NRG Energy

NRG | NYSE | 2026-10-11

Q4 2027 model ceiling: USD 305.40

Analytical Base 43/60 = 72 | Integrated energy cash flow with late-decade contracted development

20x fully costed forward-four-quarter operating profit, using the displayed quarter plus the next three, less matched end-window financial debt and finance leases plus $650m preferred liquidation preference. Cash above a $500m operating reserve is credited. Value each of 32 persistent operating outcomes using its own end-window shares and claims, then probability weight common equity. Suspend discretionary buybacks before the conditional $26.437bn debt bound is breached; no already paid buyback is reversed.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 107.97 per share (2026-10-09 regular NYSE close, 16:00 EDT); 210.210 million common shares (31 July 2026 statutory outstanding common shares); estimated equity capitalization USD 22,696.4 million. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: 78% re-rating under the owner's sequential-percentage heuristic (78% re-rating / 22% growth). Uses the dated 2026-10-09 regular NYSE close, 16:00 EDT price, Q4 2026 ceiling and Q4 2027 ceiling at the artifact's own valuation basis. This compares two percentage moves with different denominators; it is not an additive return attribution or a measurement of actual P/E expansion. The classification changes with price and forecasts.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	4,358.3	20x	199.805	305.40

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated integrated energy and smart-home operations. Realized fuel, power purchases and hedges remain in economic gross profit. Unrealized derivative marks and asset-sale gains are not capitalized. D&A, stock compensation, development expense, plant maintenance, retirement expense, integration and customer-contract amortization remain charged. Gross customer-acquisition/fulfillment cash is separately paid in funding after D&A is added back.. 20x fully costed forward-four-quarter operating profit, using the displayed quarter plus the next three, less matched end-window financial debt and finance leases plus $650m preferred liquidation preference. Cash above a $500m operating reserve is credited. Value each of 32 persistent operating outcomes using its own end-window shares and claims, then probability weight common equity. Suspend discretionary buybacks before the conditional $26.437bn debt bound is breached; no already paid buyback is reversed.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD million unless a different unit is stated.

Thesis

Research date: October 11, 2026. NYSE: NRG. USD common shares, without an ADR conversion. The October 9 regular-session close used here is $107.97. This is a completed research model, not a claim about a personal holding. The current full investing framework was read before modeling; the input sources, quarterly operating calculations and funding sensitivities are preserved beside this document.

Investment conclusion and what actually drives the target

NRG is an existing integrated power and retail platform with a large development option. Its installed plants, customer book, fuel procurement, risk management and turbine reservations are valuable when electricity availability matters more than the nominal cost of a server. But requested data-center load is several steps away from signed revenue, and construction cash arrives years before the new plants generate earnings.

The Q4 2027 model ceiling is **$305.40**, or about **2.8x** the dated $107.97 close. This is a conditional 20x operating-profit ceiling, not a market-consensus target or expected one-year investment return. The first-quarter displayed target, Q4 2026, is $231.87. The owner’s sequential-percentage Upside Driver labels this **78% Re-Rate / 22% Growth**. That heuristic compares two percentage moves with different denominators; it does not prove that actual P/E expansion explains 78% of the eventual return.

The near-term result does not depend on pretending a 2029 plant operates in 2027. The active forward window is Q4 2027 through Q3 2028. It contains no direct operating profit from the lead BYOP project. It does contain the cash cost of construction, which raises the claims deducted from equity value. Much of the gap to the market comes from applying the authorized 20x fully costed operating-profit basis to the existing business. At 15x the ceiling is about $196; at 10x it is about $87. That multiple sensitivity is more important to the active target than the first BYOP completion probability.

What NRG sells and where the economics belong

NRG earns energy and capacity revenue from generation, customer margins from retail electricity and natural gas, demand-response revenue, and equipment/service revenue from Vivint. Generation and retail are integrated exposures. Higher wholesale electricity prices can increase a plant’s gross margin while simultaneously increasing the cost of supplying a fixed-price customer. Fuel basis, hedges, outage timing and the duration of customer contracts determine which effect wins.

The model therefore has four operating products: Texas integrated energy; East integrated energy, capacity and demand response; West/Canada net of corporate eliminations; and Vivint. It does not multiply the entire approximately 25 GW fleet by a spot electricity price. It does not treat all Vivint gross margin as free cash, because acquiring and fulfilling customer contracts consumes substantial cash that appears outside the current-period expense measure.

The January 30 acquisition of LS Power's generation portfolio and CPower added roughly 13 GW across 18 facilities. Those assets are already inside the approximately 25 GW fleet and the first-half accounts. Consideration included 24.25 million shares, $6.4 billion cash and working-capital/other adjustments. The acquisition is not an additional future capacity branch; its debt, shares, depreciation and retail hedging benefits are already in the starting perimeter. Issuer closing release, June 10-Q.

Physical scarcity is local. An interconnected plant in the right load pocket with reliable fuel and deliverable capacity can be more valuable than generic planned MW elsewhere. NRG's fleet and customer book provide a route to capture that value before a greenfield project is complete. Storage, solar, uprates, demand response, transmission and other gas plants remain credible supply responses, however. The model does not assume a permanent nationwide electricity shortage.

The first half explains why EBITDA is insufficient

H1 2026 GAAP revenue was $17.737 billion, operating income $1.304 billion, net income $631 million and operating cash flow $948 million. Adjusted EBITDA rose to $2.297 billion from $2.035 billion, but adjusted EPS fell to $2.98 from $4.42 and free cash flow before growth fell to $959 million from $1.207 billion. Acquisition financing, additional shares, amortization and capital needs matter to the common shareholder. Q2 results and financial appendices.

Q2 Texas adjusted EBITDA fell to $381 million from $512 million; East rose to $469 million from $99 million as the newly acquired assets joined the group. Vivint contributed $301 million. This combination argues against treating all regions as identical AI power beneficiaries. First-quarter winter pricing hurt portions of the retail book before the LS closing fully offset those exposures, while mild Texas conditions weighed on scarcity pricing.

The reference model uses economic revenue and gross profit excluding unrealized derivative marks. H1 economic revenue of $17.741 billion and gross profit of $4.440 billion come from the issuer's segment reconciliations. Removing $84 million of unrealized derivative gains and a $37 million asset-sale gain from reported H1 operating income gives $1.183 billion of normalized operating profit. D&A, stock compensation, integration, plant costs, customer-contract amortization and retirement expense remain costs.

