Belimo

BEAN.SW | SIX Swiss Exchange | 2026-10-11

Q4 2027 model ceiling: CHF 807.72

Analytical Base 44/60 = 73 | Watchlist quality compounder; valuation requires discipline

20 x forward-four-quarter fully expensed operating profit less end-window debt, lease, pension and other claims net of cash above CHF65 m, divided by 12.3 m issued shares. Calendar quarter plus next three.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in CHF million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: CHF 783.00 per share (2026-10-09 Swiss regular close, Europe/Zurich; time not supplied by quote page); 12.300 million common shares (Fully issued 12.3 m atJune 2026; no options or other dilutive instruments); estimated equity capitalization CHF 9,630.9 million. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: 100% growth under the owner's sequential-percentage heuristic (0% re-rating / 100% growth). Uses the dated 2026-10-09 Swiss regular close, Europe/Zurich; time not supplied by quote page price, Q4 2026 ceiling and Q4 2027 ceiling at the artifact's own valuation basis. This compares two percentage moves with different denominators; it is not an additive return attribution or a measurement of actual P/E expansion. The classification changes with price and forecasts.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	490.3	20x	12.300	807.72

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Full Belimo group. Data-center revenue is contained within actuator, valve and sensor product lines. R&D, SBC, depreciation, tariffs and warranty costs remain expensed. Parent shareholders own all reported earnings. The tariff refund is a probability-weighted one-time cash asset, not recurring operating profit.. 20 x forward-four-quarter fully expensed operating profit less end-window debt, lease, pension and other claims net of cash above CHF65 m, divided by 12.3 m issued shares. Calendar quarter plus next three.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use CHF million unless a different unit is stated.

Thesis

Research as of October 11, 2026. SIX Swiss Exchange BEAN; workbook identifier BEAN.SW. Figures are CHF millions unless stated otherwise. This is a newly authorized covered company, not an assertion of a portfolio holding. The October 9 Swiss close was CHF783. The production framework dated by its current pointer was read before modeling; the fixed valuation basis is 20 x forward-four-quarter fully expensed operating profit, with debt and other claims deducted and a matched end-window share count.

Investment conclusion

Belimo supplies small but consequential parts of a much larger cooling system: valves regulate coolant, actuators move them, sensors measure performance, and software helps commission and monitor the installation. A high-value computing installation has little incentive to save a modest amount on a component whose failure can impair cooling. The qualification, support and reliability case is stronger than a claim that Belimo itself is sold out. Management explicitly said in July that internal capacity was ample. Customer electricity access and the speed of deploying complete data centers are the limiting factors.

The adopted model is a growth story under the owner's sequential-percentage definition. The first displayed target is below the current price; the Q4 2027 target is only modestly above it, so the positive target upside is classified as 100% Growth. This does not mean actual P/E expansion is measured, nor that the business is guaranteed to grow into its current valuation. The first-quarter and forward targets, exact ratio and calculated classification are saved in model.json and will populate the finished valuation tables. A high-quality product franchise can still offer little modeled upside at a high starting share price.

