ASML Holding

ASML | NASDAQ | 2026-10-11

Q4 2027 model ceiling: USD 1,685.23

Analytical Base 45/60 = 75 | Qualified lithography leader; valuation and acceptance watch

20x fully expensed F4Q US-GAAP-based operating profit less financial claims, EUR converted at fixed dated EURUSD1.1206; one NASDAQ New York registered share equals one ordinary share

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in EUR million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 1,780.34 per share (2026-10-09 16:00 America/New_York regular close); 384.100 million common shares (2026-06-28; latest disclosed common shares, excluding invented intervening buybacks); estimated equity capitalization USD 683,828.6 million. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: no positive modeled upside at the dated 2026-10-09 16:00 America/New_York regular close price of USD 1,780.34, so the Upside Driver split is unavailable.

Decision in the model

Operating profit and financial claims are in EUR million; the common-share value is translated at 1.1206 USD per EUR. One NASDAQ New York registered ordinary share equals one ordinary share.

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	29,066.4	20x	385.800	1,685.23

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

US GAAP operating profit with all ordinary R&D, compensation, depreciation and service costs expensed. Euro financial claims and operating profit are translated together into the NASDAQ registered ordinary share at fixed dated EURUSD. No investment gains, future cash generation or unexecuted buybacks are capitalized.. 20x fully expensed F4Q US-GAAP-based operating profit less financial claims, EUR converted at fixed dated EURUSD1.1206; one NASDAQ New York registered share equals one ordinary share

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use EUR million unless a different unit is stated.

Thesis

ASML is a uniquely qualified supplier to advanced semiconductor manufacturing. That does not make every entry price attractive. This model values fully expensed operating profit at 20x, converts euro operations to the NASDAQ share in US dollars, and gives expansion evidence an explicit but bounded contribution. The Q4 2027 ceiling is about $1,685 against the verified October 9 close of $1,780.34. The model therefore does not manufacture a positive upside narrative around a strong business.

ASML sells machines that pattern chips, together with service, upgrades, metrology and inspection. Its commercial EUV position is unusually difficult to replicate. Customers qualify a system inside a complicated manufacturing flow, and reliability depends on optics, light sources, motion control, software, materials, service and installation teams. This is a network of engineering capabilities rather than a single specification.

What is actually known

The latest released quarter is Q2 2026, ended June 28 and reported July 15. Q3 results were scheduled for October 14 and were not actual results at this review. Q1 and Q2 prepared management remarks, the Q2 presentation and detailed financial statements were reviewed. Full unrestricted question-and-answer transcripts were not retrieved; that access gap is recorded rather than implying complete call coverage.

Q2 revenue was EUR9,326.5 million, gross profit EUR5,035.4 million and operating profit EUR3,456.1 million. Research and development consumed EUR1,276.6 million and selling/administration EUR302.7 million. Q1 revenue was EUR8,766.9 million and operating profit EUR3,157.8 million. These are US GAAP operating figures. The model does not substitute IFRS profit, which differs because development-cost treatment and amortization differ.

Management guided Q3 revenue to EUR11-12 billion and gross margin to 55-57%, with approximately EUR1.2 billion of R&D and EUR0.4 billion of selling/administration. The midpoint produces EUR4.84 billion of operating profit. Full-year guidance was EUR43-45 billion revenue and 54-56% gross margin. Keeping the EUR44 billion and 55% midpoints implies EUR14,406.6 million of Q4 revenue after subtracting H1 and modeled Q3. That is a demanding seasonal finish, not a quarterly company promise.

Q4 expenses are modeled separately at EUR1.4 billion R&D and EUR0.45 billion selling/administration. The resulting gross margin is the residual needed to reconcile the annual midpoint. The near-term guidance periods receive no additional breadcrumb uplift. If the October 14 release changes the starting point, the quarter must be replaced with reported facts and the annual reconciliation rerun.

Outlook

Q3 2026

Total net sales	between €11.0 billion and €12.0 billion
of which Installed Base Management[1] sales	around €2.9 billion
Gross margin	between 55% and 57%
R&D costs	around €1.2 billion
SG&A costs	around €0.4 billion

FY 2026

Total net sales	between €43 billion and €45 billion
Gross margin	between 54% and 56%
Annualized effective tax rate	around 17%

[1] Installed Base Management sales equals our net service and field option sales.

ASML July 15, 2026 Page 12 Public

ASML July15,2026 issuer presentation, page12 | Q3 and FY2026 management outlook, not reported future results.

The engineering advantage and its limits

High-NA EUV offers a route to printing smaller features with fewer repeated patterning steps. The July deck records Intel qualification on selected 18A product layers. That is a meaningful production milestone, but it is not evidence that all customers have qualified all layers or that every advanced fab will adopt on the same schedule.

The economics must also allow for substitution. A High-NA tool can replace multiple low-NA exposures and associated process steps. Treating a new High-NA invoice as entirely additive while retaining all displaced low-NA demand would overstate the market. The model instead contains separate low-NA and High-NA recognized-unit paths, with a gradual High-NA ramp and no additional blanket High-NA TAM premium.

Tool throughput matters as much as installed floor area. More wafers per hour, uptime and usable layers can increase customer output without a proportionate increase in machine count. Conversely, an impressive factory-output number is not recognized revenue until shipment, installation and applicable acceptance conditions are met. Qualified Zeiss optics, light sources, skilled assembly and field installation remain important constraints.

