Mi Technovation

5286.KL | Bursa Malaysia Main Market | 2026-10-11

Q4 2027 model ceiling: MYR 7.31

Analytical Base 42/60 = 70 | Packaging materials growth / preliminary subsidiary IPO

20x rolling quarter plus next three quarters of parent-attributable fully expensed operating profit, less matched end-window parent plus retained material financial claims, divided by end-window diluted parent shares. 90% IPO completion and 10% delay or failure economics are probability weighted consistently. Same parent shares across states make averaging linear.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in MYR million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: MYR 6.78 per share (2026-10-09 Bursa regular close); 898.275 million common shares (September share dividend pro forma, corroborated September24 percentage; exact final fraction pending); estimated equity capitalization MYR 6,090.3 million. ISIN MYL5286OO009.900m issued less computed1.725m treasury; fractional entitlements not fully reconciled. This snapshot is approximate, separate from conservative diluted valuation. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: 100% growth under the owner's sequential-percentage heuristic (0% re-rating / 100% growth). Uses the dated 2026-10-09 Bursa regular close,17:00 Asia/Kuala_Lumpur, ex-distribution price, Q4 2026 ceiling and Q4 2027 ceiling at the artifact's own valuation basis. This compares two percentage moves with different denominators; it is not an additive return attribution or a measurement of actual P/E expansion. The classification changes with price and forecasts.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	313.3	20x	903.941	7.31

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Parent-attributable fully expensed operating profit. Minority material operating earnings removed quarter by quarter; financial claims include only retained subsidiary net claims. Startup R&D, D&A and SBC remain expensed.. 20x rolling quarter plus next three quarters of parent-attributable fully expensed operating profit, less matched end-window parent plus retained material financial claims, divided by end-window diluted parent shares. 90% IPO completion and 10% delay or failure economics are probability weighted consistently. Same parent shares across states make averaging linear.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use MYR million unless a different unit is stated.

Thesis

Research date: October 11, 2026. Bursa Malaysia Main Market, stock code MI / 5286, ISIN MYL5286OO009. All modeled values are Malaysian ringgit unless stated otherwise. This is newly initiated research, not a confirmed portfolio holding. The company is unrelated to Xiaomi.

Investment conclusion

Mi combines a profitable packaging-equipment business with Accurus, a supplier of solder spheres and specialty alloys. The latter is preparing for a separate Singapore listing as Mi Material. Its attraction is the combination of difficult qualifications, material consistency and expanding production outside Taiwan. Those advantages are real enough to research before every new line is qualified. They do not turn nominal capacity or an IPO valuation into parent-company earnings automatically.

The Q4 2027 model ceiling is MYR7.314720 using 20x forward-four-quarter parent-attributable operating profit. The first displayed quarter, Q4 2026, is MYR6.178064. Against the issuer's October 9 MYR6.780 close, the active horizon offers approximately 8% modeled upside, or about 1.1x today's price. The analytical Base is 70/100. The operating story is attractive; this snapshot does not establish a large valuation cushion.

The owner's Upside Driver is 100% Growth because the near-quarter target is below the share price while the forward target is above it. This is the specified sequential-percentage heuristic, not a decomposition of realized returns or direct P/E expansion. It must recalculate with the live price. An IPO headline is not evidence that the stock is chiefly a re-rating opportunity under that calculation.

The October 9 quote is already ex-entitlement to the proposed one Mi Material share per 100 parent shares. The model does not add those distributed shares to a new purchaser's parent-stock target. Nor does it add the subsidiary's indicated market capitalization on top of a valuation that already includes its operating earnings.

