Alfa Laval

ALFA.ST | Nasdaq Stockholm | 2026-10-11

Q4 2027 model ceiling: SEK 714.20

Analytical Base 45/60 = 75 | Qualified cooling supplier with funded expansion; diversified cyclicals remain material

20 x fully expensed parent-attributable forward-four-quarter operating profit, quarter plus next three, less end-window debt, leases, pension and other claims net of cash above SEK3,000 m, divided by 413.326315 m common shares.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in SEK million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: SEK 577.60 per share (2026-10-09 regular Stockholm close; quote page labels 17:29 CET despite seasonal timezone ambiguity); 413.326 million common shares (June 30 2026; issued shares equal basic and diluted count. No share-based compensation in 2024-25 and no subsequent dilutive instrument was found.); estimated equity capitalization SEK 238,737.3 million. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: 57% growth under the owner's sequential-percentage heuristic (43% re-rating / 57% growth). Uses the dated 2026-10-09 regular Stockholm close; quote page labels17:29CET despite seasonal timezone ambiguity price, Q4 2026 ceiling and Q4 2027 ceiling at the artifact's own valuation basis. This compares two percentage moves with different denominators; it is not an additive return attribution or a measurement of actual P/E expansion. The classification changes with price and forecasts.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	15,312.5	20x	413.326	714.20

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Full consolidated group. Data-center thermal equipment is inside Energy. The clean-water flow branch is a residual opportunity within Food & Pharma. R&D, acquisition amortization, ordinary depreciation and cash incentives remain fully expensed. Normalized minority operating profit is deducted once before 20 x; no additional minority book-value claim.. 20 x fully expensed parent-attributable forward-four-quarter operating profit, quarter plus next three, less end-window debt, leases, pension and other claims net of cash above SEK3,000 m, divided by 413.326315 m common shares.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use SEK million unless a different unit is stated.

Thesis

Full research model, October 11, 2026. Nasdaq Stockholm ALFA, model identifier ALFA.ST. Financial amounts are SEK millions and shares are millions unless stated otherwise. The October 9 close was SEK577.60. This is an authorized new research addition, not evidence of a portfolio holding. The current production framework was read before the model was built.

Investment conclusion

Alfa Laval brings a qualified heat-transfer franchise to liquid cooling, backed by a large industrial and marine business. The useful near-term evidence is unusually concrete: management says data-center orders are running at approximately SEK5 bn annually and the expanded capacity coming online around the end of 2026 and early 2027 is already booking. It also says the existing footprint cannot invoice that volume today. That difference determines the forecast. Orders secure future utilization; acceptance and delivery produce sales.

The reference recognizes SEK5 bn of thermal data-center sales in 2027, then SEK7 bn in 2028. A separate probability-weighted branch captures a bounded amount above that trajectory. We retain the marine, food, pharmaceutical, HVAC and cryogenic businesses, their service mix and their costs. This is not a model in which every krona of company growth is AI.