The cost categories are an analyst functional allocation, not a replacement GAAP filing. A $37 million H1 residual operating-cost allocation reconciles the economic-gross-profit schedule to that normalized operating-profit anchor. The issuer's adjusted EBITDA reconciliation also contains small other-income allocations; these are not silently capitalized as operating profit. No asset-sale gain or equity-investment revaluation is needed for the model.

Actual-to-forecast bridge and operating assumptions

The 2026 reference is $35.380 billion economic revenue and $9.720 billion economic gross profit. Its $5.450 billion adjusted-EBITDA bridge is below the issuer's $5.575 billion guidance midpoint and within the $5.325-5.825 billion range. Deducting $1.955 billion D&A, $120 million stock compensation, $30 million retirement expense, $110 million transaction/integration and $100 million other operating costs produces $3.135 billion fully costed operating profit. The probability-weighted weather branch then reduces the remaining-year outcome further.

H1 actual amounts are subtracted before the residual H2 is allocated. Texas residual sales and gross profit use a heavier Q3 seasonal weight; East and West follow their different seasonal profiles; remaining functional costs split evenly. Thus the model does not apply a full-year seasonal percentage on top of already recorded first-half results. Annual physical capex of $1.941 billion is reconciled to $655 million spent in H1; annual capitalized customer-contract cash of $1.020 billion subtracts the $587 million already spent. Annual D&A of $1.955 billion subtracts the $926 million actual.

The following reference gross-profit assumptions are separate from conditional Rule 16b branches. Revenue growth combines existing retail volume/mix, capacity revenue, usable TEF output, customer growth and realized generation margin. Management does not guide these exact segment amounts. The gross-profit schedule is deliberately explicit because the integrated energy revenue denominator contains large pass-through fuel and purchased-power amounts.

Reference product	2026 sales / GP, $m	2027 sales / GP, $m	2030 sales / GP, $m
Texas	12,000 / 3,500	12,700 / 3,850	15,200 / 4,800
East	18,000 / 3,600	19,000 / 4,000	21,300 / 4,800
West and Canada, net	3,000 / 470	3,150 / 500	3,500 / 575
Vivint	2,380 / 2,150	2,600 / 2,380	3,350 / 3,150

By 2030, reference annual operations/maintenance is $2.730 billion, selling/administration/technology $2.580 billion, D&A $2.320 billion, stock compensation $160 million, retirement expense $38 million, integration $30 million and other operating costs $115 million. The increasing costs prevent all incremental gross profit from falling to shareholders. The unusually high Vivint economic gross margin must be read with the customer-contract amortization and acquisition cash charged elsewhere; it is not a comparable hardware gross margin.

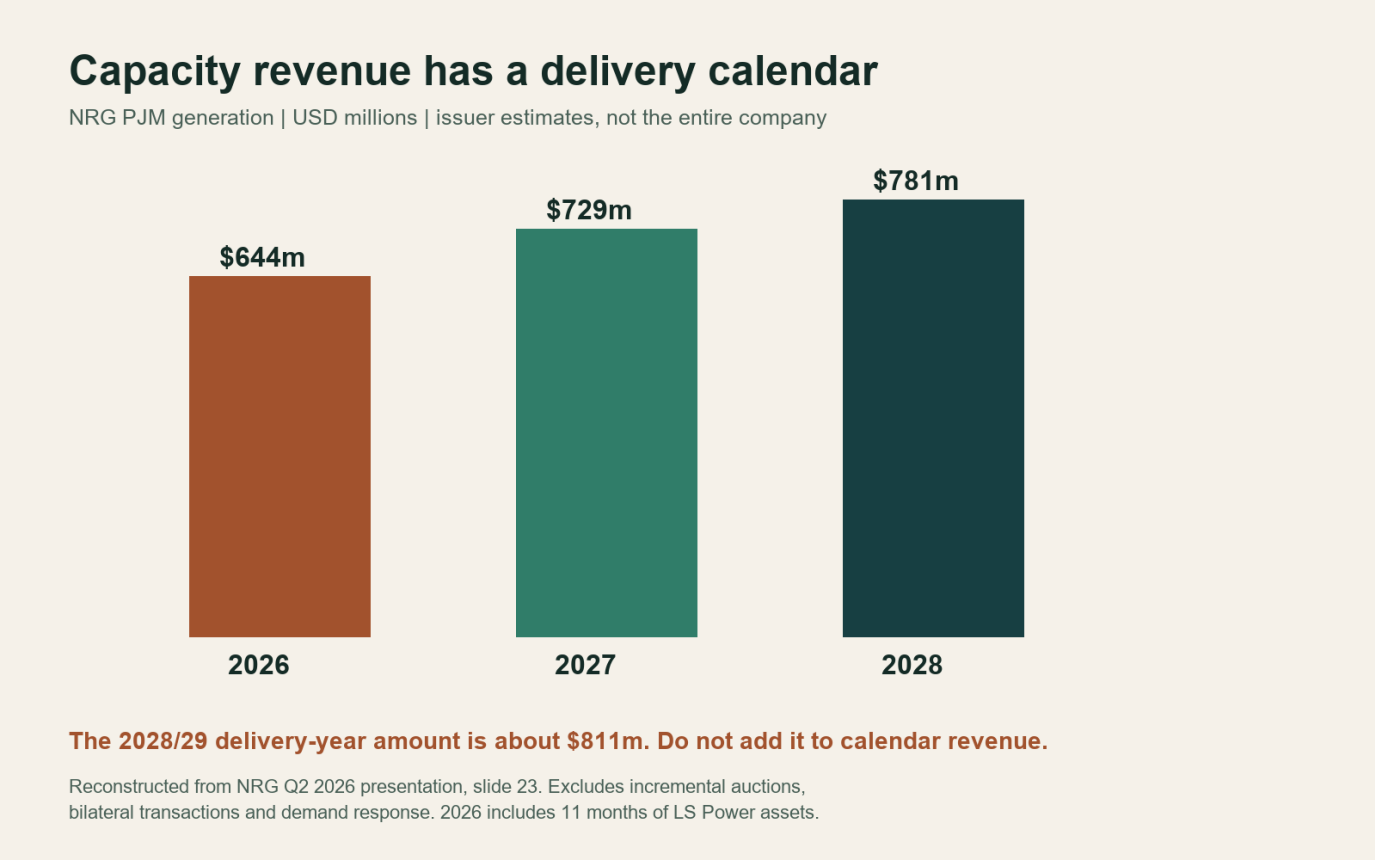

Capacity revenue has a delivery calendar

The Q2 presentation gives PJM calendar-year capacity revenue of $644 million in 2026, $729 million in 2027 and $781 million in 2028. The 2028/29 auction quantity of 6,839 MW at $325/MW-day produces about $811 million over a full delivery year. The delivery year and calendar year are different reporting windows. Adding the $811 million to the calendar series would count overlapping generation availability twice. The East reference already incorporates the disclosed calendar amounts. Q2 presentation, capacity appendix.