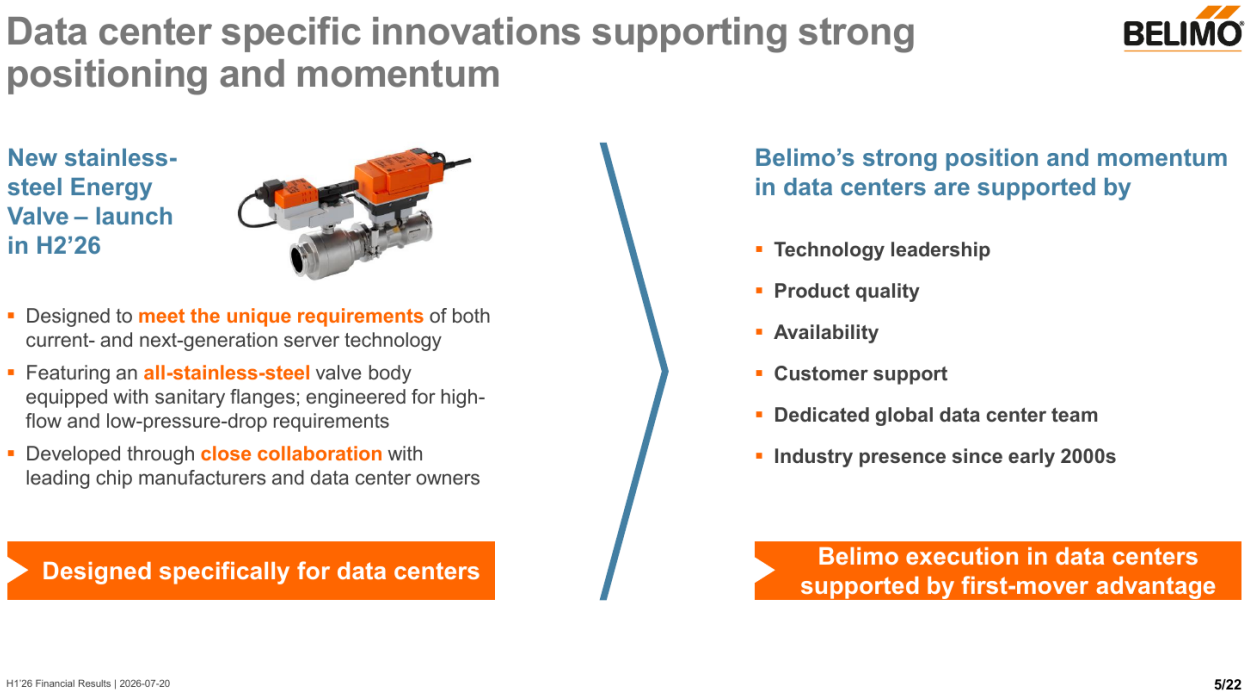

The product and the moat

The relevant stack extends from central cooling plant through distribution piping and air handling to the equipment supporting liquid-cooled racks. Belimo does not sell the whole chiller, cooling distribution unit or server. Its Energy Valve combines regulation, measurement and intelligent control. The new stainless-steel version, targeted for H2 2026 launch, uses sanitary flanges, supports high flow with low pressure drop, and addresses corrosion requirements. Management says it was developed with chip manufacturers and data-center owners. The July call calls the stainless version mix-accretive but explicitly says the new material itself does not create additional energy savings. That distinction matters: do not convert a material substitution into another energy-efficiency demand shock.

The H1 product exhibit shows the actual valve and the issuer's stated requirements, rather than an imagined full cooling plant. Longer-standing relationships, field support, availability and interoperability support switching costs. They do not establish exclusivity. Management expects other suppliers to win second-source opportunities as the

market grows; polymer-based alternatives are being discussed. Belimo's view that established standardized technology will persist is a management opinion, not proof that competing materials cannot qualify.

The digital platform allows common commissioning tools, data, security and customer interfaces across valves, actuators and sensors. September's investor visit presented the new generation and the Hinwil facility, while keeping July's financial outlook. Software functionality helps defend the hardware franchise. We have not invented a subscription revenue stream or software multiple.

Belimo July 20,2026 H1 presentation, slide 5 | Belimo H1 2026 slide 5: stainless steel Energy Valve targets high flow and low pressure drop