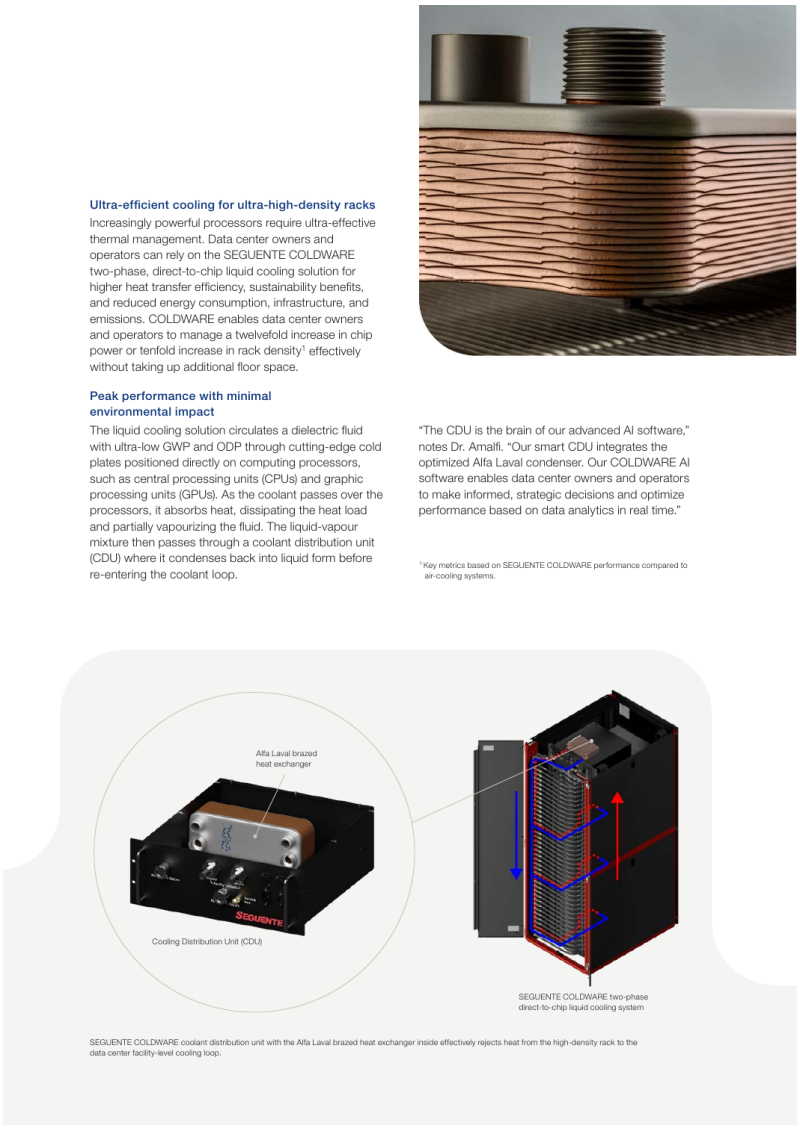

At the selected 20 x fully expensed forward operating-profit method, the model produces a mixed upside story, leaning toward Growth under the owner's sequential-percentage calculation. Both the near target and later target enter that ratio; it is a heuristic, not an accounting decomposition of P/E change versus earnings growth. The exact valuation, target multiple and shares are carried into the generated tables from model.json.

The product and the moat

Alfa Laval sells heat exchangers that move heat between separated fluid circuits, plus separation and fluid-handling equipment. In a liquid-cooled data center, these components can transfer heat from the rack or secondary loop to the facility loop. Pressure drop, fluid compatibility, fouling, reliability and thermal performance affect both cooling efficiency and the pumping load. A supplier that has already qualified with the system designer can have an advantage when customers need predictable delivery at scale.

The April 2024 SEGUENTE case explains the specific component. Its two-phase direct-to-chip system uses evaporation at the chip and an Alfa Laval brazed heat exchanger as the condenser inside a third-party coolant distribution unit. The photograph and diagram on page 3 have been inspected and are retained as the product exhibit. Alfa Laval is not the seller of the whole CDU or the server rack. Vendor claims of more than 200 kW per rack, up to 98% cooling-energy savings,60% lower total cost and 95% heat capture are comparisons against the case's air-cooling baseline; they are not universal performance guarantees or revenue multipliers.

Customer engineering, qualified designs, a broad production footprint and aftermarket support are the moat. They do not establish monopoly supply. The company must continue to compete on delivery, pressure drop, heat-transfer efficiency, quality and total operating cost. It can gain share while the industry adds capacity, but neither market share nor product-level gross margin is disclosed precisely enough to treat as a fact. The model explicitly labels both its product allocation and incremental margins as assumptions.

Alfa Laval April2024 SEGUENTE case, page3 | SEGUENTE case, April2024, page3: Alfa Laval condenser inside a third-party CDU. Complete rack value is not Alfa Laval revenue.

Two calls and the operating baseline

The April 22 and July 21 management presentations and Q&A were reviewed in full through public call reproductions and checked against primary financial reports. April described rolling data-center orders around SEK2.5 bn, up from about SEK2 bn in the preceding quarter. In July management clarified an annual pace of approximately SEK5 bn. It did not validate the analyst's suggestion that SEK2 bn had been booked in Q2 or that the same amount was already recognized revenue. The capacity being sold is principally for 2027, with further investment decisions supporting 2028.

The group reported Q2 orders of SEK22,235 m, sales 18,117 m and operating profit 2,895 m. Adjusted EBITA was 3,071 m, higher than operating profit because it excludes purchase-price amortization. H1 sales were 34,036 m,

gross profit 12,754 m, selling and administration 5,578 m, R&D920 m, other operating costs 606 m and joint-venture losses 42 m. These reconcile to H1 operating profit 5,608 m. Total H1 D&A was 1,403 m, including 350 m acquisition amortization. We use fully expensed operating profit rather than relabeling adjusted EBITA as earnings.