The illustration reproduced in this artifact is a reconstruction of those primary numeric values. It is not a screenshot of an inaccessible original slide. The 2026 figure includes only 11 months of LS Power assets; it is not a clean comparable full-year figure. Additional bilateral transactions, demand response and future auction results must be evaluated separately from this already committed revenue.

Three Texas Energy Fund projects also require disciplined scope. The operating Wharton unit is 415 MW in usable terms. Cedar Bayou 5 and Greens Bayou 6 are 689 MW and 443 MW, with mid-2028 targets. Higher nameplate ratings are not interchangeable with these deliverable figures. The TEF loan program provides approximately $1.15 billion at a 3% rate, and a Wharton completion grant is paid over time. The model does not turn the entire grant into recurring operating profit or an immediate $55 million cash receipt.

The issuer’s 445 MW of already signed grid-served data-center arrangements are also in the reference. That demand is distinct from the new 1.2 GW BYOP development. The direct increment for the signed capacity and TEF evidence is zero because the economics and capital have already been included, not because the evidence lacks official confirmation.

Reconstructed from NRG issuer presentation; original pixels unavailable | Reconstructed from the issuer's Q2 2026 presentation, slide 23. Calendar-year PJM revenue of $644m/$729m/$781m must not be added to the $811m delivery-year 2028/29 figure.

Capital arrives before earnings

The lead BYOP proposal is a 1.2 GW Texas combined-cycle plant with at least a 15-year initial term, approximately $3.2 billion investment, $500 million annual adjusted EBITDA and $375 million annual free cash flow before growth at full operation. Management described a capacity payment designed to recover capital and earn a return, plus separate recovery of fuel and operating costs. Approximately 95% of project free cash flow would be supported by capacity payments rather than data-center utilization. An investment-grade parent guarantee is contemplated. Q2 release, Q2 presentation.

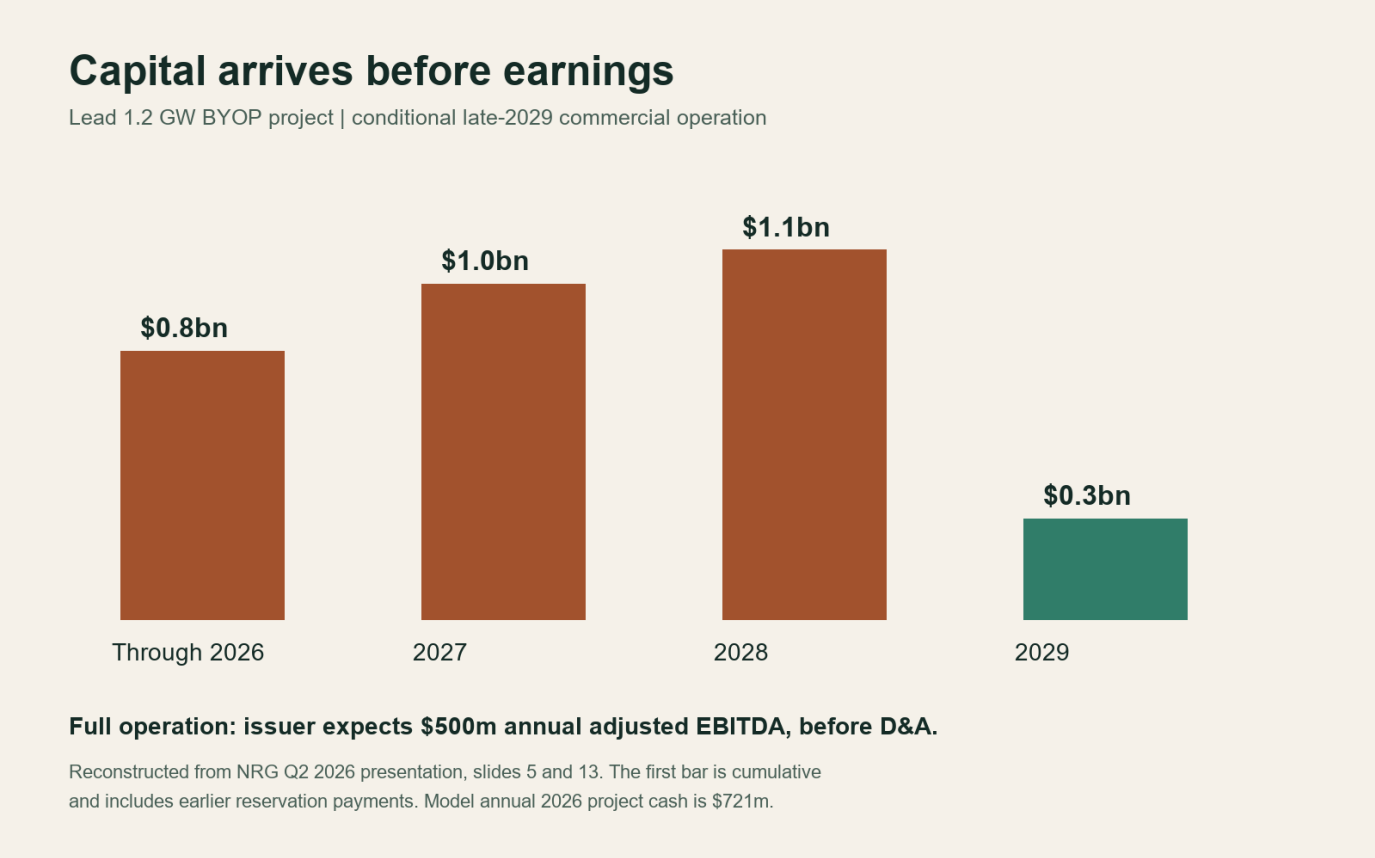

Those are proposed project economics, not evidence that all documents were executed. In August, principal commercial terms were aligned but land, final documentation, internal approval and development work remained. The September 8 announcement added conditional admission as Studied Load in ERCOT's Batch Zero process. That is a meaningful process milestone, but further study, verification and interconnection work still stand between a queue status and an operating plant. No source reviewed establishes an unconditional notice to proceed. September project update.

