Sigurd Microelectronics

6257.TW | Taiwan Stock Exchange | 2026-10-11

Q4 2027 model ceiling: TWD 121.62

Analytical Base 44/60 = 73 | Qualified testing growth; execution and capital-intensity watch

20x forward-four-quarter fully expensed operating profit attributable to Sigurd common shareholders, less matched entity-attributed financial claims and divided by end-window diluted shares. The same20x OP basis and share/horizon conventions are preserved. Sixteen explicit operating/financing outcomes are valued separately before weighting; the expected-input ceiling is disclosed only as a diagnostic.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: TWD 283.00 per share (2026-10-08 13:30 Asia/Taipei regular close); 478.254 million common shares (2026-06-30 net of treasury); estimated equity capitalization TWD 135,346.0 million. Issued483.912325m less5.658m treasury. Forecast denominator conservatively allows all issued shares back plus annual award dilution; no buyback credit. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: no positive modeled upside at the dated 2026-10-08 13:30 Asia/Taipei regular close price of TWD 283.00, so the Upside Driver split is unavailable.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	3,830.8	20x	485.672	121.62

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Sigurd consolidated revenue and operating profit already include Winstek (□□□,3265.TWO). The model never adds Winstek sales or market value again. Group ownership is52.55%; its47.45% outside operating interest is deducted once, with a small residual other-NCI proxy. Matching financial claims use the same entity attribution. The existing20x fully expensed OP basis, IFRS lease treatment, end-window claims/shares and Excel Base73 are retained.. 20x forward-four-quarter fully expensed operating profit attributable to Sigurd common shareholders, less matched entity-attributed financial claims and divided by end-window diluted shares. The same20x OP basis and share/horizon conventions are preserved. Sixteen explicit operating/financing outcomes are valued separately before weighting; the expected-input ceiling is disclosed only as a diagnostic.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use TWD m unless a different unit is stated.

Thesis

Sigurd sells semiconductor testing and related packaging services. Its October presentation establishes a growing AI, CPU/GPU, ASIC and silicon-photonics business, not a pure optical company. The model values the common shareholder's fully expensed operating earnings at 20x. This initiates research coverage; it does not establish a portfolio holding.

The corrected operating model has a credible demand mechanism: complex devices need more demanding electrical, thermal and optical tests, and customers must reserve qualified testers before large production ramps. The complication is that the service provider pays for equipment, engineers and factory capacity before that capacity generates revenue. A strong industry demand forecast can coexist with disappointing free cash flow.

What the latest evidence actually establishes

The October 6, 2026 investor presentation is a business update using first-half financial results and newer monthly revenue. It is not a new third-quarter earnings release. The August 6 approved filing reports H1 revenue of TWD11,174.473 million, gross profit of TWD3,689.372 million and operating profit of TWD2,692.105 million. H1 consolidated net income was TWD2,480.027 million, while parent-attributable net income was TWD2,225.873 million. The difference belongs to minority shareholders.

The presentation's rounded January-September revenue of TWD17,346 million implies approximately TWD6,171.527 million of third-quarter revenue after subtracting the exact first-half figure. The arithmetic retains precision internally, but the third-quarter input remains approximate because the nine-month starting point is rounded. Third-quarter gross profit, expenses and earnings are modeled, not reported.

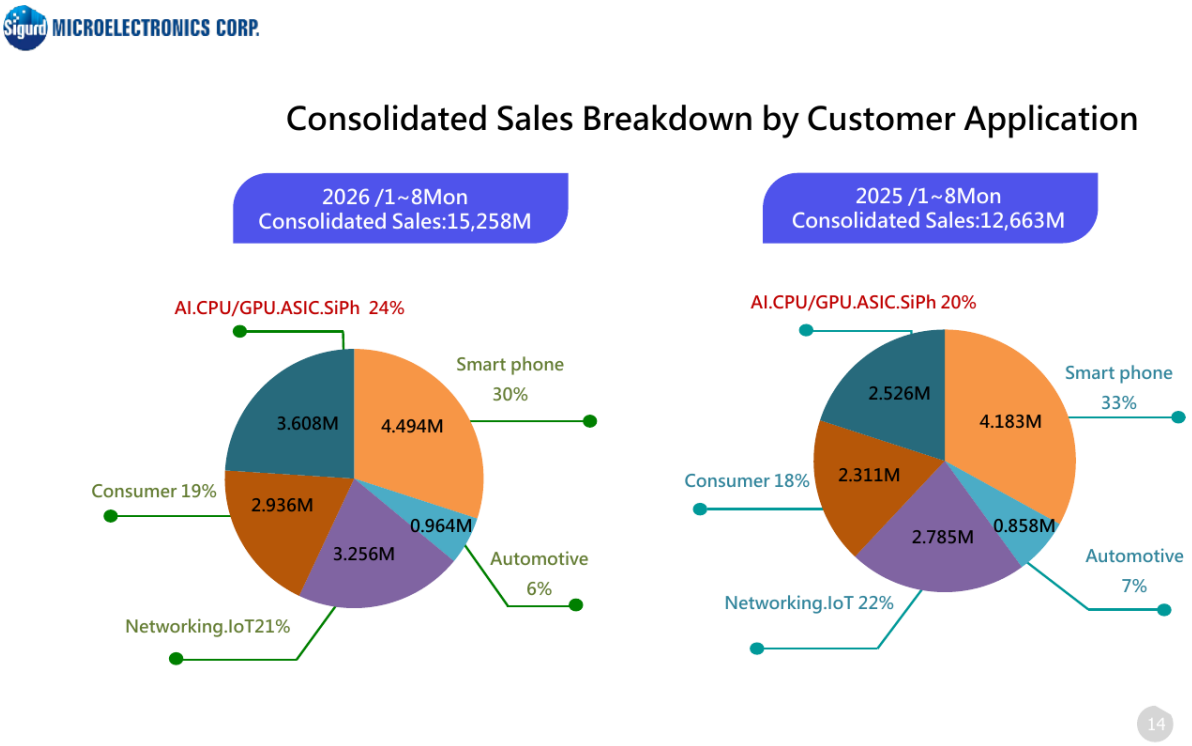

The two latest issuer presentations reviewed are June 23 and October 6. June already described strong demand, customer-reserved Hukou II capacity and expected 2026-27 plant ramps. October advances the timeline: Hukou II started production in July, while Chuangshing III was still expected to finish construction in Q4 2026 and begin production in Q1 2027. This is progress against an existing plan, not a second independent capacity announcement. An unabridged Q&A transcript was not available; unsupported transcript-only utilization, customer names and price increases are not treated as facts.