Two calls and the current operating baseline

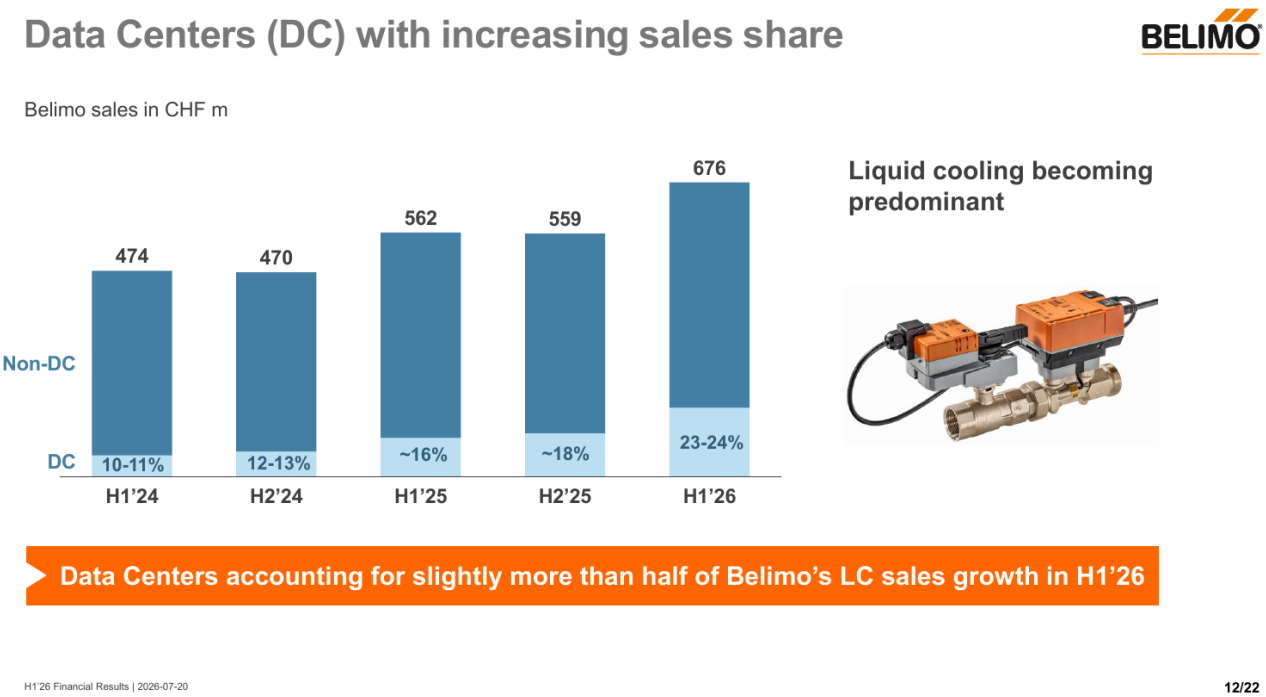

The February 23 results presentation and management Q&A were compared with the July 20 presentation and Q&A. February reported FY2025 revenue of approximately CHF1,121 m, EBIT of CHF233 m and R&D of CHF76 m. Data centers were about 17% of sales, reaching 18% in the second half. Management initially guided mid-teens local-currency revenue growth for 2026, with margin above 20%. It stressed that additional grid power and complete infrastructure deployment determine when suppliers can recognize revenue.

July's H1 results were substantially stronger: revenueCHF676.4 m, EBITCHF152.5 m and parent profitCHF124.9 m. Local-currency growth was 29.6%; reported CHF growth was 20.5%. The bridge was 22.3 percentage points of volume and mix,7.3 points of pricing, approximately 0.1 point of other factors and negative 9.2 points of FX. These are components of historical growth, not additive future forecasts. Data centers reached 23-24% of sales, approximatelyCHF156-162 m. They accounted for slightly more than half of local-currency growth, not half of revenue.

The H1 sales-mix exhibit makes the scope visible and prevents a large modeling error. Most data-center growth was recorded in control valves, with sensors also benefiting; the exact liquid-versus-air revenue split was not disclosed. Damper actuators had only modest reported CHF growth. Broader renovation, pharmaceuticals and semiconductor-factory demand remained supportive despite weak new nonresidential construction.

July removed a numerical revenue growth forecast because deployment timing was too uncertain, while reiterating strong demand and an EBIT margin above 20%. The new model does not describe its CHF1,385 m reference sales for 2026 as guidance. Management said H2 would face a higher cost base as hiring continued, increasing comparison bases and annualizing price increases. It also indicated annual capex around twice the H1 CHF45.4 m, with similarly elevated spending in 2027 and 2028.

Transcript reproductions contain small errors: the vessel retrofit saved approximatelyEUR700,000 annually according to the primary slide, notEUR700. The dividend was paid March 27 according to the interim financial statement, despite an informal April reference in the July call. Primary disclosures control these details.

