KLA Corporation

KLAC | NASDAQ | 2026-10-11

Q4 2027 model ceiling: USD 146.52

Analytical Base 46/60 = 77 | Growth thesis; no positive active-horizon upside at the selected multiple and dated price

20x fully expensed forward-four-quarter operating profit less net financial claims, divided by end-window diluted-equivalent shares. All prices and shares are adjusted for the June 11, 2026 ten-for-one split.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 195.57 per share (2026-10-09 16:00 America/New_York regular close); 1,306.547 million common shares (2026-08-03); estimated equity capitalization USD 255,521.4 million. August 5 Form 10-K cover common shares, on the post-split basis. Quoted price is the October 9 regular-session close. Forecast dilution is separate from common market capitalization. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: no positive modeled upside at the dated 2026-10-09 16:00 America/New_York regular close price of USD 195.57, so the Upside Driver split is unavailable.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	9,813.6	20x	1,322.000	146.52

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated KLA; product categories are mutually exclusive. Advanced packaging is an application subset of products, not an extra reportable segment.. 20x fully expensed forward-four-quarter operating profit less net financial claims, divided by end-window diluted-equivalent shares. All prices and shares are adjusted for the June 11, 2026 ten-for-one split.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD m unless a different unit is stated.

Thesis

As of October 11, 2026. This is an original research model reviewed under the current framework. KLA is covered, not a declared holding. Dollar amounts are US dollars and all per-share data use the ten-for-one split completed on June 11, 2026.

Investment judgment

KLA sells the measurement and defect-detection systems that help manufacturers turn expensive wafers into saleable chips. Its opportunity is broader than extra wafer starts. Larger dies, more complicated transistors, more diverse designs and finer interconnects make an undetected defect more expensive. Customers can improve the yield of an existing line faster than they can construct an entirely new fab. That creates a credible route to higher process-control spending per unit of industry equipment investment.

The business is attractive, but the October 9 closing price of $195.57 already anticipates substantial execution. The 20x fully expensed operating-profit model does not produce positive upside at the active Q4 2027 horizon. A strong company and an attractive entry price are separate judgments. This is fundamentally a growth thesis; the numerical Upside Driver must display unavailable when the active target is below the observed market price. It would be misleading to describe that condition as a positive re-rating opportunity.