Five revenue pools, one invoice

For January-August 2026, the issuer discloses TWD15,258 million of consolidated sales: TWD3,608 million AI/CPU/GPU/ASIC/SiPh, TWD4,494 million smartphone, TWD3,256 million networking/IoT, TWD2,936 million consumer and TWD964 million automotive. These sum to the total. The AI-related grouping grew about 43% from TWD2,526 million in the comparable period; it represented about 24% of total sales.

Memory revenue of TWD1,590 million, approximately 10.4% of sales, is a cross-cutting product attribute. It is already within the five application pools and is not added again. Likewise, optical, ASIC, CPU and GPU labels can overlap within the AI pool. The model does not add each label to a separate unconstrained market.

The consolidated filing distinguishes test/packaging revenue from a very small trading business. H1 test/packaging revenue was TWD11,143.960 million and external trading revenue TWD30.513 million. The five end-market forecast pools are analytical allocations of this consolidated economic activity, not five separately reported operating segments. Their margins are assumptions.

October6 issuer deck | Original end-market mix; memory must not be counted as another additive segment.

Why the customer pays for testing

An expensive chip that fails after packaging wastes more than its own wafer cost. It can strand an expensive package, attached memory, optics and customer assembly time. Testing earlier can prevent that loss, but higher signaling rates and integrated optics make the measurement more difficult.

Sigurd's original diagrams identify three optical insertions: PIC wafer sorting, optical-engine wafer test and optical-engine die test. A six-axis positioner controls fiber alignment, while tunable lasers, optical power meters and switching support measurements. The wafer platform supports a 300 mm chuck and a stated range from room temperature to 200°C. These are capabilities, not disclosed customer billings or yields.

Electrical interfaces include PAM4 112G/224G testing; optical-engine work includes BERT and TDECQ. BERT measures bit errors, while TDECQ addresses transmitter quality under an optical modulation test. Those tests are related but not interchangeable. The company also lists 200G VCSEL characterization and optical/electrical double-sided tests. Qualification requires repeatability, correlation to the customer's own test process, throughput and acceptable test-induced damage.

The economic unit is a paid testing service. The model uses TWD0.5 million invoice equivalents solely to make the sales bridge inspectable. It is not a disclosed price per tester, wafer or laser. A faster internal MAP tester can improve Sigurd's cost and customer yield without creating external equipment sales. The same automation can reduce billable test time, which is included in the adverse branch.

October6 issuer deck | Original high-speed electrical and optical test platform, from verification to volume manufacturing.

October6 issuer deck | Original three optical testing insertions and their engineering requirements.

Capacity, timing and pricing

Hukou II contains approximately 28,108 square metres, and Chuangshing III approximately 36,340 square metres. Floor area is not saleable test output. Installed equipment, program qualification, thermal capability, uptime, parallel sites and customer utilization jointly determine effective capacity. An empty bay, an unqualified tester and a low-yield test cell cannot be valued like a fully loaded line.