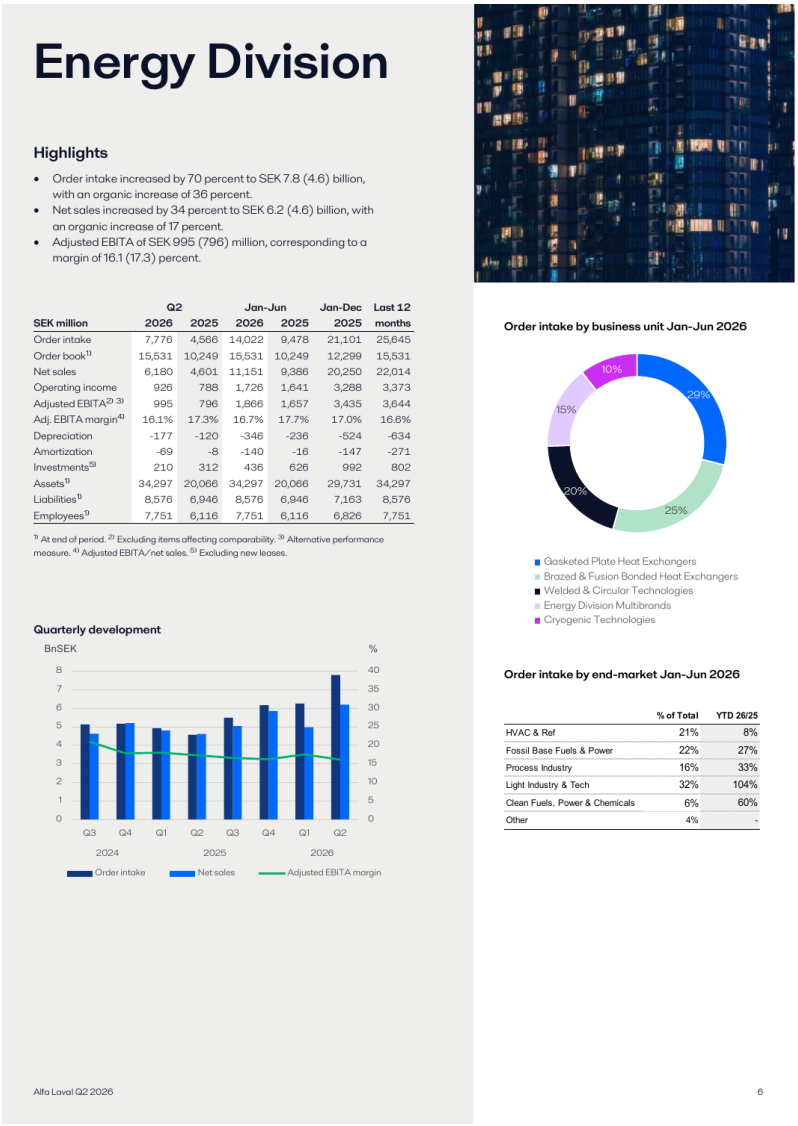

H1 operating cash flow was 3,650 m and cash capex 1,541 m. Q2 capex included roughly 450 m for a previously leased US warehouse. The current capital-spending guidance is SEK2.5-3.0 bn for 2026 and up to 1.0 bn in Q3; the model uses the upper annual bound. Management has not provided an annual 2026 revenue target. Its SEK100 bn 2030 ambition is a strategic goal, not guaranteed output.

The Energy division provides the closest read on thermal demand. H1 sales were 11,151 m and operating profit 1,726 m; adjusted EBITA was 1,866 m. Q2 orders were 7,776 m, sales 6,180 m and operating profit 926 m. Backlog reached 15,531 m. The primary page 6 exhibit shows these numbers and the technology order mix. That pie is orders, not a revenue split. Data centers sit inside several categories, so neither the entire light-industry bucket nor all Energy orders are counted as AI.

Energy margins face uneven welded and cryogenic utilization, less favorable service mix, input costs and organizational expenses. A large LNG order can improve cryogenic loading without being a data-center sale. The July 1 price action primarily compensates for energy, fossil-based inputs and related cost inflation. It is inappropriate to put the whole price increase into incremental profit.

Food & Pharma reported H1 sales 11,239 m and operating profit 1,568 m; Ocean reported 11,343 m and 2,561 m. Other and consolidation contributed 303 m sales and a 248 m operating loss. The high service share in Ocean, above 40%, makes its economics different from a new thermal-equipment ramp. Group service is approximately 30%. The cost of supporting a growing organization remains in the model.

Orders from 2026 onward exclude cancellations and currency revaluation from the new-order measure; those changes still enter backlog. Comparisons with older order figures must recognize that change. Group backlog of SEK53.546 bn had about 29.1 bn scheduled for the remainder of 2026 and 24.5 bn later. Backlog timing is useful evidence, but it is not a guarantee against customer rescheduling or acceptance delays.

Energy Division

Highlights

- Order intake increased by 70 percent to SEK 7.8 (4.6) billion, with an organic increase of 36 percent.
- Net sales increased by 34 percent to SEK 6.2 (4.6) billion, with an organic increase of 17 percent.
- Adjusted EBITA of SEK 995 (796) million, corresponding to a margin of 16.1 (17.3) percent.

	Q2		Jan-Jun		Jan-Dec	Last 12
SEK million	2026	2025	2026	2025	2025	months

Alfa Laval Q2 2026 6

Alfa Laval Q2 2026 report, page6 | Q2 2026 issuer report, page6: Energy orders, sales and profit. The order-share pie is not a revenue mix.