The company's capital schedule is approximately $0.8 billion cumulative through 2026, $1.0 billion in 2027, $1.1 billion in 2028 and $0.3 billion in 2029. The cumulative first bar includes earlier reservation payments. The current-year project category is $721 million, including a $40 million reclassification from other investment; the incremental change to the current plan is $681 million funded through less liability management. Adding both $0.8 billion and $721 million to 2026 would overstate cash use.

All planned first-project construction cash is funded in this model even though only 70% of its operating earnings is credited. This reserves for procurement, cancellation and redeployment risk and does not presume free customer

capital. It is conservative about sunk cash, but it still assumes the balance sheet can refinance and borrow within the stated limit. No unidentified capital partner is inserted to make the cash balance work.

The entire reserved equipment/EPC program is 5.4 GW through 2032. Management's discussion pipeline is more than twice that number, and about 2 GW of uprates is also under evaluation. These are not 5.4 GW of operating plants or firm billed customer orders. The second potential BYOP block is only retained as a 2031 watch item: a late-2030 indication is insufficient to assume a full year of 2030 earnings without reserving its separate multiyear build cost.

Reconstructed from NRG issuer presentation; original pixels unavailable | Reconstructed from the issuer's Q2 2026 presentation, slides 5 and 13. $0.8bn through 2026 is cumulative and includes earlier reservations; later annual build cash is $1.0bn/$1.1bn/$0.3bn. Late-2029 COD is conditional.

Probability-weighted increments and explicit overlap

Five branches are included. The probabilities are analytical assumptions, not probabilities provided by the issuer. They change operating inputs rather than multiplying the finished valuation by the Base score.

- Lead BYOP: 70% probability, zero reference overlap. The bounded conditional annual bridge is $800 million revenue, $300 million fuel/operating pass-through cost, $106.667 million depreciation over a 30-year life and $10 million incremental central support, yielding $383.333 million operating profit. Weighted full-run OP is $268.333 million. One December month is recognized in Q4 2029. The $300 million pass-through revenue and depreciation life are assumptions; changing the pass-through amount should not create profit by itself. - PJM uprates: 35% probability, 25% overlap reserve. Conditional extra sales of $50/$150/$300 million in 2028/29/30 represent a bounded subset of roughly 500 MW rather than all 2 GW. Residual revenue earns 60% GP less 10% operating support. Conditional build capital of $100/$400/$600/$300 million in 2027-30 is probability weighted; D&A remains inside the GP margin and is added back at an 8% revenue proxy in cash funding. - Merchant repricing: 40% probability, 50% overlap reserve against the reference recovery and published capacity clears. Gross conditional

revenue opportunity is $200/$400/$600/$800 million in 2027-30. Residual sales convert at 60% GP after fuel/hedge offsets less 5% support costs. This is a bounded dispatch/price proxy, not an asserted live forward curve or a claim that every customer contract reprices immediately. - Vivint upside: 45% probability, 75% overlap reserve because strong customer growth is already in the reference. Gross conditional extra sales of $75/$150/$225/$300 million in 2027-30 convert at 70% GP less 35% operating expense on residual revenue. Cash funding also pays 40% customer-contract investment and 10% physical capex, with a 20% depreciation/amortization addback. - Weather and fuel risk: 25% probability, 25% overlap reserve. Conditional extra cost is $250 million for H2 2026, followed by $300/$325/$350/$375 million annually. Residual costs reduce gross profit and operating profit. Cash collateral is modeled separately as a liquidity requirement and is not counted as a second operating loss.

The mature lead-project EBITDA bound is $400-550 million, completion probability 45-85%, asset life 25-35 years and capital 100-125% of plan. Merchant gross opportunities can halve, and the existing business gross profit has its own stress. The source's illustrative $1.2 billion 2030 and approximately $2.9 billion 2033 contracted-cash-flow opportunity is not an additional branch: it combines capacity, load and project economics already represented here.

Debt, cash, preferred stock and dilution

The starting June 30 balance is $162 million unrestricted cash, not the $5.280 billion headline liquidity total. Face debt and finance leases are $23.437 billion, compared with $23.256 billion carrying value after financing discounts/fees. Restricted cash, counterparty deposits and posted collateral are not freely available equity assets. The $650 million preferred liquidation preference is a separate senior claim; its 10.25% cash dividend is also funded. Preferred cash dividends are not subtracted from OP as well as the preference.

The model keeps a $500 million operating cash reserve, assumes a conditional additional debt limit of $3 billion, and refinances maturities while charging 5.3% interest plus explicit financing fees. Disclosed revolver and collateral-facility availability is not proof that the entire amount can be borrowed as unrestricted construction cash. The central model reaches peak face debt of $25.805 billion against the $26.437 billion bound. Because cash is maintained at a floor by borrowing, the minimum cash figure alone is not evidence of comfortable funding.

Trade working capital uses 6.5% of reference annual revenue plus a separate incremental sales component, versus the $1.748 billion June receivables-plus-inventory-minus-payables anchor. An additional $500 million collateral cash reserve is posted initially. The funding model pays the entire capitalized customer-contract cash balance after adding back its amortization, physical construction and maintenance capex, common and preferred dividends, legal-settlement cash, repurchases, award withholding and excise taxes. It does not add stock compensation back as freely distributable cash; that conservative cash treatment is retained separately from estimated dilution.

The share starting point is the statutory July 31 count of 210.210483 million, rather than the 214 million weighted-average guidance denominator. July retired shares are already in that number. The remaining 2026 buyback cash reconciles the $1 billion plan using $921 million through June, about $14 million during July and $65 million thereafter. July cash is paid once without retiring the same shares a second time. The source release's rounded $932 million through-July number differs slightly from the statutory repurchase series; the latter is used consistently.

Future annual cash repurchases are $1 billion at an assumed $130 price rising 5% annually. Net future award issuance is estimated at 1.5 million shares per year. The exact unvested grant pool and vesting schedule were not obtained, so this is a material capitalization gap, not a completed grant-by-grant share reconciliation. A no-future-buyback case is provided. Operating leases remain expensed and are not deducted again as a financial

claim; finance leases already belong to opening debt. No separate material NCI equity balance is disclosed in the consolidated June statements, and no gross unowned generation capacity is silently added.