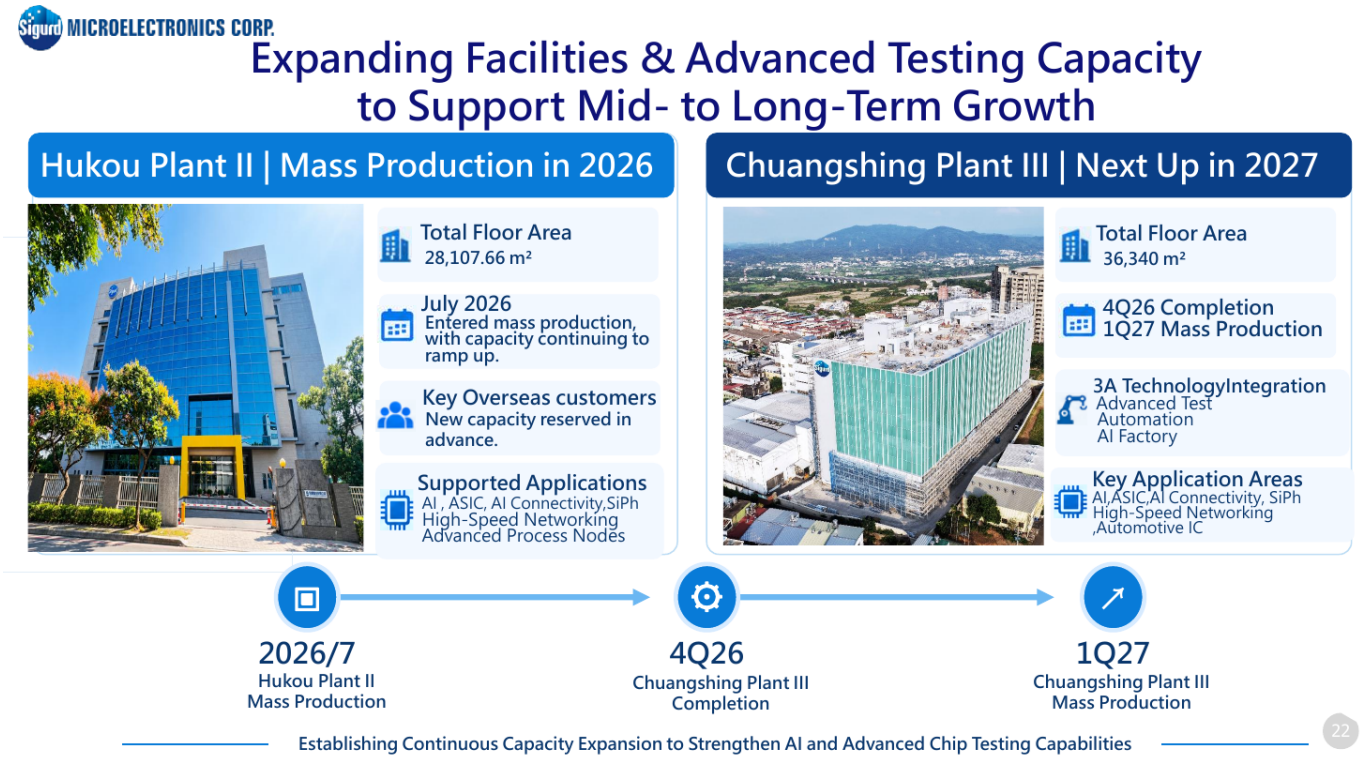

The June presentation says an important overseas customer reserved Hukou II capacity. This is a meaningful demand signal but does not disclose binding minimum purchases, cancellation penalties or a guaranteed margin. The model assumes a gradual ramp and does not capitalize a reservation as contracted profit.

The capital perimeter matters. Winstek, the company called □□□ in the Chinese filing, is already consolidated into Sigurd. The June presentation explicitly distinguishes TWD8.8 billion of parent capex from TWD18.6 billion for the group. October identifies another TWD2 billion at UTC in July, while Winstek's September increase was TWD7.779 billion, lifting its own approved program from TWD5.648 billion to TWD13.427 billion. Treating the later increases as incremental produces a TWD28.379 billion group program. This reconciles the scope; it does not establish that the full amount will be paid or commissioned in 2026.

The model subtracts the TWD6.557705 billion of group PPE additions already booked in H1. The remaining program is TWD21.821295 billion: TWD9.996670 billion outside Winstek, and TWD11.824625 billion within it. The first amount is split evenly across Q3 and Q4 2026; Winstek's program runs through Q4 2027. These are explicit payment and commissioning assumptions. June unperformed purchase contracts were TWD10.802909 billion for the group, including TWD5.180769 billion for Winstek. The commitments are part of the program, not an extra amount added on top.

Scarcity can support pricing on new or resettable orders because a delayed qualification or shipment can cost a customer far more than the test bill. It is less persuasive for fixed-price reserved work. The price branch uses a 3%

premium on only 20% of reference invoices, removes 50% for overlap with reference pricing/mix and applies 50% probability. Added capacity invoices do not receive this premium again.

Sigurd October6,2026 issuer deck, page22 | Hukou II entered production in July2026; Chuangshing III targets Q42026 completion and Q12027 production. Floor area is not qualified test output.

SIGURD MICROELECTRONICS CORP.

Investing in Future Growth

R&D, Equipment, Automation, and Facility Expansion

- In May 2026, the Board approved an additional capex of NT$2.822 billion, bringing full-year capex to NT$8.8 billion, up approximately 48% from the original plan, the group's capital expenditure is estimated to reach NT$ 18.6 billion. The additional investment aims to support increasing testing demand from AI servers, ASIC, AI Connectivity, silicon photonics, networking ICs, silicon capacitors, and 2nm flagship 5G Agentic AI chips. Sigurd will continue to expand facilities and advanced equipment while deepening its 3A Technology strategy: Advanced Test Technology, Automation, and AI Factory. These initiatives will strengthen R&D, engineering, manufacturing, and quality capabilities, supporting customers' long-term growth and driving Sigurd's medium- to long-term momentum.

15

Sigurd June23,2026 presentation, page15 | June issuer capital plan distinguishes8.8bn parent capex from18.6bn consolidated group capex; subsequent budget revisions are reconciled separately.

The reference sales and cost construction

Calendar 2027 reference sales are TWD28.5 billion: AI-related testing TWD8.0 billion, smartphone TWD7.5 billion, networking/IoT TWD6.1 billion, consumer TWD5.0 billion and automotive TWD1.9 billion. These are model forecasts, not issuer guidance. They already include meaningful capacity utilization and mix growth. Reference totals increase to TWD33.2 billion in 2028, TWD38.1 billion in 2029 and TWD42.2 billion in 2030, with lower confidence farther out.

Product gross margins begin at 41%, 31%, 34%, 29% and 31%, respectively, in 2027. They include production depreciation, equipment maintenance, direct labor, utility costs and ordinary production compensation. They are bounded allocations calibrated against the 34.2% reported Q2 gross margin, rather than claims that the company discloses each product's margin. The reference weighted margin improves mostly through a larger advanced-test share, with only 40 basis points of annual vector improvement thereafter.

Reference operating expense is TWD2.52 billion in 2027, then TWD2.96 billion, TWD3.36 billion and TWD3.70 billion. Twenty-nine percent is allocated to R&D/engineering and the rest to selling, administration and normal operating costs. All recurring employee compensation remains expensed. The old group D&A allowances of TWD5.8 billion in 2027 and TWD7.4 billion in 2030 have been replaced by a full capital-cohort schedule. Each product's prior cash contribution is retained, its old depreciation allowance is removed, and the corrected

allowance is charged once: 90% in production cost and 10% in operating expense. This correction leaves group revenue and the existing probability-weighted sales increments unchanged. It does not invent higher sales to offset the cost of the new equipment.

Probability-weighted operating evidence

The qualified-capacity branch has a 55% probability, with 35-70% sensitivity. For 2027, a TWD4 billion conditional gross opportunity is reduced by 50% for capacity and AI growth already embedded in the reference, leaving TWD2 billion. The conditional net increment rises to TWD3.2 billion in 2028 and TWD4 billion in 2029-30, then stops accelerating. The initial revenue bound is zero to TWD4 billion after overlap.

