Onto Innovation

ONTO | NYSE | 2026-10-11

Q4 2027 model ceiling: USD 216.45

Analytical Base 42/60 = 70 | Growth; the current quotation already discounts substantial execution

20x fully expensed forward-four-quarter operating profit less net claims, using end-window common shares and any conversion-premium shares. No Rigaku equity income or fair-value gain is capitalized as operating profit. Financial claims use the dated post-Rigaku pro forma balance; projected cash accumulation is not credited again. Workbook probability controls hold adopted premium shares and claims fixed; changed operating inputs require a joint premium and funding rerun.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 294.53 per share (2026-10-09 16:00 America/New_York regular close); 49.074 million common shares (2026-07-31); estimated equity capitalization USD 14,453.8 million. Common shares from the Q2 10-Q cover; October 9 regular-session close. Rigaku stake valued separately at October 9 Tokyo close JPY1,786 and BOJ 17:00 JST USD/JPY midpoint 158.335. This dated common-share snapshot is separate from forecast diluted shares.

Growth or re-rating: no positive modeled upside at the dated 2026-10-09 16:00 America/New_York regular close price of USD 294.53, so the Upside Driver split is unavailable.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	541.9	20x	49.974	216.45

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated Onto only. The 27% Rigaku investment is a separately valued financial asset, not consolidated revenue or operating profit.. 20x fully expensed forward-four-quarter operating profit less net claims, using end-window common shares and any conversion-premium shares. No Rigaku equity income or fair-value gain is capitalized as operating profit. Financial claims use the dated post-Rigaku pro forma balance; projected cash accumulation is not credited again. Workbook probability controls hold adopted premium shares and claims fixed; changed operating inputs require a joint premium and funding rerun.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD million unless a different unit is stated.

Investment conclusion and scope

Onto supplies the measurements and defect inspection that let customers manufacture increasingly complex chips and packages. The opportunity grows when a more expensive package requires tighter control of more process steps. Qualification, measurement recipes and usable throughput determine whether Onto captures that opportunity. A large semiconductor spending forecast alone does not tell us its sales.

The analytical Base is 70, or 42/60. This is coverage, not a declaration that the stock is held. The dated October 9, 2026 NYSE close is $294.53. At 20x fully expensed forward-four-quarter operating profit, the Q4 2027 ceiling is $216.45, about 0.73x that price. The operating business can grow strongly while the quoted share already anticipates more profit or a larger multiple. The model therefore does not manufacture an attractive upside figure to match an appealing business story.

The unit of account is one Onto common share in USD. The financial statements are consolidated Onto. Rigaku remains independent: its sales, profit, dividends and investment revaluation are excluded from Onto's modeled operating earnings. The strategic shareholding is valued once as a separate asset. The 2026 fiscal reporting change means these projected quarters are calendar quarters, not an inherited January-ending fiscal convention.

Where the tools earn their place

An advanced package brings together dies, redistribution layers, bumps, substrates and sometimes stacked memory. A defect introduced early can destroy value added through later steps. Onto can sell optical and infrared inspection, dimensional measurements, film measurements, lithography and factory software at different points in that flow. These tools address different problems and should not be described as interchangeable copies of a single inspection insertion.

The January technical exhibit shows how visible-light imaging, infrared inspection and three-dimensional measurement can identify different failure modes. It is a useful architectural explanation, not evidence that every pictured application has the same revenue or margin. Dragonfly G5 adds sensitivity and throughput; Atlas G6 enables smaller measurement spots in advanced-node processes. More capable tools can win applications, but faster throughput can also reduce the number of systems a customer needs. The model does not assume both unit demand and selling price rise in direct proportion to headline performance.

Manufacturing capacity at Onto is not the immediate scarcity argument. The supplier can use external factories as well as its own facilities. Qualification at the customer, application performance, installation and acceptance matter more to the near-term sales conversion. A customer whose packaging line is constrained can value an earlier delivery highly, but that does not prove Onto can charge a scarcity premium on already contracted equipment.