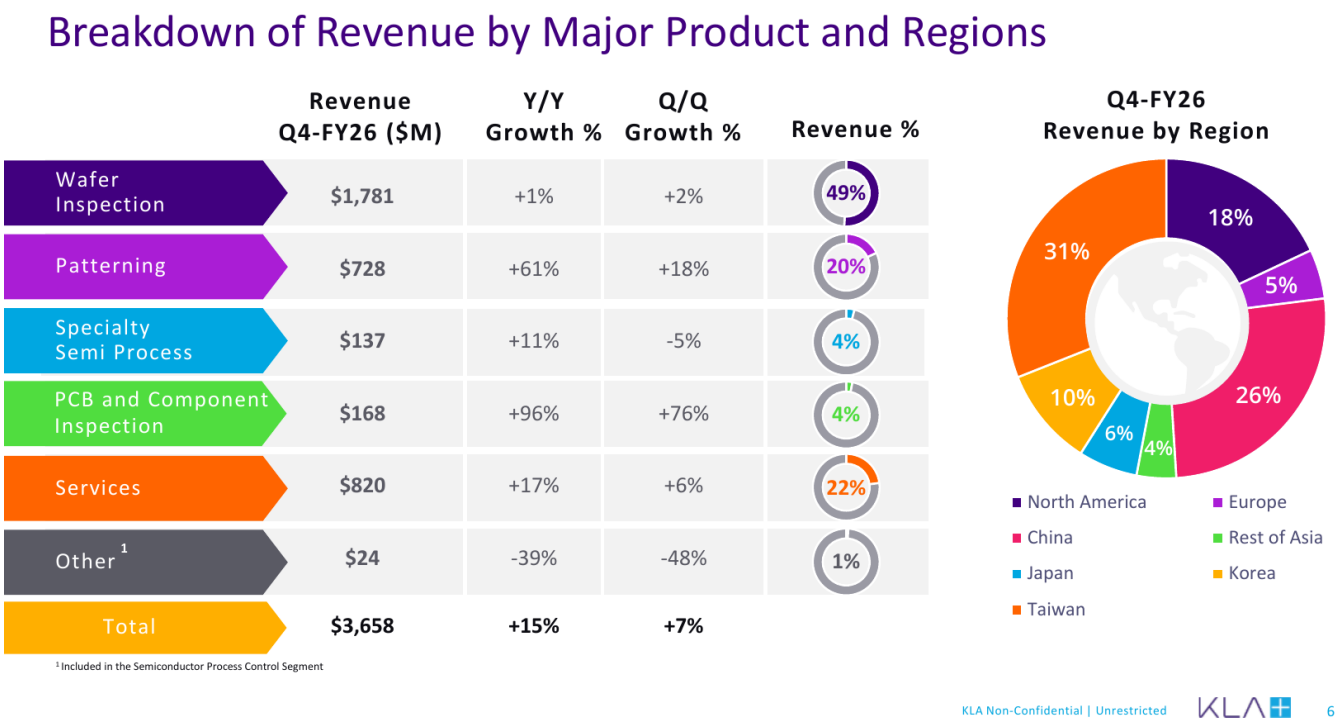

The analytical Base is 77/100, derived from 46/60 points. This is a new coverage score; existing portfolio overrides are unchanged. Core quality contributes 19, cycle 9, TAM 8, catalysts 4, macro 7 and alpha 3, less four risk points. The operating moat earns the high core score; the price itself does not raise the score.

Revenue without double counting

The June quarter generated $3.658bn revenue. The July earnings presentation divides that total into wafer inspection of roughly $1.781bn, patterning $728m, specialty semiconductor process products $137m, PCB and component inspection products $168m, services $820m and other products $24m. The rounded categories differ slightly from the exact consolidated total. These product categories are more useful for a reproducible model than adding overlapping end markets.

KLA's reportable segments include services. Semiconductor process control was $3.257bn, specialty semiconductor process $160m and PCB/component inspection $241m. Adding $820m services to those segment totals would count the same revenue twice. Advanced packaging also spans products and segments. The approximately $635m of CY2025 advanced-packaging process-control systems and July's approximately $1.1bn CY2026 outlook are narrower than the roughly $950m company-wide CY2025 advanced-packaging figure shown at Investor Day. Their difference is scope, not a mysterious revision.

The model therefore uses the six mutually exclusive product groups. Packaging growth is an application inside the inspection and patterning baseline. A separate probability branch captures only additional applications above that baseline. It does not add the full packaging market, customer capex or backlog as incremental KLA revenue.

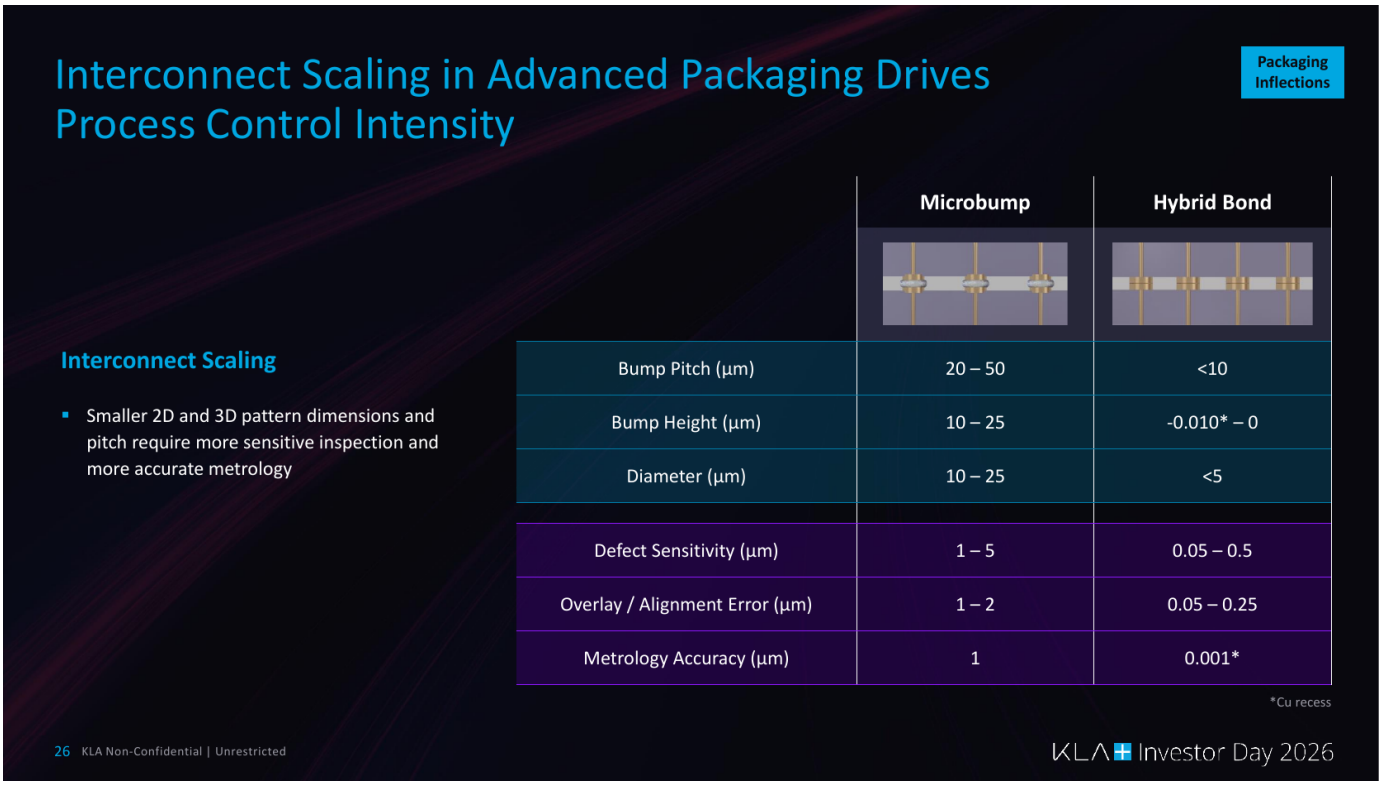

KLA | July 28, 2026 earnings deck, page 6: product categories, including services, sum to consolidated revenue. Advanced packaging crosses these categories and must not be added again.

