Sivers Semiconductors (SIVE.ST)

Full investment research | Model assumptions and source evidence

Research and financial update: October 28, 2026. Initial LiDAR production orders and the approved P11 employee-option program are incorporated. Commercial revenue forecasts, analytical Base 90, protected Excel Base 90 and the 20x forward operating-profit method are retained.

CURRENT EDITION - 28 October 2026 | Framework 8.0 | LiDAR production and P11 approval

Full investment research, current probability-weighted operating model and analytical rescore. Financial assumptions, source evidence and forward estimates are distinguished throughout.

October 28 update: production conversion and laser economics

The owner-supplied Serenity commentary and three screenshots support the merchant-laser opportunity. The active commercial assumptions are retained after checking each claim against the existing customer, capacity and price pools. Analytical Base 90 is 54/60: Core 19, Cycle 8, TAM 10, Catalysts 5, Macro 10, Alpha 5 and risk deduction 3. The current risks cover conversion/economics, capital/execution and competition/architecture. The new material supplies useful validation within these existing categories.

LiDAR enters production

Sivers announced first production orders from an unnamed strategic LiDAR customer on October 20. Shipments begin in Q4 2026 as automotive and industrial programs enter production in 2027. The company retains cumulative lifecycle revenue potential of USD 53M to 138M. Its initial purchase-order amount remains undisclosed. October 20release

The model already carries USD 2M in Q4 2026, USD 11M in 2027, USD 25M in 2028, USD 35M in 2029 and USD 36M in 2030, totaling USD 109M. The new production milestone supports that timing. Incremental revenue, manufacturing cost, support cost and operating profit selected from the release are zero because its scope overlaps the existing stream. Aeva is an inferred customer identity. Its possible datacenter SOA route remains inside the separately modeled 50%-weighted follow-on pool.

Capacity, customer conversion and pricing

The existing schedule includes internal 100M plus inferred external 200M annual capacity from Q1 2028. The September 3 company release targets more than 100M internal capability operational in Q4 2027. External comparable product allocation, yields and backend throughput remain open. Existing 2028 probability-weighted DFB output is 109.701M emitter-equivalents within the conditional 300M envelope. Scarcity and supplier diversification support the retained Jabil 85%, advanced pluggable 75% and early-assessment 55% conversion weights.

The current 2028 revenue forecast is USD 977.8525M. Its gross margin is 57.6803%, within the commentary's 50 to 60%-plus long-run range. The model uses a 6.25 USD standard-laser proxy and 75 USD per eight-emitter custom array. The supplied 3 to 6 USD lower-range and 6 to 12 USD custom comments require product-content matching before changing these assumptions.

The following alternatives use the same approved P11 cost, 20x multiple, 10.6 SEK/USD and 358.2035385M economic shares as the active Q4 2027 forecast. Each changes the specified commercial assumption independently.

Conditional case	F4 operating-profit change, USD M	Q4 2027 target, SEK/share
Active forecast	0.000000	201.460221
Advanced pluggable conversion 80%; earlier assessment 60%	7.433965	205.859956
Standard-laser ASP 5 USD; manufacturing unit costs held	-58.201313	167.014223

The joint conversion case adds USD 17.051836M revenue, USD 9.672838M gross profit and USD 0.852592M support cost in 2028, giving USD 8.820246M incremental operating profit. Both customer cohorts draw from their existing allocations. Capacity, loading, pricing and other cohorts remain unchanged. The diagnostic assumes five percentage points of additional conversion for each cohort and provides a bounded test for stronger qualification evidence.

The 5 USD pricing case reduces standard-laser revenue 20% for the three pluggable cohorts, holds manufacturing unit cost and applies the existing 5% incremental-support selection symmetrically. It reruns the policy premium over the same eligible pool. Arrays, volumes and conversion probabilities remain unchanged. The four-quarter revenue reduction is USD 61.318125M. A separate literal constant-gross-margin calculation gives SEK 181.209560; that calculation also reduces manufacturing dollars with price at unchanged units. The held-unit-cost case exposes the cost rigidity of a price decline.

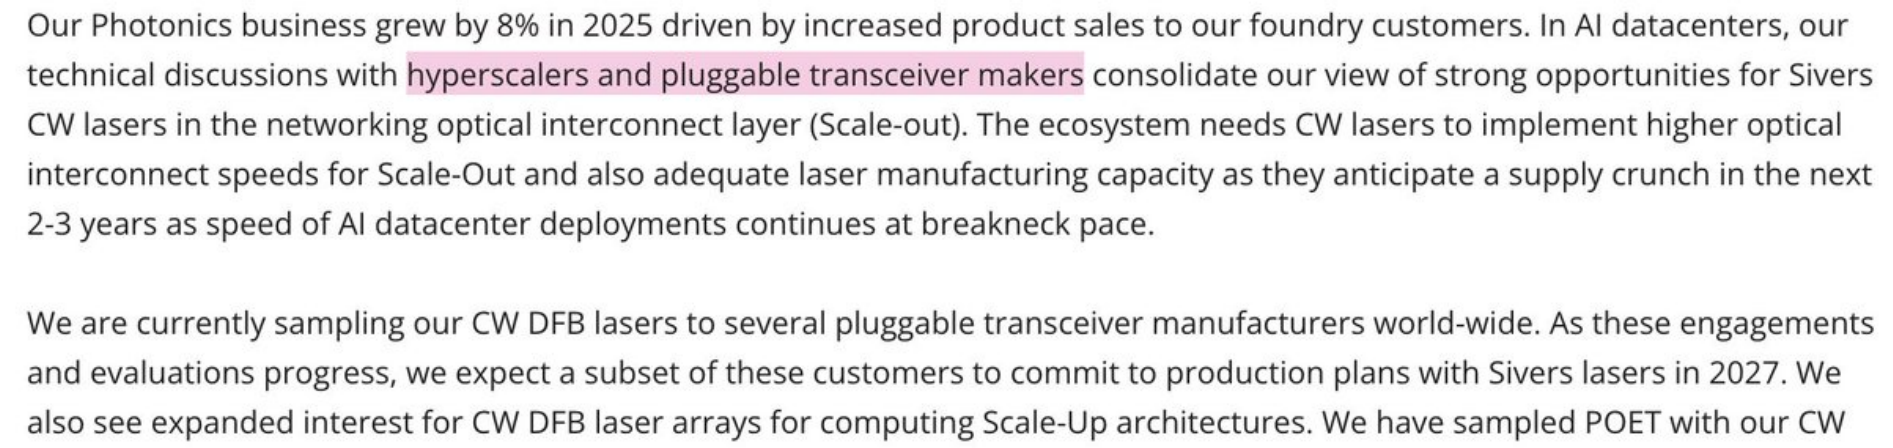

Consumer biosensing and evidence dates

The Fortune 100 biosensing program remains a long-cycle opportunity. Apple identity and 50M potential RFQ units are Serenity's inference. The existing 25%-weighted consumer/TFLN allocation contributes USD 7.171875M revenue and USD 4.446563M gross profit in 2028. A distinct biosensing volume case requires product content per device, ASP, shipment period and capacity allocation. A 50M device count cannot be equated directly with the model's emitter-equivalent and eight-laser-array units.

The screenshot reporting 8% Photonics growth is from the Q4 2025 report, published February 26, 2026. The newest available Q2 2026 report shows Photonics sales down 8% year over year. The Chinese screenshot lacks visible issuer attribution; the commentary attributes it to Innolight. Prepayments mentioned there establish no Sivers cash receipt. The biosensing screenshot has been located in a secondary Q4 2025 call transcript; exact original audio wording remains unverified.

The latest issuer-linked calls are Q2 on August 27 and Q1 on May 29. Reports and replay metadata were reviewed. Full spoken and Q&A verification remains open because accessible replay pages did not expose their transcript text. The next company report is scheduled for November 26.

Owner-supplied source images

Our Photonics business grew by 8% in 2025 driven by increased product sales to our foundry customers. In AI datacenters, our technical discussions with hyperscalers and pluggable transceiver makers consolidate our view of strong opportunities for Sivers CW lasers in the networking optical interconnect layer (Scale-out). The ecosystem needs CW lasers to implement higher optical interconnect speeds for Scale-Out and also adequate laser manufacturing capacity as they anticipate a supply crunch in the next 2-3 years as speed of AI datacenter deployments continues at breakneck pace.