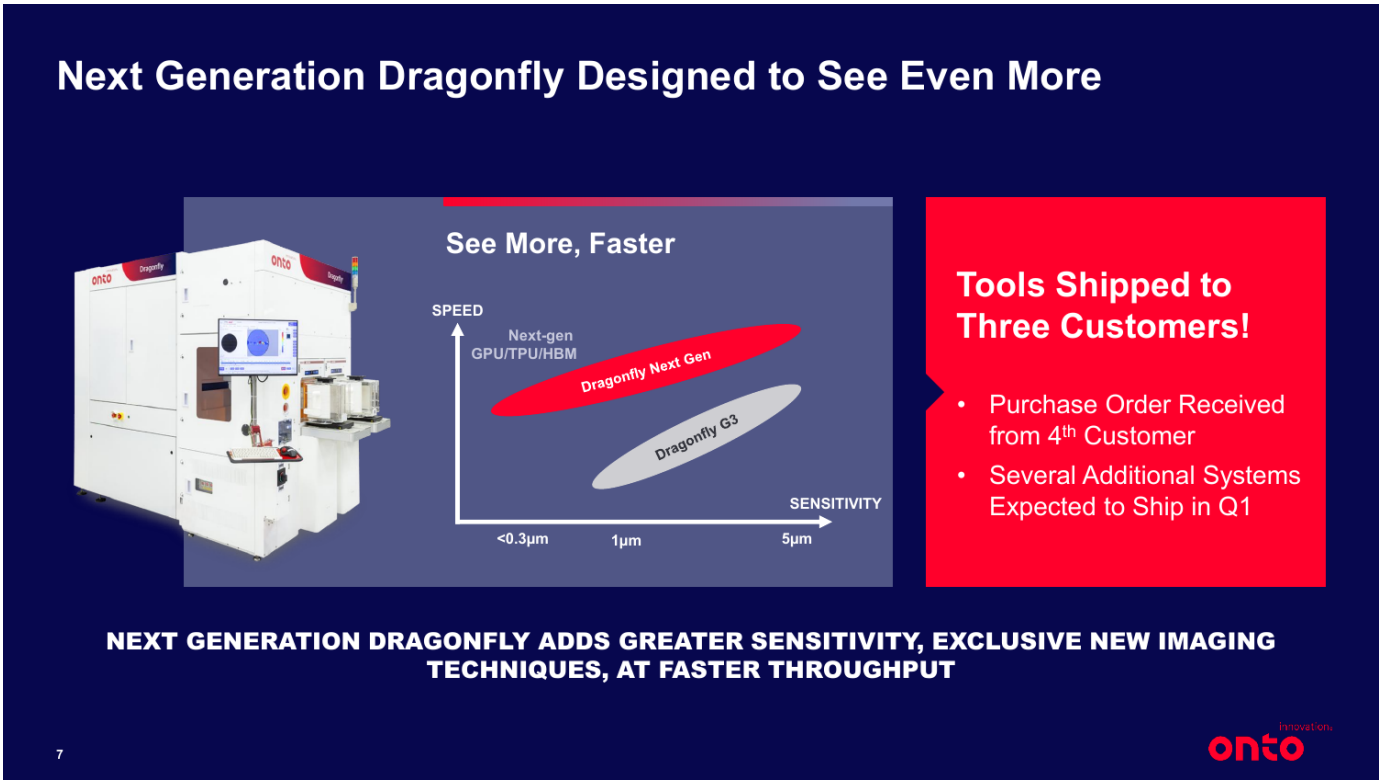

Onto Innovation | Onto January 13, 2026 presentation, page 6: optical and infrared measurements address different failure modes through a stacked package. Historical technical diagram; not current revenue guidance.

What changed in the latest results

The May 5 release recorded Q1 revenue of $291.949m and operating profit of $33.514m. It also established early customer qualifications for the newer Dragonfly and Atlas platforms. The August 6 release then reported Q2 revenue of $343.129m, gross profit of $183.254m and operating profit of $63.550m. First-half revenue was $635.078m. These are actual financial results, distinct from the estimates that follow.

The August management record supports stronger advanced packaging demand, node investment and product adoption. Its backlog exceeds $1.1bn, including a large OSAT program. That backlog supports the reference forecast; it is not added again as an independent probability branch. The approximate $50m silicon-photonics order pool is also already represented, with about two-thirds due in 2027. Silicon photonics sits in the specialty category in this model so it does not appear twice as both packaging and specialty sales.

The two latest earnings-call records, May 5 and August 6, were read together with the September 9 management conference. The later discussion is useful for evaluating how much of the new-platform opportunity remains qualification work. Fifteen application studies are not fifteen completed production wins. The existing G3 platform also remains commercially useful; an automatic replacement of every older tool would exaggerate the G5 opportunity.

Onto Innovation | Onto January 13, 2026 presentation, page 7: the next-generation Dragonfly combines sensitivity and throughput. January customer status is superseded by May and August qualification updates.

The operating forecast and its limits

The reference forecast is organized into four mutually exclusive revenue buckets: advanced-node systems; advanced packaging systems excluding silicon photonics; specialty systems including silicon photonics and SDI; and software/service excluding the separately modeled Rigaku license branch. Revenue is recognized as accepted deliveries or service provision, not at the date of a customer capex announcement.