Revenue recognition and the full-group reference

The model separates five product groups: data-center thermal equipment, other Energy products, Food & Pharma, Ocean, and other/consolidation. Reference 2026 sales are respectively SEK3.0 bn,20.7 bn,25.6 bn,24.0 bn and 0.6 bn, totaling 73.9 bn. The H1 data-center split is an explicit 1.25 bn analytical allocation inside actual Energy sales 11.151 bn. The other H1 division totals come directly from the report.

Every 2026 product forecast subtracts the H1 allocation before distributing the remaining amount across Q3 and Q4 in a 25:27 proportion. Actual H1 sales plus those remaining quarters equal 73.9 bn. H1 actual gross profit and fully expensed costs are retained. The remaining product gross margins are scaled to reconcile the modeled annual gross profit; actual first-half profit is not rewritten. H1 actual operating profit plus the remaining reference quarters equals SEK12.4425 bn for 2026.

The 2027 reference is SEK80.82 bn: thermal 5.0 bn, other Energy 22.2 bn, Food & Pharma 28.0 bn, Ocean 25.0 bn and other 0.62 bn. By 2030 the reference reaches 99.8 bn, close to the strategic 100 bn ambition. Thermal rises to 11 bn, while other Energy reaches 26.1 bn, Food & Pharma 34 bn and Ocean 28 bn. These paths are

analyst estimates grounded in current backlog, capacity, installed service and plausible adjacent demand. They are not management guidance or a bank target.

Food & Pharma includes the phased Acelen biofuel project, including its approximately SEK1.1 bn order and delivery horizon extending through 2029. Ocean includes new LR-tanker pump penetration and service. LR economics are less directly comparable to Alfa Laval's established MR position, and the company does not claim a similarly compelling value proposition in every crude-oil tanker application. Commissioning capability must grow alongside order intake.

Desmet was acquired in 2022. The October 5 announcement to integrate it fully by July 2027 does not create another acquisition's worth of revenue. The reference includes growth and ongoing integration costs; no undisclosed synergy target is added. Similarly, the Indonesian collaboration concerns 40 already installed exchangers and four-year performance assessments, not a fresh 40-unit order. A bounded service proxy is small and overlaps the existing service trajectory.

Probability-weighted incremental evidence

The thermal-expansion branch assigns 55% probability to additional annual sales of SEK0/0.5/1.5/2.5/3.5 bn in 2026-30 above the reference. A50% overlap reserve leaves half as potentially incremental. The residual earns 42% gross contribution, less 17% for engineering, qualification, selling, warranty and support, yielding 25% operating contribution. It requires incremental capex equal to 25% of weighted sales and working capital at 18.5% of annual sales. Ordinary depreciation remains expensed; its 6% cash addback is not an earnings uplift.

The probability reflects qualified customer programs, bookings into expanded capacity and management's indication of further investment. It remains below certainty because more capacity does not automatically become accepted production, customer power can delay deployments and competitors can qualify. Sensitivities vary probability 35-70%, the 2028 conditional increment 750-2,000 m, overlap 35-75% and operating contribution 18-30%. These are analytical bounds rather than source-authored forecasts.

A separate 35%-probability pricing branch assesses a 3% premium on 25% of new or repriceable reference thermal orders. Seventy-five percent is reserved for overlap with normal price recovery and mix. Of the remaining increment,70% is gross contribution and 30% is incremental expense, leaving 40% operating contribution. It does not reprice the additional thermal branch or fixed-price backlog. The small positive residual recognizes the customer's cost of waiting while respecting the statement that most actual price action offsets costs.

A complementary clean-water flow branch assigns 40% probability to a long-term SEK1 bn opportunity, with conditional annual sales around 167 m in 2027,500 m in 2028,833 m in 2029 and 1 bn in 2030. Seventy percent overlaps existing Food & Pharma growth. The remaining sales earn 38% gross contribution less 16% operating costs, or 22% operating contribution. Management identified the opportunity but did not give this annual ramp; the timing and allocation are explicit analyst assumptions. No acquisition is required or modeled.

A downside branch assigns 25% probability to delays affecting 5%/10%/10%/5%/0% of reference thermal sales in 2026-30 before 50% overlap. Lost gross contribution is 42%, with only 12% of flexible expenses saved, giving 30% lost operating contribution. Baseline investment remains committed. This reflects ramp and acceptance risk rather than assuming every announced megawatt immediately produces revenue.

Heat-pump recovery, the Desmet integration, LR tanker penetration, the older SEGUENTE case and Indonesia service were all assessed with numerical probabilities and bounded proxies. They add no second increment because the relevant reference product paths already include them, or the event is old and already represented. Those dispositions and their overlap explanations are retained individually in the evidence ledger.