That additional revenue earns 32% gross margin after its depreciation and direct costs, less 8% for added applications support and operating expense. The resulting conditional operating margin is 24%, before common-shareholder attribution. This is less than simply assigning mature reference margins to an immature plant. The 2027 probability-weighted consolidated operating contribution is TWD264 million before the minority allocation.

The pricing branch retains 75% of incremental premium revenue after production and support cost. It is separate from utilization, applies only to reference invoices and fades by 25% after 2028. The adverse execution/efficiency branch has 30% probability and removes 8% of reference AI revenue, with a 40% decremental operating margin. Delayed qualification and more efficient parallel testing are treated as one overlapping risk rather than independent shocks.

No extra branch is applied to 2026: the monthly revenue anchor and near-term margin forecast already embody the July start and current demand. That zero is an overlap and timing decision. It is not a rule that forward evidence must await official confirmation.

Earnings belong to more than one shareholder

At June 30, common issued shares were 483.912325 million. Treasury holdings were 5.658 million, leaving 478.254325 million outstanding. H1 diluted weighted-average shares were 481.117 million. The model retains the full issued denominator and its existing 0.22 million quarterly dilution assumption. No price split, multiple or horizon convention changes in this correction.

Winstek is not an unconsolidated investment. Sigurd's June consolidated filing lists a 51.90% direct holding through one subsidiary, a 0.03% holding through another and an additional 0.62% holding acquired by UTC. The filing's material minority-interest table gives a 47.45% noncontrolling share, corresponding to 52.55% for the group. Sigurd's credit terms require at least 51% and board control; a narrower standalone source mentions a 50% threshold, so the stricter group covenant governs this analysis.

All Winstek sales are already inside the five consolidated application pools. The correction therefore adds neither its sales, its standalone share-price value nor its full independent growth branches to group earnings. Winstek's independently costed operating forecast is used only as an embedded allocation of the unchanged consolidated total. Its 47.45% outside operating interest is deducted once. A 0.26234% reserve on the remaining group's operating profit covers the small residual other-NCI exposure; this is the H1 net-income residual after normalizing Winstek to the ending ownership percentage, not a measured forecast of future subsidiary operating profit.

The embedded Winstek OP proxy is converted to the group's existing IFRS lease convention. Its standalone full-rent treatment is adjusted by the small net difference between modeled long-lease cash cost and the ROU depreciation retained in group OP. Financial claims then include the associated lease claim once. Matching NCI financial claims are removed from the consolidated claims deducted from common equity. No additional NCI

book-value or market-value claim is deducted. A higher embedded Winstek profit share can reduce parent-attributable earnings when the total group profit is held fixed; that is an attribution sensitivity, not a claim that Winstek growth is bad for Sigurd.

6.對本集團具重大性之非控制權益之子公司：

Sigurd H1 consolidated financial report, page18 | Statutory June filing identifies Winstek (□□□) as a material consolidated subsidiary with47.45% noncontrolling ownership.

Cash, financing and the capital-spending stress

June cash was TWD12,084.450 million. Face bank debt is TWD13,422.835 million, including the TWD9.855 million of unamortized loan fees that were previously netted from the carrying value. Group lease claims are TWD756.266 million. The TWD3 billion bond redemption already occurred in H1 and is not repeated. Restricted deposits, corporate bonds and cross-holdings receive no available-cash credit.

H1 PPE cash payments were TWD6,093.438 million. The old TWD6,056 million input was approximately this number after subtracting TWD37.475 million of disposal proceeds; it was not gross cash capex. Future additions are converted to cash with a separately identified TWD880.944 million opening net equipment-payable bridge, paid across H2. Already purchased June WIP is not paid for again.

The consolidated cash model pays the full capital program. Its modeled group additions are TWD13.796670 billion in H2 2026, TWD13.624625 billion in 2027, TWD9 billion in 2028 and TWD8 billion in each later year. It also pays

the full TWD2,305.580 million June-declared dividend balance, comprising TWD2,032.431 million for parent shareholders and TWD273.149 million outside the parent, and the separately accrued TWD608.297 million prior-period employee/director compensation. Future recurring compensation remains fully expensed in OP; the opening balance is a cash-timing item.

The cash bridge preserves 3.5% bank interest, 20% cash tax on positive earnings after interest, 20% working capital on positive sequential revenue growth, and TWD50 million quarterly lease service. It maintains a TWD3 billion operating cash floor. Current debt is assumed refinanced at maturity; that is an explicit rollover assumption, not free borrowing. Incremental draws cannot exceed the disclosed TWD8.391509 billion unused group credit pool, which already includes Winstek's TWD3.877950 billion. The two facilities are never added twice.

Winstek's standalone funded expansion assumes a hypothetical pro-rata equity raise, with 90% financing probability and 3% issuance fees. Consolidation eliminates the parent's 52.55% subscription against subsidiary proceeds. Only outside shareholders' 47.45% gross proceeds enter group cash, and the group pays all issuance fees. The central probability-weighted net outside contribution is about TWD2.17 billion. There is no second parent-subscription cash expense after the full group capex has been paid. Pro-rata participation preserves ownership; no unannounced raise is represented as an established fact.

The central path reaches TWD20.08 billion of group bank debt, approximately TWD6.66 billion above June, while preserving the cash floor. Six of the 16 combinations of the three original operating branches and outside-equity availability would miss that floor if every future dividend were paid. A bounded capital-allocation policy cancels only the necessary future, undeclared common dividend before that breach. It preserves the existing declared dividend and all modeled contracted capital and operating costs. The largest cancellation is about TWD409 million. All 16 modeled combinations then remain within the documented credit envelope; their probability-weighted Q4 2027 valuation is TWD121.62, close to the expected-input model's TWD121.63.

This proves arithmetic feasibility at the consolidated level, not that cash and collateral can freely move between each legal entity. Lender covenants, facility renewal, draw eligibility and parent participation remain material conditions. A 20% capex overrun, half the unused facilities becoming unavailable, or the combined adverse stress still fails the modeled funding limit; their raw valuation arithmetic is not presented as a funded target. No rescue equity or unlimited credit is inserted to erase the failures.