Why packaging creates more measurements

Inspection finds defects; metrology measures dimensions and material properties. KLA combines optical, electron-beam, reticle and other measurements with analysis software. Different instruments trade sensitivity, throughput and cost. Finding a subtle defect during process development does not establish that the same slow measurement will be economical on every wafer during volume production.

The March technical presentation compares microbump pitches of 20-50 micrometers with hybrid-bond pitches below 10 micrometers. Its illustrative defect-sensitivity requirement tightens from 1-5 micrometers to 0.05-0.5. The 0.001-micrometer metrology figure refers specifically to copper recess, not a universal accuracy requirement for every package measurement. More interconnects and tighter tolerances create additional measurement work, but the tool recipe and sampling plan determine how much of that work becomes equipment revenue.

HBM adds complexity because larger dies contain more logic and less repetitive memory structure. Logic, memory and package yield interact: stacking good dies incorrectly can destroy value accumulated through several expensive manufacturing steps. KLA already supplies equipment to the front end, and some of those platforms can be adapted to advanced packaging. That gives it an installed knowledge advantage while requiring application engineering and customer qualification.

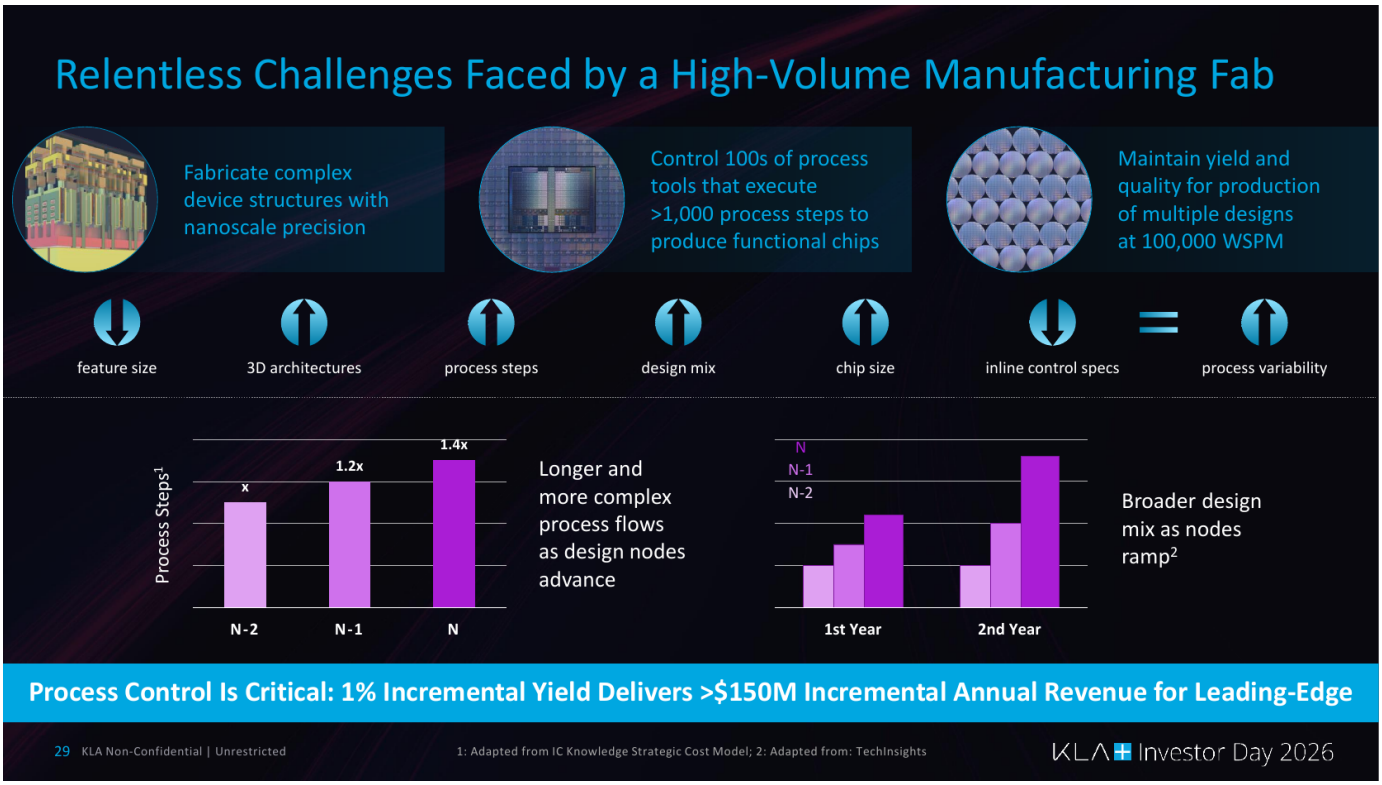

KLA | March 12, 2026 KLA technology presentation, page 26: hybrid-bond dimensions require tighter defect sensitivity and overlay measurement than microbumps. Units are micrometers; the 0.001 figure refers specifically to copper recess.