Fully expensed economics

The starting functional gross margins are 42% for thermal,33.5% for other Energy,33% for Food & Pharma,42% for Ocean and 20% for other sales. Future margin improvement is limited to 30/20/20/10/0 basis points annually for three years. These are allocations that reconcile to the group, not purported disclosed product margins. Production labor, ordinary depreciation and acquisition amortization remain in operating costs.

Selling and administration starts at SEK11.2 bn annually and grows 6.5%; R&D starts at 1.95 bn and grows 8%; other operating costs, integration and joint-venture losses start at 1.25 bn and grow 4%. Cash long-term incentives are expensed. The H1 amounts are subtracted for the remaining 2026 quarters, preserving the current-year bridge. The framework's 20 x multiple is applied to fully expensed parent-attributable operating profit, not adjusted EBITA or EBITDA.

Baseline capex is 3.0/3.5/3.8/4.0/4.2 bn in 2026-30. Remaining 2026 capex subtracts actual 1.541 bn before forecasting H2. Baseline D&A is 2.8 bn in 2026, less actual 1.403 bn for the remaining quarters, and rises 150 m annually thereafter. The new capacity can require cash before revenue acceptance; the funding schedule therefore retains investment when the delay branch occurs.

Capital, minority interests and funding

June cash was SEK4,628 m and short-term investments 349 m, totaling 4,977 m. Gross debt was 17,507 m, leases 3,484 m, pensions 1,032 m and derivative liabilities 419 m. The model retains these gross claims and does not also deduct reported net debt. It does not credit the 596 m positive derivative position. Ordinary operating provisions remain in operating economics and are not another debt claim.

Working capital starts from actual inventory 17,939 m plus trade receivables 11,918 m less trade payables 6,350 m and customer advances 10,614 m, totaling 12,893 m. Future working capital is 18.5% of annual sales. It is not calculated by multiplying a seasonally high quarter by four. The minimum cash reserve is 3,000 m. Debt interest 3%, cash interest 1.5%, lease interest 3% and tax 25% are disclosed model assumptions; tax guidance is 24-26%.

The January 14 Chinese acquisition was 72% owned, had approximately 400 m annual sales, and cost 619 m, with 527 m paid and 92 m deferred. It is already in H1 and the reference. The deferred 92 m is paid in Q4 2026 and is removed from the financial claim thereafter. No acquisition cash flow is charged twice. Its assumed 15% operating margin and 28% outside ownership create 16.8 m annual minority operating profit; the remaining 63.2 m normalized minority attribution covers other subsidiaries. This 80 m initial annual attribution is a bounded model allocation anchored to H1 minority net profit 28 m, not a disclosed subsidiary earnings forecast. It is deducted once before 20 x; book minority interest 442 m is not deducted again.

There are 413.326315 m shares, equal basic and diluted. The 2025 annual report records no share-based compensation in 2024 or 2025. Its long-term incentive programs are cash based. The model therefore retains the full common-share denominator and includes incentives in costs, without fabricating stock dilution. Dividends of SEK9 per share, growing 6% annually as an assumption, are paid in Q2.

Debt includes bank, export, bilateral, commercial-paper and bond funding. The unused EUR700 m revolving facility runs to 2028, with a separate 200 m accordion not assumed drawn. The model permits 7.5 bn additional SEK debt as a bounded translation of that committed line and explicitly assumes subsequent refinancing. Existing bonds are held through a rollover convention while surplus cash accumulates; no early redemption of noncallable debt is assumed. Six hundred million annual lease principal and minority cash distributions are deducted in funding, with replacement lease claims held approximately stable.

Sensitivity, score and what would change the view

The score is raw 45/60, rounded to analytical Base 75: Core 17, Cycle 8, TAM7, Catalysts 4, Macro 8, Alpha 3 and Risk minus 2. Qualified thermal products, a global installed base and service relationships support quality. Input costs, mix, diversified cyclical markets, qualification competition and delivery execution prevent an unqualified scarcity score. The master had no existing Alfa Laval row; this is a new analytical score, not a manual override.

Each valuation window uses four consecutive quarters and the financial claims and shares at the end of that same window. The funding sensitivities rebuild the entire cash path. They include weaker thermal execution, no incremental pricing or flow opportunity, full delay realization and higher capex. A cash floor alone cannot establish funding adequacy, so maximum debt and the explicit borrowing limit are reported alongside minimum cash.

The strongest invalidation would be expanded capacity failing to ship at the implied 2027 pace, order cancellations or repeated acceptance delays, declining qualification wins, gross margins failing to cover input costs, or working capital growing faster than sales. A broad marine or food-industry slowdown could offset strong cooling. Conversely, reported thermal sales, accepted shipments, new qualification wins and sustained contribution margins would justify revisiting the incremental branch.