The existing fleet creates a valuable service and upgrade business. Q2 installed-base management revenue was EUR2,761.7 million, supported by upgrades as well as routine service. That is a separate invoice pool from new systems. Applying an extra service percentage to total revenue after already including that pool would count the same activity twice.

ASML July15,2026 issuer presentation, page6 | Issuer Intel High-NA production milestone; customer- and layer-specific.

Customer adoption is staggered

September 8 issuer releases give customer-specific High-NA timing. Intel reported use on selected layers of a subset of Panther Lake products. Its more-than-one-million-wafer milestone combines certification/testing, R&D and volume production; it is not one million volume-production wafers. Samsung plans High-NA DRAM high-volume manufacturing by 2028. TSMC intends advanced-node high-volume manufacturing from 2030. These are different adoption paths, not a synchronized industry ramp.

TSMC's larger 12-inch photomask program targets a pilot line by 2031 and lithography-system readiness for advanced-node production by 2033. These are photomask dimensions, not wafer diameters. Current 6-inch masks can support earlier High-NA use, with design-specific floor-planning or stitching. Neither mask milestone establishes an incremental accepted-tool count in 2027-2028.

The existing High-NA path already includes 5 recognized equivalents in 2027 and 8 in 2028. The Samsung and Intel evidence supports the plausibility of that gradual ramp; it does not disclose additional units above it. A bounded proxy for one 2028 tool would be EUR 400 million revenue, EUR 170 million gross profit at the model's 42.5% margin, and EUR 40 million incremental R&D/installation/support, leaving EUR 130 million operating profit. I assign 70% probability to Samsung reaching its stated 2028 High-NA production milestone; this is an analytical judgment, not a reported probability. The proxy is fully overlapped with the existing eight-tool pool, so it contributes zero additional revenue or profit. Customer allocations remain unknown, and one tool is a sensitivity unit, not an order claim.

TSMC's 2030 plan is an outer-year adoption boundary. I assign 65% probability to that production timing, with a 2029-2031 qualification/acceptance watch window rather than assuming a current award. A one-tool 2030 sensitivity at EUR 420 million and 47.5% gross margin, less 10% incremental operating costs, gives EUR 157.5 million operating profit before probability or overlap. The existing outer-year High-NA path already accommodates gradual adoption; apply 100% overlap to this illustrative unit and zero increment to the active Q4 2027 valuation

window. Revisit on customer-specific accepted-tool evidence or a material delay, not merely another repetition of the roadmap.

The Eindhoven BIC North campus first phase targets 2029. Its initial staffing primarily relocates existing teams. Gross campus floor area and eventual workplace capacity cannot be converted into extra saleable systems; a 2029 first phase adds zero to 2027 capacity. The existing output-expansion branch already represents the relevant supplier build-out. No separate campus revenue premium is added.

Cycle, market expansion and confidence

ASML participates in the advanced-logic and memory manufacturing investment cycle. Low-NA EUV is an established platform undergoing a capacity ramp; High-NA remains in early customer adoption. A numerical percentage of peak demand cannot be established from available evidence. The model does not label the whole company pre-revenue or assign it the asymmetry of an unqualified start-up.

The first expansion phase is advanced logic and DRAM capacity, including AI compute and high-bandwidth-memory demand. The second is greater critical-layer intensity and High-NA adoption, offset where fewer exposures replace multipatterning. The third is the installed fleet's recurring service and productivity upgrades, plus broader edge, industrial and consumer semiconductor demand. New applications do not create a separate revenue surcharge: their effect must enter accepted units, mix, lithography intensity or the already modeled service pool.

Revenue vector	Evidence and derivation	Confidence
2026 guidance-calibrated systems	July Q3/FY group guidance; service allocation shown separately	HIGH for company guide; MEDIUM for implied Q4 allocation
Low-NA EUV	July capacity plan; accepted-equivalent units x assumed invoice ASP	MEDIUM for 2027-2028 units; LOW for outer-year units and all product margins
High-NA EUV	July/September Intel milestones, Samsung 2028 plan, TSMC 2030 plan; modeled accepted-unit path	LOW for quantities, invoice ASP and margin; customer plans are not contracts
ArF immersion	July output and expansion plan x assumed invoice ASP	MEDIUM for 2027-2028 units; LOW beyond and for margins
Dry DUV	Existing product pool extended with modest modeled demand; no separate AI TAM allocation	LOW
Metrology and inspection	Existing product pool and process complexity; modeled adoption and capture	LOW
Installed-base service and upgrades	Q2 actual revenue, installed fleet and upgrade economics; separate invoice pool	MEDIUM for near-term extrapolation; LOW for 2028-2030 growth and product margin

Quarterly totals after 2026 are Model, not Actual or company guidance. Confidence is MEDIUM for the guidance-linked 2026 group revenue and LOW for outer-year fully decomposed profit, because product margins and service growth are assumptions even where unit direction has stronger evidence. No long-range customer capex or TAM estimate changes that uncertainty label.