The invoice: spheres, alloys and equipment

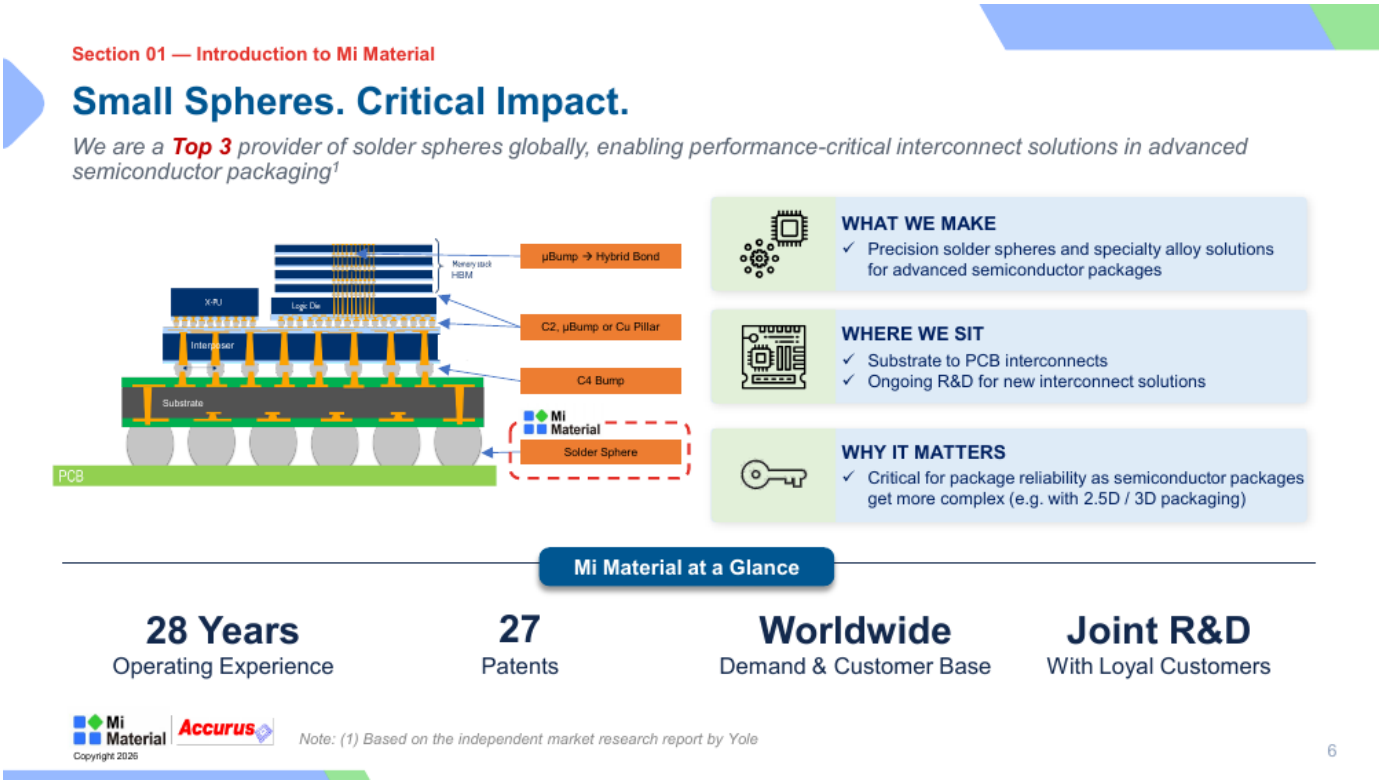

The equipment unit sells die sorting and smart binning, laser and precision bonding, test handlers and inspection. The Mi-series sorting platform is the existing anchor. The Ai, Si and Vi families broaden content, but their separate revenue and margins are not disclosed. The FY2025 report describes Mi18 expanding from 10 to 40 simultaneous die bins, reducing repeat handling. Ai20 targets large, warpage-sensitive 2.5D bonding. Known-good-die handling aims to avoid putting expensive defective dies into assembled modules. These are specific productivity functions, rather than a claim on all OSAT equipment spending.

The materials unit sells tightly controlled solder spheres. Standard tin-silver-copper formulations coexist with Cyclomax, iSAC, Ecolloy and copper-core products. Product performance concerns joint fatigue, shock

resistance, collapse height, dimensional consistency and low alpha emissions. Qualification of the material, process and manufacturing site matters as much as the word "solder."

Hybrid bonding does not remove every solder connection in a package. The issuer's diagram separates bonded die stacks from lower-level package, substrate and board interconnections. That limits a simple "hybrid bonding kills solder" thesis. It does not prove every product has indefinite immunity from substitution. Solderless interfaces can still displace particular applications, and competitors can qualify alternatives.

Two smaller businesses remain expenses before they become a major source of profit. Vehicle technologies had just MYR1.505m first-half sales and a MYR13.611m pre-tax loss. The SiC unit had no first-half sales. Their reference revenue remains modest and their development spending stays in operating costs. No separate venture-option valuation is added.

Issuer materials_presentation PDF page6 | Solder spheres sit at package/substrate/PCB connections. The diagram distinguishes those interfaces from hybrid-bonded die stacks.

Demand and the qualification bottleneck

The strongest moat is designed-in reliability combined with manufacturing consistency. The materials presentation describes two-to-five-year or longer BOM qualifications and roughly 17-year average customer relationships. That can make a qualified supplier valuable when a customer wants to increase output without introducing another failure mechanism. It does not mean a newly constructed plant inherits all prior qualifications on day one.

The geographic evidence makes that distinction concrete. The group had 13 Taiwan and six China lines, but the circular gives approximately 82% Taiwan utilization and 13% China utilization in 2025. China customer qualifications and export-license restrictions matter. Idle floor space in one country is not automatically substitute supply for a qualified program elsewhere.

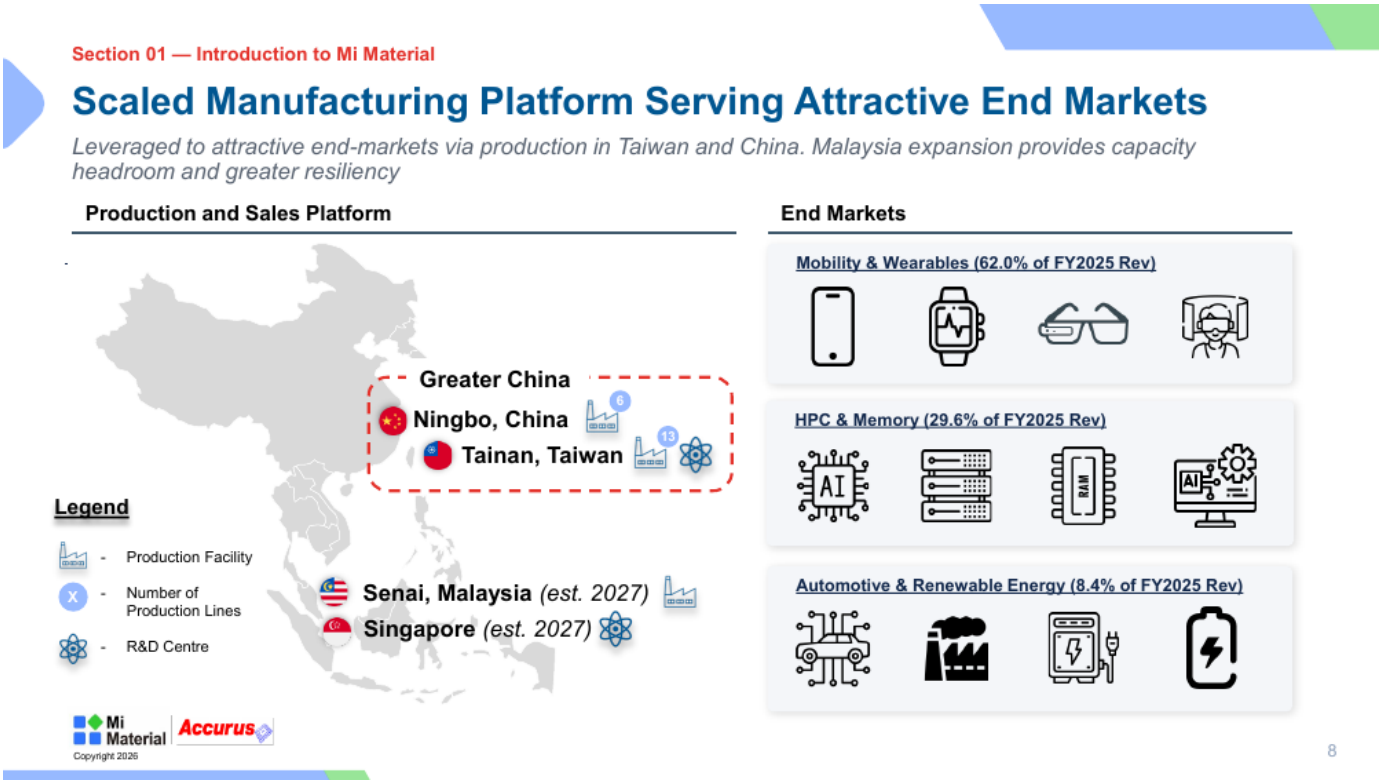

Malaysia's first three lines are expected to be ready around Q4 2026, with a ramp in early 2027 and six-to-nine months to reach full production after starting. Four more lines are planned later. Taiwan upgrades and line

repurposing stretch into 2027-29, with some commercial capacity not until 2030. A Texas demonstration facility is not treated as immediately saleable mass-production capacity.