We are currently sampling our CW DFB lasers to several pluggable transceiver manufacturers world-wide. As these engagements and evaluations progress, we expect a subset of these customers to commit to production plans with Sivers lasers in 2027. We also see expanded interest for CW DFB laser arrays for computing Scale-Up architectures. We have sampled POET with our CW

Owner-supplied management screenshot. Authenticated to the Q4 2025 CEO statement, published February 26,2026.

供应链：DFB 物料供应

1.6T DFB 紧缺下的物料保障

面对 2026-2027 DFB 芯片供给紧张，公司相比二线厂商具备优势：

①大客户身份带来上游优先供货权；

②通过预付款、加急费、签署 2-3 年长约、参股上游锁定产能；2026Q2 经营现金流转负，主要是锁定物料带来的资金支出；

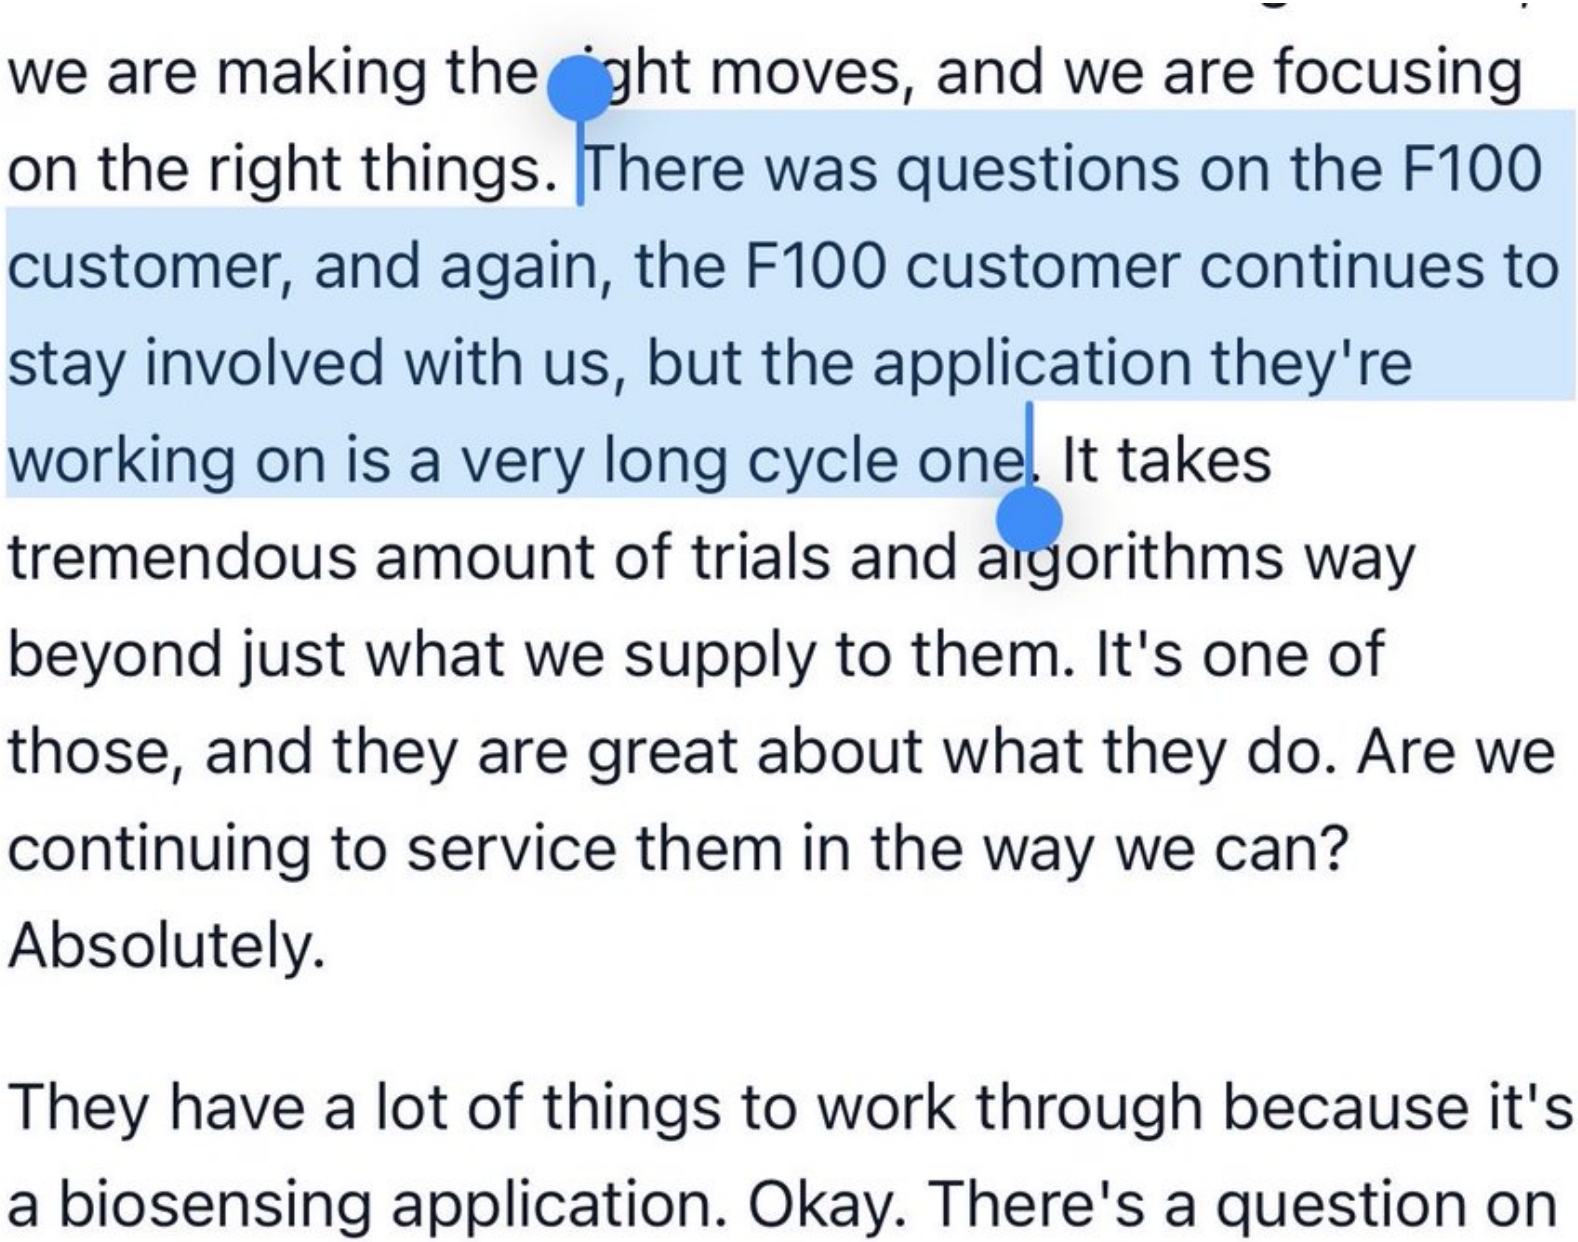

③导入新供应商，新产能 2026 下半年-2027 逐步释放，供应压力会缓解。 但下游需求持续高景气，整体物料依旧维持偏紧，除非需求下行，否则紧缺格局难以彻底消除。

行业景气度、2028 年需求、技术迭代

行业景气判断

公司看好行业，判断**2027-2029 年光模块行业持续繁荣**。依据：下游客户资本开支具备持续性，AI 应用已经形成正向现金流，支撑持续采购。

Owner-supplied Chinese supply-chain screenshot. Visible crop lacks issuer attribution. The saved commentary attributes the discussion to Innolight.

Owner-supplied biosensing screenshot. The customer remains unnamed in the visible text; Apple identity and RFQ scale are inferred.

Q2 2026 issuer report. Q1 2026 issuer report. Q4 2025 issuer report.

Moat review: capacity, qualification and customer economics

Qualification review completed October 10; financial references updated October 28. Serenity's owner-supplied reply describes three distinct advantages: manufacturing capacity, difficult customer qualifications and technology that improves the customer's product. The strongest supported interpretation is qualified capacity plus custom integration. A temporary industry shortage can help a supplier win a design; keeping that design after supply expands depends on performance, reliability, cost and the customer's alternatives. The current model already recognizes these mechanisms. The Q4 2027 target remains **SEK 201.460221/share** at **20x forward-four-quarter operating profit**. Analytical Base and the current Excel Base are both **90**. Both Base scores retain their current90 selection.