The customer’s cost of waiting

KLA illustrates a leading-edge fab where one percentage point of yield is worth more than $150m of annual customer revenue. That is a scenario supplied by management, not a universal fab statistic and certainly not KLA revenue. It explains why a customer may pay for a tool that accelerates yield learning or prevents a costly excursion.

The bottleneck is qualified, usable output. More factory floor area does not instantly produce precise optics, sensors, stages and accepted tools. July management described optical-component capacity that can require 12-24 months to add, and discussions extending into the second half of 2027. KLA's internal labor and floor capacity can respond faster than some suppliers. Customer fabs also need to be ready. A complete production line cannot operate merely because one vendor has shipped its share of the equipment.

That combination supports a bounded incremental delivery case. It does not support the assumption that all unserved semiconductor demand converts immediately into KLA orders, or that a longer delivery time automatically produces an equivalent price increase. Supplier capacity and customer readiness are modeled as related constraints, with one combined downside branch rather than several overlapping haircuts.

KLA | March 12 presentation, page 29: KLA illustrates how yield learning and more complex process flows increase the value of process control. The $150m customer yield example is not KLA revenue.

Moat and competitive response

The moat combines difficult hardware, customer process knowledge, algorithms, qualification history and a broad portfolio. A defect found by one measurement can improve the recipe used by a faster instrument. This relationship helps KLA sell a useful production workflow rather than an isolated instrument specification. Recurring service contracts and installed tools deepen the relationship.

The March deck cites 56.5% process-control market share in 2024 using a third-party industry estimate. This is historical, scoped market information, not a guaranteed future share. KLA competes with capable optical, electron-beam and material-analysis suppliers. Onto, Nova, Applied Materials, Hitachi and specialized packaging vendors may win particular applications even when KLA grows overall. X-ray can solve problems inaccessible to optical systems, but throughput and cost determine its high-volume role. KLA's April management discussion estimated a relatively small current X-ray market and cautioned against assuming immediate broad replacement of optical inspection.

Customers can also improve yield, tune sampling or use existing tools more efficiently. Those responses can moderate equipment demand. China's local substitution and export restrictions create additional limits. The model does not assume KLA can sell every needed tool into every geography.

What the newest two calls changed

The April 29 fiscal Q3 call highlighted stronger packaging demand, memory process-control intensity and a supply-constrained industry. Its roughly $1bn CY2026 process-control packaging outlook was raised to roughly $1.1bn in July. The July 28 fiscal Q4 call showed strengthening service growth and expected second-half calendar revenue about 20% above the first half, with further growth into 2027. These are management outlooks, not completed sales.

The June results provide the verified anchor: revenue $3,657.556m, gross profit $2,244.448m, R&D $399.023m, SG&A $291.477m and operating profit $1,553.948m. Net income was $1,363.059m. Fiscal-year revenue was $13,579.476m and operating profit $5,660.780m. September guidance was $4.0bn revenue plus or minus $200m, GAAP gross margin 61.6% plus or minus one percentage point, and GAAP operating expense around $698m. September results had not been released as of this review.

One presentation appendix retains a stale fiscal-quarter heading. Its July 28 date, EPS and share counts match the September quarter, which the earnings release correctly identifies as fiscal Q1 2027. The model uses calendar quarters throughout: September 2026 is Q3 2026, not an actual fiscal Q3 result. The stale March $14bn calendar-2026 target shown for historical context is not substituted for July's updated operating outlook.

Fully expensed operating model

The September starting quarter uses the guidance midpoints: revenue $4bn, gross profit $2.464bn and operating expenses $698m, producing $1.766bn operating profit. Product allocation is an explicit analytical assumption. December revenue of $4.49bn follows the approximate half-on-half growth indication; its product mix and costs are forecasts rather than company guidance.

CY2027 reference revenue is $19.2bn. Its building blocks are $9.4bn wafer inspection, $4.3bn patterning, $700m specialty process products, $900m PCB/component products, $3.8bn services and $100m other products. Services grow as installed tools move out of warranty and into support contracts. Inspection and patterning grow with accepted system deliveries, new designs and application intensity. No undisclosed system unit counts or ASPs are presented as facts.