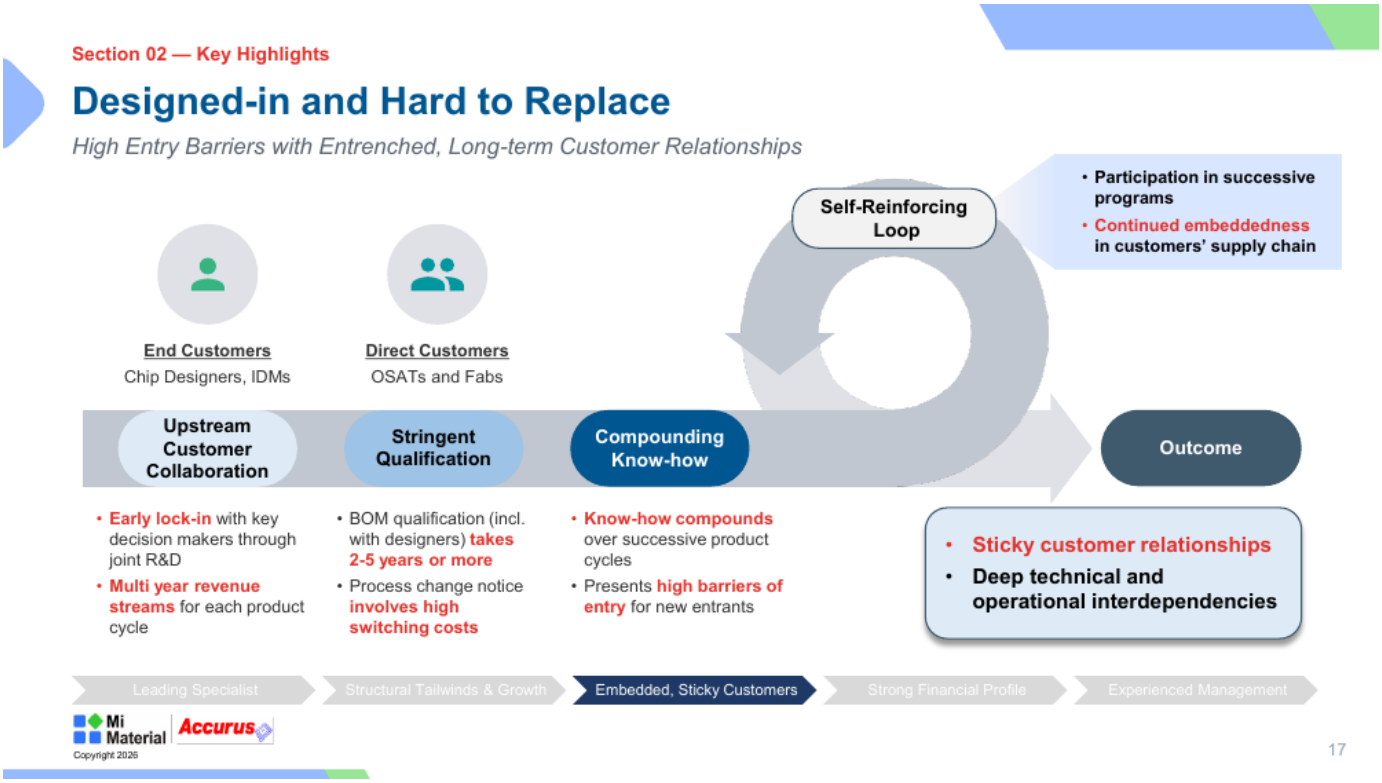

There is an unresolved capacity-unit conflict. Cached primary circular text describes thousands of billions of spheres, whereas October bank commentary uses single-digit billions for the same starting platform. The relative expansion and line counts can be compared, but the absolute sphere count differs by 1,000x. We do not silently pick a convenient unit, divide revenue by it or call the resulting ASP verified. The model instead calibrates revenue to reported segment sales and makes bounded qualification assumptions. Original typeset capacity pages or issuer clarification are a precise follow-up item.

End-market concentration is a counterweight to the AI story. FY2025 materials sales were 62% mobility and wearables, 29.6% HPC and memory, and 8.4% automotive and renewables. Equipment was even more mobile exposed: 80.3% mobility and wearables and 16.4% HPC and memory. AI packaging helps both units, but a weaker smartphone cycle can still matter.

The commissioned Yole study describes a USD275m 2025 solder-sphere serviceable market and USD978m in 2031. The larger USD1.9bn market definition should not be substituted for today's addressable sphere business. No market-share-times-TAM forecast is inserted into this model. Customer, product and geographic qualification determine the revenue captured.

Issuer materials_presentation PDF page8 | FY2025 materials revenue was62% mobility and wearables,29.6% HPC and memory,8.4% automotive and renewables. Nineteen existing lines are not nineteen interchangeable qualified factories.

Issuer materials_presentation PDF page17 | Issuer says BOM qualification often takes2-5years or more. It is customer/product-specific, not automatic qualification of a new location.

Actual results and the cash-conversion warning

Q2 revenue was MYR226.022m, up from MYR154.121m a year earlier. Parent net profit was MYR55.208m. First-half revenue reached MYR393.781m and parent profit MYR86.187m. The segment table reports MYR178.076m equipment revenue and MYR214.200m material revenue. Materials growth was supported by volume, selling prices and mix; those are different drivers and should not be presented as one pure unit-volume number.

For an operating valuation, pre-tax profit is not interchangeable with operating profit. First-half reported operating profit before interest was MYR109.529m; excluding the identified non-operating lines gives approximately MYR107.344m core operating profit. The Q2 equivalent is about MYR70.381m. We retain ordinary depreciation, research, selling costs, share compensation and startup losses. We exclude interest income, FX speculation and asset-value changes from the capitalized operating stream.