The source is Tom's pasted Serenity reply to Rian's question, received October 10. An exact permalink/date for Serenity's reply was not supplied. Its informal estimates and explicit sole-source guess remain attributed judgments. The linked URL identifies Rian's question. Repeated recaps of prior company releases belong to the same research stream and leave the underlying order status unchanged.

Capacity is valuable, but its units and date govern the economics

The September 3 issuer announcement targets more than 100M annual CW DFB lasers at expanded Glasgow, with operation expected in Q4 2027. The August 27 Q2 report gives a long-term 1:2 internal-to-partner capacity model. The existing 100M internal plus 200M external floor is therefore the same conditional 300M interpretation in Serenity's reply. It is already in the quarterly build from Q1 2028. Another 300M layer would duplicate the supply envelope.

The 300M envelope measures annual capacity. The existing loading and customer conversion assumptions produce about 110M expected DFB emitter-equivalents in calendar 2028 (109.701M before rounding), roughly 37% of the 300M annual envelope. It also reserves capacity for legacy products, different die sizes, SOA/process mix and manufacturing constraints. External allocation, mixed-product good-unit yields and backend acceptance remain important tests. A commissioning target alone does not establish those quantities. The shipment display below is synchronized to the current workbook conversion weights; this corrects an older table display and does not change modeled sales or profit.

TrendForce's June 3 forecast puts combined 2026 EML and CW-DFB capacity at about 50.7M monthly. Multiplying by twelve gives 608.4M annualized capacity. That combines technologies and uses an earlier period than Sivers' eventual expansion. Dividing 300M by 608.4M would not establish Sivers' future share of qualified merchant CW supply. Serenity's 3-5-year shortage, 5-7 supplier qualification count, Broadcom expansion and Lumentum 2031 visibility comments provide attributed market context for the existing customer and supply assumptions.

Qualifications make the custom-array case more defensible

Serenity's distinction between standard 70/100mW products and custom optical-I/O arrays is useful. Standard products still need qualification, but more eligible suppliers can compete for those designs as capacity arrives. Custom arrays must satisfy wavelength grid, power, coupling, temperature, reliability and manufacturing requirements together. The March 2023 Ayar demonstration and December 2024 manufacturing partnership support a real, multiyear engineering relationship. They do not quantify a new October 2026 allocation.

Customer switching costs can support retention while customers pursue alternative qualified sources. Ayar's own technical discussion favors supplier diversity and standardized wavelength grids. Interoperability does not prove that a competitor is already qualified to replace Sivers in a particular design. Equally, a successful custom design does not prove no alternative can ever qualify. The exact 'could not do it without Sivers' phrase was not recovered in primary material. It remains attributed to Serenity as a paraphrase.

Jabil is the clearest forthcoming test of commercial performance

The April 15 collaboration announcement confirms the Sivers laser route in Jabil's 1.6T LRO product. Jabil's endorsement supports the joint design's performance and power objectives. System-level efficiency also depends on the module architecture; its full benefit cannot be attributed to the laser alone. The exact EVP moat quote is located in a third-party conference transcript, but the original replay was not recovered. Neither that quote nor the issuer release establishes exclusive supply.

Assign **35%** to the specific sole-laser-source hypothesis for this named design: a subjective single-credible-source weight, reflecting Serenity's explicit guess and the confirmed collaboration. This is different from the existing **85%** commercial conversion weight. Sole sourcing would describe who supplies the modeled allocation; it does not automatically expand that allocation or raise its ASP. Do not multiply existing Jabil revenue by 35%, or add a second Jabil cohort. The issuer's current timing is Q4 2026 beta, anticipated orders in H1 2027 and production ramp in H2 2027. Serenity's possible Q2 proof point is an earlier interpretation; the model's revenue timing is retained.

Rule 16b: explicit incremental disposition

Signal / outcome	Probability and existing economics	Increment above the active case	Decision and next test
Capacity and shortage support existing pluggable conversion	Jabil 85%; alpha cohort 75%; assessment cohort 55%. The current 100+200M capacity schedule feeds loading and cohort units once.	100% overlap with existing envelope and customer pools; incremental units, revenue and OP are zero.	Revisit when dated usable external capacity, yield or accepted orders changes the existing schedule. No new independent probability discount is applied to duplicated capacity context.
Custom optical-I/O qualification and retention	Ayar 80%; ELS 80%; other I/O 40%. Existing custom-array allocation and differentiated price/margin assumptions remain.	Conditional allocation equals the existing allocation; incremental revenue, GP and opex are zero.	Raise or reduce the affected cohort after new design acceptance, customer allocation, substitution or timing evidence. The demonstrations establish the earlier engineering milestones; new wins require their own evidence.
Sivers is sole laser source in Jabil's named LRO design	35% hypothesis, bounded diagnostic 25-50%; separate from 85% cohort conversion.	Existing unit allocation and ASP are retained in either sourcing outcome: 35% x (conditional revenue - existing revenue) = 0. Incremental GP less incremental qualification/support cost = 0 OP.	No supplied quantity or price claim establishes an allocation beyond the existing pool. More Jabil volume or a scoped, like-for-like price premium would create an incremental bridge.
Manufacturing process/yield advantage supports greater profit	No measured new yield advantage is supplied. Current product margins already improve with ramp and mix; existing customer weights govern sales.	Attempted proxy: more good units per wafer or lower cost per good unit. No changed yield, die mix, wafer starts or unit-cost endpoint is established; no separate margin increment selected.	Seek comparable good-unit yield, accepted output or manufacturing-cost evidence. Source esteem does not establish a measured process advantage.

The zero increment reflects overlap and the absence of a changed economic endpoint after the unit/price/yield checks. The model can value a scoped, quantified breadcrumb before official confirmation. The current model already values unconfirmed production opportunities. A new scoped breadcrumb can change those probabilities or economics before a final contract, while retaining costs, finite capacity and the existing valuation method. The qualification review retains the 40% policy-pricing case and all commercial forecasts. The October 28 P11 approval revision updates compensation expense and expected share delivery as derived below.

SOA content, arrays and wafer output are different units

The July SOA and Stranded InP articles describe a route in which a lower-power seed laser and a high-power amplifier together deliver the required light. This is relevant to Sivers because it can create amplifier content while changing the number, power and packaging of seed lasers. Mapping that content to conventional DFB emitters at the current $6.25 proxy requires explicit product and cost assumptions. The current model already separates SOA follow-on, the initial SemiNex program, LiDAR and optical-I/O arrays.

The July 25 illustration is particularly useful for capacity discipline. Its one-wavelength design uses one 100 mW DFB and four 650 mW SOAs, compared with eight 250 mW-class DFBs, to feed eight 22 dBm fiber outputs. The author assumes 0.25 mm2 for the seed, 1.4 mm2 for each SOA and 0.6125 mm2 for each alternative DFB. That implies 5.85 mm2 versus 4.90 mm2 of gross die area, about 19.4% more in the amplifier design. Once the workbook's assumed manufacturing and packaging yields are included, its wafer-equivalent use is roughly twice as large. The author supplies illustrative inputs. Sivers' actual die dimensions, yields and costs remain unmeasured in this evidence.

Product	100 mW CW	250 mW CW	650 mW SOA	400 mW CW (0.5-1 MHz linewidth) *competent vendor	400 mW CW (0.5-1 MHz linewidth) *loser vendor	200G EML	Coherent lite Rx
width (mm)	0.25	0.35	0.7	0.5	0.5	0.25	2
length (mm)	1	1.75	2	3	5	1.5	5
area (mm^2)	0.25	0.6125	1.4	1.5	2.5	0.375	10
wafer size (in)	4	4	4	4	4	4	6
dice per wafer	25888	10103	4551	4308	2526	17200	1513
Yield %	50	50	35	50	30	30	20

Package yield %	50	50	40	50	50	50	80
sellable dice	6472	2525.75	637.14	1077	378.9	2580	242.08
pkg cost $	500	500	500	500	500	500	1000
wafer cost $	2000	2000	2000	2000	2000	2000	6000
process cost $	4000	4000	4000	4000	4000	4000	5000
COGS per dice $	1	2.6	10.2	6	17.2	2.5	49.6
ASP (guess) $	3.5	10	20	40	40	10	100
Gross Margin %	71	74	49	85	57	75	50
Optical Pow Per InP Area (mW/mm^2)	400	408.2	464.3	266.7	160		

Author model: assumed die area, process yields and finished output. Sivers' measured parameters remain open inputs; converting this illustration to emitter-equivalent capacity requires a product-specific bridge.

