth that exceeds its associated engineering costs; and packaging utilization that converts prepaid inventory into cash without requiring progressively larger advances. HBM4E silicon results and production qualification matter more than another repetition of the 16Gbps design specification.

The strongest contrary evidence would be continued gross-margin erosion, a large customer delay, inventory rising faster than accepted shipments, less favorable advance terms, or deposits lost because reserved packaging capacity was not used. Export restrictions and Taiwan concentration remain structural risks. Broadcom, Marvell, Alchip and customers' own implementation teams constrain the idea that every custom-chip dollar must accrue to GUC.

This is economically a growth story. Under the owner's exact sequential-percentage Upside Driver method, however, the active target is below the current price, so the display is unavailable. Labeling it 100% Growth would incorrectly imply that positive modeled upside exists to divide. The growth thesis and the valuation conclusion should be communicated together.

Source coverage and follow-up

The complete Q1 and Q2 financial statements, management reports and decks were retrieved from GUC. All substantive presentation pages were inspected, including the technology, geographic and application charts. Exact monthly sales and share count came from the issuer financial page; the last traded quote came directly from the Taiwan Stock Exchange daily record. September HBM4E and May partner announcements were retained with their dates and source hashes.

The issuer's latest Q2 and prior Q4 webcast links were located, but the public player did not provide a readable transcript in the retrieved page. Full spoken Q&A coverage is therefore an explicit gap. No inaccessible remarks are paraphrased as if reviewed. The written management record is sufficient for the current operating proposal, while the October 29 financial release and a verified full Q&A remain the next evidence tasks.

Funding scenario record

Sixteen combinations of new designs, optical I/O, NRE pricing and delivery delay were rebuilt independently. Amounts are TWD million; the advance-loss case subtracts 25% of June contract liabilities once. Positive cash is distinct from maintaining the desired TWD5,000m operating reserve. No future accumulated cash enters the valuation claim.

Design / optical / price / delay	Minimum cash	After advance shock	Cash shortfall
0/0/0/0	8,080.4	4,776.7	0.0
0/0/0/1	8,080.4	4,776.7	0.0