Belimo July 20,2026 H1 presentation, slide 12 | Belimo H1 2026 slide 12: data centers are 23-24% of sales, not half the business

Demand, content and capacity

Management retained a CHF40-60 m market-content estimate per gigawatt for the full set of products it addresses. That is an addressable-content estimate, not Belimo revenue per GW or a guaranteed share. Higher heat density can increase content per rack, but fewer racks then fit within the same power envelope. We do not multiply both effects into demand. The model instead starts from disclosed company sales and a bounded product revenue path.

The reference annual DC revenue grows fromCHF356 m in 2026 toCHF516 m,714 m,909 m and 1,117 m in 2027-30. These are analyst forecasts. They include valves, sensors and actuators; those amounts are already inside the product lines, never added as another segment. The non-DC businesses grow roughly high single digits to low double digits through energy efficiency, retrofit conversion, industrial demand and normal pricing. The remaining H2 2026 reference is CHF708.6 m, split evenly into Q3 and Q4 at CHF354.3 m each. Added to reported H1 sales of CHF676.4 m, this reconciles to CHF1,385 m for the full year. The phrase 50/50 means half of remaining H2 in each quarter, not half of annual sales. From 2027 each quarter uses 25% of annual sales. Short December and project timing can create actual seasonality.

Factory floor space and logistics bins are not sold units. The Hinwil addition and leased US locations support availability, but management's short lead-time advantage requires inventory. The model retains working capital rather than treating an asset-light assembly operation as having no capital needs. Supplier qualification and project engineering also take time; the February call describes multi-year product development cycles. Qualification wins can raise the duration of the revenue stream, while a burst of general industry capex cannot be booked immediately.

Probability-weighted incremental evidence

BEAN-LIQUID-CONTENT has 60% probability. Above the reference, the conditional extra annual sales path isCHF20/110/220/340/450 m for 2026-30. Half is reserved for overlap with already strong DC growth and higher-value product mix. The residual earns 45% gross contribution less 15% incremental engineering, R&D, qualification, selling and support expense, giving 30% operating contribution. This is a analytical branch, not a management forecast. The probability reflects actual adoption and customer collaboration, moderated by competition and customer deployment constraints. A35-75% probability range,35-75% overlap range and 22-35% operating contribution range bound it.

BEAN-DEPLOYMENT-DELAY has 25% probability. The conditional shortfall is 10% of reference DC sales in 2026,20% in 2027-28,10% in 2029 and zero in 2030, with 50% overlap reserved against the conservative deployment already in the reference. Lost gross contribution is 45%, while only 10% of sales can be removed from flexible expenses. This is an earnings timing risk, not an extra capacity shortage. The model recalculates working capital and funding from the resulting expected revenue path.

The scarcity-pricing branch is assessed but adds zero. A bounded 3% premium on 25% of new DC orders is smaller than the pricing and mix already embedded in the reference. July management described ample capacity, stable pricing and short lead times. It would be inconsistent to invent a large shortage surcharge. Stainless-steel mix, historical price increases and margin leverage are already counted. This justified zero is separate from the positive liquid-cooling branch.

The remaining CHF32.1 m tariff refund claim is not treated as perpetual operating profit. A70% probability, full recovery conditional case,18.5% tax and Q4 2027 collection assumption create a one-time expected cash receipt ofCHF18.31305 m. It reduces financial claims once. The CHF1.3 m already recognized in H1 is excluded from recurring forward earnings. Litigation and administrative timing are unresolved; no unrelated legal forecast is implied.

Product economics and fully expensed costs

The company reports costs by nature, not product gross margins. Our functional gross margins are analytical allocations, calibrated around the reported H1 economic margin and fully costed. The reference uses 46% for actuators,40% for general HVAC control valves,47% for DC valves and 45% for sensors, with limited 20 bp annual improvement for three years. Production labor, materials, ordinary depreciation and tariffs sit inside those margins. R&D is 7% of reference sales; selling, corporate and support starts atCHF201.4 m annually and grows 8%; an additional launch, warranty and tariff reserve starts atCHF3 m. These lines include SBC and nonproduction depreciation, and they must not be layered on top of the full statutory personnel expense again.