The latest additional issuer disclosure is an estimate, not a finished Q3 group financial statement. On October 5, management described material sales of about USD37.8m and gross margin of 47.5%, compared with USD32.7m and 48.0% in Q2. Our MYR151.2m Q3 material revenue uses an explicit constant MYR4.00/USD planning rate. The company has not guided the complete 2027-30 consolidated forecast shown here.

The cash-flow statement deserves as much attention as the income statement. First-half operating cash flow was negative MYR35.159m despite strong profit. Inventories used MYR39.294m and receivables MYR112.344m, partly offset by higher payables. Growth can consume cash even when gross margins improve. The active bridge therefore uses working capital equal to 40% of changes in annualized quarterly sales, and tests 55%. It does not extrapolate net income directly into free cash flow.

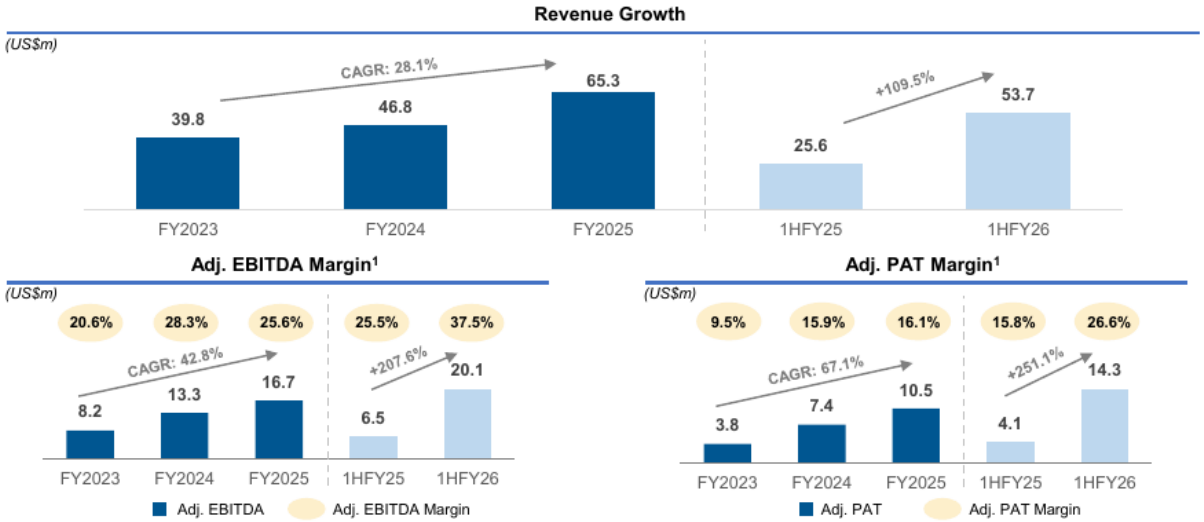

June financial debt was MYR104.785m and lease liabilities MYR29.068m. Group cash-flow cash equivalents were MYR363.206m. An additional MYR8.751m of longer deposits is excluded from usable cash rather than counted

twice. First-half equipment and intangible purchases totaled about MYR26.116m; the announced international build-out requires substantially more.

Section 03 — Financial Overview

Track Record of Growth

Spearheaded by performance-critical, proprietary alloy products

Pricing: distinguish alloy value from metal inflation

The issuer describes periodic price adjustment for tin, silver and copper inputs. That supports resilience but is not proof that the full increase in selling prices is pricing power. More expensive silver can lift sales and working-capital needs without adding an equivalent amount of profit.

The separate Rule 16b premium branch therefore applies only to 30% of a fixed 90% delivered reference material revenue cohort, at a conditional 2% premium and 45% probability. Eighty-five percent of the incremental price dollar reaches gross profit and 15% funds additional support. The full maximum 10% reference-volume shortfall is excluded first, so the pricing premium is never earned on that undelivered cohort. It excludes ordinary raw-material pass-through, the full backlog and volume already assigned to faster qualification. The resulting 2027 completed-IPO case adds only MYR1.05462m operating profit before minority ownership, not an indiscriminate margin step-up.

That modest increment reflects a plausible customer cost of waiting: an inexpensive interconnect input can hold up a much more valuable package. Competitive suppliers, periodic repricing and customer bargaining prevent us from treating that asymmetry as certainty.

Issuer materials_presentation PDF page22 | Periodic raw-material price pass-through protects economics; it does not make every metal-price dollar incremental profit.

IPO economics: parent value is not the subsidiary headline

The September shareholder circular was an illustration. It used SGD1.00, a different vendor-share mix, and retained ownership of 72.38% before full over-allotment or 70.66% after it. Those values must not be called final October terms.

Accessible October reporting describes an indicative SGD1.80 issue, approximately SGD168m of primary proceeds, 26m vendor shares and about 73.7% parent ownership. The issuer confirms that a preliminary prospectus was lodged October 5. Full primary prospectus retrieval was blocked by the public registry's security challenge, so the revised capitalization and costs remain provisional. No final registered prospectus or completed IPO has been verified as of this research date.

The model assigns 90% probability to completion and 10% to delay or failure. Completion uses a 73.7% initial retained share, reduced further for the remaining 4.6875m awards in the September schedule. We shadow-dilute those awards immediately rather than wait for vesting. The first 1.5625m award tranche is assumed to be inside the provisional initial capitalization; the final prospectus must confirm this.

Completion receives net primary cash of (SGD168.12m minus SGD12m fee reserve) and parent vendor cash of (26m shares times SGD1.80 minus SGD1.75m fee reserve), translated at the circular's MYR3.1783/SGD convention. These are scenario assumptions. Primary proceeds stay in the subsidiary. Vendor proceeds go to the parent. No second gain from selling the same stake is capitalized in operating profit.

The failure case receives no IPO cash, retains the materials business, and cuts its expansion spending and later revenue path. It assumes the conditional distribution does not complete if the listing fails. That assumption needs checking against definitive terms. Higher retained earnings can make its near-horizon target exceed the successful-IPO case, despite slower eventual growth. Listing is a financing and ownership event, not automatic value creation.

The parent had 900m issued shares before treasury adjustments. The circular's September share-dividend arithmetic gives 898.275m outside treasury; the September 24 director-interest percentage corroborates that approximately, but the exact aggregate fractional outcome remains unavailable. The market-cap snapshot is consequently labeled approximate. Valuation conservatively assumes all 900m issued shares participate from Q4 2026 and adds 0.25% annual award dilution. It credits no hypothetical treasury-share sale cash. Exchange-traded bank warrants on the stock are not company-issued dilutive securities.