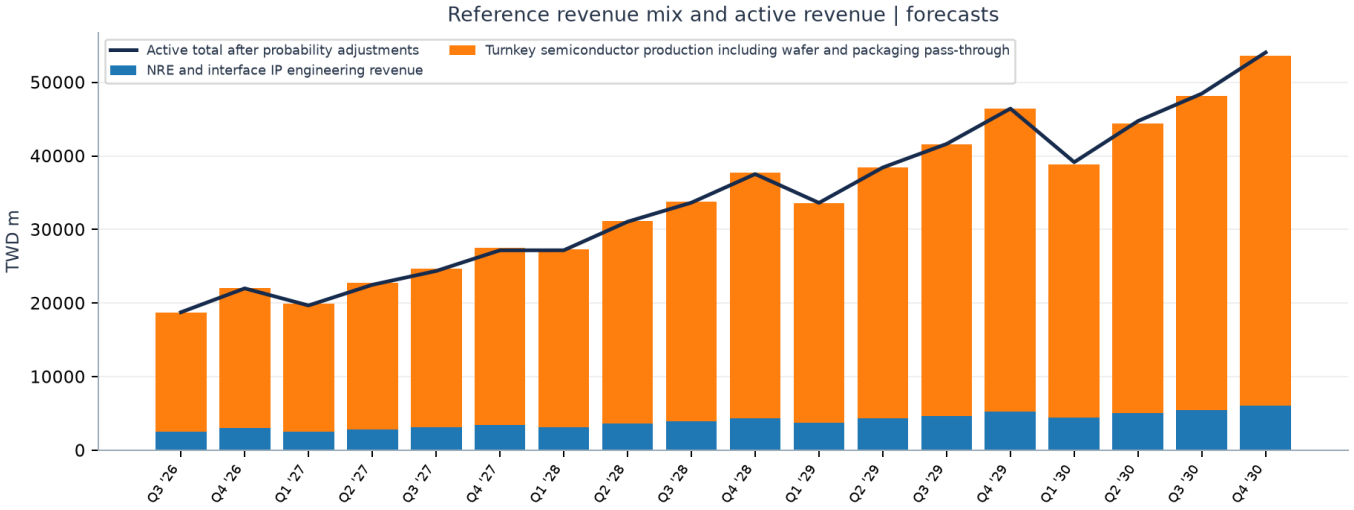

Design / optical / price / delay	Minimum cash	After advance shock	Cash shortfall
0/0/1/0	8,080.4	4,776.7	0.0
0/0/1/1	8,080.4	4,776.7	0.0
0/1/0/0	8,080.4	4,776.7	0.0
0/1/0/1	8,080.4	4,776.7	0.0
0/1/1/0	8,080.4	4,776.7	0.0
0/1/1/1	8,080.4	4,776.7	0.0
1/0/0/0	8,080.4	4,776.7	0.0
1/0/0/1	8,080.4	4,776.7	0.0
1/0/1/0	8,080.4	4,776.7	0.0
1/0/1/1	8,080.4	4,776.7	0.0
1/1/0/0	8,080.4	4,776.7	0.0
1/1/0/1	8,080.4	4,776.7	0.0
1/1/1/0	8,080.4	4,776.7	0.0
1/1/1/1	8,080.4	4,776.7	0.0

A value of 1 means the conditional event occurs and 0 means it does not. The active model uses the explicit branch probabilities, not an equal average of these stress cases. The NRE premium is recalculated on the corresponding design outcome. Core price margins exclude foundry and packaging pass-through revenue from the eligible premium pool.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Reusable interface IP, customer-specific engineering and TSMC integration create qualification and switching costs. GUC still pays the foundry and competes with large ASIC vendors and in-house teams.
Cycle	9	Nine-month sales and 3nm turnkey expansion are already real; booked sales do not establish subsequent margins.
TAM	9	More advanced-node and HBM-rich custom silicon increases design difficulty and production content, with substantial wafer pass-through.
Catalysts	4	October 29 results, NRE milestones, HBM4E silicon validation, production qualifications and accepted turnkey shipments.
Macro	7	AI infrastructure investment is supportive, offset by Taiwan concentration, export rules and customer concentration.
Alpha	2	Revenue versus retained profit and advance-funded working capital are more useful than naming an unconfirmed hyperscaler.
Risk classes	-6	Six deductions: concentration, production pass-through margins, customer qualification delays, packaging utilization commitments, working-capital exposure and demanding quotation.
Total	41/60	Rounded Base 68. Both artifact and new workbook row use this score; this is not a manual override.