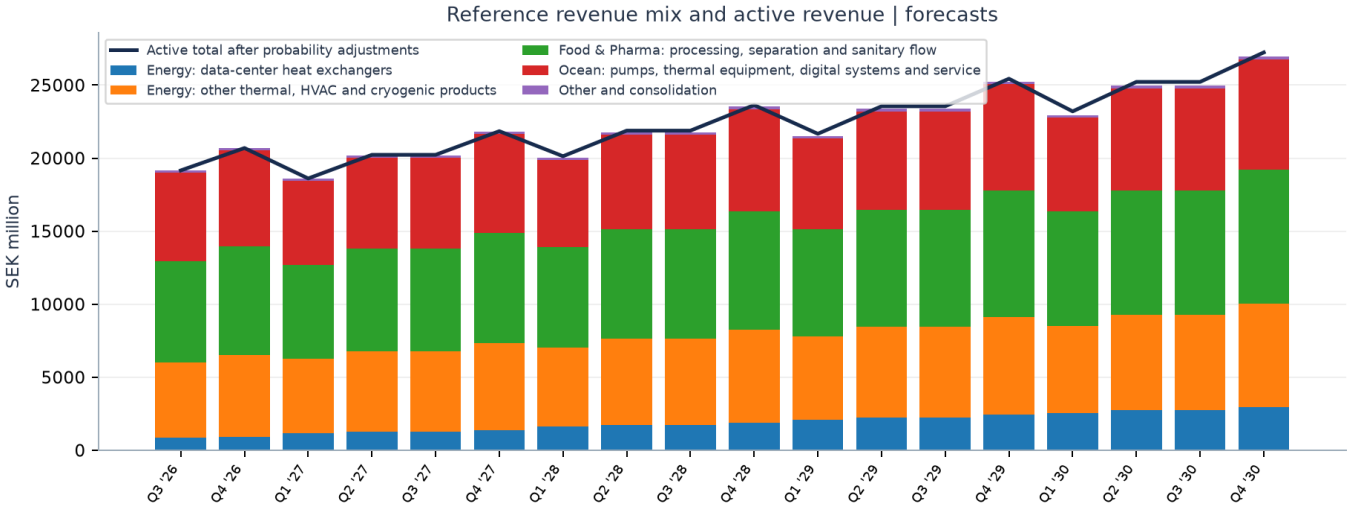

Q3 results on October 27, the November 18 capital markets day and the end 2026/early 2027 capacity ramp are the next checks. The Desmet July 2027 integration date matters for cost and cross-selling execution, but has no standalone revenue windfall. Source originals, publication dates and hashes are retained in source/source_manifest.json. Both current calls, the complete current report and the full four-page technical case were reviewed; the 2025 annual report was reviewed for relevant financial and capital notes. The product and Energy exhibits were visually inspected from original pages. The quote provider labels the October 9 observation 17:29 CET; seasonal timezone labeling is ambiguous, so it is treated as a dated close rather than a precisely verified exchange timestamp.

The saved Q4 2027 ceiling is SEK714.195307 and Q4 2026 is SEK632.825047, compared with the dated SEK577.60 share price: about 1.24 x at the active horizon. The owner formula gives 57% Growth and 43% Re-Rate. The joint no-positive-branch/full-delay/higher-capex case is SEK697.481099; it retains the substantial reference businesses and is not a guaranteed floor. Maximum debt remains SEK17,507 m in that scenario, with no additional draw.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Qualified heat-transfer design, a global installed base and service support create switching costs; alternatives and customer purchasing power remain.
Cycle	8	Record backlog and expanded capacity booked into 2027 support growth, while service mix, ramp costs and volatile projects limit certainty.
TAM	7	Higher thermal and fluid content plus marine and biofuel demand; company revenue capture is scoped separately from whole data-center spending.
Catalysts	4	October 27 results, end 2026/early 2027 capacity, November 18 capital markets day and Desmet integration by July 2027.
Macro	8	AI heat density and energy security help; industrial, marine and foreign-exchange cycles remain material.
Alpha	3	Order-to-invoice timing, fully expensed OP and explicit component capture are reconciled rather than treating booked capex as immediate sales.
Risk classes	-2	Two points deducted for execution/input-cost pressure and diversified cyclical demand.
Total	45/60	Rounded Base 75. Both artifact and new workbook row use this score; this is not a manual override.