A unit and invoice model

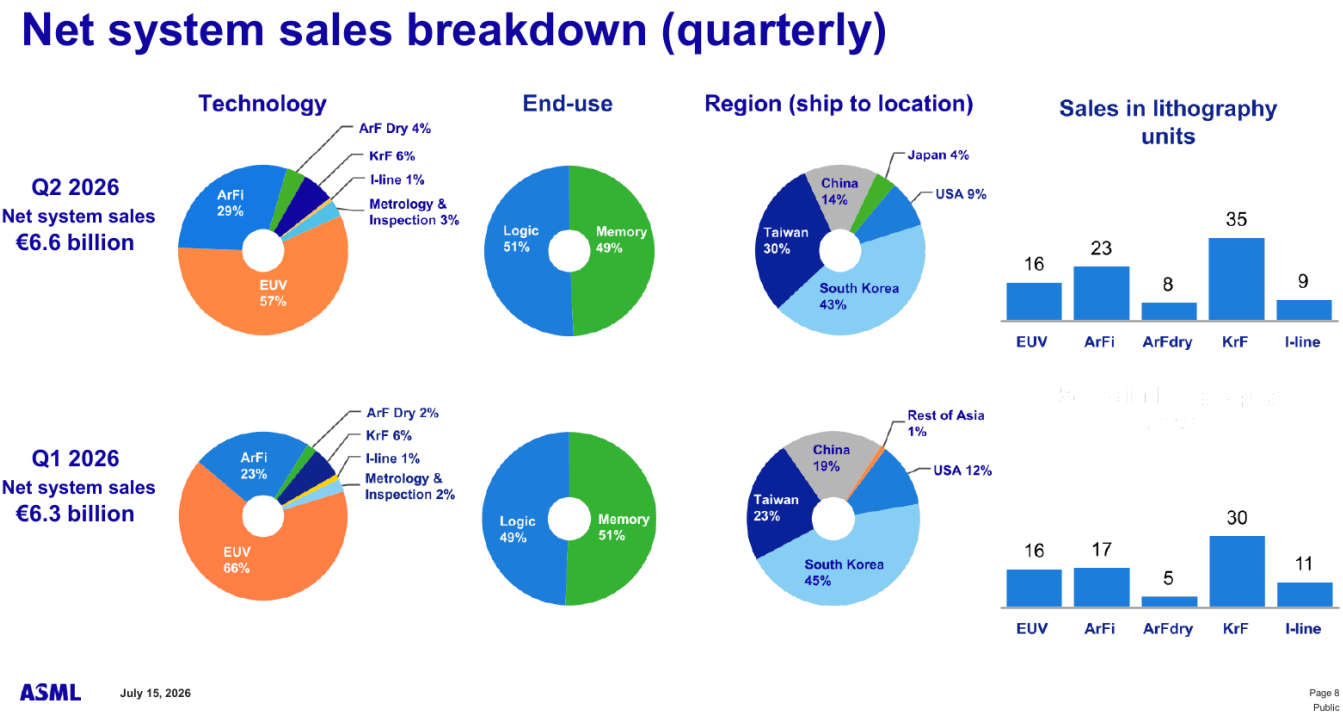

All operating values are in EUR millions. Calendar years and calendar quarters are used consistently. The NASDAQ security is a New York registered ordinary share with a one-for-one ordinary-share relationship, not an invented ADR ratio. The output uses the October 9 ECB reference EURUSD rate of 1.1206, held fixed as a modeling convention rather than represented as an executable closing currency quote.

The 2027 reference includes 82 low-NA EUV equivalents at EUR245 million, 5 High-NA equivalents at EUR390 million, and 160 immersion equivalents at EUR84 million. Dry DUV contributes EUR3 billion, metrology/inspection EUR1.1 billion, and installed-base service/upgrades EUR14 billion. These analytical inputs total EUR53.58 billion. Equivalent units mean recognized invoices; they are not asserted to be factory shipments.

The 2028 reference uses 100 low-NA equivalents at EUR250 million, 8 High-NA at EUR400 million, and 200 immersion at EUR88 million. Together with EUR3.15 billion dry DUV, EUR1.4 billion metrology/inspection and EUR17 billion service, that totals EUR67.35 billion. Reference revenue reaches EUR76.07 billion in 2029 and EUR83.47 billion in 2030. Those outer years are scenario estimates, not disclosed orders or management guidance.

Low-NA gross margin begins at 58% in 2027 and rises only half a percentage point annually. High-NA starts at 40% and improves 2.5 points annually as early-unit costs are absorbed. Immersion starts at 52% and improves one point annually. Dry DUV, inspection and service use 43%, 53% and 66%. Product margins are not disclosed at this granularity, so these are transparent allocations rather than claimed company facts.

Fully expensed reference R&D and administration are EUR7.2 billion in 2027, EUR8 billion in 2028, EUR8.8 billion in 2029 and EUR9.6 billion in 2030. Ordinary depreciation, compensation and stock-based compensation stay inside operating costs. Interest income, investment gains and tax benefits are not operating profit. The modeled service margin and expense growth are important sensitivities; installed-base revenue is valuable but not costless.

ASML July15,2026 issuer presentation, page8 | Issuer recognized tool counts and invoice mix.

Customer capex and demand-side calibration

The supply model must be supported by customer spending. ASML reported EUR24.4743 billion of system sales and EUR8.193 billion of service/field options in 2025. The bridge below calibrates only systems, including metrology and inspection. Service, parts and field upgrades are excluded from the equipment wallet and remain in the separate installed-base model.