Reference sales rise to $22.960bn, $26.240bn and $29.380bn in CY2028-30. Those are model assumptions, including a favorable semiconductor cycle. They exceed the midpoint of management's March $26bn CY2030 target, so they should not be mistaken for a conservative forecast merely because the valuation multiple is 20x. The July outlook supports stronger earlier growth, but later years remain less certain.

Product gross margins are modeled separately: 66.5% wafer inspection, 66% patterning, 43% specialty, 49% PCB/component, 52% services and 45% other products in the outer years. These are proxies, not company disclosures. Reference R&D and SG&A total $3.3bn in 2027, $3.96bn in 2028, $4.56bn in 2029 and $5.2bn in 2030. Ordinary stock compensation, rent, acquired-intangible expense and customer support remain inside operating costs. The model does not capitalize a non-GAAP EPS number as though it were fully expensed operating profit.

Probability-weighted forward evidence

The supplier-capacity branch assigns 50% probability to extra accepted system sales above the already strong reference trajectory. Gross conditional revenue of $600m in 2027 grows to $1.4bn in 2030; a 50% overlap reserve removes capacity growth already in the reference. A 64% incremental gross margin less 17% engineering and support gives a 47% operating contribution. The first-year gross amount is only about 4% of reference product sales. It is a bounded output proxy, not an official factory plan.

The new-packaging-application branch uses 45% probability. Gross incremental sales of $250m in 2027 grow to $900m in 2030, also reduced by 50% for overlap. The reference already embeds a roughly $1.3bn CY2027 advanced-packaging process-control subset. New application revenue earns 62% gross margin, less 18% application development and support. The branch does not count all larger substrates or hybrid-bonding expenditure as KLA sales.

Pricing has only 30% probability and a narrow scope: a further 2% premium on 20% of eligible new inspection/patterning sales, with 50% overlap removed. Its 65% incremental operating contribution includes component and support costs. Management explicitly said in April that it does not price purely on scarcity and would not change terms in the middle of an order. This is a product-value and new-terms hypothesis. The zero increment on existing fixed-price orders is justified by that counter-evidence, not by waiting for official confirmation of every future price.