The operating implication is to retain a mixed-product capacity constraint. The existing 300M annual emitter-equivalent scenario was constructed for DFB-based cohorts. Its at-least-20% reserve for legacy products, SOA/process mix and manufacturing constraints provides a modeling buffer. The wafer-area demand of a 650 mW amplifier requires separate analysis. More amplifier allocation could use more area or a different epitaxy/backend flow; higher content per shipped

device could still produce attractive revenue. Neither the author's gross-area ratio nor nominal wafer capacity resolves that tradeoff. Qualification, allocation and backend throughput must be reconciled in the same units before adding output.

The primary Sivers ECOC 2025 slides provide a useful evidence hierarchy. The 200 mW curve is at 55 C sink temperature. The reliability slide concerns 45 mW at 70 C; its reported 10,000-hour HTOL and 5,000-hour accelerated test cannot be transferred to 200 mW or 650 mW devices. The sixteen-wavelength array is presented as development work. These facts support an engineering path while keeping production yield and the qualified operating envelope explicit.

The Aeva route now has a dated commercial breadcrumb beyond July's proposal. Its August 5 announcement describes an optical-engine development agreement for a major hyperscaler, with deployment targeted in H2 2027 and a 2028 production ramp. The release does not identify the engine customer, InP supplier, volumes or ASP. Thus it strengthens the commercialization mechanism without proving Aeva's datacenter program is a Sivers award. Supplier identification requires evidence beyond the saved anonymous email and employment screenshot. The December 19, 2024 Sivers/Ayar release establishes that historical relationship; it does not prove current exclusivity or a new 2026 prepayment. No measured array-yield failure or supplier termination is established by the July article.

The current financial overlap is concrete. The 50%-weighted SOA follow-on contributes $3M in 2027, $18M in 2028, $34M in 2029 and $50M in 2030, separate from the finite $3.4M initial SemiNex program and the $109M modeled LiDAR lifecycle. "Downstream routing" already places Aeva-related datacenter SOA inside the follow-on pool if Sivers linkage is supported. Adding Aeva's whole engine or ELS selling price would duplicate downstream content Sivers does not necessarily sell. Conversely, weakness in one monolithic array need not invalidate separate discrete-laser or amplifier opportunities.

No July financial increment or new independent risk branch is selected. The existing 85% Jabil, 75% alpha, 55% assessment, 80% ELS, 80% Ayar and 50% SOA weights remain unchanged, as do the 40% policy case and capacity schedule. The active Q4 2027 price target is SEK 201.460221 after the separate incentive-cost and economic-share allowances below, with analytical Base 90 and current Excel Base 90 retained. The engineering review adds no further revenue increment. The next useful inputs are actual amplifier die/yield data, Sivers' share of the proposed optical source, customer program timing and whether that content exceeds the follow-on pool already modeled.

Technical alternatives qualify the competitive claim. The March 12 optics-basket article uses a 70mW Furukawa product example to dismiss its CPO relevance. A March 2024 issuer demonstration already specified 100mW per channel across 16 channels at 55C. That disproves a universal 70 mW output-power ceiling but does not establish a qualified 350-400mW source for a particular NVIDIA engine. Compare suppliers on matched power, wavelength, coupling and qualification. The old portfolio-wide monopoly language in the legacy ams OSRAM note is corrected separately; it does not change Sivers' current probabilities.

Review scope: complete saved July 11, July 18 and July 25 articles and all 43 image elements were accounted for. One locally saved SOA figure was a placeholder; its original illustration was recovered separately from the cited 2017 research paper and retained in the audit. Original submitted files were preserved. Generic teaching diagrams, the author's spreadsheet assumptions and issuer measurements have distinct evidentiary status.

Array and amplifier measurements: scope matters

Aeva's SOA paper adds a useful measurement checklist to the existing amplifier opportunity. Its curves show high output with a single injected seed and efficient operation at elevated temperature. Sweeping the seed across several wavelengths separately does not establish low distortion under simultaneous DWDM loading. The reported FIT 4 at 40 C and 90% confidence is an accelerated reliability extrapolation with stated activation-energy and current assumptions. A fleet failure rate requires operating-field data. Data-center capture still requires the application's noise, saturation, thermal, packaging and reliability tests. The reviewed material does not independently identify Sivers as the source of this particular device. [IA08 images 037-040; P06]

The current model already separates the initial SemiNex program, the 50% SOA follow-on and LiDAR revenue, and explicitly places possible Aeva-related data-center content in the follow-on pool. Keep that boundary. The same applies to array competition: the Lumentum/NVIDIA per-channel DFB-SOA route and Intel's integrated amplification show that seed-laser counts and power can change with architecture. Sivers'75% alpha, 55% assessment, 80% ELS and 80% Ayar probabilities already recognize product-fit and customer-conversion opportunities; the papers do not disclose a new Sivers allocation. Mixed-product wafer area, good-array yield and backend throughput remain open inputs. They require reconciliation within the existing 300 M-equivalent capacity envelope.

P01: Design and Packaging of a DWDM CW-DFB Laser Array for Co-Integrated Optical Interconnects (2026-05-26 conference; IEEE added 2026-06-17). P05: An 800 Gbps/Fiber Silicon Photonic Microring Based DWDM Transceiver in an Open Cavity Package (2026 VLSI paper; exact publication day not verified). P06: Aeva high-power semiconductor optical amplifier announcement (2026-01-15). Detailed paper figures were inspected in the submitted article; full IEEE papers were not independently recovered. These measurements refine acceptance tests. Customer allocation and commercial yield remain open inputs.

Q4 2027 price target

P11 status: approved October 22; grant economics modeled. The Q4 2027 price target is **201.460221 SEK/share**, with analytical Base **90** and current Excel Base **90**. A three-year service-period expense begins with the modeled November 27, 2026 grant. The divisor carries a net legacy-option reserve and adds P11 at its modeled November 2029 vesting. Assumptions, accounting limits and revision triggers are stated below.

Current model item	Value	
Q4 2027 price target		201.4602 SEK/share
Valuation window	Q4 2027 to Q3 2028	
Artifact analytical Base		90/100
Current portfolio Excel Base		90/100

A 10% premium on half of the existing pluggable-laser revenue pool, weighted at 40%, raises profit without increasing capacity or customer-conversion probabilities.

The sanctioned valuation remains **20x forward-four-quarter operating profit**, with the retained profit basis and currency conversion, and the explicit economic-share path below. The active price target next rolls on January 1, 2027.