TSMC's reported 2025 capex was $40.9 billion and its July 2026 budget was $60-64 billion. Samsung DS spent KRW47.5 trillion in 2025 and KRW25.603 trillion in H1 2026. SK hynix's 2025 cash PPE spending was KRW27.519 trillion; the July prospectus described higher 2026 spending, and a later attributed call described a high-40s trillion range. Intel reported $17.672 billion gross capex in 2025, guided above $20 billion for 2026 and significantly more for 2027. These budgets include buildings, cleanrooms and other equipment, not only ASML invoices.

Micron reported gross PPE spending of $15.857 billion in FY2025 and $30.712 billion in FY2026. Its FY2027 net-spend discussion implies more than approximately $50 billion across the two halves, not a precise calendar gross budget. The bridge assumes fiscal gross spending of $60 billion in FY2027, $69 billion in FY2028 and $79.35 billion in FY2029. Calendar proxies use two thirds of the current fiscal year and one third of the following fiscal year. This uniform timing assumption is LOW confidence and does not reconstruct actual quarterly cash flows.

Customer group	CY2025	CY2026	CY2027 model	CY2028 model	Unit
TSMC	40.90	62.00	77.50	89.12	USD bn
Samsung DS	47.50	51.21	61.45	73.74	KRW tn
SK hynix	27.52	47.00	56.40	67.68	KRW tn
Micron	20.81	40.47	63.00	72.45	USD bn
Intel	17.67	21.00	28.00	34.00	USD bn
China-owned residual	20.00	23.00	25.00	27.00	USD bn
Other residual	15.00	17.00	20.00	23.00	USD bn

The 2026 Samsung figure is twice H1, an analytical run-rate proxy. TSMC 2027/2028 grows 25%/15% from the 2026 midpoint. Samsung and SK hynix each grow 20% in 2027/2028. Intel 21/28/34 is a scenario consistent with directional guidance, not disclosed annual budgets. China-owned and other customer pools are explicit low-confidence assumptions, not reported market totals. They exclude the named companies' overseas fabs, preventing geographic double-counting. Vary each residual by at least 25% when testing the result.

For each customer, systems demand equals normalized capex x eligible front-end equipment share x addressable lithography/metrology wallet x ASML vendor capture x 90% annual recognition. The 10% allowance covers slippage and acceptance timing without adding next-year recovery. All wallet fractions are analytical priors, not disclosed customer purchasing splits. The front-end exclusion also removes construction, packaging and capitalized upgrades already represented in service. The composite wallet includes metrology; it is not added a second time.

Customer group	Front-end share	ASML-addressable wallet	Vendor share	Effective calibrated capture
TSMC	60%	33%	97%	18.5%

Customer group	Front-end share	ASML-addressable wallet	Vendor share	Effective calibrated capture
Samsung DS	60%	30%	88%	15.2%
SK hynix	65%	32%	92%	18.4%
Micron	65%	32%	92%	18.4%
Intel	55%	32%	95%	16.1%
China-owned residual	60%	35%	70%	14.1%
Other residual	55%	30%	80%	12.7%

The raw 2025 bridge gives EUR22.92 billion, a -6.4% difference from actual system sales. Applying one common 1.0680 calibration factor reconciles to EUR24.4743 billion. This is a fitted historical reconciliation, not independent proof of the customer allocations. Constant analytical translation uses USD1.1206 per EUR and KRW1,450 per USD; neither is asserted to be a historical annual average. The calibrated customer proportions drive forward demand, while the separate tool/ASP model constrains recognized revenue.

EUR billions	2025	2026	2027	2028
Calibrated system-demand envelope	24.47	34.81	44.68	52.03
Existing recognized-system reference	Actual 24.47	Guide-calibrated	39.58	50.35

The demand envelope supports the direction and scale of the EUR39.58 billion and EUR50.35 billion recognized-system reference, but the cushion is not a contract. The active model recognizes qualified output rather than adding the capex result to product revenue. Lowering forward customer budgets by 25% and effective capture by 10% cuts the envelope to EUR30.16 billion in 2027 and EUR35.12 billion in 2028, below the unit model. That is a disconfirmation threshold requiring lower recognized units or later timing if it becomes the best evidence. The cash-capex, shipment and acceptance clocks can differ substantially.

SK hynix separately disclosed approximately KRW11.9 trillion of intended EUV scanner acquisitions with delivery by December 2027. This supports a real lithography wallet but does not specify annual revenue acceptance or tool mix. It is inside the capex envelope, not another demand branch. Its construction and packaging projects must also remain inside, rather than be added to, corporate budgets.

ASML's four unnamed customers above 10% represented 61.2% of total 2025 sales; its largest customer accounted for 23.9% and the top two for 38%. Those figures include service. The bridge does not claim the issuer confirmed the named allocations, and system-only wallet estimates cannot by themselves reproduce total customer concentration. This unresolved allocation and the assumed future budgets keep the demand bridge LOW confidence.

What the forward evidence changes

Management described approximately 65 low-NA EUV and 130 immersion shipments in 2026, around 30% more output in 2027, and investigation of a further approximately 30% increase in 2028. The second expansion is an investigation, not guaranteed accepted capacity. The reference already captures most of these volumes.

The capacity-acceptance branch assigns a 55% probability to the remaining bounded gap. In 2027 that is only 2.5 extra low-NA and 9 immersion equivalents above the reference. In 2028 it is 9.85 and 19.7. Conditional

incremental revenue earns 55% gross margin and incurs 10% additional operating expense, leaving 45% operating-profit contribution. The residual falls to 2 low-NA and 5 immersion equivalents in 2029 and zero in 2030 as expansion becomes embedded. It is not compounded forever.