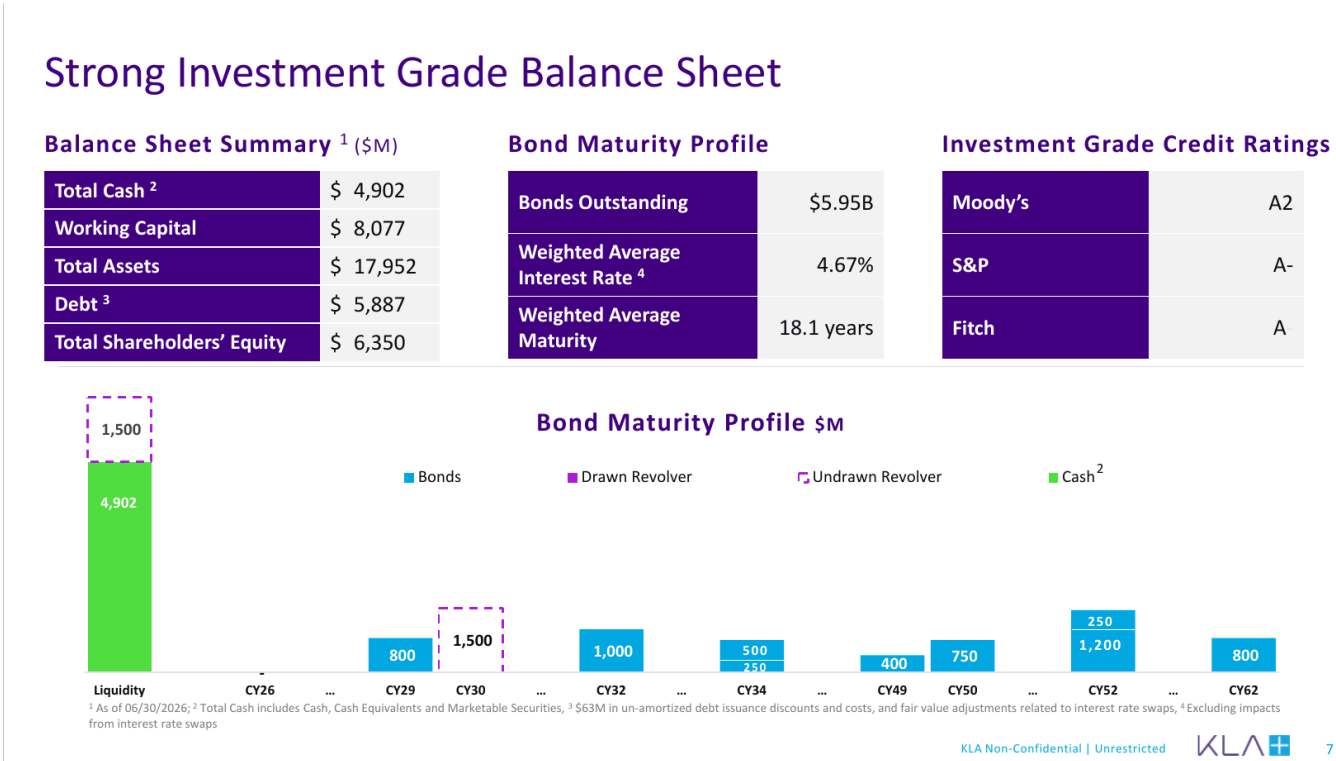

A 25% joint downside branch removes 5% of product sales for supplier, customer-fab and export delays. Services are excluded. Lost gross profit is partly offset by avoidable expense. These probabilities are ASTRA modeling assumptions. Their bounds, incremental economics and overlap adjustments appear in the model ledger so they can be challenged without changing the valuation method.

Debt, cash and the stock split

Verified June cash and marketable securities total $4,902.408m. Bond principal is $5,950m; the $5,887.415m accounting carrying value is lower because of discounts, fees and other adjustments. Principal is the relevant contractual claim. The first modeled maturity is $800m in March 2029. No convertible-share election is required for these bonds. The undrawn revolver is liquidity capacity, not cash.

The model retains a $1.5bn operating cash reserve and a $25m combined reserve for small finance leases and foreign pension liabilities described as immaterial but not separately quantified. The latter is explicitly a $0-50m uncertainty bound. Net claims are therefore $2,572.592m. Operating-lease liabilities of $264.298m are not deducted again because full rent remains in operating profit. That avoids penalizing the same lease twice.

The quoted market capitalization uses the 1,306.546783m common shares reported as of August 3. The valuation starts from September management guidance of 1,312m diluted shares, then adds 1.25m shares each quarter. It gives no credit for unexecuted future buybacks. Repurchase authorization is not a mandatory debt claim and does not prove a lower future share count. All values are split adjusted; applying a pre-split EPS or share count would create a tenfold error.

KLA | July 28 earnings deck, page 7: $5.95bn bond principal versus $5.887bn accounting carrying value, with $4.902bn cash and securities. Undrawn credit is not cash.

Funding and stress checks

The separate funding schedule tests all 16 combinations of the four branches. In those states the pricing revenue is recalculated from the actual corresponding volume state, not from a fixed weighted active volume. Cash starts from the verified June balance after reserving the $25m uncertain claims. The schedule retains tax, coupon payments, a further $25m annual interest reserve for floating-rate swap exposure and fees, capital spending, working-capital investment, dividends and the $800m 2029 maturity. The issuer swapped $2bn of fixed-rate notes into floating exposure; a fixed coupon sum alone would not capture that risk. It assumes no future discretionary repurchases, new borrowing or equity financing.

Tax is modeled at 20%, above the current planning rate, with $150m quarterly capex rising to $180m. Working-capital investment consumes 30% of sequential revenue increases. Ordinary rent remains in operating costs. Every tested state stays above the $1.5bn cash floor, so the forecast does not require a financing-induced share issue. This is a bounded model stress test, not a statement that every conceivable recession or acquisition would be self-funded. The valuation retains the verified net-claim anchor rather than adding speculative future cash on top of capitalized operating earnings.

Catalysts, falsification and follow-up

The immediate checkpoint is the September-quarter release and its December outlook. The most useful subsequent evidence is accepted system output, component lead-time improvement, advanced-packaging application conversion and service-contract growth. Backlog must be read with cancellation rights, delivery timing and customer readiness; it is not recognized revenue.

The thesis weakens if customers reduce inspection intensity through higher tool throughput or sampling efficiency, if new fabs slip, if critical optics remain unavailable, or if export rules remove accessible customers. It strengthens

if KLA sustains additional application wins while fully expensed margins improve despite DRAM component costs. A price correction without deterioration in those facts would affect entry valuation, not automatically the analytical moat score.