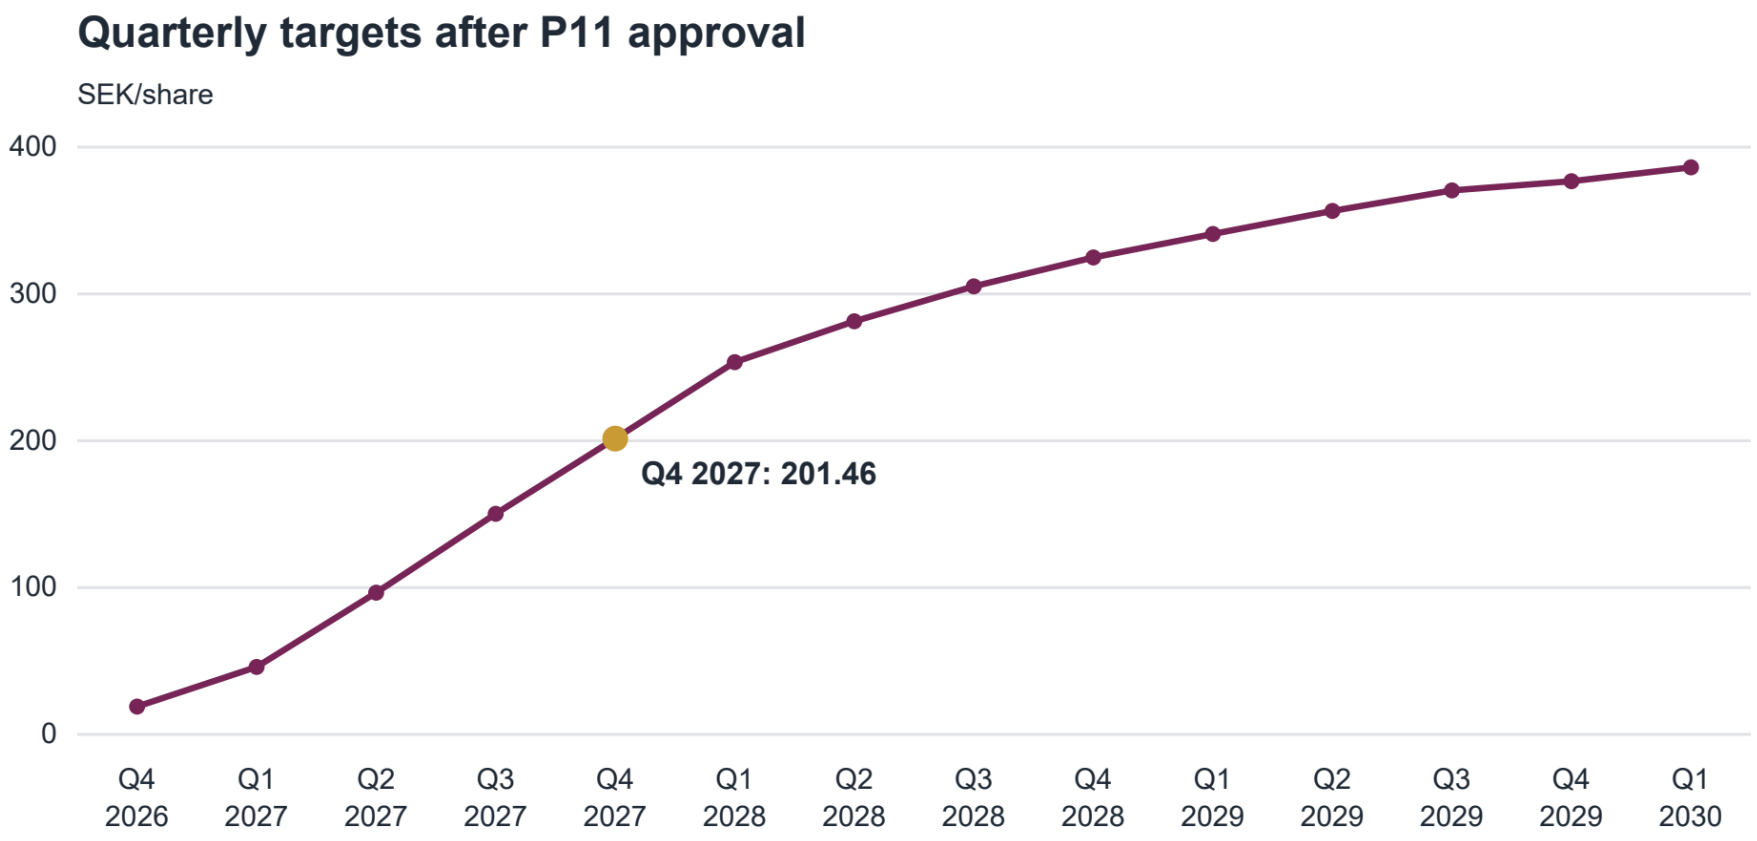

Figure 1. Current quarterly price targets, SEK/share. Gold marks Q4 2027. P11 expense, the economic-share allowance and the 40% policy contribution are included once.

Price target quarter	Current price target SEK/share
Q3 2026	neg
Q4 2026	18.9378
Q1 2027	45.9379
Q2 2027	96.5288

Price target quarter	Current price target SEK/share
Q3 2027	150.2378
Q4 2027	201.4602
Q1 2028	253.5378
Q2 2028	281.3805
Q3 2028	305.1666
Q4 2028	324.8530
Q1 2029	340.8472
Q2 2029	356.5500
Q3 2029	370.5198
Q4 2029	376.7907
Q1 2030	386.2493

Analytical Base and scored conviction

Category	Score	Evidence and limit
Core Thesis	19/20	Qualified CW laser and array technology with scarce merchant supply, named partners and a materially larger manufacturing path; competition remains real.
Cycle Stage	8/10	Six additional pluggable engagements, Jabil's dated production path and available foundry capacity support conversion; high-volume revenue remains ahead.
TAM Expansion	10/10	Higher-speed modules, SiPh/CPO, optical I/O, SOAs, LiDAR and RF/defense extend the technical opportunity without adding overlapping market totals.
Catalysts	5/5	Q4 2026 qualification/LiDAR, H1/H2 2027 Jabil milestones and Q4 2027 Glasgow commissioning. Listing remains conditional.
Macro	10/10	AI optical deployment plus prospective demand for qualified, geographically diversified supply; historical U.S. foundry candidates strengthen this route, with actual eligibility still uncertain.
Alpha	5/5	Highest-weight Serenity research connects new merchant supply with buyer shortages and multiple routes to production.
Risks	-3	The detailed scored-risk section below defines the deduction; no additional policy risk is counted twice.
Total	54/60 = 90/100	Elite; price-independent analytical thesis score

Artifact analytical Base: 90/100. Current portfolio Excel Base: 90/100. The current portfolio value follows the owner's removal of manual overrides. It is shown separately from the analytical scoring table.

The prospective preference for qualifying supply strengthens the structural demand tailwind for Sivers beyond general AI demand. Historical U.S. foundry candidates make a qualifying route plausible, while the actual partner and content status remain unresolved. Macro receives one point; no additional Core, Alpha, TAM or customer-conversion credit is added for the same signal. Uncertain qualification, funding and execution remain in the existing risk classes.

Base measures thesis quality. The 40% policy probability weights only the incremental operating economics, once; neither Base nor the policy weight is applied again to the final price target. Scores use integer category points on the /60 framework lattice.

Policy breadcrumb and economic hypothesis

Serenity's October 1 post attributes Washington meetings to Morgan Stanley and reports a possible 3.2T-focused restriction, with a potential 65% U.S.-value route for Chinese modules. The source expects laser pricing to matter more than broad module-share redistribution. Treat this as an attributed policy scenario; the original MS note and final FCC language establishing these exact terms were not recovered. The separate September 25 Senate proposal concerns sensitive federal systems and a five-year transition. The exact FCC terms still require their own source verification.

Serenity policy post | Foundry follow-up | Separate Senate proposal

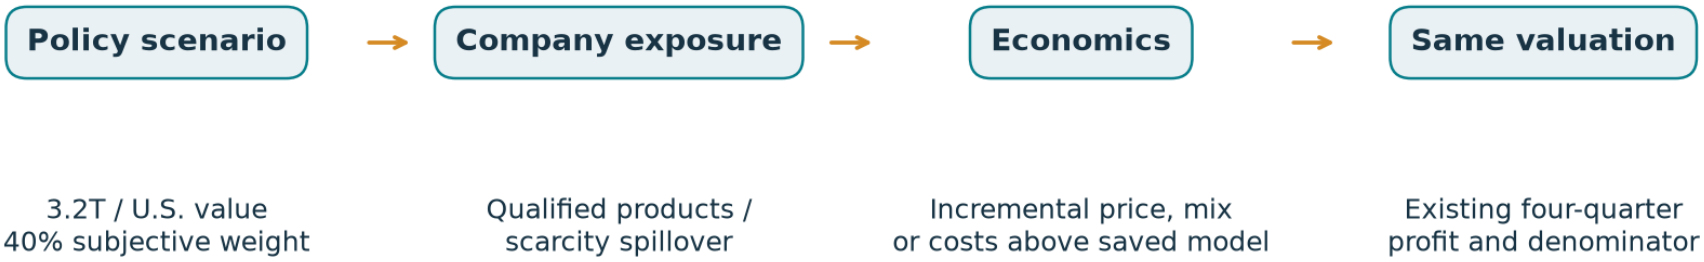

Figure 2. Analytical transmission of the attributed policy scenario. The model diagram traces assumed policy-to-customer economics.