The incremental branch separately charges its engineering and selling burden. D&A addbacks are only a cash-flow reconciliation; they do not increase valuation earnings. Capex isCHF90/95/100/110/115 m in 2026-30 plus 15% of positive incremental revenue. Baseline D&A is CHF46 m in 2026, less the CHF22.1 m already reported in H1, leaving CHF23.9 m for H2. Baseline capex of CHF90 m less the actual CHF45.4 m leaves CHF44.6 m for H2. Each remaining amount is split evenly between Q3 and Q4; incremental branch capex and D&A are added separately. D&A rises CHF6 m annually thereafter, with 4% of positive incremental sales added

for cash reconciliation. Company capex guidance provides a near-term anchor; later spending is a model assumption.

Capital, cash and shareholder claims

June cash wasCHF103.1 m, loans 94.5 m, lease liabilities 34.7 m, employee benefit liabilities 6.5 m, and other financial/derivative liabilities about 2 m. The net-debt presentation ofCHF27.7 m already includes leases and current financial assets; adding it to those same gross claims would double count. The model uses the gross components. It does not credit the pension surplus that was excluded by the IAS19 asset ceiling or assign speculative value to small private investments.

Opening working capital is actual receivables 231 m plus inventory 231.3 m minus trade payables 78 m. Thereafter the stock is 28% of annualized sales, not 28% of one quarter. H1 working-capital absorption was 78.7 m, explaining why strong earnings did not immediately translate into equal free cash flow. Minimum operating cash is 65 m; short-term loans can be repaid with surplus cash, and limited borrowing bridges dividend timing. Cash interest 0.5%, debt 2.5%, lease 2.5% and tax 18.5% are transparent proxies. Existing leases are maintained with replacement commitments;1.8 m quarterly lease principal is charged in cash, with the lease claim held approximately stable.

There are 12.3 m fully issued registered shares. The FY2025 exact outstanding count was 12.299969 m after 31 treasury shares. The interim report says no options or other dilutive instruments exist. It shows treasury purchases and awards offsetting in H1. The model therefore conservatively uses all 12.3 m issued shares and charges the net cash cost of replacement awards, after adding back only the expensed noncash SBC. Awards are not added again on top of a denominator that already includes all issued shares. The reportedCHF10 annual dividend is modeled inQ1 and grows 5% annually as an assumption, avoiding an unrealistic smooth quarterly payment.

Valuation, sensitivity and score

Every ceiling uses that quarter and the following three quarters of operating profit, multiplied by 20, less the end-window claims and divided by 12.3 m shares. The debt and cash paths are rebuilt when scenario assumptions change. The company has no material minority attribution in these statements: all H1 profit belongs to BELIMO Holding AG shareholders. No bank target or current market P/E is imported into the valuation.

The analytical Base is 73, from raw 44/60: Core 17/20, Cycle 8/10, TAM7/10, Catalysts 4/5, Macro 7/10, Alpha 3/5 and Risk-2. The score recognizes a strong product franchise and measurable DC sales, while discounting FX/tariffs, competition, customer power constraints and limited valuation edge. It is not an override of any existing workbook score; the company was absent from the master at the targeted membership check.

The main invalidation would be DC sales losing momentum despite announced customer capex, falling qualification win rates, inventory outrunning demand, a weak new-product launch, or pricing failing to cover costs. A stronger Swiss franc can also reduce both reported sales and margin. Management's rough FX sensitivity is not precise enough to use as an exact quarterly exchange-rate model. The explicit sensitivity package changes DC probability/overlap, increases the delay probability and removes the contingent refund while rebuilding funding. The joint stress removes every favorable liquid-cooling increment, sets the delay event to 100% with zero overlap reserve, removes the refund and raises all remaining capex 20%. Both maximum debt and the CHF144.5 m borrowing bound are reported, so a cash floor cannot conceal an unfunded financing assumption.

Catalysts and evidence to revisit

The H2 stainless Energy Valve and Danbury experience center are commercial execution checks, not guaranteed revenues. Customer adoption, actual shipments and pricing should validate the higher-value mix. The January 18,2027 sales release and March 1 full-year results will test the 2026 reference and cash conversion. Watch DC percentage alongside absolute sales, material/personnel costs, working capital, capex and the status of tariff receivables. September's facility event is already reviewed evidence, not a future catalyst.