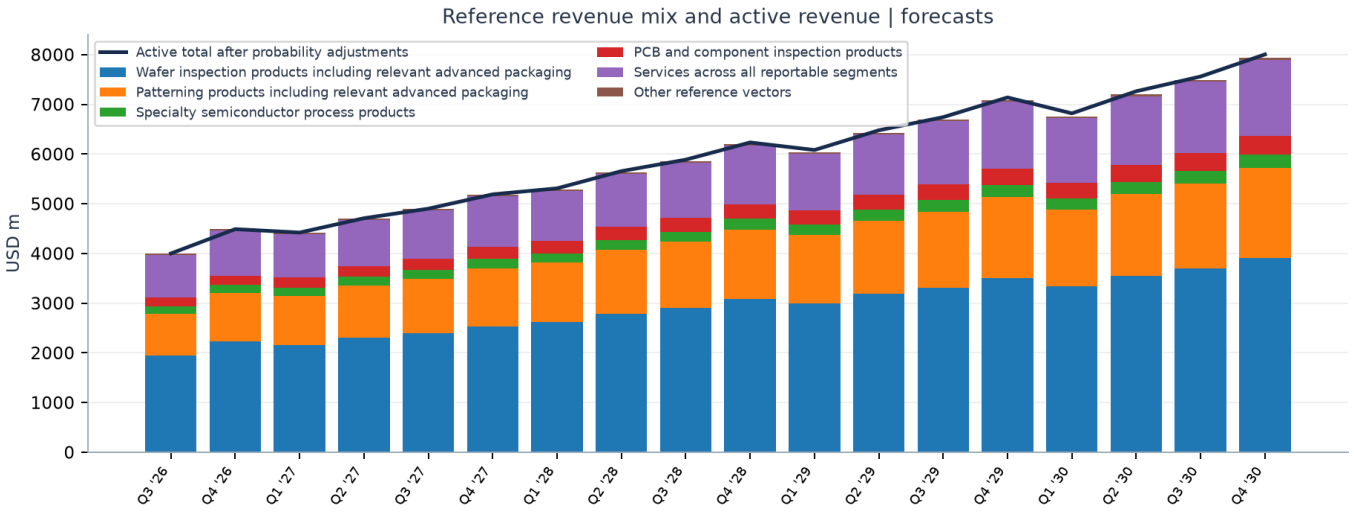

KLA's March technical material reinforces the usefulness of inspecting the inspection suppliers. It does not by itself establish a new outside-universe investment: names such as Onto, Nova and Camtek are being reviewed separately in this authorized backlog. No new portfolio row, score or target should be created merely because a supplier appears in a technical diagram.

Root review recalculated pricing on accepted eligible units after the matching delay state. The adopted Q4 2027 ceiling is $146.52041004, versus the October 9 $195.57 close. An additional joint stress turns off every positive branch, applies the full delivery-delay branch and removes another 20% of annual revenue from 2027 at a 50% decremental operating margin. Its same-method ceiling is $107.25669818; minimum modeled cash is $4877.408m, above the $1,500m operating reserve. This wider cycle test is a scenario, not a guaranteed floor. Future cash generation is retained for liquidity analysis and is not added a second time to the valuation.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	19	Broad qualified portfolio, repeatable yield economics, proprietary optics and algorithms, and customer process knowledge; strong services attach.
Cycle	9	The backlog rose to $12.57bn, with customer discussions extending into 2027 and supplier commitments later. Orders are cancellable and shipment timing remains constrained.
TAM	8	GAA, HBM, larger dies, reticles and advanced packaging increase inspection intensity; not every new process step needs another KLA system.
Catalysts	4	September results, component supply additions, advanced-packaging acceptances and service-contract conversion after warranty.
Macro	7	Strong global AI investment, offset by export restrictions, tariffs and geographical concentration.
Alpha	3	The application/product boundary and stock split matter. Pricing power is value-based; management rejects opportunistic mid-order scarcity repricing.
Risk classes	-4	Four deductions for supplier and fab timing, China restrictions, competing measurement technologies, and an already demanding quotation.
Total	46/60	Rounded Base 77. Both artifact and new workbook row use this score; this is not a manual override.

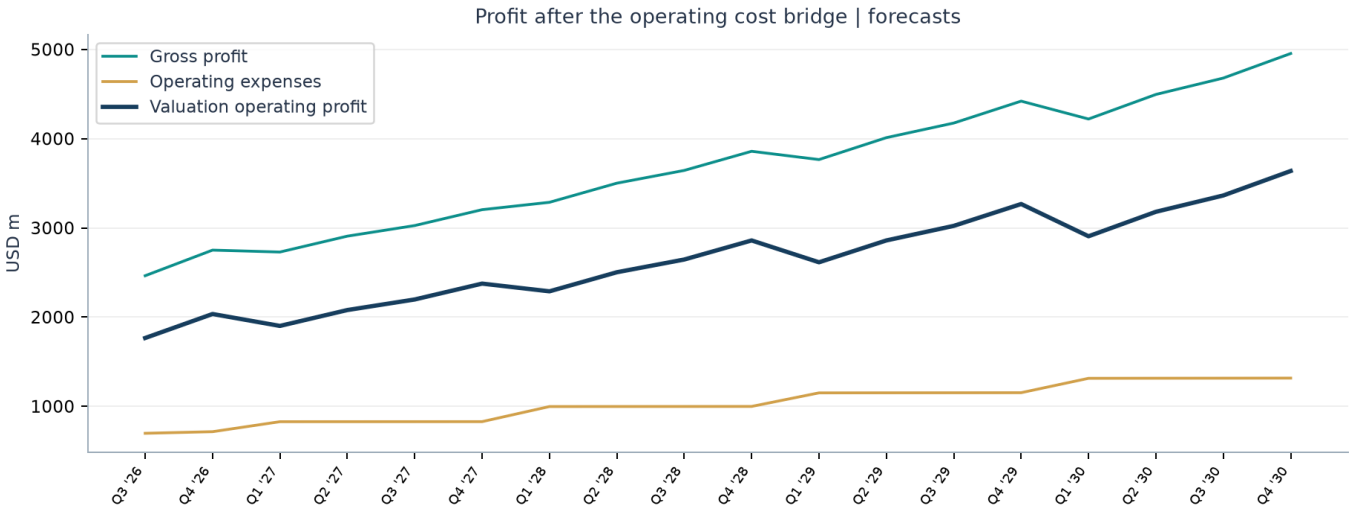

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	4,000.0	0.0	4,000.0
Q4 2026	4,490.0	0.0	4,490.0
Q1 2027	4,416.0	5.1	4,421.1
Q2 2027	4,704.0	5.4	4,709.4
Q3 2027	4,896.0	5.6	4,901.6