Q3 is anchored to the $390m revenue midpoint and $85.55m GAAP operating-profit midpoint. Its product allocation is analytical. Q4 assumes $420m of revenue and about $102m of operating profit, allowing second-half growth above the stated first-half comparison. Q4 is not a reported actual. The exit non-GAAP margin discussion is checked against substantial expense deductions rather than relabeled as GAAP.

For CY2027, the reference buckets are $600m advanced nodes, $650m packaging, $300m specialty and $250m software/service, totaling $1.8bn. The corresponding CY2028 amounts are $700m, $800m, $360m and $285m. CY2029 totals $2.41bn and CY2030 $2.64bn before incremental branches. Quarterly allocation is 22%, 24%, 26% and 28% of each annual total. This moderate back-end weighting is an assumption about customer ramps, not a disclosed shipment schedule.

The source does not publish a complete unit, ASP or product-level margin table. The model therefore uses an accepted-revenue proxy rather than inventing tool shipment counts. Baseline packaging growth already covers existing customers and booked orders. New studies must earn separate incremental credit only after an explicit overlap deduction. Actual tool mix, installation timing and customer purchases will be the most useful replacements for these proxy inputs.

Fully expensed earnings bridge

The Q3 issuer reconciliation is particularly important. GAAP operating-income guidance is $81.4-89.7m, versus $119.7-130m after exclusions. Acquired-intangible amortization alone is $19.7m. The model keeps those costs in the operating-profit denominator. It also retains research, selling, administrative, restructuring and stock-compensation expenses. Depreciation and amortization are added back only in the separate liquidity test, not in the 20x earnings valuation.

Reference CY2027 product gross margins are 59% for advanced nodes, 57% for packaging, 51% for specialty and 53% for software/service. Their weighted result is about 55.9%. Reference operating expenses are $620m, including about $78.8m of acquired-intangible amortization. Later annual operating costs rise to $690m, $755m and $805m as the business expands. The modeled cost base includes rent for both existing facilities and the planned headquarters, so operating-lease liabilities are not deducted a second time from enterprise value.

With all probability branches applied, CY2027 revenue is $1,852.234475m and operating profit $416.704909m. CY2028 is $2,261.881450m revenue and $593.474818m profit. CY2029 reaches $2,580.531600m and $726.319915m; CY2030 reaches $2,845.643425m and $831.085101m. These figures are model outputs. They are not management guidance or analyst targets. More detailed unit economics would warrant changing them, not merely increasing confidence around the same numbers.

Onto Innovation | August 6, 2026 release, page 9: Q3 GAAP operating-income guidance is $81.4-89.7m. The non-GAAP outlook removes substantial amortization and restructuring costs, which the model retains.

Incremental evidence branches

The largest positive branch is new G5 applications. A 55% probability is applied to gross incremental revenue of $150m, $300m, $400m and $450m in CY2027-30, with 40% removed for baseline and backlog overlap. The first-year gross value is a bounded proxy of roughly $10m per application across fifteen studies, not a claim that all studies produce that amount. Contribution is 62% gross profit less 15% additional engineering, selling and support cost. Probability bounds are 35-70%; the retained portion can range from 40-80%.

Silicon-photonics expansion receives 50% probability on gross additional revenue of $40m, $90m, $150m and $200m, retaining half after overlap and execution reserves. The existing order pool is covered in the reference before this branch. Incremental contribution is 60% gross profit less 15% operating expense. The 2030 served-market statement is a contextual ceiling, not a direct sales allocation. A zero-award or delayed production outcome remains possible.

Rigaku-related licenses receive 55% probability on gross Onto revenue of $20m, $35m, $55m and $75m, retaining 75% after scope and software overlap. The first-year range is $10-30m. Management's interest-offset discussion supports trying such a bounded proxy, but it does not establish a license rate. A 95% gross margin is reduced by

25% operating cost for continuing development and deployment. Rigaku's own revenue and earnings never enter this branch.

A smaller value-capture branch applies 35% probability to a 3% premium on 20% of eligible packaging sales, then removes half for mix overlap. Only new or repriceable terms qualify. Extra component and support costs leave 65% operating contribution. This is a product-value and cost-pass-through case, not a claim that Onto's own production is sold out. External-factory efficiency and higher-value mix are already in reference gross margins.

Finally, a 25% negative branch shifts 10% of reference packaging sales outside the modeled year. Lost gross profit is partly offset by avoidable costs. This captures customer construction, acceptance and cycle risk once. It is not a second penalty for the same volume shortfall under another name. The positive and negative paths remain visible in the probability ledger and can be changed independently after new evidence, with linked price eligibility recomputed where volume changes.