Rebuilt funding stress, not just target sensitivity

Scenario	Q4 2027 arithmetic ceiling	Peak debt, $bn	Within $26.437bn bound?
No favorable branches	$301.04	25.736	Yes
Merchant revenue opportunity halves	$303.40	25.823	Yes
BYOP commissioning delayed four quarters	$305.40	25.805	Yes
Build capital costs 25% higher	$298.73	26.992	No: funding incomplete
Collateral stress plus $1.8bn	$295.44	27.779	No: funding incomplete
Cash tax payments triple	$302.59	26.284	Yes
No future discretionary buybacks	$295.07	24.873	Yes
Existing economic gross profit down 10%	$176.83	28.819	No: funding incomplete
Joint operating and capital stress	$197.01	32.251	No: funding incomplete
15x operating profit sensitivity	$196.38	25.805	Yes
10x operating profit sensitivity	$87.31	25.805	Yes

Each case rebuilds quarterly interest, cash taxes, capex, working capital, repurchases, claims and shares. The no-favorable-branches case still funds the first plant’s planned capital, consistent with the conservative central capital reservation. A four-quarter commissioning delay leaves the Q4 2027 target unchanged because direct BYOP earnings start after the active window; it does impair later years.

The raw ceilings in failed funding cases are **not funded investable outcomes**. Higher construction cost, an extra $1.8 billion collateral call, a 10% existing-gross-profit decline and the joint stress breach the debt limit. They would require reduced buybacks, delayed construction, partner capital, additional borrowing on different terms, or common equity dilution. No undefined financing is granted for free. The joint stress reaches about $32.251 billion debt, almost $5.8 billion above the modeled bound, so preserving a positive formula output is not enough to claim solvency under that stress.

Funding decisions within each operating outcome

The adopted model values 32 persistent operating outcomes separately, using the five branch probabilities. Independence is an analytical simplification, not a measured correlation. All first-project BYOP construction cash remains paid even if its operating outcome fails. Uprate and smart-home investment follows the related outcome.

With an inflexible buyback plan, four outcomes carrying 5.25% total probability exceed the conditional debt bound by up to USD22.017m. The adopted policy instead suspends only future discretionary repurchases and the related

excise tax before drawing beyond USD26.437bn. Cancelled repurchases restore the corresponding shares and raise subsequent dividend cash. Already paid July repurchases are retained. The largest cumulative cancellation is USD21.799m, and every one of the 32 standard operating outcomes stays within the modeled debt bound and USD500m reserve.

This is an analytical financing policy, not announced management guidance or a guarantee of available credit. The larger separate capex, collateral and gross-profit stresses in the preceding table are expected-input diagnostics with the original fixed repurchase plan; their raw values are not the adopted probability-weighted target or fully financed downside targets. They continue to expose the need for broader mitigation. The operating probability controls in Excel retain each outcome's saved funding schedule; a substantive scenario revision must rebuild financing.

Quarterly valuation, earnings path and score

The active-window expected operating profit is USD 4,358.324 million. Each of 32 outcomes applies 20x to its own Q4 2027 through Q3 2028 operating profit and deducts its own Q3 2028 claims, using its own Q3 2028 shares. Weighting those per-share values produces USD 305.401621. The model does not divide expected profit by expected shares when funding changes the denominator.

Year	Expected revenue, $m	Expected fully costed OP, $m
2027	37,498.4	3,796.7
2028	39,935.0	4,541.5
2029	41,931.4	5,045.3
2030	44,182.5	5,689.2

Valuation quarter	20x OP ceiling, USD
Q3 2026	214.27
Q4 2026	231.87
Q1 2027	244.48
Q2 2027	262.84
Q3 2027	279.58
Q4 2027	305.40
Q1 2028	326.28
Q2 2028	341.28
Q3 2028	354.65
Q4 2028	375.30
Q1 2029	394.76
Q2 2029	416.66
Q3 2029	437.28
Q4 2029	464.78

Valuation quarter	20x OP ceiling, USD
Q1 2030	486.87

The analytical score is 43/60, or **72/100**. Core 16 reflects difficult-to-replicate operating sites, retail scale and generation/fuel risk management, offset by commodity exposure. Cycle 8 recognizes acquired fleet benefits and capacity pricing with current weather and hedge constraints. TAM 7 credits localized large-load demand without counting all requested GW. Catalysts 4 reflects concrete study, contract and commissioning milestones. Macro 8 reflects reliability demand with affordability and financing risks. Alpha 3 reflects the calendar, capital and cash distinctions. Risk minus 3 addresses leverage, conditional development and incomplete hedge/share details. This new-company analytical score does not authorize changing any existing portfolio override.

What the next disclosures must resolve

The most useful next evidence is a final BYOP contract and its credit support, land and permit status, ERCOT study results, a firm notice to proceed, turbine/EPC payment obligations, and project-level financing terms. The Q3 call should update whether mild weather, inherited hedges or retail pricing change the base operating bridge. The 2027 hedge book and dispatch spreads matter sooner than late-decade AI revenue.

For the balance sheet, obtain the exact remaining award pool, subsequent repurchases, refinancing conditions, collateral capacity and the distinction between drawable cash facilities and letter-of-credit support. For the operating model, test mid-2028 TEF completion, Vivint origination cash and churn, fuel basis and retirement/maintenance obligations. A final customer agreement would raise certainty; a process milestone alone should not change operating dates or remove the full funding cost.

Second-order beneficiaries include qualified turbine suppliers, EPC labor and gas infrastructure. Those relationships do not mean their sales should be added to NRG's own earnings. NRG is also a power supplier to the broader compute system and competes with other generation approaches. No change to another covered company's model is made by this research.

Source coverage and limitations

The review used the issuer's January closing release; May 6 first-quarter and August 4 second-quarter financial releases; the Q2 presentation and June 10-Q text; and the September 8 project update. The two latest available management-call records reviewed are May 6 and August 4, including management discussion and Q&A. Public reproduced transcripts were available in full page text, but contain transcription errors, and are not claimed to be verified complete recordings. Primary figures control where wording conflicts, including the mid-2028 TEF schedule and usable MW.