Operating model and incremental evidence

Reference equipment revenue is MYR480m in 2027, rising to MYR700m in 2030. Reference materials revenue is MYR620m, MYR740m, MYR880m and MYR1,000m across those years in the completed-IPO case. Equipment gross margin is 50%; materials gross margin runs from 46.5% to 48%. These are model assumptions calibrated to the current mix and ramp, not management guidance.

Equipment operating support and R&D consume 20% of revenue. Materials incur 10% plus explicit new-site fixed expense. Vehicle and SiC development costs remain substantial even when revenue is small. Corporate costs are separate. Manufacturing depreciation is inside gross profit; it is added back only in the cash bridge. SBC stays expensed without a cash add-back in funding, which is conservative alongside the share schedule.

The faster-Malaysia-qualification branch begins with a gross 2027 opportunity of MYR80m. Half is already embedded in reference growth, leaving MYR40m. At 65% probability and a 35% incremental operating margin, it contributes MYR9.1m before minority ownership. Later conditional increments are MYR80m, MYR100m and MYR120m of revenue, not the entire plant's output added to an already growing business. The failure state gets only one-quarter of that incremental qualification opportunity because spending is lower.

A separate equipment branch assigns 55% probability to MYR25m distinct 2027 revenue after 50% overlap, at 50% gross margin less 18% support expense. The expected operating contribution is MYR4.4m. A 30% adverse branch removes 10% of reference 2027 material sales, using 45% gross contribution with 5% variable cost savings. Fixed research is retained. That costs MYR7.44m before minority ownership in the completed-IPO case.

The active blended ceiling is MYR7.314720 versus MYR7.034102 with these incremental branches turned off and funding rebuilt. That difference is the model's incremental evidence treatment. Neither a bank target nor an IPO-market-value comparison supplies the answer.

Funding bridge and limits

The circular identifies MYR281.58m June cash outside the material business, and MYR73.52m banking facilities there with approximately MYR3m used. Subtracting that cash from group cash-flow cash equivalents gives an MYR81.626m material cash proxy. The model reconciles both pools independently. The lease split, MYR25.5m parent/other and MYR3.568m materials, is a proxy that preserves the exact group liability.

Parent capex includes MYR130m in 2027, incorporating a building-cost reserve above the circular's MYR97.73m partial funding allocation. The actual VTBU property purchase price is not verified. Materials spend MYR170m/180m/115m/60m in 2027-30 after MYR45m in H2 2026. Recurring research remains an operating expense. The failed-IPO case cuts material capex to MYR60m/65m/65m/60m and lowers the revenue path. Facility schedules are not interpreted as guaranteed invoiced capacity.

Each quarter explicitly includes operating profit, cash tax, depreciation add-back, interest, working capital, capex, lease principal, IPO/vendor cash and dividends. Lease principal and equal new leases leave the liability unchanged; cash still pays the principal. Material dividends are assumed at 20% of positive net income,

upstreamed only at the retained percentage. The failed-IPO case also distributes 20%, entirely to the parent. Parent cash dividends are modeled at 30% of positive attributable income after the known July payment.

The parent can draw only within the dated MYR73.52m facility. No additional material facility is invented; its ceiling is the existing June MYR101.785m debt face, which is assumed renewable and tested as a risk. Both ordinary transaction cases remain cash positive. The active IPO case has a minimum modeled parent cash balance near MYR249m; the failure case needs under MYR2m of new parent debt after repaying the opening balance. These are projections, not bank commitments.

MYR100m parent and MYR40m material operating cash reserves are excluded from the equity target. Only cash above those levels offsets debt and leases. The model deducts only the retained share of material net financial claims, matching the exclusion of minority operating earnings. Adding all subsidiary cash while removing only minority profits would overstate parent value.

The joint adverse case is deliberately not described as funded. It combines failed IPO, no favorable incremental branches, full adverse demand, three percentage points lower gross margins, 55% working capital, 25% greater capex and an additional MYR80m headquarters cost. Its calculated Q4 2027 value is about MYR6.08 before financing remedies, but parent cash eventually becomes negative and the reserve shortfall reaches about MYR206m. Spending reductions, equity or newly committed credit would be required. A valid financed target for that case cannot be asserted without choosing one of those remedies.

Sensitivities, downside and thesis breakers

The isolated completed-IPO case is MYR7.28. Reducing retained ownership to the older 70.66% bound yields MYR7.10; a three-point group gross-margin reduction yields MYR6.51. A 10% stronger ringgit against material-dollar sales yields about MYR6.84 under the simplified cost convention. These are rebuilt scenarios, not changes to the adopted probability-weighted path. The USD and SGD conventions are explicit constants, not current exchange-rate forecasts.

Thesis breakers include a failed Malaysia qualification ramp, weak customer acceptance despite available lines, inability to pass through higher metal costs, a material drop in mobile demand, and continued working-capital expansion without collections. Capital allocation is a separate risk: profitable materials may fund property and vehicle projects whose returns are not established. Even a strong solder business can be an unattractive stock if minority dilution, cash consumption or price paid overwhelms its growth.

A bull outcome needs accepted output and cash conversion, not simply the maximum announced line count. Better custom-alloy economics, expansion that qualifies on schedule, and distinct equipment wins could support the favorable bounds. A share-price rise alone cannot validate any of those operating assumptions.