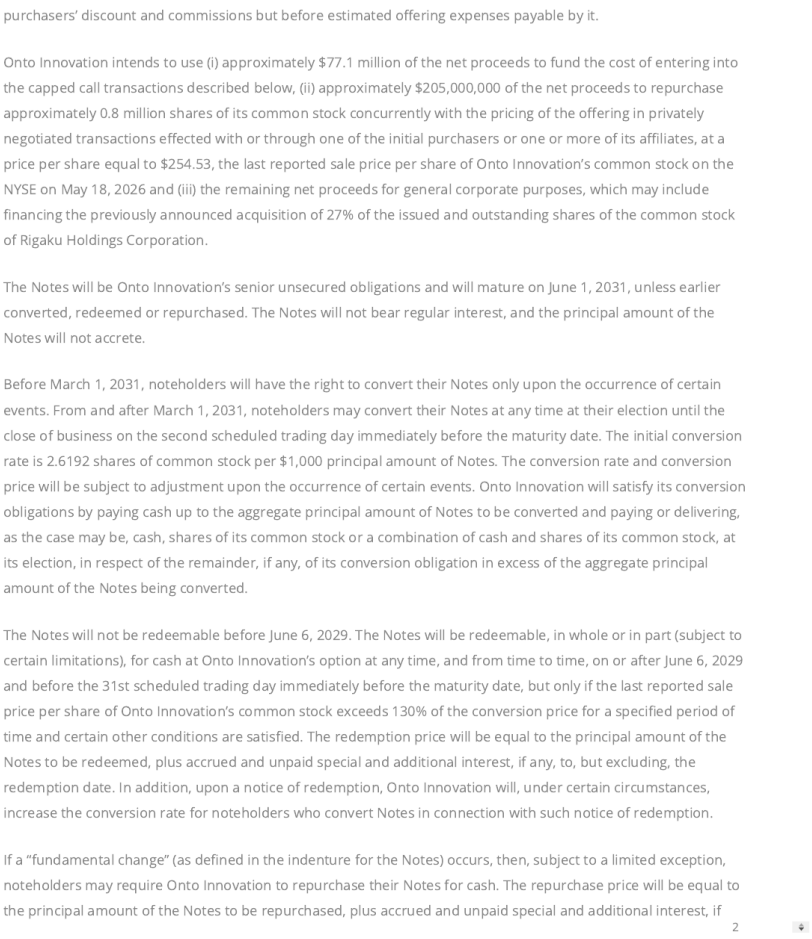

Rigaku, cash and shareholder claims

The August 10 closing release puts the Rigaku cash purchase near $720m. The June $1,882.150m cash and marketable-securities balance is therefore reduced to $1,162.150m for the pro forma liquidity starting point. Intervening operating cash is not guessed. The 61.123436m Rigaku shares are marked at the October 9 Tokyo close of JPY1,786 and the BOJ 17:00 USD/JPY midpoint of 158.335, giving approximately $689.465m. Only 75%, or $517.099m, is credited to valuation because it is a strategic holding with transfer, tax and market risks. None is treated as cash available to fund operations.

The final convertible issuance was $1.5bn, including the exercised option. The initial $1.3bn pricing headline is not the final debt balance. It bears no ordinary coupon and matures in June 2031. The model deducts face value rather than the lower accounting carrying value. It keeps a $200m operating liquidity reserve and no unused facility credit. The resulting valuation net claim is $20.751m after the haircut investment asset. Operating leases remain in rent expense; there is no duplicate lease debt deduction.

Current common shares are 49.074247m as of July 31, not the quarter's weighted-average diluted count. The forecast adds 0.10m ordinary shares per quarter as a compensation-dilution allowance. The conversion rate implies 3.9288m underlying shares at an initial strike near $381.796. Principal must be paid in cash, while the premium may be delivered in shares. Each active valuation window is solved with the appropriate premium shares and retained face debt. No capped-call benefit is credited. In the Q4 2027 window the target is below the strike, so there is no modeled conversion-premium dilution and the end-window denominator is 49.974247m.

The investment-asset haircut is visible rather than hidden in the multiple. With no Rigaku asset credit, the same Q4 2027 operating model gives about $206.10. Full marked asset credit gives about $219.90. The active $216.45 lies between them. This range is an asset-valuation sensitivity, not a forecast that the stake will be sold. The semiconductor license opportunity remains separate from that asset treatment.

purchasers' discount and commissions but before estimated offering expenses payable by it.