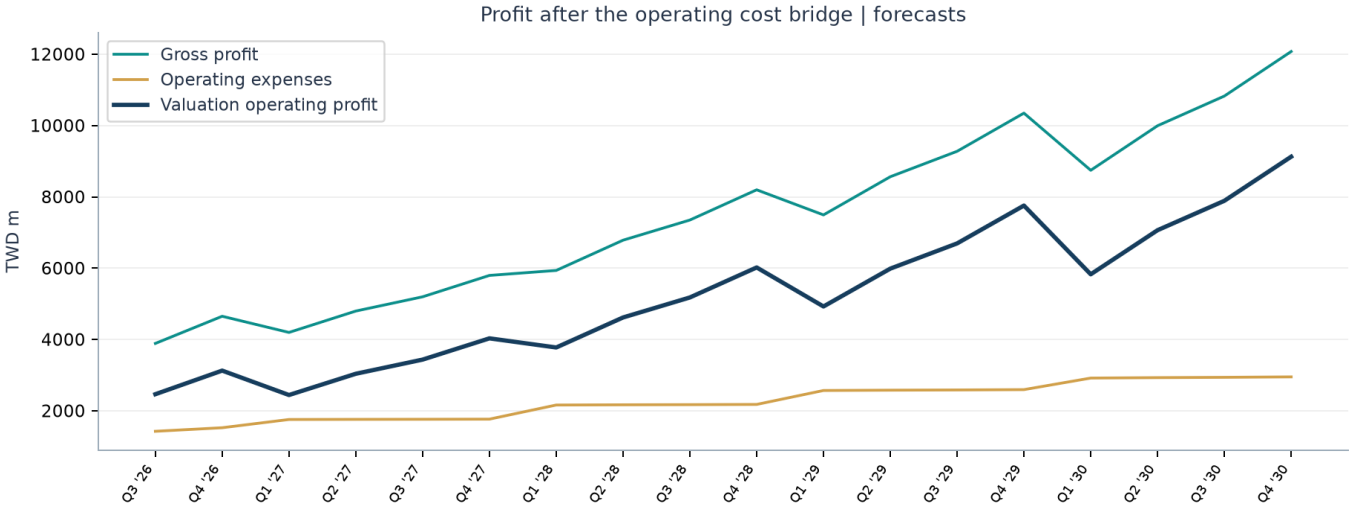

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	18,754.5	0.0	18,754.5
Q4 2026	22,000.0	0.0	22,000.0
Q1 2027	19,950.0	-271.9	19,678.1
Q2 2027	22,800.0	-310.8	22,489.2
Q3 2027	24,700.0	-336.7	24,363.3
Q4 2027	27,550.0	-375.5	27,174.5
Q1 2028	27,300.0	-123.1	27,176.9
Q2 2028	31,200.0	-140.7	31,059.3
Q3 2028	33,800.0	-152.4	33,647.6
Q4 2028	37,700.0	-170.0	37,530.0
Q1 2029	33,600.0	21.2	33,621.2
Q2 2029	38,400.0	24.3	38,424.3
Q3 2029	41,600.0	26.3	41,626.3
Q4 2029	46,400.0	29.3	46,429.3
Q1 2030	38,850.0	297.6	39,147.6
Q2 2030	44,400.0	340.1	44,740.1
Q3 2030	48,100.0	368.5	48,468.5
Q4 2030	53,650.0	411.0	54,061.0