Depreciation without counting the same asset twice

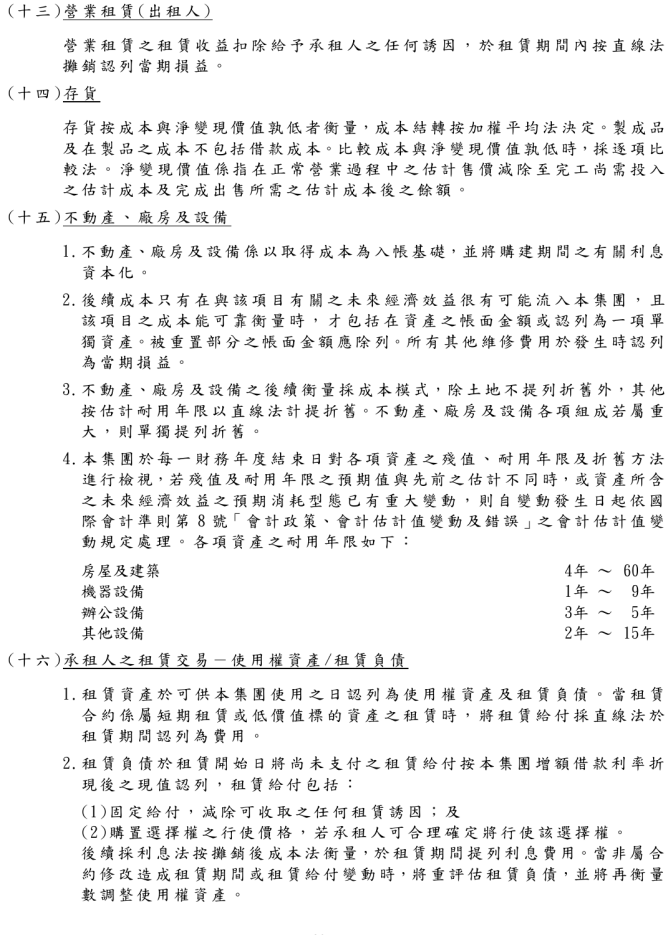

The starting in-service D&A and new-capital cohorts are separate. H1 group D&A was TWD2,067.897 million, including TWD436.526 million at Winstek. Removing Winstek leaves TWD1,631.371 million for H1, or TWD815.6855 million per quarter. That run rate already includes assets commissioned during H1; those historical commissioned additions are not added to a new cohort again. The remaining existing-asset run rate tapers as assets reach the end of their lives.

June WIP was TWD5,330.865 million, including TWD880.308 million at Winstek. The residual TWD4,450.557 million had not yet entered the in-service pool. It receives only future depreciation on commissioning, not a second capex cash payment. New cohorts then include only purchases after June. The model assumes midpoint commissioning and 90% equipment over five years plus 10% buildings over 20 years. The audited issuer policy allows equipment lives of 1-9 years and buildings of 4-60 years; the selected mix and lives are modeling judgments within those ranges, not issuer guidance.

The 2027 D&A total is TWD8,807.398 million. It comprises TWD3,100 million of existing ex-Winstek D&A, TWD823.353 million for its opening WIP and TWD2,311.884 million for post-June capital; Winstek contributes TWD860 million existing D&A, TWD162.857 million opening-WIP D&A, TWD1,536.624 million new-capital D&A,

and TWD12.680 million ROU depreciation. This replaces the old TWD5,800 million allowance. The model preserves cash margins and deducts only the difference; it does not subtract both old and new D&A.

The Q4 2027 result is sensitive to these engineering assumptions. At 60% equipment and five-year equipment lives the modeled ceiling is TWD173.14; 90% equipment and seven-year lives gives TWD180.50; 60% equipment and seven-year lives gives TWD212.39. Delaying only opening-WIP commissioning by one quarter leaves the active-horizon result near TWD121.52 because most of that commissioning still occurs before the horizon. These sensitivities retain the same revenue and cash spending; they isolate cost timing and economic lives. They are not alternative analyst price targets.

（十三）營業租賃（出租人）

營業租賃之租賃收益扣除給予承租人之任何誘因，於租賃期間內按直線法攤銷認列當期損益。

（十四）存貨

存貨按成本與淨變現價值孰低者衡量，成本結轉按加權平均法決定。製成品及在製品之成本不包括借款成本。比較成本與淨變現價值孰低時，採逐項比較法。淨變現價值係指在正常營業過程中之估計售價減除至完工尚需投入之估計成本及完成出售所需之估計成本後之餘額。

（十五）不動產、廠房及設備

1. 不動產、廠房及設備係以取得成本為入帳基礎，並將購建期間之有關利息資本化。
2. 後續成本只有在與該項目有關之未來經濟效益很有可能流入本集團，且該項目之成本能可靠衡量時，才包括在資產之帳面金額或認列為一項單獨資產。被重置部分之帳面金額應除列。所有其他維修費用於發生時認列為當期損益。
3. 不動產、廠房及設備之後續衡量採成本模式，除土地不提列折舊外，其他按估計耐用年限以直線法計提折舊。不動產、廠房及設備各項組成若屬重大，則單獨提列折舊。
4. 本集團於每一財務年度結束日對各項資產之殘值、耐用年限及折舊方法進行檢視，若殘值及耐用年限之預期值與先前之估計不同時，或資產所含之未來經濟效益之預期消耗型態已有重大變動，則自變動發生日起依國際會計準則第 8 號「會計政策、會計估計值變動及錯誤」之會計估計值變動規定處理。各項資產之耐用年限如下：

房屋及建築	4年 ～ 60年
機器設備	1年 ～ 9年
辦公設備	3年 ～ 5年
其他設備	2年 ～ 15年

（十六）承租人之租賃交易－使用權資產/租賃負債

1. 租賃資產於可供本集團使用之日認列為使用權資產及租賃負債。當租賃合約係屬短期租賃或低價值標的資產之租賃時，將租賃給付採直線法於租賃期間認列為費用。
2. 租賃負債於租賃開始日將尚未支付之租賃給付按本集團增額借款利率折現後之現值認列，租賃給付包括：

(1)固定給付，減除可收取之任何租賃誘因；及
(2)購置選擇權之行使價格，若承租人可合理確定將行使該選擇權。
後續採利息法按攤銷後成本法衡量，於租賃期間提列利息費用。當非屬合約修改造成租賃期間或租賃給付變動時，將重評估租賃負債，並將再衡量數調整使用權資產。

-26-

Sigurd2025 audited financial report, page26 | Audited accounting policy: equipment1-9years and buildings4-60years. Selected model mix and lives remain assumptions.