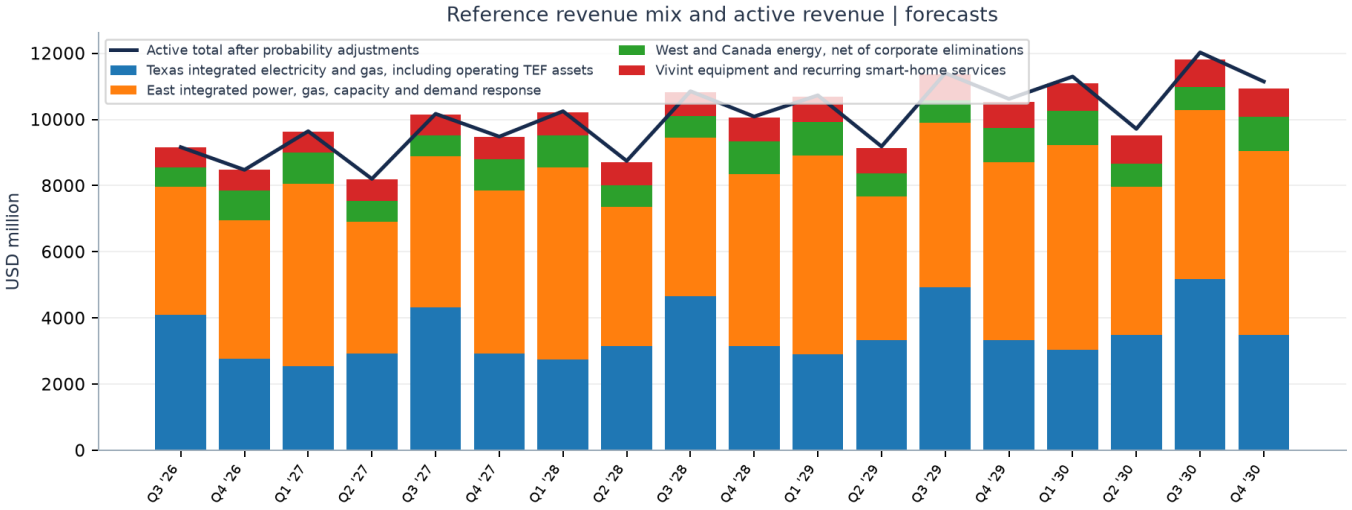

Direct downloads of the IR PDFs and SEC filing returned 403, while their primary text and numeric tables were readable through the web tool. The screenshot adapter did not return inspectable PDF pixels. Therefore the two source exhibits are clearly labeled reconstructions from primary numbers, and their generated image pixels were inspected for readability. No unavailable source slide was represented as visually inspected. The dated close uses the October 9 historical row; the site header's $107.98 at 15:59:59 is not substituted for the final $107.97 close.

Primary sources: Q1 release, Q2 release, June 10-Q, Q2 presentation, September project update, LS Power closing. Call text references: May 6, August 4. Price: October 9 historical row.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Operating fleet, retail customer relationships, risk management, turbine slots and development experience form a difficult-to-replicate platform. Power and customer pricing remain competitive.
Cycle	8	LS Power is already consolidated, capacity payments rise and two TEF units approach operation; mild weather, battery and solar additions and inherited hedges temper near-term scarcity.
TAM	7	Large loads create generation and load-management opportunities, but requested GW are not signed demand and final generation requires years of capital deployment.
Catalysts	4	Q3 guidance, BYOP final documentation, ERCOT study milestones, PJM procurement, mid-2028 TEF commissioning and late-2029 lead-project COD.
Macro	8	Electricity reliability and localized AI demand support deployment. Affordability policy, gas supply, carbon costs and interest rates can offset that support.
Alpha	3	The analysis separates calendar capacity revenue, earnings recognition and up-front build cash, and treats the first BYOP plant as incremental to the operating fleet.
Risk classes	-3	Three points deducted for leverage and collateral liquidity, conditional contracts and execution, and undisclosed hedge or product economics.
Total	43/60	Rounded Base 72. Both artifact and new workbook row use this score; this is not a manual override.

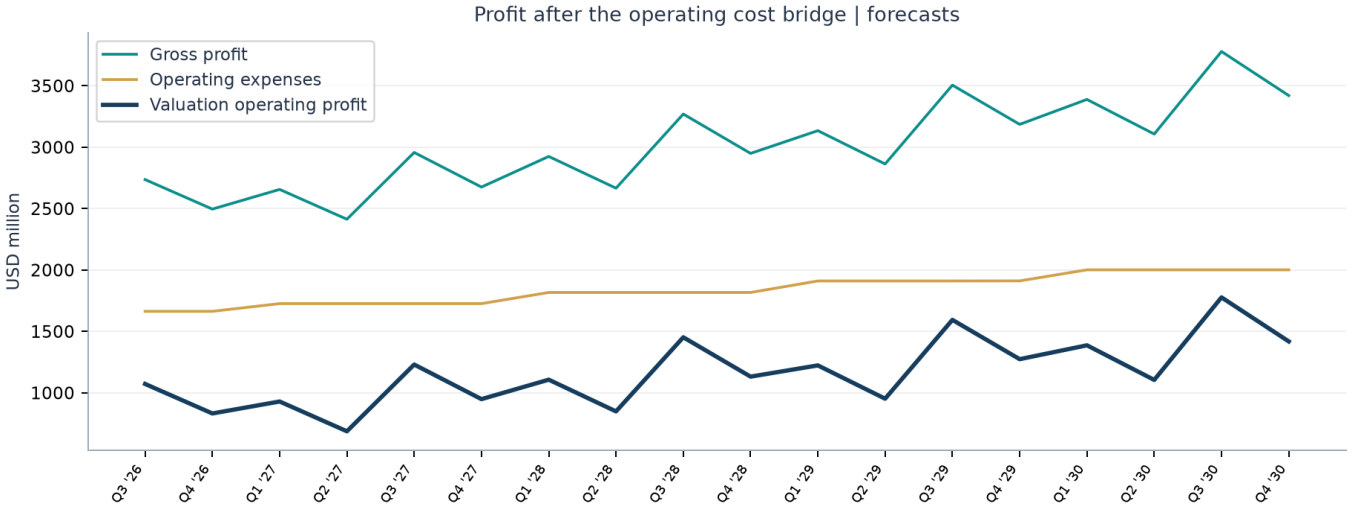

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	9,162.7	0.0	9,162.7
Q4 2026	8,476.3	0.0	8,476.3
Q1 2027	9,632.0	12.1	9,644.1
Q2 2027	8,191.0	12.1	8,203.1