Onto Innovation intends to use (i) approximately $77.1 million of the net proceeds to fund the cost of entering into the capped call transactions described below, (ii) approximately $205,000,000 of the net proceeds to repurchase approximately 0.8 million shares of its common stock concurrently with the pricing of the offering in privately negotiated transactions effected with or through one of the initial purchasers or one or more of its affiliates, at a price per share equal to $254.53, the last reported sale price per share of Onto Innovation's common stock on the NYSE on May 18, 2026 and (iii) the remaining net proceeds for general corporate purposes, which may include financing the previously announced acquisition of 27% of the issued and outstanding shares of the common stock of Rigaku Holdings Corporation.

The Notes will be Onto Innovation's senior unsecured obligations and will mature on June 1, 2031, unless earlier converted, redeemed or repurchased. The Notes will not bear regular interest, and the principal amount of the Notes will not accrete.

Before March 1, 2031, noteholders will have the right to convert their Notes only upon the occurrence of certain events. From and after March 1, 2031, noteholders may convert their Notes at any time at their election until the close of business on the second scheduled trading day immediately before the maturity date. The initial conversion rate is 2.6192 shares of common stock per $1,000 principal amount of Notes. The conversion rate and conversion price will be subject to adjustment upon the occurrence of certain events. Onto Innovation will satisfy its conversion obligations by paying cash up to the aggregate principal amount of Notes to be converted and paying or delivering, as the case may be, cash, shares of its common stock or a combination of cash and shares of its common stock, at its election, in respect of the remainder, if any, of its conversion obligation in excess of the aggregate principal amount of the Notes being converted.

The Notes will not be redeemable before June 6, 2029. The Notes will be redeemable, in whole or in part (subject to certain limitations), for cash at Onto Innovation's option at any time, and from time to time, on or after June 6, 2029 and before the 31st scheduled trading day immediately before the maturity date, but only if the last reported sale price per share of Onto Innovation's common stock exceeds 130% of the conversion price for a specified period of time and certain other conditions are satisfied. The redemption price will be equal to the principal amount of the Notes to be redeemed, plus accrued and unpaid special and additional interest, if any, to, but excluding, the redemption date. In addition, upon a notice of redemption, Onto Innovation will, under certain circumstances, increase the conversion rate for noteholders who convert Notes in connection with such notice of redemption.

If a "fundamental change" (as defined in the indenture for the Notes) occurs, then, subject to a limited exception, noteholders may require Onto Innovation to repurchase their Notes for cash. The repurchase price will be equal to the principal amount of the Notes to be repurchased, plus accrued and unpaid special and additional interest, if

2

Onto Innovation | May 18, 2026 pricing release, page 2: conversion principal must be paid in cash; only the remainder may be delivered in shares. Final issuance increased to $1.5bn including the option, confirmed in the Q2 filing.

Funding, risks and evidence that would change the view

The liquidity test evaluates all 32 combinations of the five operating branches. Conditional pricing uses each state's realized program volume. Cash flow includes a 25% tax provision on positive operating profit, noncash depreciation/amortization, a 25% working-capital charge on sequential revenue increases and quarterly capital expenditure. Rent and ordinary personnel costs remain expensed. The test begins with $1,162.150m cash and excludes Rigaku proceeds, buyback authorizations and terminated facilities.

The contractual note maturity lies beyond the forecast, in June 2031. As a readiness check, the model reserves the full $1.5bn principal against the December 2030 cash endpoint. None of the tested states requires a financing issue while maintaining the $200m reserve. This result is bounded by the assumed cost and working-capital profiles; it is not proof that every possible acquisition, repurchase or downturn is funded.

The strongest counter-evidence is valuation, not a claim that the technology lacks merit. The quoted stock requires more earnings or a higher multiple than this fully expensed model provides at the active horizon. Competition can limit share and price; higher throughput can reduce tool count; customer concentration can shift

timing abruptly. Integration costs, strategic investment liquidity and future conversion mechanics complicate comparisons with an apparently simple non-GAAP EPS multiple.

The next useful evidence is accepted G5 deliveries by application, a cleaner split of packaging and photonics revenue, actual license economics, and full cash reporting after the Rigaku purchase. The December analyst day may improve the long-term product and margin bridge. The sequential-percentage Upside Driver is unavailable at the current price because the Q4 2027 target is below it. In business terms Onto remains a growth story, but that label is not a substitute for positive modeled upside.