The pricing branch has a 50% probability. It assumes a 3% premium on 20% of new or repriceable systems invoices, then halves that increment because reference invoice prices already increase. Fixed-price backlog is excluded. Ninety percent incremental gross margin less 15% incremental selling/engineering expense gives a 75% operating-profit contribution on that small revenue increment. The premise is the customer's cost of waiting for qualified output, not an announced ASML price increase.

A combined acceptance-delay branch carries 25% probability and removes 8% of reference low-NA plus immersion invoices in the modeled period. It allows 10% cost relief against the lost revenue's 55% gross contribution. Customer-site readiness, installation and supplier delays are correlated; they are represented once. No automatic future recovery is credited. China restrictions are an additional reason to treat revenue recognition conservatively, not grounds to erase all non-China growth.

Together with the replacement-parts pricing branch below, the active model produces calendar revenue of about EUR53.78 billion in 2027 and EUR68.96 billion in 2028, with operating profit of EUR23.45 billion and EUR31.39 billion. The model can accept credible forward evidence before official confirmation while showing exactly which economics were already embedded.

Replacement-parts pricing and the size of the eligible pool

The Elec's October 10 Korean report attributes to industry sources an agreed 10% increase for EUV/DUV replacement parts supplied to Samsung and SK hynix in South Korea from January 2027. It does not establish a 10% increase on all ASML machines or worldwide service revenue. The owner sets implementation probability to 100%. This is a modeling instruction; the report remains attributed industry evidence and the geographic, contract and cost boundaries remain uncertain.

The bounded central proxy is 30% of global service revenue exposed to Korea and 30% of that pool being separately repriceable parts. Both are LOW-confidence analytical assumptions. Applying the reported 10% increase and a 50% overlap haircut to EUR14 billion of 2027 reference service revenue gives EUR63 million conditional incremental sales. A 30% cost-of-sales allowance and 10% support/administration allowance leave EUR37.8 million conditional operating profit. At the owner-selected 100% probability, the active contribution is EUR63 million sales and EUR37.8 million operating profit in 2027.

The existing system-pricing branch excludes these service invoices. The remaining overlap haircut recognizes pricing already implicit in the service growth path. It remains 50% in 2028, rises to 75% in 2029 and reaches 100% in 2030, preventing perpetual duplicate price growth. Geography and eligible-part shares each range from 20% to 40%, with realized pricing of 5-10%. Probability is fixed at 100% by the owner; the revenue and cost sensitivities remain separate. Review the effect when actual invoices, exclusions or cost offsets become clearer. No customer earnings model is changed here.

Cross-book implications and five scored risks

ASML links to covered TSMC, Intel, Samsung, Micron and SK hynix through lithography purchases and qualification. More usable customer capacity can relieve constraints for chip designers and downstream networking suppliers, but it can also expand memory supply and eventually weaken memory pricing. A strong ASML order book is therefore not automatically an equal profit upgrade for every customer. Monitor ASML accepted output alongside customer wafer starts, yields, utilization and product pricing.

KLA, Lam Research and Applied Materials share some customer investment drivers but sell different process steps. High-NA can reduce repeated patterning steps, so more ASML revenue can coincide with lower deposition/etch intensity on a given layer. Inspect process-step content before inferring a uniform equipment benefit. No other company forecast changes in this deep dive.

The risk deduction is five points, one per business class: customer concentration; export controls; concentration in qualified upstream suppliers; installation/acceptance and execution; and technology substitution/lithography intensity. Customer-site and installation delays are one correlated financial downside branch, not separately added shocks. Valuation is assessed through the ceiling and current-price comparison, not deducted again from the analytical Base.

Cash, dilution and financial claims

June cash and short-term investments totaled EUR7,581.5 million. Balance-sheet debt carrying value was EUR3,719.7 million. A EUR5 billion operating cash reserve produces a fixed net financial claim of EUR1,138.2 million. Future cash generation is not added again to enterprise value, and the model gives no separate credit for strategic investments or a hypothetical sale of the Zeiss interest.

The statutory debt narrative contains face-value figures that have not been fully reconciled to the carrying total. A conservative EUR4.75 billion debt claim would reduce the ceiling by approximately $3 per share. This is explicitly a claim bound; it is not an assertion that the lower carrying figure was erroneous. Operating leases and normal occupancy costs remain operating expenses, avoiding an extra lease deduction without a matching earnings adjustment.

The starting modeled diluted count is 385 million, rising by 0.1 million per quarter. Q2 diluted weighted-average shares were 384.9 million; June common shares were 384.1 million. The last number is used only for a dated market-cap cross-check. The October 5 issuer notice records 277,000 executed repurchases for EUR 442.5 million during September 28 to October 2. This is only a subset of post-June activity, not a reconciled current diluted count. Deducting those shares without the matching cash cost and intervening issuance would bias value upward. The model retains its explicitly dated balance-sheet/share basis pending a complete reconciliation; future authorized buybacks are not treated as completed reductions. Valuation divides each four-quarter operating-profit window by the final quarter's diluted shares.