Gross profit, operating expenses and earnings

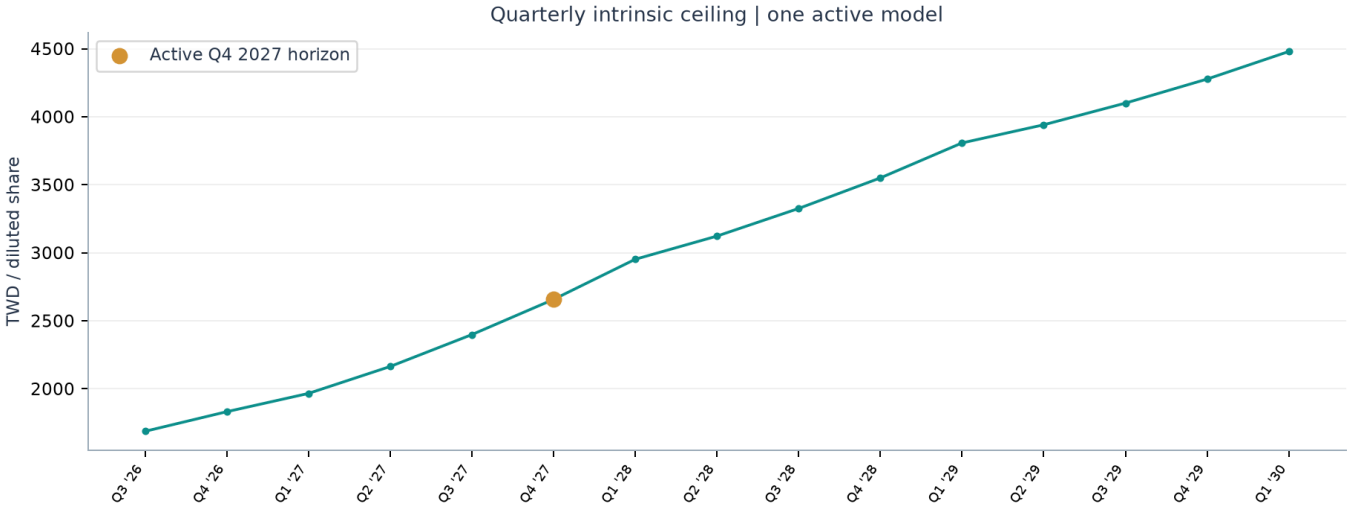

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter / status	Revenue	GP	Opex	Valuation OP	OP margin
Q3 2026 / Total revenue is actual July-September monthly sales; NRE mix, gross margin and all profits are forecasts pending October 29 results	18,754.5	3,888.2	1,424.0	2,464.2	13.1%
Q4 2026 / Analytical forecast; no company revenue or margin guidance imported	22,000.0	4,650.0	1,524.0	3,126.0	14.2%

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Four-quarter earnings window	F4Q OP	Multiple	Shares	Ceiling
Q3 2026	Q3 2026 to Q2 2027	11,069.1	20x	134.363	1,687.59

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Turnkey sales in TWD millions; wafer and packaging cost are retained	Status
Q3 2026	16,254.500	Total revenue is actual July-September monthly sales; NRE mix, gross margin and all profits are forecasts pending October 29 results

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	NRE and interface IP engineering revenue	2,500.0	58.0%	1,450.0
Q3 2026	Turnkey semiconductor production including wafer and packaging pass-through	16,254.5	15.0%	2,438.2
Q4 2026	NRE and interface IP engineering revenue	3,000.0	60.0%	1,800.0
Q4 2026	Turnkey semiconductor production including wafer and packaging pass-through	19,000.0	15.0%	2,850.0
Q1 2027	NRE and interface IP engineering revenue	2,520.0	60.0%	1,512.0
Q1 2027	Turnkey semiconductor production including wafer and packaging pass-through	17,430.0	15.5%	2,701.7
Q2 2027	NRE and interface IP engineering revenue	2,880.0	60.0%	1,728.0
Q2 2027	Turnkey semiconductor production including wafer and packaging pass-through	19,920.0	15.5%	3,087.6
Q3 2027	NRE and interface IP engineering revenue	3,120.0	60.0%	1,872.0
Q3 2027	Turnkey semiconductor production including wafer and packaging pass-through	21,580.0	15.5%	3,344.9
Q4 2027	NRE and interface IP engineering revenue	3,480.0	60.0%	2,088.0
Q4 2027	Turnkey semiconductor production including wafer and packaging pass-through	24,070.0	15.5%	3,730.8
Q1 2028	NRE and interface IP engineering revenue	3,150.0	61.0%	1,921.5
Q1 2028	Turnkey semiconductor production including wafer and packaging pass-through	24,150.0	16.5%	3,984.8
Q2 2028	NRE and interface IP engineering revenue	3,600.0	61.0%	2,196.0
Q2 2028	Turnkey semiconductor production including wafer and packaging pass-through	27,600.0	16.5%	4,554.0

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2028	NRE and interface IP engineering revenue	3,900.0	61.0%	2,379.0
Q3 2028	Turnkey semiconductor production including wafer and packaging pass-through	29,900.0	16.5%	4,933.5

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Enterprise-to-equity reconciliation

20x fully expensed forward-four-quarter operating profit less net financial claims, using end-window diluted shares. Ordinary leases are normalized to full cash rent in operating costs and are not deducted a second time. Financial claims use the dated June balance, excluding TWD5bn of operational cash. Future accumulated cash is not added. Deposits, license payments and capex are tested in separate funding schedules; the advance-loss stress can breach the desired reserve without exhausting cash.