Competition, second-order effects and duration

Sigurd benefits from growth in difficult-to-test chips, but the opportunity is shared with ASE, KYEC and other qualified OSATs. Test-equipment suppliers such as Advantest and Teradyne benefit when Sigurd buys equipment, while their delivery constraints can delay Sigurd's own revenue. Optical alignment and inspection suppliers may capture value before the OSAT receives steady service revenue.

An optical supplier's sold-out capacity does not guarantee Sigurd gets its testing. Customer qualification, device architecture and outsourcing decisions determine the route. Winstek is both a relevant packaging/testing supplier and an already consolidated subsidiary. Holding both listed securities creates overlapping economic exposure. That overlap should be recognized in portfolio construction, while each security still has its own per-share valuation and capital claims.

The moat lasts while customers value program correlation, yields, installed capacity and qualification lead time. It weakens if customers qualify alternatives, bring testing in-house, reduce test duration or purchase enough equipment to remove the bottleneck. A supplier's process improvement can be excellent for customers while limiting long-run test revenue per chip.

What would change the model

The near-term tests are Chuangshing III's actual production start, Hukou II utilization, exact consolidated capex, customer-reservation terms, new program mix and gross margin after higher depreciation. The model should rise if qualified paid output exceeds the reference without disproportionate costs, or if repeatable premium terms are demonstrated. It should fall if test efficiency reduces revenue faster than costs, qualification slips, traditional end markets weaken or subsidiary earnings accrue disproportionately to outside owners.

The analytical score is 44/60, rounded to 73. It reflects a strong but capital-intensive execution story. The dated price-based growth/re-rating label should be recalculated from the first displayed target and active horizon using the owner's sequential-percentage method; it is not a permanent business label or a literal P/E decomposition.

Ownership and correction sensitivity

Holding the consolidated OP path fixed, increasing the embedded Winstek OP allocation by 25% gives a Q4 2027 ceiling of TWD112.27; reducing it by 25% gives TWD130.98. The direction reflects a larger or smaller share accruing to outside Winstek owners, with the total group profit unchanged. These quoted attribution and useful-life sensitivities use the expected-input diagnostic and require a full scenario rebuild before adoption. This is a diagnostic of allocation uncertainty, not an independent group sales forecast.

The final Q4 2027 ceiling is TWD121.621281. It weights the 16 independently valued operating/funding outcomes; the TWD121.628164 expected-input result is a separate diagnostic. An earlier internal calculation omitted part of the capital perimeter; that superseded calculation is retained only in the recoverable audit history, not as a previously delivered target. Most of the change comes from previously omitted group capital costs and the corrected depreciation profile, with cash claims and attribution also reconciled. The model remains at 20x fully expensed F4Q OP, uses the same end-window share schedule and retains the analytical and Excel Base of 73. The source, assumption and funding records are retained with the adopted model.

Recalculating the ownership bridge

The embedded Winstek expected OP allocation is held fixed when the three existing group operating branches are toggled. The reference NCI deduction is 47.45% of that Winstek OP plus 0.26234% of the residual group's reference OP. Each conditional group branch then carries only the 0.26234% residual minority deduction on its own OP increment. This explicit bridge avoids applying one uniform group haircut to every operating change. It also explains why the zero-group-branch reference still contains the separately estimated embedded Winstek business. The embedded allocation is not an additional sales forecast.

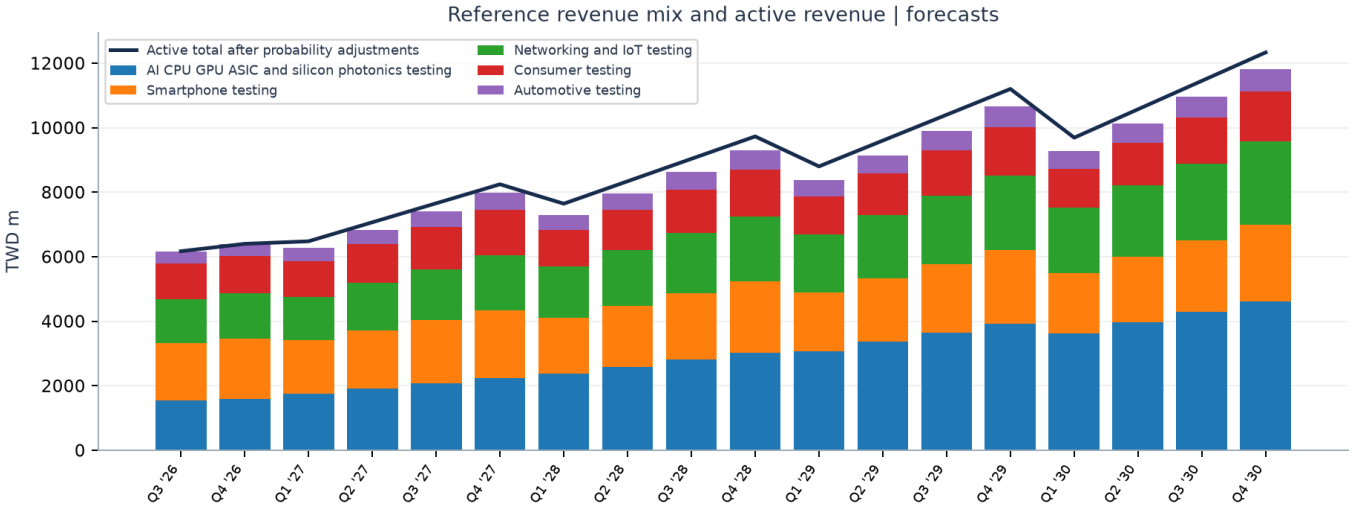

Changing Winstek's embedded operating assumptions, ownership, capital timing or financing requires rebuilding its attribution and the consolidated cash paths before adopting revised targets. The scenario schedules retain