A separate funding check includes cash taxes, interest, a working-capital charge, annual capex rising from EUR2.4 billion to EUR3.2 billion, and EUR3.2 billion annual dividends. All eight combinations of the original capacity, system-pricing and acceptance-delay branches retain more than EUR9.7 billion of cash after the first modeled quarter without new borrowing. This conservative funding check excludes the new replacement-parts benefit. This is a bounded stress check, not a replacement cash-flow valuation or a probability claim about independent events. No incremental future buyback is assumed.

Consolidated statements of cash flows

Quarter on quarter

(in millions €)	Q2 2025	Q3 2025	Q4 2025	Q1 2026	Q2 2026

1 Free cash flow, which is a non-GAAP measure, is defined as net cash provided by (used in) operating activities minus purchases of Property, plant and equipment and intangible assets, see US GAAP Consolidated Financial Statements.

ASML July 15, 2026 These numbers have been prepared in accordance with US GAAP. Numbers are presented in millions for readability; therefore, rounding variances may exist. Page 15 Public

ASML July15,2026 issuer presentation, page15 | Original June-quarter cash-flow bridge; profit and cash conversion differ.

Valuation, classification and what would change the conclusion

The valuation uses 20x forward-four-quarter fully expensed operating profit less the financial claim, translated into dollars. The Q4 2027 window includes Q4 2027 through Q3 2028. It is not a target based solely on calendar-2027 profit. The analytical score is 45/60, or 75, reflecting exceptional competitive position but real valuation, export and execution risks. This initiates research coverage and does not establish a portfolio holding.

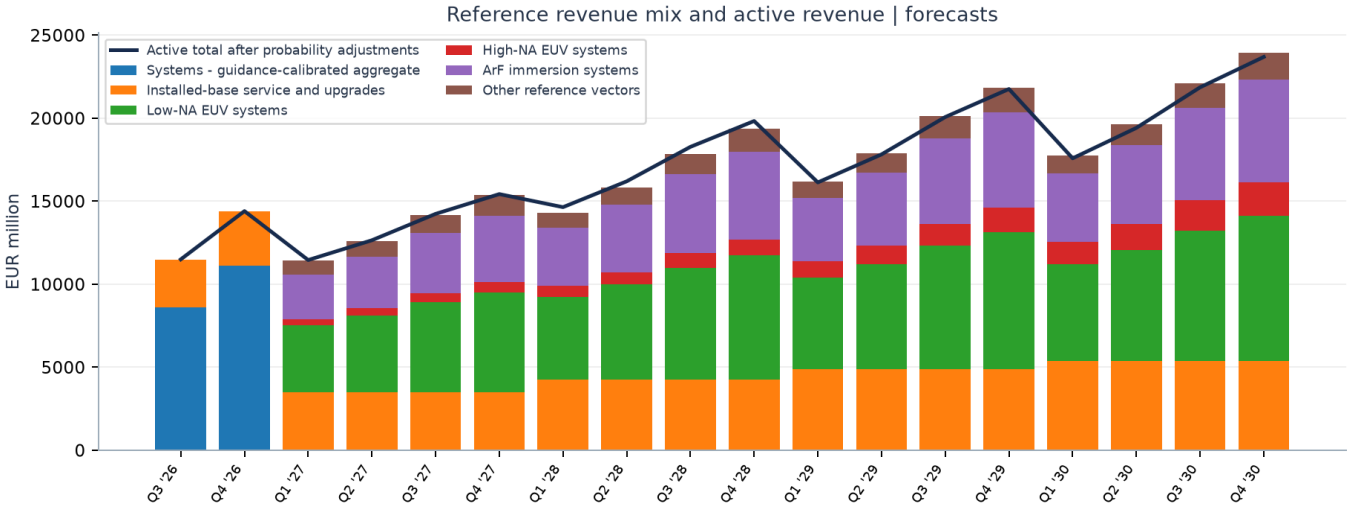

At the dated October 9 quote, the active ceiling is below the share price. The owner's Upside Driver rule therefore returns unavailable instead of calling the stock 100% growth or forcing a re-rating percentage. The underlying operating story is substantial growth; the modeled return opportunity depends on the price paid. The 20x valuation basis is not silently raised to make the answer positive.

The closest catalysts are the October 14 results, conversion of supplier expansion into installed customer output, new-system mix and acceptance, and High-NA qualification breadth. Disconfirmation would include customer power/factory delays, weaker utilization or upgrades, faster throughput reducing tool needs, export restrictions, pressure on the modeled service margin, or a less profitable product mix. These signals should change the appropriate unit, timing or cost input rather than trigger an indiscriminate multiple increase.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	20	Unique commercial EUV supplier, customer process qualification, optics/light-source ecosystem and installed service network.
Cycle	8	Order visibility and stated2027 output expansion support a strong cycle, but customer factories govern acceptance.
TAM	8	Additional critical layers, DRAM and High-NA expand lithography opportunity; High-NA can also replace multiple low-NA exposures.
Catalysts	4	Q3 earnings October14, supplier expansion,3800F qualification and2028 acceptance.
Macro	7	Advanced compute investment is strong, with customer concentration and export restrictions.
Alpha	3	Uses units, invoice mix, service and acceptance rather than equating fab capex with ASML sales.
Risk classes	-5	Five distinct business risk classes, one point each: customer concentration; export controls; qualified-supplier concentration; customer acceptance and execution; technology substitution and lithography intensity. Market price is excluded from the analytical Base.
Total	45/60	Rounded Base 75. Both artifact and new workbook row use this score; this is not a manual override.