Gross profit, operating expenses and earnings

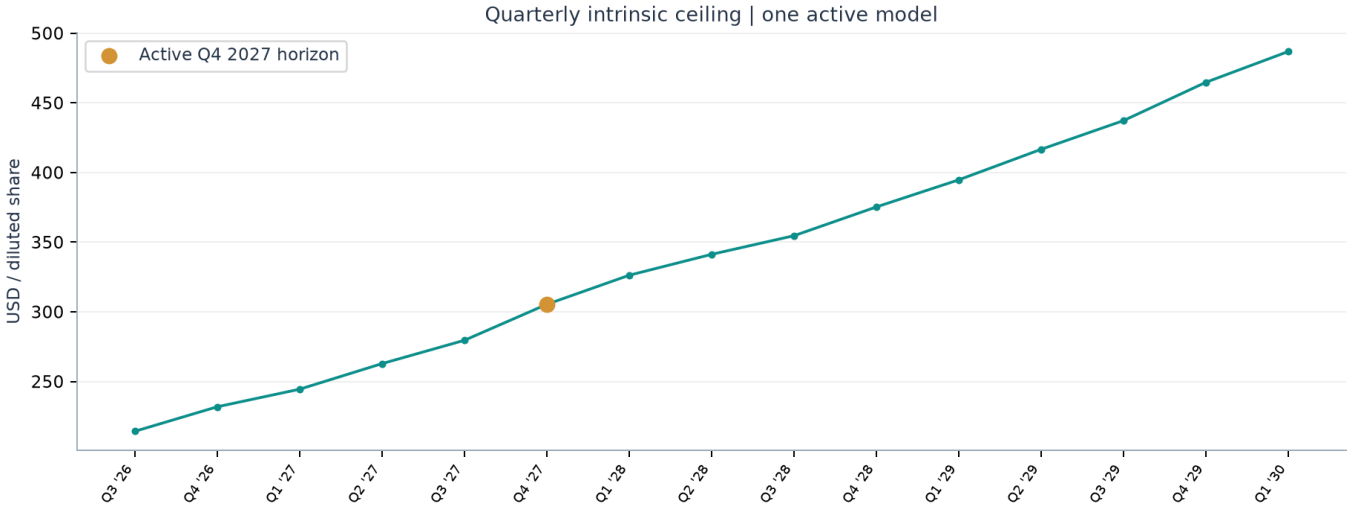

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Four-quarter earnings window	F4Q OP	Multiple	Shares	Ceiling

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Texas integrated electricity and gas, including operating TEF assets	4,091.9	28.5%	1,165.5
Q3 2026	East integrated power, gas, capacity and demand response	3,862.1	24.8%	959.5
Q3 2026	West and Canada energy, net of corporate eliminations	607.2	15.2%	92.0
Q3 2026	Vivint equipment and recurring smart-home services	601.5	90.3%	543.1

Q3 2030	682.5	645.0	580.0	40.0	9.5	7.5	28.8
Q4 2030	682.5	645.0	580.0	40.0	9.5	7.5	28.8

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Enterprise-to-equity reconciliation

20x fully costed forward-four-quarter operating profit, using the displayed quarter plus the next three, less matched end-window financial debt and finance leases plus $650m preferred liquidation preference. Cash above a $500m operating reserve is credited. Value each of 32 persistent operating outcomes using its own end-window shares and claims, then probability weight common equity. Suspend discretionary buybacks before the conditional $26.437bn debt bound is breached; no already paid buyback is reversed.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Persistent outcomes and common equity

Operating outcomes remain coherent across the earnings window. Each outcome uses its own fully expensed profit, financial claims and end-window diluted shares. Negative common-equity value is floored before probability weighting. Cash needed for operations is not surplus valuation cash. Funding inputs must be rebuilt when operating assumptions change.

Outcome funding paths

USD million. Cash flow includes operating profit, noncash adjustments, tax, capex and working capital. Financing and claims assumptions are shown separately. A funding failure invalidates that outcome; an available facility is not automatically received cash.

Claim decisions, overlap and triggers

NRG-LEAD-BYOP

p: 0.7

overlap: 0.0

Conditional: A 1.2 GW owned CCGT begins operation in December 2029, with $800m annual revenue comprising an assumed $500m capacity-like payment plus $300m fuel and operating-cost pass-through. Only one month is recognized in Q4 2029. No direct operating profit appears in Q4 2027 or its forward window.

bridge: From $800m sales, deduct $300m pass-through costs, $106.667m depreciation on $3.2bn over 30 years, and $10m incremental central support. Annual conditional OP is $383.333m; probability-weighted OP is $268.333m. The full first-project capital plan is funded, not only 70%, to reserve for procurement and redeployment risk. No assumed customer capital or partner proceeds fund the model.

reason: August principal commercial alignment, an investment-grade counterparty, equipment/EPC reservations and September conditional studied-load admission support a 70% completion probability. Land, contracts, studies and approvals remain unfinished. The probability is an analytical judgment, not issuer guidance.

bounds: Completion probability 45-85%, COD delay 0-4 quarters, $400-550m conditional EBITDA, 25-35-year depreciation life and capex 100-125% of plan. The model adds $10m support cost beyond the issuer project EBITDA.

NRG-PJM-UPRATES

p: 0.35

overlap: 0.25

Conditional: Additional annual revenue of $0/0/50/150/300m in 2026-30 from a subset of existing-site uprates and conversions, not all 2 GW. A rough 500 MW mature subset anchors the conditional $300m opportunity.

bridge: After a 25% overlap reserve against baseline fleet optimization, residual revenue earns 60% GP less 10% engineering and support expense, or 50% OP. Conditional capital is $100/400/600/300m in 2027-30; probability-weighted capital is paid. D&A is included in the GP assumption, with 8% of incremental revenue added back in cash funding.

reason: The issuer identified approximately 2 GW of opportunities and is pursuing long contracts or PJM procurement. Less than half may fit auction economics. Final scope, awards and acceptance are unresolved, so probability is 35% rather than full credit.

bounds: 0-1 GW accepted capacity by 2030, probability 20-50%, overlap 25-60%, OP margin 35-55%, gross build cash $1.0-1.8bn.

NRG-MERCHANT-REPRICING

p: 0.4

overlap: 0.5

Conditional: A bounded $200/400/600/800m of gross price and dispatch revenue opportunity in 2027-30, before a 50% overlap reserve for the baseline recovery and published capacity clears.

bridge: Residual revenue converts at 60% GP, allowing for fuel, emissions, purchased retail power and hedge offsets, less 5% incremental operating support. The result is 55% OP on residual dollars. Do not apply generation-only price sensitivity to the entire integrated retail business.

reason: Company sensitivities demonstrate positive exposure when hedges roll, and local load can tighten pricing. Current ERCOT curves and mild weather contradict an immediate windfall; 2027 inherited hedges also remain. Probability is 40%.

bounds: Probability 20-60%, overlap 35-75%, revenue opportunity 50-125% of the central conditional amounts. No price shock is added on top of a fully repriced baseline.