matched end-window claims and shares; they are not universal fixed financial claims that remain correct under every slider change.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Qualification, test programs and optical alignment are sticky, but there are competing OSATs.
Cycle	8	Current customer reservations and 2026/27 facilities support a multi-quarter ramp, with capex risk.
TAM	8	Five customer application pools reconcile to group revenue; optical testing is not a separate added TAM.
Catalysts	4	Hukou II utilization, Chuangshing III qualification and 224G/optical production ramps.
Macro	8	AI compute and connectivity supportive; smartphone, FX and geography remain cyclical.
Alpha	4	Separates cross-cutting product labels, budget revisions and consolidated parent/subsidiary exposure; Winstek is already in Sigurd revenue.
Risk classes	-4	Concentration, depreciation/funding, customer qualification and minority/scope uncertainty are four distinct risks.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

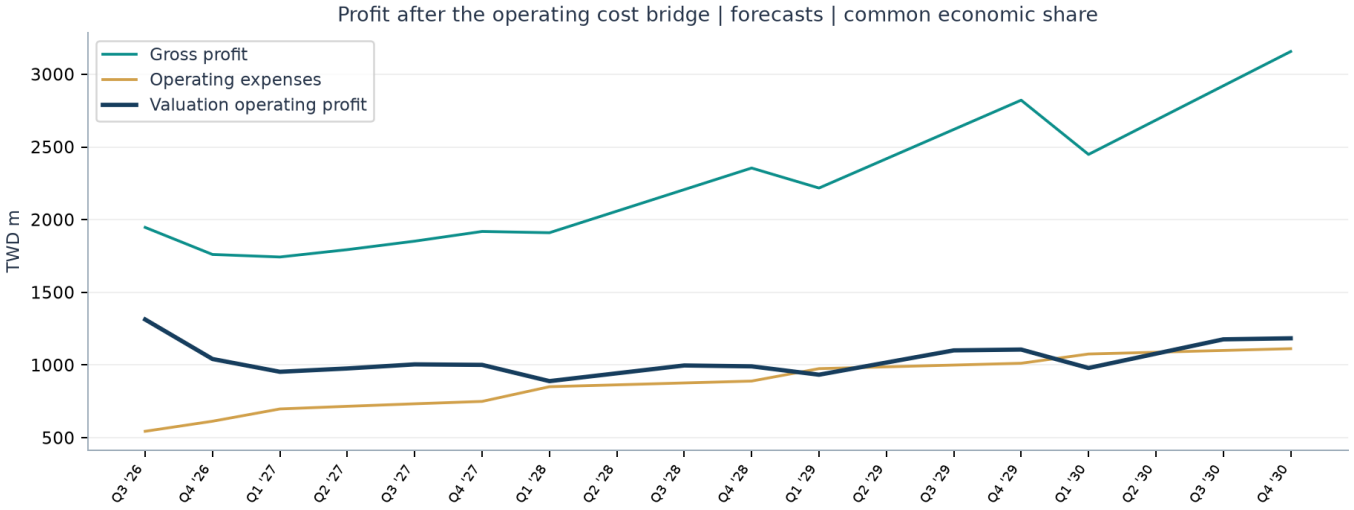

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	6,171.5	0.0	6,171.5

Gross profit, operating expenses and earnings

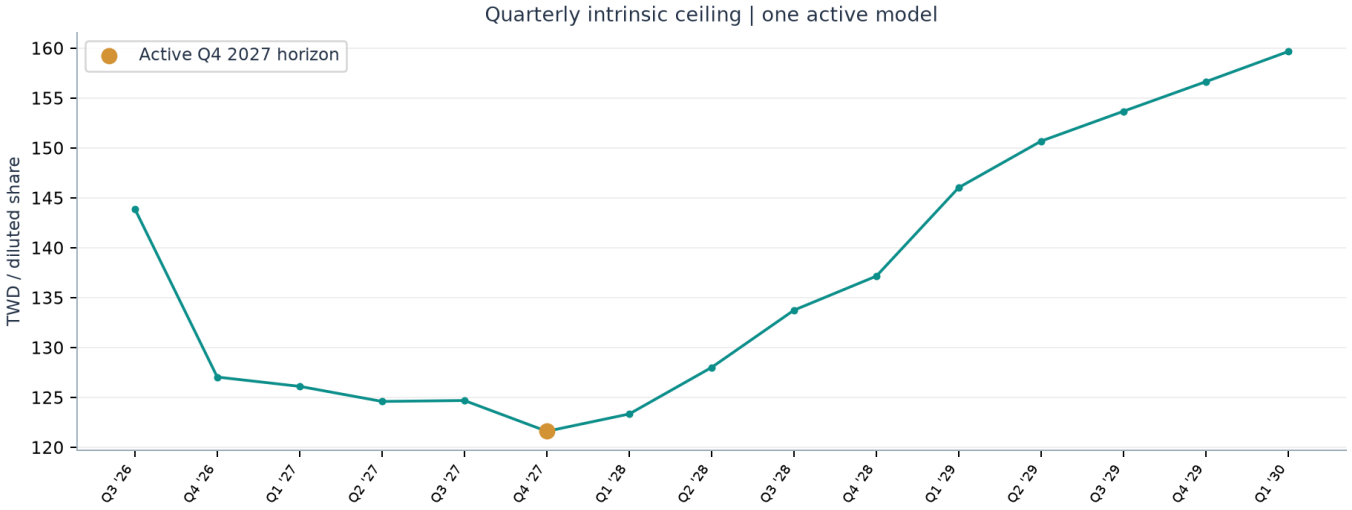

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter / status	Revenue	GP	Opex	Valuation OP	OP margin

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	AI CPU GPU ASIC and silicon photonics testing	1,542.9	37.9%	584.9
Q3 2026	Smartphone testing	1,789.7	29.4%	526.3

Q4 2030	268.2	656.8	145.8

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Quarter	Branch	p	Conditional revenue	Conditional GP	Conditional opex	Weighted OP

Subsidiary ownership and common operating profit

The preceding weighted OP is after branch-specific minority earnings. Reference and conditional subsidiary profit are allocated within consolidated sales and costs, never added as a second revenue source. Ownership is reported; future subsidiary margins, volume and credit sharing are labeled assumptions.