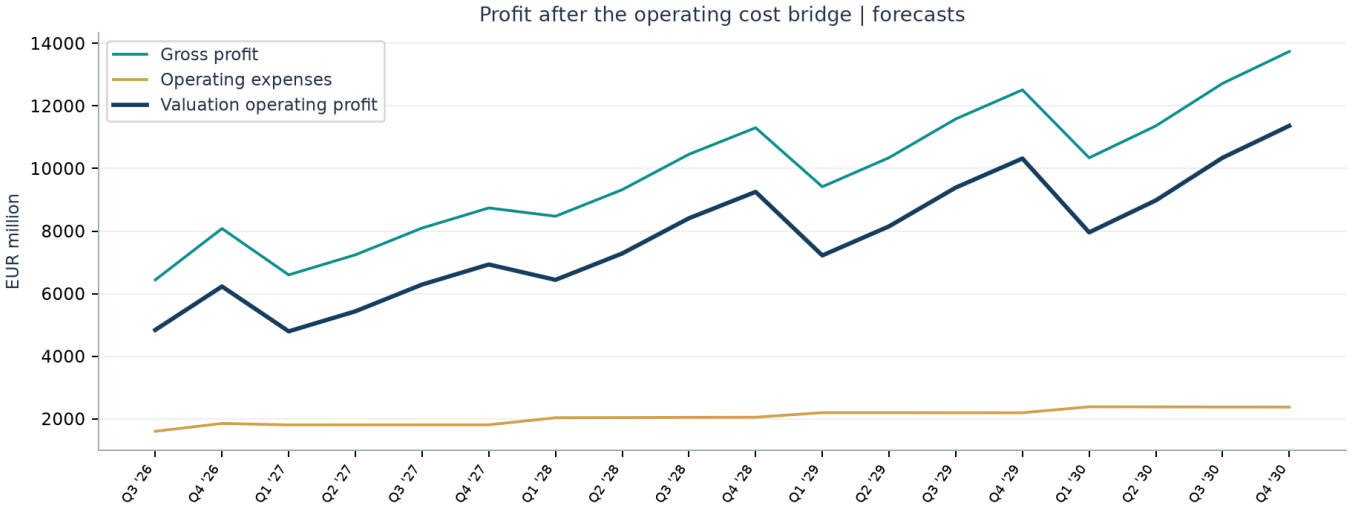

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	11,500.0	0.0	11,500.0

Gross profit, operating expenses and earnings

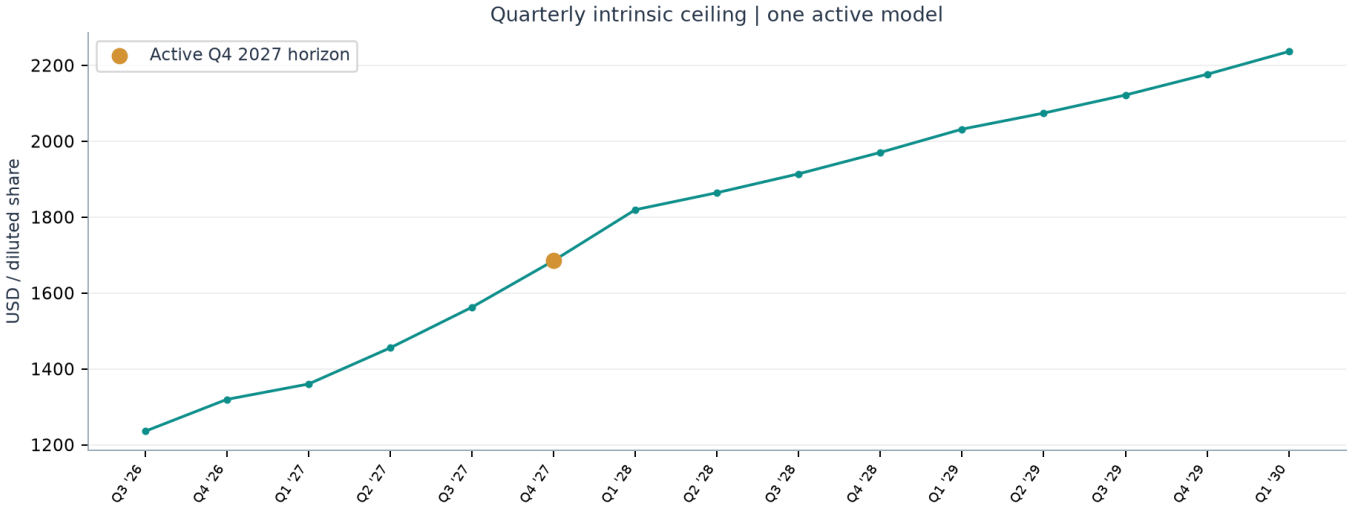

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter / status	Revenue	GP	Opex	Valuation OP	OP margin

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Systems - guidance-calibrated aggregate	8,600.0	52.6%	4,526.0
Q3 2026	Installed-base service and upgrades	2,900.0	66.0%	1,914.0
Q4 2026	Systems - guidance-calibrated aggregate	11,106.6	53.1%	5,901.6
Q4 2026	Installed-base service and upgrades	3,300.0	66.0%	2,178.0
Q1 2027	Low-NA EUV systems	4,018.0	58.0%	2,330.4
Q1 2027	High-NA EUV systems	390.0	40.0%	156.0
Q1 2027	ArF immersion systems	2,688.0	52.0%	1,397.8