Assigned common policy-scenario probability: 40%. Subjective initial weight above the single-source 25-35% band because Serenity has the owner's highest weighting and attributes Washington meetings to Morgan Stanley. The exact future rule, timing and economic effect remain uncertain. The source chain runs from Morgan Stanley through Serenity, and the probability includes that dependence.

Only the three pluggable laser cohorts receive a policy-induced merchant premium. Half of their already probability-weighted sales is a bounded U.S.-foundry/qualifying allocation proxy. No capacity or existing customer probability is added. Ten percent is an analyst price sensitivity above the inherited flat laser ASP. Reported pricing remains an open input.

Eligible fractions are bounded scenario assumptions. Manufacturing-origin certification remains unverified. U.S. corporate domicile and a U.S. listing do not prove manufacturing origin. If the final content definition excludes the modeled products, their eligible fraction goes to zero.

For component and integrated suppliers, the filtered revenue pool means 3.2T-linked sales plus incremental cross-generation pricing spillover from competition for common qualified capacity. The model reaches 800G/1.6T through competition for shared qualified capacity. Direct regulatory treatment requires separate

verification. Fractions are LOW-confidence exposure proxies. Geographic market shares remain unverified.

Signal ledger field	Current treatment
Signal ID / date	FCC-OPTICS-20261001; Serenity/MS source chain
What is already included	All saved product growth, shortages, capacity, customer probabilities and contracts. The bridge adds only the explicitly calculated incremental economics.
Probability and timing	40% common policy scenario; price/cost intensity 0 before Q3 2027, 25% Q3 2027, 50% Q4 2027, 75% Q1 2028, 100% from Q2 2028. AAOI mix uses its own slot ramp.
Numerical contribution	Q4 2027 operating quarter: delta revenue 0.585000, delta consolidated OP 0.526500 (USD millions). Forward-four-quarter valuation OP changes 4.581563.
Dependence	The policy probability is shared across companies. These portfolio exposures share the same policy outcome and are correlated. Existing customer-conversion probabilities are already inside source revenue.
Raise weight	Rule/proposal scope supports qualifying content and timing; company product/foundry evidence improves; customer sourcing or like-for-like price negotiations support the incremental premium.
Reduce weight	Policy is delayed beyond the horizon, the content definition excludes products, supply eases, fixed contracts prevent repricing, unit costs absorb the premium, or 3.2T conversion slips.
Zero-contribution boundary	No broad TAM uplift, no new factory capacity, no OCS benefit and no blanket-ban recovery. AAOI receives no modeled units before 2028. MXL is assessed separately as a candidate.