Source and visual record

The source record preserves the May and August releases, Q2 filing, May convertible terms, January technical deck, August Rigaku closing release, both latest earnings-call records, September management conference and dated share/FX quotations. All January and Q2 pages were reviewed as rendered contact sheets; selected technical, financial reconciliation, Q1 financial and financing pages were inspected at full resolution. Exhibit captions preserve their original date and page. January forecasts are historical context, not presented as the newest outlook.

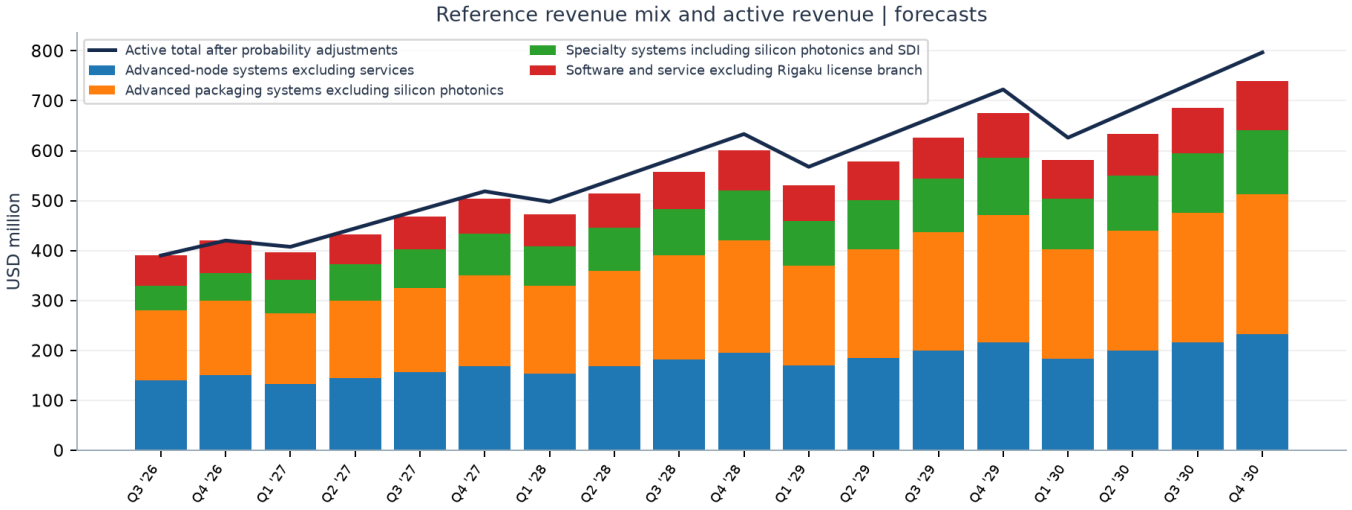

Open inputs include tool ASPs, exact product margins, license contract economics, timing of qualification conversion, investment transfer/tax costs and any post-July common-share change. Each is recorded in the evidence gaps. The valuation probabilities and numerical paths were substantively reviewed before publication. The workbook controls keep active financial claims and conversion-premium shares fixed; any adopted operating revision requires the funding and premium calculations to be rerun.

Financial claims are held at the dated pro forma balance rather than crediting future operating cash a second time. The separate liquidity test measures funding capacity; its growing cash balances do not also boost the published ceiling. The issuer closing release contains an extraneous word “billion” after its exact yen consideration; the model uses the approximately USD720 million consideration and the consistent yen amount, not that typographical unit.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Qualified optical measurements and defect algorithms are embedded in complex production flows; competitors remain capable.
Cycle	9	Backlog, advanced packaging and node spending support the cycle, but some 2027 expectations remain discussions.
TAM	8	More interconnects, smaller structures, silicon photonics and panels create additional inspection steps.
Catalysts	4	G5 application conversions, accepted OSAT deliveries, next results and the December analyst day.
Macro	7	AI capital expenditure supports customers; geographic concentration and trade restrictions remain risks.
Alpha	3	Separating orders, new application wins, investment assets and fully expensed costs improves the earnings bridge.
Risk classes	-5	Five deductions: qualification and acceptance timing; customer concentration; competition and throughput substitution; strategic investment liquidity; convertible and integration complexity.
Total	42/60	Rounded Base 70. Both artifact and new workbook row use this score; this is not a manual override.