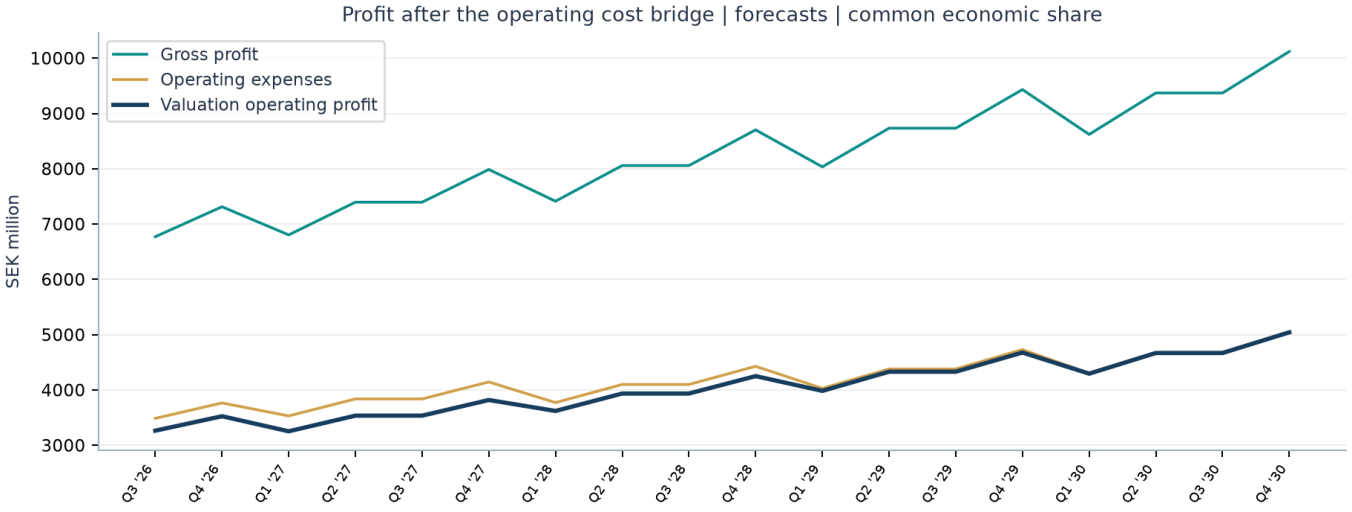

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	19,165.4	-4.7	19,160.7
Q4 2026	20,698.6	-5.1	20,693.5

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Four-quarter earnings window	F4Q OP	Multiple	Shares	Ceiling

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Energy: data-center heat exchangers	841.3	40.9%	344.1
Q3 2026	Energy: other thermal, HVAC and cryogenic products	5,191.8	32.6%	1,693.7

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Subsidiary ownership and common operating profit

The preceding weighted OP is after branch-specific minority earnings. Reference and conditional subsidiary profit are allocated within consolidated sales and costs, never added as a second revenue source. Ownership is reported; future subsidiary margins, volume and credit sharing are labeled assumptions.

Adopted funding and financial claims

This saved funding scenario includes cash taxes, interest, capital investment, working capital, distributions and any separately specified closure cash. New borrowing is a modeled requirement, not confirmed lending. Probability controls hold this schedule fixed; an adopted operating revision must rebuild funding. Gross debt, leases, pension, negative derivative balances and unpaid acquisition consideration are deducted once, net of cash above the SEK3,000 m reserve. Minority earnings are deducted from valuation OP, while consolidated cash generation and actual modeled minority distributions govern funding. Existing debt rolls rather than being assumed redeemable early. Available revolver expires 2028; later refinancing is an explicit condition. Controls hold active financial claims fixed; separately saved stresses rebuild the funding path.

Quarter	Operating cash	Investment	New borrowing	Debt repaid	End debt	End cash

Common operating claim

Minority operating earnings are allocated within existing consolidated group profit and deducted once before valuation. These normalized allocations are model proxies. The lease column includes only claims outside gross debt, avoiding a second deduction for leases already in debt.

Quarter	Consolidated OP	Minority OP	Common OP	Extra lease claim	Net financial claim

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

ALFA-THERMAL-EXPANSION

p: 0.55

Conditional: Additional thermal sales of SEK0/500/1,500/2,500/3,500 m in CY2026-30 above reference 3,000/5,000/7,000/9,000/11,000 m. This is an analyst scenario.

overlap: 0.5

bridge: Reserve 50% for overlap. Incremental GP42% less engineering, selling, qualification and warranty costs 17% gives 25% OP. Capex 25%, D&A6% already expensed, and working capital 18.5% of annual sales.

reason: July management says expanded early 2027 capacity is booking and further investment supports 2028. The reference already includes SEK5 bn in 2027; only additional execution is probability weighted.

bounds: Probability 35-70%; additional CY2028 sales SEK750-2,000 m; overlap 35-75%; OP contribution 18-30%.

ALFA-QUALIFIED-PRICE

p: 0.35

Conditional: A3% premium on 25% of new or repriceable reference data-center thermal sales.

overlap: 0.75

bridge: After 75% overlap,70% gross contribution less 30% incremental costs gives 40% OP. The additional thermal branch is not repriced again.

reason: Qualification and customer cost of waiting support 35% probability of incremental pricing. Actual July price action mostly offsets cost inflation, so it cannot be treated as pure margin.

bounds: Premium 0-5%; eligible revenue 15-35%; overlap 50-100%.