Q4 2030	5,724.000	Analytical calendar-quarter forecast

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Wafer inspection products including relevant advanced packaging	1,950.0	67.2%	1,309.5
Q3 2026	Patterning products including relevant advanced packaging	840.0	65.5%	550.2
Q3 2026	Specialty semiconductor process products	150.0	43.0%	64.5
Q3 2026	PCB and component inspection products	180.0	49.0%	88.2

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

SUPPLIER_CAPACITY_OUTPERFORMANCE

probability: 0.5

Conditional: Gross extra accepted system sales of $600/1,000/1,200/1,400m in CY2027/28/29/30; retain 50% after overlap with the already strong reference ramp.

bounds: Probability 30-65%; retained revenue 25-75% of gross. First-year gross equals approximately 4% of reference product sales; it is a throughput proxy, not a disclosed production plan.

overlap: Baseline already incorporates backlog, WFE expansion, memory intensity and supplier capacity additions. The branch represents deliveries above that baseline, not the entire backlog or customer capex.

bridge: 64% GP less 17% incremental R&D, field service and selling costs = 47% OP.

source: July 28 management call: component capacity, 12-24 month lead times and planning above customers' central forecast.

NEW_PACKAGING_APPLICATIONS

probability: 0.45

Conditional: Gross extra AP-related system sales $250/450/700/900m, reduced 50% for existing application and node-ramp overlap.

bounds: Probability 25-65%; first-year gross $100-400m. Proxy equals roughly 20% of a $1.3bn reference CY2027 AP-system subset.

overlap: The approximately $1.1bn CY2026 AP process-control systems outlook and $1.3bn CY2027 reference subset are embedded in wafer inspection and patterning. No added $950m CY2025 company-wide AP total, which has broader scope than the $635m process-control systems figure.

bridge: 62% GP less 18% application development and support = 44% OP.

source: March 12 technology deck and April 29/July 28 calls: tighter interconnects and advanced front-end tools entering packaging.

NEW_PRODUCT_VALUE_PRICING

probability: 0.3

Conditional: 2% additional premium on 20% of eligible inspection/patterning sales plus weighted incremental capacity/application sales, with a further 50% overlap reserve. Eligible reference units are reduced by the same delay state before pricing; no price gain on undelivered units.

bounds: Probability 15-45%; premium 0-3%; eligible mix 10-30%.

overlap: Existing mix improvements and normal value-based price changes are in baseline. No repricing of fixed orders; no generic scarcity surcharge. Management explicitly rejected pricing purely on scarcity.

bridge: 25% incremental component cost and 10% operating support leave 65% OP contribution.

source: April 29 pricing answer and July 28 component-cost normalization discussion.

SUPPLY_FAB_EXPORT_DELAYS

probability: 0.25

Conditional: 5% of reference product revenue slips outside its forecast year or is lost; services are excluded.

bounds: Probability 15-40%; affected products 3-10%.

overlap: Single joint reserve for component bottlenecks, customer construction and export restrictions. These correlated constraints are not separate demand shocks.

bridge: 63% lost GP less 12% avoidable expense = 51% OP reduction.

source: Annual backlog risk disclosures and management supply/cleanroom discussion.

Remaining bounded uncertainties

- Product-level ASPs, unit shipments and GAAP margins are not disclosed; product sales and margins are labeled modeling proxies.

- The July deck appendix page 16 retains a stale Q4 FY2026 heading. Its July 28 note, EPS, revenue and share guidance match the September FY2027 quarter; the release establishes the correct period.

- September results were not yet released by October 11. Calendar quarters in this model must not be confused with KLA fiscal quarters ending in June.

- Small finance leases and foreign pension obligations are described as immaterial without a usable exact claim total. A $25m combined valuation and cash reserve is an assumption, bounded at $0-50m; ordinary rent and pension service costs remain expensed.

- The June cash balance is the verified funding anchor. Subsequent operating cash and discretionary buybacks are not credited to the target; later capital transactions require refresh.

- No lower future share count is inferred from the repurchase authorization. The valuation starts from management's September diluted-share guide and grows by 1.25m shares per quarter.

- A strong operational outlook does not ensure target upside at a premium market price. The owner's Upside Driver is unavailable when the active target is below the current price.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