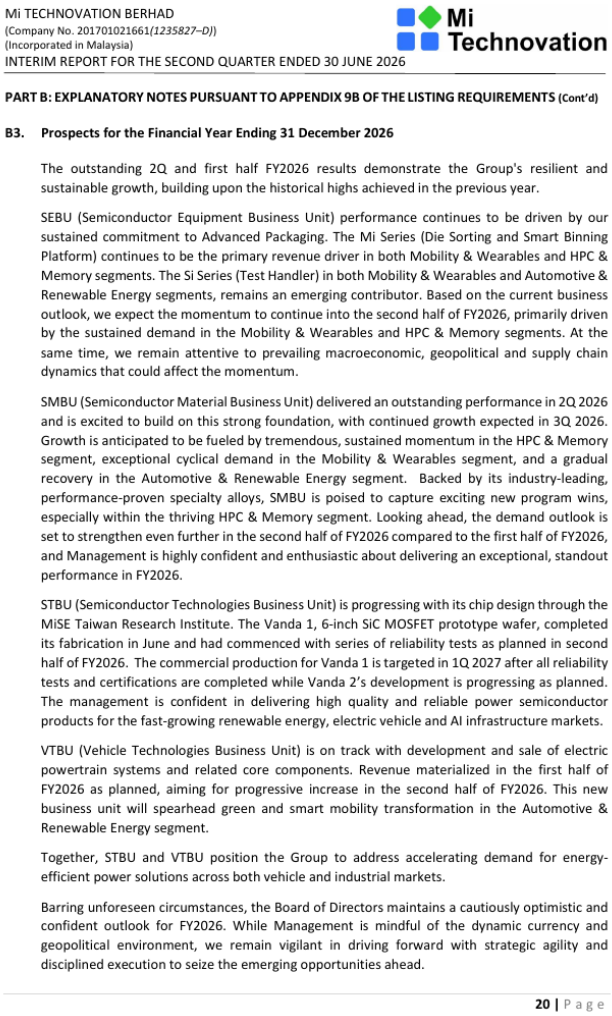

Two management records and the next checkpoints

The two latest complete accessible management financial reviews are the May 21 Q1 report and July 20 Q2 report. May discussed emerging vehicle sales, SiC prototypes and foreign-exchange risk. July strengthened the materials outlook, described robust HPC/memory and seasonal mobility demand, and moved the SiC discussion toward a Q1 2027 commercial target after reliability tests. Full management-call Q&A transcripts were not recovered, so no invented question-and-answer record appears here.

The next useful evidence is the final prospectus and allocation result, Q3 actual results including cash conversion, Malaysia production and customer qualification progress, and a precise reconciliation of treasury and subsidiary award shares. Later checkpoints include regional utilization, parent building expenditure and expiry of the

equipment subsidiary's existing pioneer tax benefit in early 2029. The cash bridge steps parent tax from 23% to 25% then rather than assuming the incentive lasts forever.

The narrow research priority is to verify terms and operating execution. Mi is already a real profitable business with a credible packaging exposure. The current model says its growth can justify modest upside from the dated quote, while the planned listing introduces ownership and funding details that deserve continued scrutiny.

Mi Technovation

PART B: EXPLANATORY NOTES PURSUANT TO APPENDIX 9B OF THE LISTING REQUIREMENTS (Cont'd)

B3. Prospects for the Financial Year Ending 31 December 2026

The outstanding 2Q and first half FY2026 results demonstrate the Group's resilient and sustainable growth, building upon the historical highs achieved in the previous year.

SEBU (Semiconductor Equipment Business Unit) performance continues to be driven by our sustained commitment to Advanced Packaging. The Mi Series (Die Sorting and Smart Binning Platform) continues to be the primary revenue driver in both Mobility & Wearables and HPC & Memory segments. The Si Series (Test Handler) in both Mobility & Wearables and Automotive & Renewable Energy segments, remains an emerging contributor. Based on the current business outlook, we expect the momentum to continue into the second half of FY2026, primarily driven by the sustained demand in the Mobility & Wearables and HPC & Memory segments. At the same time, we remain attentive to prevailing macroeconomic, geopolitical and supply chain dynamics that could affect the momentum.

SMBU (Semiconductor Material Business Unit) delivered an outstanding performance in 2Q 2026 and is excited to build on this strong foundation, with continued growth expected in 3Q 2026. Growth is anticipated to be fueled by tremendous, sustained momentum in the HPC & Memory segment, exceptional cyclical demand in the Mobility & Wearables segment, and a gradual recovery in the Automotive & Renewable Energy segment. Backed by its industry-leading, performance-proven specialty alloys, SMBU is poised to capture exciting new program wins, especially within the thriving HPC & Memory segment. Looking ahead, the demand outlook is set to strengthen even further in the second half of FY2026 compared to the first half of FY2026, and Management is highly confident and enthusiastic about delivering an exceptional, standout performance in FY2026.

STBU (Semiconductor Technologies Business Unit) is progressing with its chip design through the MiSE Taiwan Research Institute. The Vanda 1, 6-inch SiC MOSFET prototype wafer, completed its fabrication in June and had commenced with series of reliability tests as planned in second half of FY2026. The commercial production for Vanda 1 is targeted in 1Q 2027 after all reliability tests and certifications are completed while Vanda 2's development is progressing as planned. The management is confident in delivering high quality and reliable power semiconductor products for the fast-growing renewable energy, electric vehicle and AI infrastructure markets.

VTBU (Vehicle Technologies Business Unit) is on track with development and sale of electric powertrain systems and related core components. Revenue materialized in the first half of FY2026 as planned, aiming for progressive increase in the second half of FY2026. This new business unit will spearhead green and smart mobility transformation in the Automotive & Renewable Energy segment.

Together, STBU and VTBU position the Group to address accelerating demand for energy-efficient power solutions across both vehicle and industrial markets.

Barring unforeseen circumstances, the Board of Directors maintains a cautiously optimistic and confident outlook for FY2026. While Management is mindful of the dynamic currency and geopolitical environment, we remain vigilant in driving forward with strategic agility and disciplined execution to seize the emerging opportunities ahead.

Ownership presentation and model controls

Outside shareholders receive their share of material operating profit after actual operating costs. The ownership allocation is shown separately from operating expense in the adopted model. Consolidated revenue and gross profit are not reduced by minority ownership. Each IPO outcome carries its own ownership and net financial claims, then the 90% completion and 10% failure outcomes are averaged. Their parent share counts match, so this gives the same common-share value as weighting the two separate targets.

Spreadsheet operating probability controls hold the adopted funding schedule fixed. A new substantive scenario must rebuild working capital, taxes, financing, ownership and claims using the saved transaction model; the control is not a fully dynamic funding model.

IPO completed funding

MYR million. Parent and material cash are ring-fenced. The MYR100m and MYR40m operating reserves are excluded from value.

Quarter	Parent cash	Material cash	Parent bank debt	Material bank debt	Net parent claims
Q3 2026	267.52	40.00	0.00	70.40	-68.06
Q4 2026	393.10	487.51	0.00	0.00	-591.72

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Qualification, alloy know-how and die handling help, but consumer exposure and customer bargaining remain significant.
Cycle	8	Strong actual material growth and capacity investment, with execution still ahead.
TAM	8	Fine pitch and complex packages lift reliability demand, constrained by capacity and qualification.
Catalysts	4	Final IPO terms, Q3 actual cash conversion and Malaysian qualification.
Macro	7	AI packaging demand offset by mobile cyclicality, FX, China policy and metal costs.
Alpha	4	Separate substrate connections from hybrid-bond interfaces, and model retained ownership plus ring-fenced cash.
Risk classes	-5	Preliminary transaction terms, working capital consumption, minority leakage, startup spending and source unit inconsistency.
Total	42/60	Rounded Base 70. Both artifact and new workbook row use this score; this is not a manual override.