Primary source originals and hashes are retained in source/source_manifest.json. The July report and 22-page deck were read, relevant annual report financial/capital sections were inspected, and the two latest results calls were reviewed against issuer materials. The September 27-page investor deck was also reviewed; embedded video frames are not represented as quantified financial evidence. The displayed product and DC-mix exhibits were rendered from the original issuer PDF and visually checked. The dated price is a public quote, not an official exchange trade tape; its page supplied the date and session, but not an exact timestamp.

Current-year actual-to-forecast reconciliation

The June product totals are approximately CHF254 m actuators, CHF389 m valves and CHF33 m sensors. An explicit CHF0.4 m rounding reconciliation is assigned to sensors. The estimated H1 DC allocation is CHF8 m actuators, CHF143 m valves and CHF8 m sensors, totaling CHF159 m or 23.5% of reported sales. These subdivisions are analytical allocations, not disclosed product-by-end-market figures. Each annual product reference has its corresponding H1 allocation subtracted before forecasting H2.

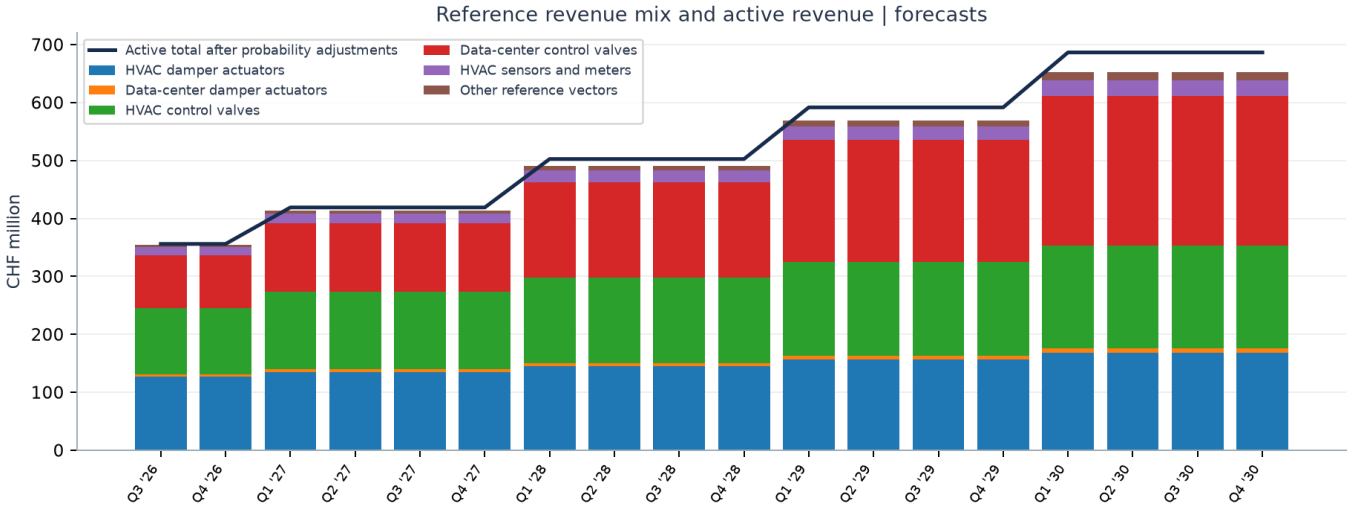

The issuer reports costs by nature. To reconcile the functional model, H1 R&D is allocated at 7% of sales (CHF47.348 m), selling/administration at CHF100.7 m and the separate reserve at CHF1.5 m. These are functional allocations within actual costs, not additional expense above the statutory statement. The implied functional H1 gross profit is CHF302.048 m, yielding the reported CHF152.5 m EBIT. Remaining H2 gross profit is the annual product-based gross profit less this H1 allocation; a common factor adjusts the remaining product margins. Full-year reference EBIT is CHF309.8 m, reconciling actual CHF152.5 m plus H2 CHF157.3 m. The already reported H1 tariff recovery remains in actual EBIT; no recovery is embedded in forward recurring EBIT. The separate uncertain refund affects only future cash.