ALFA-DC-FLOW

p: 0.4

Conditional: Additional clean-water flow sales reach SEK1 bn annually in 2030: CY2027/28/29 conditional 167/500/833 m before 70% overlap.

overlap: 0.7

bridge: GP38% less incremental operating costs 16% gives 22% OP. The 70% overlap reserve acknowledges existing Food & Pharma growth. No acquisition sales are added.

reason: July management identified a complementary organic flow opportunity around SEK1 bn long term. Timing and qualification are uncertain; probability 40%.

ALFA-ACCEPTANCE-DELAY

p: 0.25

Conditional: Conditional delay of 5%/10%/10%/5%/0% of reference thermal sales in CY2026-30 beyond each modeled year.

overlap: 0.5

bridge: Lost GP42%, with only 12% flexible costs saved, gives 30% lost OP. The central case reserves 50% for overlap. Baseline capex remains committed; working capital is rebuilt.

reason: Capacity ramps and customer power or commissioning constraints can delay accepted shipments. Probability 25%.

ALFA-DESMET-INTEGRATION

p: 0.65

increment: 0

overlap: 1

zero reason: Desmet was acquired in 2022. Integration through July 2027 is not a new acquisition. Existing Food & Pharma growth and integration costs cover a bounded 1-2% cross-selling proxy; no quantified cost-saving target has been disclosed.

ALFA-INDONESIA-SERVICE

p: 0.75

increment: 0

overlap: 1

zero reason: The Indonesia agreement covers 40 already installed heat exchangers and four years of assessments. A bounded SEK0.1-0.5 m annual service proxy is immaterial and overlaps the service reference. Do not book 40 new equipment sales.

ALFA-LR-TANKERS

p: 0.55

increment: 0

overlap: 1

zero reason: Ocean reference sales rise from SEK24 bn in 2026 to 28 bn in 2030, including LR tanker penetration and service. A bounded 2% Ocean upside proxy equals SEK500 m in 2027 and fits within the existing SEK1 bn increment. LR economics differ from MR; the whole tanker market is not incremental.

ALFA-HEAT-PUMP-RECOVERY

p: 0.5

increment: 0

overlap: 1

zero reason: Management expects gradual heat-pump recovery toward the prior SEK2 bn peak around 2030, with potential SEK1 bn upside beyond it. Other Energy grows SEK5.4 bn by 2030 and already includes recovery. Do not add another SEK1 bn immediately.

ALFA-SEGUENTE-CASE

p: 0.6

increment: 0

overlap: 1

zero reason: The technical case is dated April 2024, not a new 2026 order. It supports qualification and the thermal reference. Rack-level 200 kW and 98% cooling-energy figures are vendor comparison claims, not industry averages or company sales.

Remaining bounded uncertainties

- Quarterly data-center sales are not disclosed. H1 thermal revenue of SEK1,250 m is an analyst allocation within reported Energy revenue of SEK11,151 m, not a company fact.

- Product gross margins are analytical functional allocations. The primary report supplies group gross profit and operating costs. D&A and purchase-price amortization remain in operating profit; cash addbacks do not raise valuation earnings.

- No annual 2026 revenue guidance was given. The reference SEK73,900 m sales path and the longer-term product forecasts are analyst assumptions. The 2030 SEK100 bn strategic ambition is not contracted revenue.

- Call reproductions contain transcription errors: adjusted EBITA is sometimes called EBITDA; the July SEK5 bn data-center statement refers to annual order pace, not trailing revenue or a confirmed SEK2 bn quarter. The approximately SEK20 bn Q3 order indication is not 20% growth. Primary financial tables control.

- The EUR700 m revolver is available through 2028. The model allows SEK7,500 m additional debt as a conservative proxy at roughly SEK11.09/EUR. It excludes the EUR200 m accordion and assumes refinancing beyond expiry; this is not a perpetual guaranteed facility.

- Normalized minority operating profit of SEK80 m in 2026 is a modeling allocation: the 72%-owned Chinese business has approximately SEK400 m annual sales and assumed 15% OP, creating SEK16.8 m minority OP; the other SEK63.2 m covers remaining subsidiaries. The normalized amount is consistent with but not directly disclosed by H1 minority net profit of SEK28 m. No minority book value is deducted.

- The SEK419 m derivative liability is retained without credit for SEK596 m derivative assets. Pension claims are gross SEK1,032 m. Operating provisions are already handled in costs and are not added again as debt.

- The model holds existing gross debt at maturity through refinancing and retains surplus cash. It does not assume noncallable bonds can be redeemed early. Quarterly liquidity does not measure every intra-quarter cash trough.

- No new acquisition is assumed. The Chinese January acquisition is already included in actual H1 and the annual reference. Its SEK92 m deferred payment is paid once in Q4 2026.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