Valuation quarter	Claims date	Reference claims	Weighted change	Total claims used	Ceiling / share

NEW_DESIGN_CONVERSION

probability: 0.6

Conditional: CY2027/28/29/30 gross new NRE TWD1,000/2,000/3,000/4,000m and associated turnkey sales TWD12,000/22,000/30,000/40,000m; retain 40% NRE and 30% turnkey after overlap.

bounds: Probability 40-75%; gross first-year NRE TWD500-1,500m and turnkey TWD6,000-18,000m. A first-year proxy of two large programs at TWD500m NRE and TWD6,000m turnkey each; program count and contract values are assumptions, not disclosed customer wins.

overlap: Reference already includes existing 3nm cloud ramps, advanced-node migration and most HBM-related growth. No Tesla AI6 revenue is assigned and no separate addition for the generic ASIC TAM.

bridge: 60% NRE GP less 25% engineering expense; turnkey GP 15.5-17% less 2.5% engineering and selling cost. Weight the combined conditional economics once.

source: September 22 HBM4E design-ready and customer adoption release, April HBM4 platform and Q2 product-mix record.

OPTICAL_IO_PRODUCTION

probability: 0.35

Conditional: Gross optical-I/O-related GUC sales TWD300/1,500/4,000/7,000m in CY2027-30; retain only 25% after overlap and partner invoice exclusions.

bounds: Probability 20-50%; retained first-year TWD0-150m. Proxy is engineering services followed by small production programs, not the full rack or optical-component bill.

overlap: 75% deduction covers advanced-node reference growth, the new-design branch and partner-owned hardware. No additive Wiwynn rack, Lightmatter optical-engine or Ayar revenue.

bridge: 28% blended GP less 10% engineering and integration expense = 18% conditional OP.

source: May 4 Wiwynn technical collaboration and issuer optical-I/O capability; no firm production revenue contract.

NEW_NRE_PRICING

probability: 0.3

Conditional: 3% premium on 25% of reference NRE plus probability-weighted new NRE; remove 50% for mix and prior commercial overlap.

bounds: Probability 15-45%; premium 0-5%; eligible slice 15-35%.

overlap: No premium on fixed-price backlog or pass-through wafers. Existing NRE mix and rising engineering costs remain in the reference.

bridge: 15% delivery cost and 20% operating support leave 65% of incremental price as OP. Funding stress states recompute eligibility using each new-design outcome.

source: Scarce experienced advanced-node engineering and more complex HBM/3D implementation; this is a bounded value-capture inference, not an announced price increase.

RAMP_DELAY

probability: 0.3

Conditional: 15% of reference turnkey sales shift beyond their forecast year, plus TWD250m annual extra qualification cost.

bounds: Probability 15-45%; delivery shortfall 5-25%.

overlap: One combined customer-schedule, packaging-yield and acceptance risk rather than separately stacking correlated bottlenecks.

bridge: Lost turnkey gross profit offset by 2% avoidable operating cost; retain extra qualification spending.

source: Quarterly mix volatility, customer-specific qualification and utilization-dependent packaging security deposits.

Remaining bounded uncertainties

- The issuer does not disclose customer-specific contract values, ASIC unit shipments, die ASPs or NRE/turnkey gross margins. Segment margins and the program-value proxy are explicit assumptions.

- No primary confirmation of a Tesla AI6 award, exclusivity, chip count or economics was found. This is an unresolved customer-identification claim, not a separate modeled win.

- Q3 total revenue is known from monthly disclosures; Q3 product split and earnings are not yet reported. The next scheduled results are October 29.

- Q2 and Q4 issuer webcast links resolve to a JavaScript player without a readable transcript. Both latest quarterly management reports and complete decks were read, but a complete spoken Q&A review remains unavailable.

- HBM4E is design-ready and taped out; the September release does not establish completed production qualification or yield.

- Security-deposit refund thresholds, packaging quantities and utilization commitments are not disclosed. Third-party 60,000-wafer claims are not used.

- Cash is June 30 reported cash plus unrestricted time deposits. Customer advances make much of it operationally necessary; TWD5bn is reserved rather than treating the whole balance as excess.

- Potential employee-bonus shares are estimated using H1 EPS dilution plus 25,000 quarterly future shares. Bonuses remain fully expensed, whether ultimately cash or stock; no share buyback is assumed.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