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Claim decisions, overlap and triggers

CAPACITY_ACCEPTANCE

probability: 0.55

Conditional: Additional recognized low-NA/immersion invoices above 82/160 reference units in 2027 and 100/200 in 2028: only 2.5/9 and 9.85/19.7 extra units respectively. The 2029 residual shrinks to 2/5; 2030 is zero because expansion is embedded.

bounds: 2027 extra 0-2.5 low-NA and 0-9 immersion; 2028 extra 0-9.85 low-NA and 0-19.7 immersion. Probability sensitivity 35-70%.

overlap: Reference already captures most stated 30% 2027 expansion and potential 30% 2028 expansion. Do not add full company or customer capex. The 2029/2030 residual fades.

bridge: Conditional revenue = extra accepted units times modeled invoice price; 55% incremental gross margin less 10% incremental installation/R&D/SG&A = 45% incremental operating profit.

source: July 15 Q2 prepared call. Investigated capacity is not a delivery commitment.

NEW_ORDER_VALUE_CAPTURE

probability: 0.5

Conditional: 3% premium on 20% eligible new or repriceable system invoices, with a 50% overlap haircut. No 2026 guidance increment.

bounds: Premium 0-5%; eligible share 10-30%; probability 30-65%.

overlap: Reference prices already rise; halve the otherwise eligible premium. Fixed-price backlog is excluded.

bridge: Reference systems revenue x 20% x 3% x 50%; 90% incremental gross profit less 15% incremental operating expense = 75% operating-profit contribution.

source: Customer cost of waiting and supply bottlenecks; analytical pricing proxy, not announced ASML price increase.

CUSTOMER_ACCEPTANCE_DELAY

probability: 0.25

Conditional: 8% of low-NA plus immersion reference invoices delayed or lost within the modeled recognition period.

bounds: 4-12% invoice delay; probability 15-40%.

overlap: One combined risk for customer readiness, supply and installation constraints. No separate correlated penalties or extra capex demand.

bridge: Negative revenue x 55% gross margin less 10% cost relief = 45% operating-profit impact. No automatic next-quarter recovery credited.

source: Earnings-call installation dependencies, China restrictions and major-customer concentration.

KOREA_REPLACEMENT_PARTS

probability: 1.0

Conditional: Reported 10% replacement-parts price increase in South Korea from January 2027. Model eligible sales as 30% of global installed-base service revenue in Korea x 30% separately repriceable replacement parts. These two scope estimates are LOW-confidence proxies, not disclosed ASML splits.

bounds: Korea share 20-40%; parts/repriceable share 20-40%; realized increase 5-10%; probability fixed at 100% by owner; eligible sales and cost sensitivities remain. Central conditional 2027 revenue increment EUR 63 million and OP EUR 37.8 million at the owner-selected 100% probability.

overlap: 50% haircut in 2027-2028 for pricing already implicit in service growth; 75% haircut in 2029; 100% by 2030 as the price level is absorbed into the reference. The existing new-system pricing branch has no replacement-parts revenue. Do not apply 10% to all systems or global services.

bridge: Service revenue x 30% Korea x 30% eligible parts x 10% price x residual share. Allow 30% incremental cost of sales and 10% incremental support/administration on the price increment, giving 60% incremental OP. 2027 active incremental revenue EUR 63 million and OP EUR 37.8 million at 100% probability.

source: The Elec Korean original, October 10, 2026, industry sources report Samsung/SK acceptance. Attributed reporting, not issuer guidance.

trigger: Q3 October 14 call, Korea customer procurement disclosures, January 2027 invoices or later service growth/margins. Reassess eligible share, exclusions and cost offsets on evidence; retain the owner-selected 100% probability unless the owner changes it or new contradictory evidence is surfaced for review.

counter: Undisclosed eligible sales, bundled service contracts, cost inflation, negotiated offsets and existing service-price assumptions can reduce the net increment.

probability basis: Owner explicitly directed 100% on October 11, 2026. This is the adopted modeling probability for the reported scoped price event, not an assertion of independently verified invoices, eligible revenue or profit conversion.

Remaining bounded uncertainties

- Prepared management remarks from the latest two quarters were read; unrestricted full Q&A transcripts were not retrieved.

- System-level margins and future invoice prices are analytical allocations, not disclosed product profitability.

- Interim debt face-value narrative is not fully reconciled to the EUR 3,719.7 million carrying total. A EUR 4,750 million financial-claim bound lowers each ceiling by EUR 1,030.3 million x FX / end-window shares.

- The October 9 price and June 28 common-share count have different dates. Later executed buybacks exist, but a complete cash, issuance and share-count reconciliation is unavailable; no partial buyback credit is taken.

- No guaranteed 2028 EUV/immersion capacity, customer allocation or installation/acceptance schedule.

- High-NA customer plans do not disclose accepted-tool quantities, invoice prices or ASML product margins. TSMC high-volume manufacturing starts in 2030 under its stated plan, not 2027-2028.

- Customer system-wallet allocations and 2027/2028 budgets are not disclosed for every customer. The fitted capex bridge is LOW confidence; a 25% budget/10% capture downside falls below the unit forecast and would require revisiting recognized output.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