NRG-SMART-HOME

p: 0.45

overlap: 0.75

Conditional: Additional annual Vivint revenue of $75/150/225/300m in 2027-30, above the reference service and equipment growth, from better net customer additions and retention.

bridge: Reserve 75% for growth already embedded in the reference. Residual revenue earns 70% GP after service, hardware and amortization costs, less 35% sales, support and acquisition-related operating costs. Funding pays customer contract investment equal to 40% of weighted incremental revenue plus 10% physical capex; 20% depreciation/amortization is added back.

reason: Q1 customers grew about 9% against a 5-6% longer-term plan and Q2 service economics improved. The model already has strong growth; the small residual and 45% probability avoid treating every acquisition as free recurring margin.

bounds: Probability 25-60%; overlap 60-100%; OP contribution 20-40%. Customer origination cash and churn remain decisive.

NRG-WEATHER-FUEL

p: 0.25

overlap: 0.25

Conditional: Additional H2 2026 cost exposure of $250m, then $300/325/350/375m annually in 2027-30, from unavailable generation, fuel basis, emissions and replacement power during unfavorable market conditions.

bridge: Reserve 25% for adverse conditions already in the baseline. Residual cost reduces GP and OP directly. This is an expected operating cost, while a separate collateral cash reserve addresses liquidity without being counted as a second earnings loss.

reason: The first half demonstrated that high regional prices can hurt retail load before owned generation or hedges offset them. A 25% residual stress probability captures imperfect matching, not a forecast of a repeat named storm.

NRG-PUBLISHED-CAPACITY

p: 1

overlap: 1

increment: 0

zero reason: PJM calendar revenues of $644m, $729m and $781m in 2026-28 and the 2028/29 delivery-year gross amount of about $811m are already inside the East reference. They are different time conventions, not additive sources. Subsequent auctions are uncertain.

NRG-TEF-AND-445MW

p: 0.9

overlap: 1

increment: 0

zero reason: The operating 415 MW Wharton unit, remaining 689 MW and 443 MW TEF projects targeted for mid-2028, and 445 MW already signed large-load agreements are included in baseline growth and capital. A separate uplift would double count them. The model does not substitute higher nameplate figures for usable capacity.

NRG-SECOND-BYOP

p: 0.25

overlap: 0

increment: 0

zero reason: The next 1.2 GW block has a credible conditional opportunity but a late-2030 indication is too narrow to assume a full 2030 profit year. A bounded $300-450m fully costed annual OP proxy at 25% completion probability is retained as a 2031 follow-up, outside operating rows ending Q4 2030. Earlier acceptance would require adding its full multiyear capital schedule before adopting earnings.

NRG-FCF-ILLUSTRATION

p: 0.5

overlap: 1

increment: 0

zero reason: The $1.2bn 2030 and approximately $2.9bn 2033 contracted-FCF illustrations combine existing capacity payments, signed load and conditional projects. They are not independent profit forecasts; adding them to project or capacity branches would duplicate the same economics.

Remaining bounded uncertainties

- Reference 2026 economic revenue and functional cost allocations are analyst estimates constrained by H1 actuals and a $5.45bn adjusted EBITDA bridge, below the issuer's $5.575bn midpoint. Economic revenue is not the same as GAAP revenue including derivative marks. Subsequent growth is an assumption, not company segment guidance.

- Exact future merchant hedge volumes, fuel basis, carbon costs and customer repricing cohorts are undisclosed. July presentation sensitivities are not October live forward curves; no claim is made that the curves have been refreshed.

- The first BYOP customer, executed final contract, exact fuel pass-through revenue, depreciation policy and maintenance schedule are undisclosed. The modeled $300m fuel/operating reimbursement, 30-year life and $10m support cost are bounded assumptions. Project FCFbG is not levered distributable cash.

- All $3.2bn first-project cash is reserved despite probability-weighted earnings. Cumulative 2026 spend includes earlier reservation payments. The remaining cash model uses $721m 2026 project capex within the annual combined capex bridge; it does not add both $0.8bn cumulative and $721m annual outlays.

- Debt is $23.437bn face debt plus finance leases at June 30, before $181m unamortized financing fees/discounts. A conditional $3bn extra borrowing bound is a modeling limit, not a claim that all $5.068bn disclosed liquidity is unrestricted cash borrowing. Maturing debt is assumed refinanced; rate and collateral stresses must remain visible.

- July 31 common shares are 210.210483m. Net future award issuance is estimated at 1.5m per year, informed by stock compensation and the approximately 1m Q2 treasury-method dilution difference; the exact unvested pool and future vesting schedule remain missing. This is not a complete grant-by-grant capitalization table. Shares are not the 214m guidance weighted-average denominator.

- Remaining 2026 buybacks reconcile to the $1bn plan using $921m through June, an approximately $14m July increment in the statutory filing, then $31m and $34m after July. Q3 cash therefore pays $45m, but shares fall only for the $31m after the July 31 starting share count. The release rounded through-July repurchases to $932m versus about $935m in the filing; the model uses the statutory series consistently. Later $1bn annual repurchases use $130 rising 5% annually, are cash-funded and subject to a no-buyback sensitivity. Actual timing and prices will differ.

- Operating leases remain in operating costs and are not deducted again as an equity claim. Finance leases are already included in face debt. Preferred principal is deducted once; preferred cash dividends reduce funding but do not reduce the OP valuation numerator.

- The June financials show no separate material NCI equity line. The model values the consolidated operating perimeter and does not assign 100% of a gross 385 MW Ivanpah or any unowned pipeline capacity to shareholders. Equity-method investment income and non-operating asset marks receive zero separate credit.

- Direct downloads of the IR PDFs and SEC filing returned 403. Primary tables and notes were readable in the web tool, but PDF screenshots returned references without inspectable pixels. Reconstructed charts are explicitly labeled; no unavailable slide pixels are claimed as visually inspected. The two public reproduced call texts, including management discussion and Q&A, include obvious transcription errors, checked against primary tables where applicable.

- The32 branch outcomes use independent probabilities as an analytical simplification. Their funding policy can suspend future discretionary repurchases, but still assumes refinancing and up to$3bn additional borrowing. This is a conditional funding limit, not a bank commitment. Severe separate capital/collateral stresses remain unfinanced without further action.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