The active Q4 2027 ceiling is CHF807.719490 and Q4 2026 is CHF622.984132, using the same dated CHF783 share price. The joint stress without favorable incremental content or a refund, with full deployment delay and 20% higher capex, gives CHF706.740458. This is a scenario bound with the reference businesses retained, not a guaranteed floor. Probability controls in the workbook hold the active funding path fixed; use the saved fully rebuilt cash scenarios before adopting a changed forecast.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Long-lived qualified fluid-control hardware, global support, interoperable products; no sole-source claim.
Cycle	8	DC ramps visible in sales and mix, ample own capacity; customer power delays.
TAM	7	Increasing liquid cooling and retrofit content; per-GW scope stable 40-60 m, not compounded with per-rack density.
Catalysts	4	H2 stainless valve and Danbury center, new Hinwil capacity, January 2027 sales.
Macro	7	AI cooling and energy efficiency offset subdued nonresidential construction and CHF.
Alpha	3	Clear separation of actual 23-24% DC share, timing constraints and fully expensed earnings; high market multiple limits valuation edge.
Risk classes	-2	Two deductions for FX/tariff and competitive/deployment exposure.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

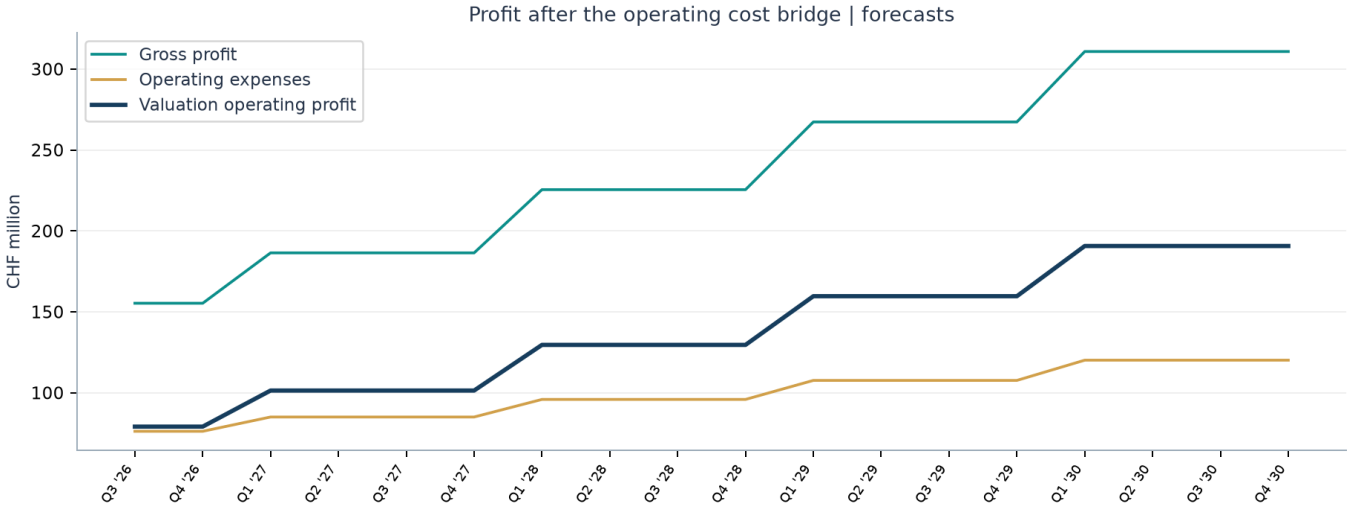

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	354.3	1.8	356.1
Q4 2026	354.3	1.8	356.1

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	HVAC damper actuators	127.0	45.3%	57.6
Q3 2026	Data-center damper actuators	3.5	45.3%	1.6
Q3 2026	HVAC control valves	114.5	39.4%	45.1

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Adopted funding and financial claims

This saved funding scenario includes cash taxes, interest, capital investment, working capital, distributions and any separately specified closure cash. New borrowing is a modeled requirement, not confirmed lending. Probability controls hold this schedule fixed; an adopted operating revision must rebuild funding. Claims equal gross borrowings, leases, pension and other financial liabilities less cash above the CHF65 m reserve. Cash flow includes working capital, lease principal, replacement awards and the one-time expected tariff refund. March dividends are seasonal. Repeated loan drawdowns and repayments are not simultaneous debt. The CHF50 m extra borrowing bound is a modeling condition, not a verified new commitment. Probability controls hold this active claims path fixed; separately saved stresses rebuild the cash path.