Quarter	Consolidated OP	Reference minority	Active minority	Common OP

Enterprise-to-equity reconciliation

20x forward-four-quarter fully expensed operating profit attributable to Sigurd common shareholders, less matched entity-attributed financial claims and divided by end-window diluted shares. The same20x OP basis and share/horizon conventions are preserved. Sixteen explicit operating/financing outcomes are valued separately before weighting; the expected-input ceiling is disclosed only as a diagnostic.

Valuation quarter	Claims date	Reference claims	Weighted change	Total claims used	Ceiling / share

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Persistent outcomes and common equity

Operating outcomes remain coherent across the earnings window. Each outcome uses its own fully expensed profit, financial claims and end-window diluted shares. Negative common-equity value is floored before probability weighting. Cash needed for operations is not surplus valuation cash. Funding inputs must be rebuilt when operating assumptions change.

Q4 2027 outcome	Probability	F4Q OP	End shares	Claims	Ceiling

Outcome funding paths

TWD m. Cash flow includes operating profit, noncash adjustments, tax, capex and working capital. Financing and claims assumptions are shown separately. A funding failure invalidates that outcome; an available facility is not automatically received cash.

Quarter / outcome	End cash	Capex	Working capital	New funding	Diluted shares

Claim decisions, overlap and triggers

QUALIFIED_TEST_CAPACITY

p: 0.55

source: June and October management decks

bounded: Conditional annual net revenue TWD2.0/3.2/4.0/4.0bn in CY2027-30; bounds 0-4bn in 2027. Selected p55%, sensitivity35-70%.

bridge: Existing net incremental testing revenue and32% GP less8% support remain unchanged. The common-shareholder allocation is now explicit entity-level minority attribution rather than a uniform89.75% group haircut.

overlap: Reference already includes consolidated Winstek, AI and networking growth. Winstek N2/optics branches are used only to attribute embedded profit; they are not added to group sales. No additive floor-space or order multiplier.

decision: Activate proposal from2027; no extra2026 increment because revenue/ramp already anchored.

counter: Automation reduces required test hours and new facility space may lack qualified testers.

NEW_ORDER_PRICE

p: 0.5

bounded: 3% conditional premium on20% new/repriceable reference invoices;50% overlap; bounds0-5% premium and10-30% exposure.

bridge: Premium revenue x75% incremental OP retention. No extra price on capacity-branch invoices.

overlap: Half already reflected in reference mix; fixed-price backlog excluded.

decision: 2027-28 then25% fade.

RAMP_DELAY_AND_TEST_EFFICIENCY

p: 0.3

bounded: Lose8% reference AI invoice revenue, bounds5-15%.

bridge: 48% gross decrement less8% variable opex relief=40% consolidated OP loss.

overlap: Captures deployment delay and efficient parallel test together, not two independently added demand shocks.

decision: Apply adverse branch each forecast year.

WINSTEK_OUTSIDE_EQUITY

p: 0.9

source: Winstek independently built capital-funding proposal, not an announced raise

bounded: 90% probability of pro-rata financing; sensitivity75-97%. Only47.45% gross proceeds less100% issuance fees enter group cash. Complementary10% has no outside proceeds.

overlap: Subsidiary capex, facility capacity and bank balances are already within the consolidated group. Parent52.55% equity subscriptions eliminate against subsidiary receipts. No addition of the subsidiary market value or NCI book value.

bridge: Financing changes group cash/claims only, not operating revenue. Existing20x OP basis is retained; outcome-specific claims are deducted at the F4Q end. Future undeclared common dividends may be reduced to respect the documented credit envelope.

decision: Retain full group operating/capital schedule in both financing alternatives; no new parent shares or unlimited borrowing assumed.

counter: Cash/facility ringfencing, ownership covenant and lender permissions remain conditions; stresses retain failures.

Remaining bounded uncertainties

- The28.379bn reconciled approved capital envelope is not a disclosed cash-payment schedule. June18.6bn includes Winstek; July2bn and September7.779bn are later increases. Their additive treatment and payment timing need confirmation against future filings.

- Group cash and unused credit cannot automatically be transferred between all legal entities. The funding model is a consolidated envelope, not proof of covenant compliance or unrestricted parent liquidity. Existing borrowings are assumed refinanced at maturity; no new unlimited facility is assumed.

- Winstek OP is an embedded attribution proxy from its independently costed forecast, not extra group earnings. Other-NCI reserve uses an end-period-ownership-normalized H1 net-income residual and is not a measured future OP allocation.

- Outside Winstek equity is hypothetical, not announced. Pro-rata Sigurd participation maintains52.55% ownership and satisfies the stricter51% parent credit covenant, subject to lender terms and capital access. A no-outside-equity stress is retained.

- New group D&A replaces the old allowance. Five-year equipment and20-year building lives, midpoint commissioning, existing-asset taper and opening WIP commissioning are explicit bounded assumptions.

- No extra Winstek revenue, capacity branch, equity stake value or NCI book-value deduction is applied. Separate coverage of the parent and subsidiary creates overlapping economic exposure for portfolio construction.

- Latest management decks reviewed June23 andOctober6. Full unabridged management Q&A remains unavailable. Current price283TWD isOctober8close;October9Taiwan holiday.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