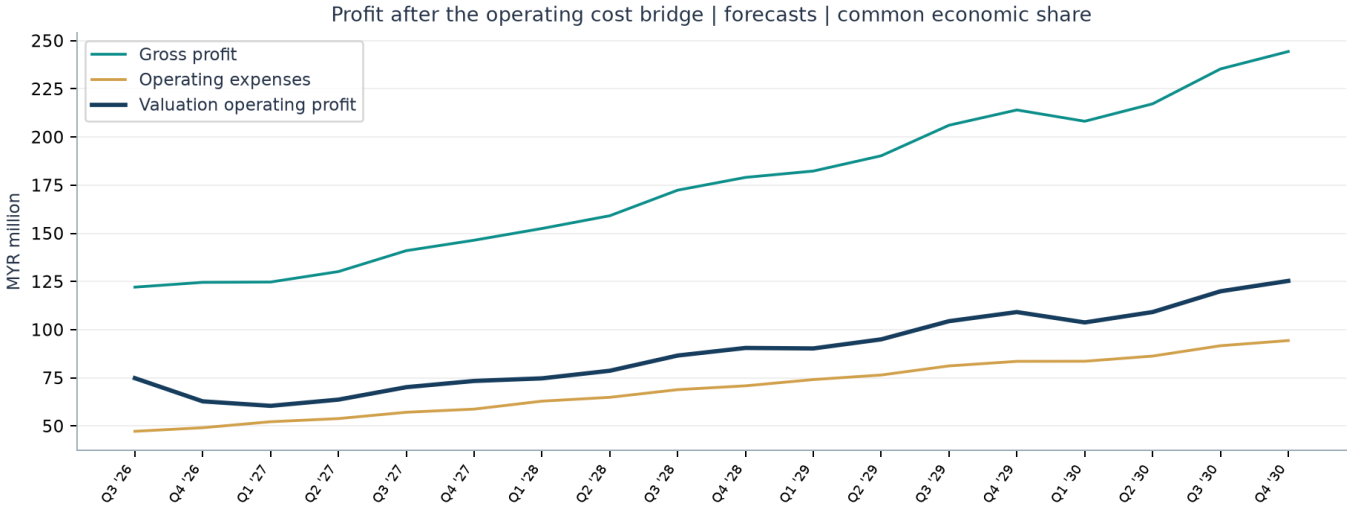

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	252.4	0.0	252.4

Q4 2030	488.7	28.0	516.7

Gross profit, operating expenses and earnings

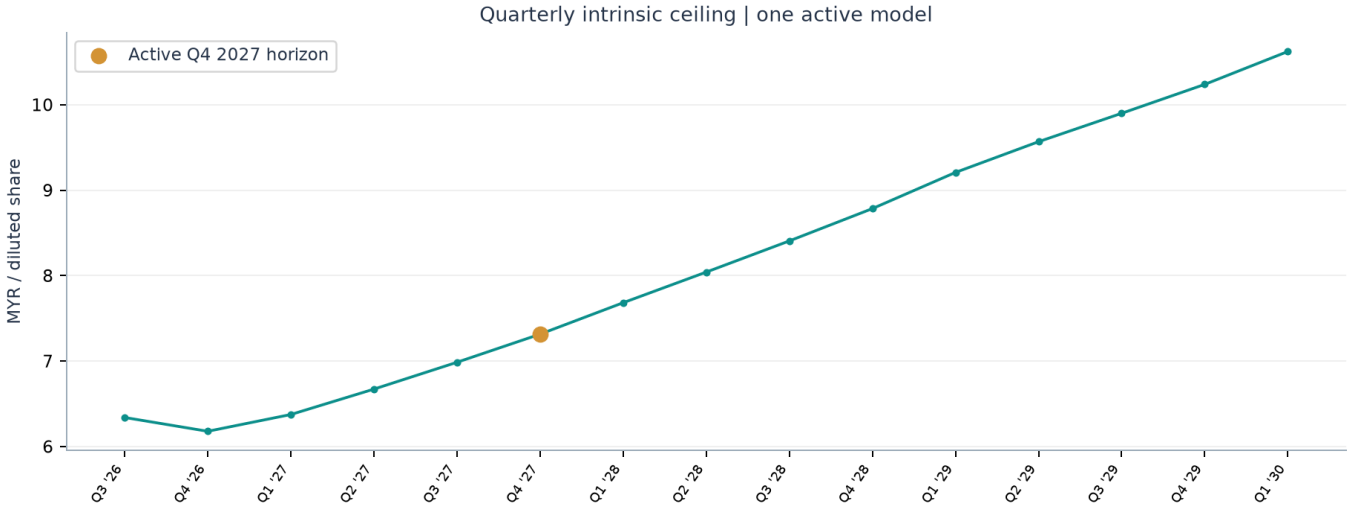

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Semiconductor equipment	100.0	50.0%	50.0
Q3 2026	Solder spheres and specialty alloys	151.2	47.5%	71.8

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Subsidiary ownership and common operating profit

The preceding weighted OP is after branch-specific minority earnings. Reference and conditional subsidiary profit are allocated within consolidated sales and costs, never added as a second revenue source. Ownership is reported; future subsidiary margins, volume and credit sharing are labeled assumptions.

Quarter	Consolidated OP	Reference minority	Active minority	Common OP

Enterprise-to-equity reconciliation

20x rolling quarter plus next three quarters of parent-attributable fully expensed operating profit, less matched end-window parent plus retained material financial claims, divided by end-window diluted parent shares. 90% IPO completion and 10% delay or failure economics are probability weighted consistently. Same parent shares across states make averaging linear.