Common operating claim

Minority operating earnings are allocated within existing consolidated group profit and deducted once before valuation. These normalized allocations are model proxies. The lease column includes only claims outside gross debt, avoiding a second deduction for leases already in debt.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

BEAN-LIQUID-CONTENT

p: 0.6

Conditional: Extra annual CHF20/110/220/340/450 m CY2026-30, with the entire 2026 increment recognized in remaining H2, above the reference DC revenue path CHF356/516/714/909/1117 m, before overlap. Added sensor/valve content, faster customer deployment and qualification success; not a market-share fact.

overlap: 0.5

bridge: 50% reserve against already aggressive DC growth and higher-value mix; 45% incremental GP less 15% R&D/qualification/selling =30% OP. Additional capex 15%, NWC28% of annual sales, D&A4% of residual revenue already expensed in COGS.

reason: 23-24% H1 DC share and high-end liquid cooling adoption, installed relationships and H2 stainless launch support p 60%; external power bottlenecks, second sourcing and no firm DC backlog reduce certainty.

sensitivity: p 35-75%; gross CY2027 incremental 60-160 m; overlap 35-75%; incremental OP22-35%

BEAN-DEPLOYMENT-DELAY

p: 0.25

Conditional: DC reference sales haircut 10% in 2026,20% in 2027-28,10% 2029,0% in 2030 before 50% overlap; projects slip beyond the modeled year.

overlap: 0.5

bridge: Lost revenue 45% GP, only 10% flexible opex savings:35% lost OP; fixed engineering and support retained. NWC/capex and funding recalculated.

reason: CFO expressly distinguishes order entry from physical customer deployment and identifies power availability as the limiting factor.

BEAN-SCARCITY-PRICE

p: 0.25

Conditional: Potential 3% premium on 25% of new DC orders

overlap: 1

increment: 0

zero reason: Bounded proxy 0.25*0.03*DC sales is already covered by reference 2% annual pricing and higher DC product GM. July CFO reports ample internal capacity, short lead times and stable pricing. Historical 7.3% price contribution cannot be added again.

BEAN-TARIFF-REFUND

p: 0.7

Conditional: Remaining CHF32.1 m contingent asset; 70% receipt probability, net 18.5% tax inQ4 2027

overlap: 0

bridge: One-time expected net cash CHF18.31305 m; reduces end-window claims once; never capitalized at 20 x as recurring OP.

reason: Primary interim disclosure probable but not virtually certain; timing/appeal risk. H1 recognized 1.3 m excluded from forward recurring OP.

BEAN-RETROFIT-REPLACEMENT

p: 0.65

increment: 0

overlap: 1

zero reason: HVAC8-10% reference growth includes RetroFIT+; data-center refresh does not force replacement of valves if thermal load/specification is unchanged. No automatic 5-year whole-valve replacement annuity.

Remaining bounded uncertainties

- Product gross margins and DC product splits are analyst allocations; issuer reports expenses by nature, not product gross profit. Baseline calibrates to H1 economic margin without inventing disclosed segment GM.

- 2026 H1 actualDCmix 23-24%; annual reference 25.7% is forecast, not guidance. No disclosed air/liquid revenue split.

- Exact June treasury share count not separately published;12.3 m fully issued denominator conservatively includes all shares. No outstanding dilutive instruments; future awards assumed market purchased with cash charge.

- No quantitative company FY2026 revenue guidance remained in July; projected 1385 m and future growth are analyst assumptions.

- No USD/CHF forecast: CHF model rates broadly constant versus H1; 10% USD weakening cited rough margin impact around 1.15-1.50 pp; transcription inconsistency bounded in sensitivity.

- Contingent tariff refund cash timing and recoverability remain uncertain.

- Management call reproductions checked against primary decks; transcript typos corrected by source slides: vessel savings EUR700 k, not 700; dividend March 27,not April.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