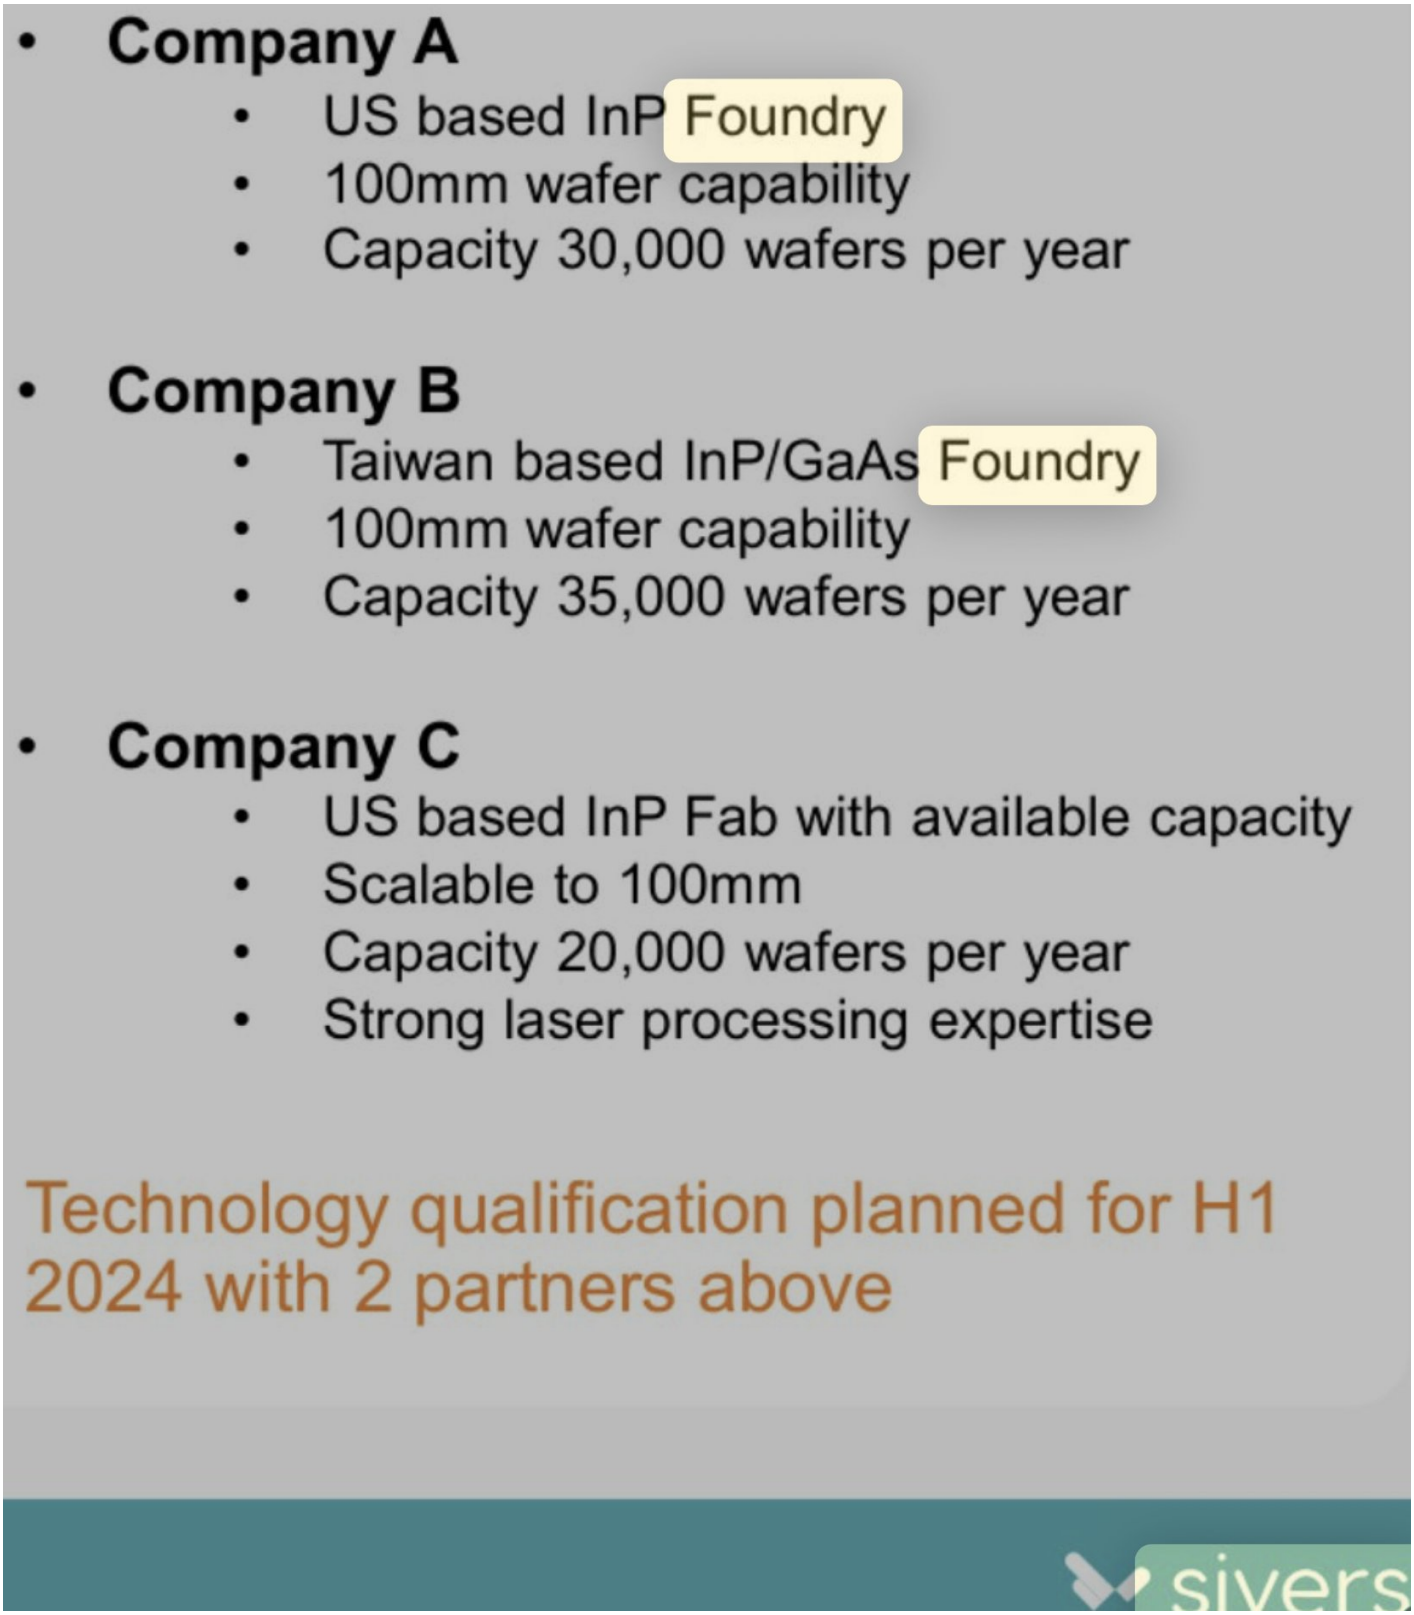

Conditional inputs selected before calculating targets

Input	Value	Evidence status
Relevant qualifying exposure	50.00%	LOW-confidence analyst assumption; inherited cap where labeled
Conditional incremental price premium	10.00%	LOW-confidence analyst assumption; inherited cap where labeled
Incremental COGS / price revenue	5.00%	LOW-confidence analyst assumption; inherited cap where labeled
Incremental opex / incremental revenue	5.00%	LOW-confidence analyst assumption; inherited cap where labeled

Incremental COGS and opex rates use incremental price revenue as their base. Original product revenue and COGS retain their existing treatment. AAOI mix cost uses unit COGS separately. AXTI stranded COGS is a fraction of COGS attached to lost units. Chinese component-cost rates apply to affected reference COGS.

Timing is an analyst sensitivity. A deliberately labeled early-sourcing proxy ahead of a 2028 3.2T ramp. Earlier quarters receive zero incremental policy revenue. Full intensity begins Q2 2028 and remains an uncertain continuation through the saved forecast only. These dates express the model's assumed regulatory and order timing. The probability sensitivity below includes a no-policy control; a later start would reduce the near-term contribution.

Historical foundry evidence at the point of use

Source exhibit supplied by Tom with Serenity's October 1 follow-up. It lists historical candidate foundry capacities and H1 2024 qualification plans. Present Sivers allocations remain unverified.

The two U.S. candidates make a U.S. partnership plausible. The slide does not identify today's second foundry or establish qualifying content. The 30,000 / 35,000 / 20,000 figures are wafers per year at candidate facilities. They cannot be added to the existing 300M emitter-equivalent scenario or converted to Sivers sellable lasers without area, yield, loading, allocation and backend data. Glasgow remains Scottish supply and WIN remains Taiwanese supply. The current model assigns a 50% qualifying/spillover exposure proxy only to the existing Jabil/alpha/assessment laser cohorts.

Incremental revenue, cost and profit

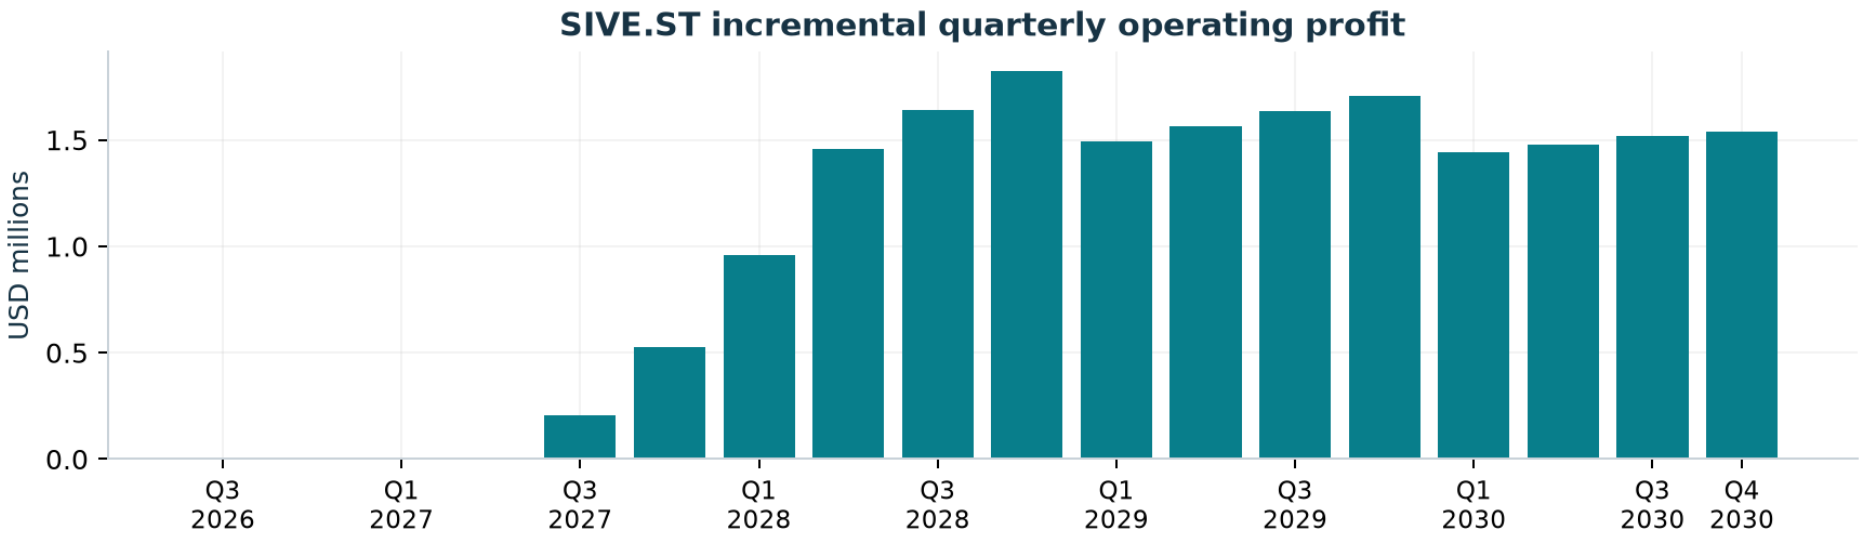

Figure 3. Incremental consolidated operating profit, USD millions. The table isolates the weighted policy effect; P11 cost is shown separately below.

Quarter	Delta revenue	Delta COGS	Delta gross profit	Delta opex	Delta OP
Q3 2026	0.0000	0.0000	0.0000	0.0000	0.0000
Q4 2026	0.0000	0.0000	0.0000	0.0000	0.0000
Q1 2027	0.0000	0.0000	0.0000	0.0000	0.0000

Active-window product bridge

Product / event	Pre-policy operating pool	Filtered exposure	Weighted delta revenue	Weighted delta OP
Jabil	23.9062	11.9531	0.2391	0.2152
Three alpha makers	25.3125	12.6562	0.2531	0.2278
Three assessment makers	9.2812	4.6406	0.0928	0.0835

Filtered exposure is a scenario allocation. Verification of U.S.-origin revenue remains open. For cost cases the exposure is an affected cost pool; AAOI substitution units are explained in its separate bridge. All financial amounts use the company table units.

Business research and source evidence

The following sets out the company thesis, historical results, guidance, capacity, program probabilities, risks and original source images. Source dates remain visible. Operating assumptions below feed the complete current financial tables, including the explicit probability-weighted policy contribution.

Inherited September 30 breadcrumb inputs and source images

These probabilities express explicit investment judgments under Framework 8.0. Statistical frequencies and confirmed order coverage remain unmeasured. Unconfirmed but credible evidence can affect the model when its company-specific transmission is quantified.

Three alpha customers conversion revision

Reference probability: 70% -> 75%; five percentage points, weighted once.