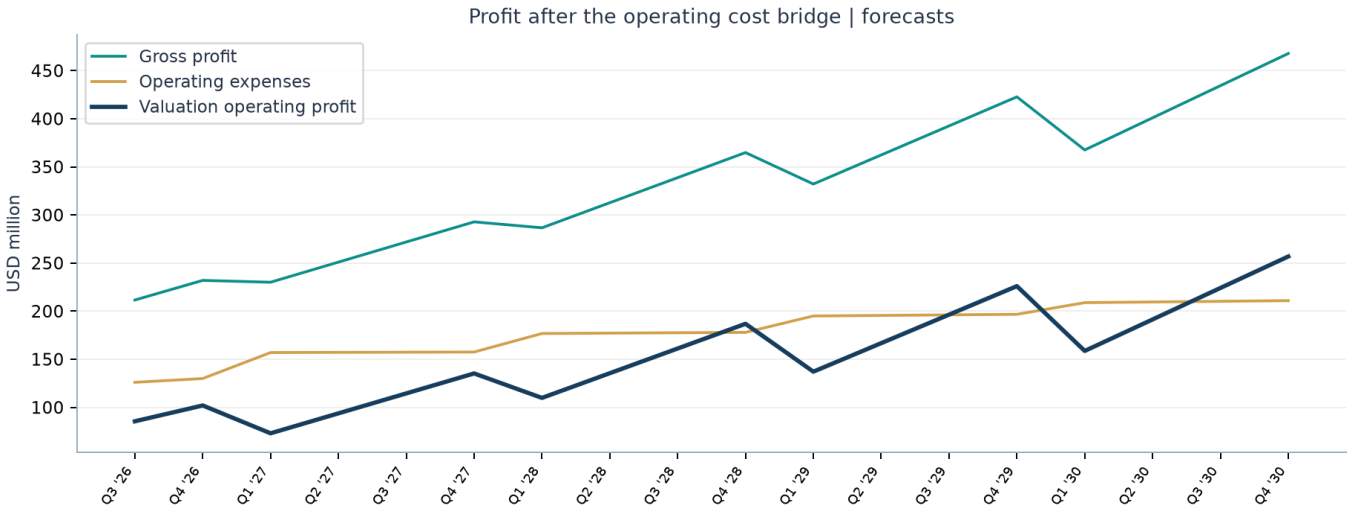

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	390.0	0.0	390.0
Q4 2026	420.0	0.0	420.0
Q1 2027	396.0	11.5	407.5

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Advanced-packaging system revenue, USD millions; accepted deliveries rather than broad customer capex	Status
Q3 2026	140.000	Q3 revenue and GAAP operating-profit guidance midpoints; product allocation is assumed
Q4 2026	150.000	Q4 forecast; calibrated to H2 growth above 25% and non-GAAP exit margin commentary, with full expense deductions
Q1 2027	143.000	Analytical forecast; not company guidance
Q2 2027	156.000	Analytical forecast; not company guidance
Q3 2027	169.000	Analytical forecast; not company guidance
Q4 2027	182.000	Analytical forecast; not company guidance
Q1 2028	176.000	Analytical forecast; not company guidance
Q2 2028	192.000	Analytical forecast; not company guidance
Q3 2028	208.000	Analytical forecast; not company guidance
Q4 2028	224.000	Analytical forecast; not company guidance
Q1 2029	200.200	Analytical forecast; not company guidance
Q2 2029	218.400	Analytical forecast; not company guidance
Q3 2029	236.600	Analytical forecast; not company guidance
Q4 2029	254.800	Analytical forecast; not company guidance
Q1 2030	220.000	Analytical forecast; not company guidance
Q2 2030	240.000	Analytical forecast; not company guidance

Quarter	Advanced-packaging system revenue, USD millions; accepted deliveries rather than broad customer capex	Status
Q3 2030	260.000	Analytical forecast; not company guidance
Q4 2030	280.000	Analytical forecast; not company guidance

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Advanced-node systems excluding services	140.0	56.0%	78.4
Q3 2026	Advanced packaging systems excluding silicon photonics	140.0	55.0%	77.0
Q3 2026	Specialty systems including silicon photonics and SDI	50.0	50.0%	25.0
Q3 2026	Software and service excluding Rigaku license branch	60.0	52.0%	31.2
Q4 2026	Advanced-node systems excluding services	150.0	57.0%	85.5
Q4 2026	Advanced packaging systems excluding silicon photonics	150.0	56.0%	84.0
Q4 2026	Specialty systems including silicon photonics and SDI	55.0	51.0%	28.1
Q4 2026	Software and service excluding Rigaku license branch	65.0	53.0%	34.5
Q1 2027	Advanced-node systems excluding services	132.0	59.0%	77.9
Q1 2027	Advanced packaging systems excluding silicon photonics	143.0	57.0%	81.5
Q1 2027	Specialty systems including silicon photonics and SDI	66.0	51.0%	33.7

Q4 2030	72.5	114.8	14.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Enterprise-to-equity reconciliation

20x fully expensed forward-four-quarter operating profit less net claims, using end-window common shares and any conversion-premium shares. No Rigaku equity income or fair-value gain is capitalized as operating profit. Financial claims use the dated post-Rigaku pro forma balance; projected cash accumulation is not credited again. Workbook probability controls hold adopted premium shares and claims fixed; changed operating inputs require a joint premium and funding rerun.