Valuation quarter	Claims date	Reference claims	Weighted change	Total claims used	Ceiling / share

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

IPO_COMPLETION

probability: 0.9

Conditional outcome: October 28 expected completion; indicative 73.7% retained before remaining awards. 10% delay/failure case retains 100%, no proceeds and reduced subsidiary capex/growth. Retained ownership bound70.66-75%; no completed financing asserted.

reference overlap: Transaction only changes cash, ownership and matched spending. No separate IPO market capitalization or free distributed stock added to the ex-entitlement parent target.

financial bridge: Expected parent OP and ownership-adjusted net financial claims are the90/10 probability-weighted outcomes. Parent share denominator identical across states, so expected-equity averaging equals the displayed linear formula.

counter evidence: The primary final prospectus is not yet verified. September SGD1.00 illustration was superseded in attributed October reports; terms may change.

FASTER_MALAYSIA_QUALIFICATION

probability: 0.65

Conditional outcome: Gross faster-qualification pool80/160/200/240m MYR in2027/28/29/30, half already in reference, leaving40/80/100/120m.2027 gross pool bound50-110m with overlap35-70%. Failure-state benefit is one-quarter of this amount.

reference overlap: 50% of gross pool is inside reference growth from620m material revenue2027 to1000m2030. No multiplication of all19-to33 lines into sales.

financial bridge: 65% x distinct sales x(45% GP less10% R&D/commercial support), then retained stake. IPO-state2027 consolidated expected revenue26m and OP9.1m before minority deduction.

counter evidence: Taiwan82% utilization versus China13% in2025 proves nominal lines are not fungible. Malaysia qualification takes time; capacity-unit inconsistency prevents a unit-price shortcut.

QUALIFIED_ALLOY_PREMIUM

probability: 0.45

Conditional outcome: 2% premium on30% of a fixed90% delivered reference material revenue cohort from2027; bounds0-3% premium and15-40% cohort.

reference overlap: The full maximum10% material shortfall is removed from the pricing cohort before probability weighting. Only fresh qualified alloy commercial terms, not tin/silver pass-through, the whole backlog, or faster-qualification revenue. Reference margin already includes better product mix.

financial bridge: 45% x eligible sales x2% x(85% GP less15% support), then retained stake.2027 IPO-state expected revenue1.5066m and pre-minority OP1.05462m.

counter evidence: No announced surcharge and periodic metal pass-through is not economic rent. Direct OSAT/IDM bargaining and alternative qualified alloys cap pricing power.

EQUIPMENT_ADVANCED_PACKAGING

probability: 0.55

Conditional outcome: Gross additional equipment opportunity50/90/130/160m over2027-30;50% overlap leaves25/45/65/80m.2027 conditional distinct bound15-35m.

reference overlap: Reference equipment revenue480m2027 already grows from existing Mi-series smart binning. Only distinct Ai/Si/Vi adoption beyond reference is added; not all OSAT capex.

financial bridge: 55% x distinct revenue x(50% GP less18% engineering/service/R&D), entirely parent attributable.2027 expected revenue13.75m, OP4.4m.

counter evidence: No product-level backlog or confirmed customer acceptance quantities. Sorting is not the same as hybrid bonding; large competing platforms can integrate functions.

MOBILE_AND_QUALIFICATION_RISK

probability: 0.3

Conditional outcome: Reference material sales shortfall10/8/6/5% in2027/28/29/30.2027 bound5-20%.

reference overlap: Applied to reference only, not another haircut on probability-weighted favorable revenue; metal-cost changes already in costs.

financial bridge: Lost sales at45% GP with5% variable expense savings, then retained stake.2027 IPO-state expected sales loss18.6m and OP loss7.44m before minority.

counter evidence: Actual Q2 strength and Q3estimate reduce immediate downside; mobility still62% ofFY2025 material sales and80.3% of equipment.

SIC_AND_VEHICLE_OPTIONS

probability: 0.35

Conditional outcome: Q1 2027 SiC commercial target conditional on reliability certification. Bounded additional2028 sales5-15m and vehicle sales10-25m attempted.

reference overlap: 100% of bounded optionality overlaps modest reference device12m/vehicle30m2028. Zero extra increment, while device8m and vehicle34m annual fixed development expense remain.

financial bridge: No separate option valuation; startup losses reduce parent OP. Commercial target is not an accepted volume commitment.

counter evidence: H1VTBU revenue1.505m versus PBT loss13.611m; STBU no revenue. Prototype fabrication does not establish qualified mass-production.

INDUSTRY_SAM

probability: 0.7

Conditional outcome: Commissioned Yole2025 SAM275mUSD to978m2031; assume70% chance of broadly similar multi-year growth, with2031 bounded750-1000m.

reference overlap: 100% overlap with company-specific materials volume/mix reference and qualification branch. No direct share-times-TAM revenue increment.

financial bridge: Capacity, customer qualification, mix and costs drive the active model. The broader1.9bn market is not the existing sphere SAM.

counter evidence: Commissioned study, end-market definitions and silver-price pass-through may differ from company USD sales. Current market-share claim is not a guaranteed future share.

Remaining bounded uncertainties

- Final registered October IPO prospectus, actual allotment, vendor/OA shares, net fees and retained interest are not independently verified. MAS public page presented a security challenge; no bypass attempted. Active terms are provisional scenarios.

- Actual September fractional treasury-share distribution result remains unavailable from issuer page;898.275m is the disclosed pro forma calculation, corroborated by rounded September24 ownership percentages. Valuation conservatively uses all900m fromQ4 plus0.25% annual awards, with no treasury sale proceeds.

- Solder-sphere capacity units disagree by1000x between cached September circular and October bank commentary. Relative line counts and revenue calibration are used; no saleable sphere count is asserted.

- Material and parent June lease split is a proxy(3.568m/25.5m) preserving actual group29.068m. Material balance sheet excludes8.751m long deposits. Parent/material cash split uses circular pro-forma cash and group cash-flow cash equivalents.

- October preliminary capital-use amounts may include operating research and working capital. Model separates recurring R&D expense and conservative facility capex; final project budgets and VTBU building total remain unknown.

- No verified incremental material credit capacity beyond the June debt face. Active state and IPO-failure case fund within staged caps; adverse cases disclose reserve shortfall and must not be described as funded.

- Latest two accessible management records are May21 Q1 and July20 Q2 written financial reviews, supplemented by July31/August presentation and October5 update. Full earnings-call Q&A recordings/transcripts were not recovered.

- Customer identities X/Y/Z are anonymized; no customer names, purchase orders, qualification dates, product margins or exact unit ASP are invented.

- Displayed growth versus re-rating calculation depends on live price. No comparison is performed if active forward ceiling is belowMYR6.78.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