G5_NEW_APPLICATIONS

probability: 0.55

Conditional: Gross new-application sales of $150/300/400/450m in CY2027/28/29/30; retain 60% after removing 40% overlap with existing customer growth and the backlog.

bounds: Probability 35-70%; retained sales 40-80% of gross. The proposed gross value represents about $10m per application across 15 studies in 2027, scaling successful installed applications later; this is an explicit proxy, not tool ASP guidance.

overlap: Reference packaging revenue already includes the $200m OSAT order and continuing G3/G5 demand. No second addition for panel opportunities or the general packaging TAM.

bridge: 62% incremental GP less 15% engineering, field support and selling expense = 47% OP.

source: May and August management calls, updated September 9 conference: application studies and customer qualifications.

SILICON_PHOTONICS_EXPANSION

probability: 0.5

Conditional: Gross $40/90/150/200m additional system sales in CY2027/28/29/30; retain 50% after baseline, award and timing overlap.

bounds: Probability 30-65%; gross 2030 range $100-250m. No share of a $500m served market is imported directly into revenue.

overlap: Existing $50m orders, about two-thirds due in 2027, are covered by at least $35m silicon-photonics sales inside the specialty reference bucket; this branch is subsequent distinct orders.

bridge: 60% GP less 15% engineering and customer support = 45% OP.

source: August 6 results and management call; silicon photonics belongs to specialty, not the advanced-packaging category.

RIGAKU_LICENSES

probability: 0.55

Conditional: Gross Onto license/associated software revenue of $20/35/55/75m CY2027/28/29/30, less a 25% scope and reference-software overlap reserve.

bounds: Probability 30-70%; first-year gross $10-30m. The May interest-offset remark supports a bounded proxy, not a contracted license rate.

overlap: No Rigaku company sales, equity-accounted earnings, dividends or investment revaluation enter Onto OP. Future hybrid tool hardware is not separately added.

bridge: 95% GP less 25% continuing software development and deployment costs = 70% OP.

source: May 5 management call and August 10 closing release.

VALUE_BASED_NEW_TERMS

probability: 0.35

Conditional: 3% price premium on 20% of reference plus weighted new-application packaging sales; retain 50% after mix overlap.

bounds: Premium 0-5%, eligibility 10-30%, probability 20-50%.

overlap: Fixed-price orders excluded. Existing external-factory efficiency and G5 mix already improve reference margins. No scarcity premium is inferred from competitors or customer fab bottlenecks.

bridge: 25% incremental component cost and 10% operating support leave 65% OP contribution.

source: September 9 management discussion of 2027 terms and product value; May call reported no material production constraint.

PACKAGING_ACCEPTANCE_DELAY

probability: 0.25

Conditional: 10% of reference packaging deliveries shift outside the modeled year.

bounds: Probability 15-40%; delayed volume 5-20%.

overlap: Single combined customer construction, qualification and cycle risk; no additional identical demand haircut.

bridge: 57% lost GP less 12% avoidable cost gives a 45% negative OP contribution.

source: Tool qualification duration, customer-fab dependencies and the distinction between backlog and subsequent discussions.

Remaining bounded uncertainties

- ONTO does not publish tool ASPs, unit shipments or product-level GAAP margins. Revenue, product mix and conditional application values are explicit proxies; source figures are not invented unit economics.

- Q3 results were not yet reported as of October 11. Backlog coverage beyond early 2027 is less firm; 2027-30 numbers are analytical assumptions.

- Rigaku license rates, full hybrid-tool economics, strategic share transfer restrictions and tax cost of a sale remain unresolved. A 25% haircut is applied to marked investment value; this asset is excluded from the cash funding test.

- Existing and new headquarters operating-lease rent remain within forecast operating costs. The $19.770m existing and $36.4m future headquarters undiscounted commitments are disclosed for liquidity context, not subtracted again as valuation claims.

- The cash bridge subtracts the August $720m Rigaku purchase from June cash; intervening operating cash and subsequent fair-value changes await the next filing.

- Conversion-premium dilution is solved for each active valuation window without capped-call credit; changing probabilities or multiples requires resolving it. Fixed active funding and dilution in a sensitivity are not a complete alternative financing state.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