The new 100-150 mW NPO discussion broadens the architecture fit of Sivers power range. The earlier shortage and 300M hybrid capacity are already included. Those earlier five-point increases remain in the reference; this current model leaves them unchanged and separately models the policy price increment.

Operating bridge: Unweighted cohort revenue = saved weighted revenue / original conversion p. Increment = unweighted revenue x(new p-old p). Keep capacity, loading, ASP, FX and shares. Incremental opex 5% of new revenue is an explicit support-cost proxy; original depreciation and other costs retained.

Limits and counter-evidence: No new capacity is added. This does not identify the six customers as Chinese buyers. Arrays, discrete lasers and ELS cannot share an assumed selling price. Probability increases are modest because scarcity was already priced.

Global 800G/1.6T demand could reach 200mn units by '27

During Sep 17-23, we held investor meetings with optical communications suppliers, including Innolight, CIG, DS Precision, and Everbright, as well as upstream suppliers like Crystal-Optech/Sunny Optical/Himax. Supply chain indicated solid transceiver demand through 2027, with consensus expectations for both 800G/1.6T demand to reach 90-100mn units each. However, shipments will likely remain constrained by upstream component supply, with DSP the most cited bottleneck, particularly for 1.6T. mSAP PCB and CW lasers are also in tight supply. Although investor feedback suggests less concern about 800G shipments, Innolight noted that both 800G/1.6T could face supply shortages.

Tier-2 suppliers offer positive guidance

Tier-2 suppliers are providing positive guidance for 2027: (1) DS Precision guides to 35mn units, including 10mn of 1.6T; (2) CIG targets monthly output of 2mn units in 2027 vs 1.5mn by end-2026, implying potential annual output of 18-24mn units, with more than 40% from 1.6T; and (3) Luxshare expects output of 6-8mn units in 2027, with 1.6T accounting for c.50%. All three highlighted sufficient component supply for 2027 and

User-supplied evidence for Three alpha customers conversion revision. The quoted forecast or estimate retains the source status described above. Original exhibit, panel 1 of 2; read from top to bottom.

said they had secured DSPs for 1.6T transceivers. However, investor feedback indicates greater confidence in tier-1 suppliers' positioning and a preference to discount tier-2 vendors' guidance because of concerns about DSP supply. Our checks suggest potential DSP volume of 60-70mn units in 2027, broadly in line with most investors' views.

NPO offers potential upside into 2028

All transceiver makers indicated they are working on 3.2T/6.4T NPO projects. Innolight noted that, in a bull case, the market could reach 30-50mn OE units in 2028, vs current expectations of 2-5mn units in 2027 and more than 20mn in 2028. Nvidia's NPO project remains in the sampling stage, and more concrete orders could emerge toward year-end or in early 2027. On design, we see both integrated-laser and ELS approaches, while the supply chain is seeking to use more 100-150mw CW lasers even in ELS solutions.

Passive: more smartphone optic suppliers enter market

More smartphone optical suppliers are expanding into passive components, initially focusing on FAU-related for transceivers with a goal of entering CPO. Crystal-Optech noted that smartphone optical suppliers benefit from greater coating-equipment capacity as equipment lead times have lengthened. However, contributions are unlikely before 2027, as testing/certification typically take a year. Sunny said it is in sampling stage and engaging more closely with domestic customers. On CPO, Himax highlighted its close partnership with FOCI and is working on a 3rd-gen design. Himax noted that 2027 will remain an engineering-run stage but looks positive on future growth.

User-supplied evidence for Three alpha customers conversion revision. The quoted forecast or estimate retains the source status described above. Original exhibit, panel 2 of 2; read from top to bottom.

1. Thesis, bottleneck and S-curve

Sivers combines qualified laser technology with access to additional production capacity at a time when optical-module manufacturers are competing for merchant CW laser supply. The decisive opportunity is the intersection of three things: demand shifting toward silicon-photonics pluggables and external light sources; established integrated suppliers directing more laser production into their own modules; and Sivers preparing several customer programs on a hybrid internal/foundry supply base. Serenity's September 8 supply-chain synthesis receives the strongest research weight. R1

The investable bottleneck is **customer-qualified light at the required wavelength, power, reliability and production volume**. Converting laser IP to sales requires qualified production capacity. Access to new manufacturing supply materially improves the probability of conversion during a shortage. The qualified-supply opportunity spans several architectures. Several suppliers manufacture InP lasers; Sivers' capture depends on customer-qualified output.

The commercial sequence is pluggables first, then NPO and external light sources, followed by larger optical-I/O deployments. Jabil's initial orders are expected in H1 2027 and its production ramp in H2 2027. Six additional pluggable engagements provide breadth beyond that lead program. Glasgow is targeted to become operational in Q4 2027, while foundry supply supports earlier ramps. Optical I/O becomes a modeled production allocation in 2028. R3, R5

Sivers is pre-scale in revenue and entering the qualification-to-production portion of the S-curve. It has a broad set of credible routes to market; the most important remaining variables are conversion speed, customer allocation, qualified output and economic capture. The model includes the benefit of the shortage in customer probabilities and stable near-term component ASPs. It does not assume all prospective customers convert, or that shortage pricing lasts forever.

TAM Expansion Lens

Phase	What the technology enables	Framework treatment and model boundary
Phase 1: AI datacenters	CW lasers for 800G/1.6T pluggables, NPO, CPO external light sources, optical I/O and SOAs	Primary economic driver. Three optical architectures share one allocated laser-capacity pool.
Phase 2: Physical AI and adjacent infrastructure	Automotive/industrial LiDAR, remote sensing, SATCOM, defense and telecom beamforming	Engineering-supported adjacency. LiDAR and RF are separate revenue pools; application weights are not reapplied as revenue discounts.
Phase 3: New markets	TFLN-based sensing, consumer wearables, OCT, quantum and free-space optical systems	Small explicit TFLN/consumer allocation from 2028; other opportunities unmodeled. No named Apple production award assumed.

The framework's 100%/50%/20% thematic lens informs TAM scoring. The company model uses its own explicit program weights once. Those two systems must not be multiplied together as duplicate probabilities. Sivers supplies a broadly useful light-source technology, but competing materials and architectures still determine its addressable portion.

2. Latest actuals, financing and management timing

The financial anchor is the August 27 Q2 report, including its restated comparative presentation. P1

Q2 2026 actual, SEK millions unless stated	Reported value
Revenue	53.8
Wireless / Photonics revenue	37.9 / 15.9
Hardware / NRE revenue	29.2 / 24.6
Gross profit	-19.7
EBIT	-116.9
Adjusted EBITDA	-35.5
Depreciation and amortization	18.6
Share-based payment expense adjustment	50.3
U.S. dual-listing preparation adjustment	12.4
Operating cash flow / quarter-end cash	-70.0 / 62.7
H1 revenue	115.6

Product growth was about 13.4% reported and 18% at constant FX; these are different bases. Actual hardware and NRE totals imply a 45.7% NRE share. The Board does not issue numerical forward financial forecasts. The production-ramp schedule below is the research forecast. P1, P2

Capital structure: the August 31 share filing records **356,740,332 ordinary shares and votes** after exercise of 1,659,015 warrants. The September 29 notice reports the same gross issued count, including **12,872,916 treasury shares**. The valuation retains gross ordinary as a floor, reserves uncovered older options economically and adds expected P11 delivery from Q4 2029. This economic-share proxy supports valuation. Reported diluted EPS uses its own accounting denominator. Supporting C shares and the corresponding award pool enter this valuation reserve once. P3

The funding record is approximately SEK 825M of gross equity capital across the 2026 transactions, including the SEK 700M larger raise, plus conversion of the USD 12M convertible. The larger raise and conversion completed after the Q2 balance-sheet date; the remaining USD 5M term loan was subsequently repaid. Current cash also reflects fees, debt repayment, operating cash flow and working-capital movements after those raises. P1, P2

The USD 30M Glasgow investment uses a material portion of the financing capacity. At the model FX, it equals SEK 318M, or about 45% of the SEK 700M raise before fees, debt repayment, operating losses and working capital. The model includes depreciation. A fully funded cash-flow forecast requires a separate working-capital and financing bridge. Working-capital needs could rise sharply as foundry purchases precede customer receipts. P4; analyst arithmetic

Current timing spine

Milestone	Current interpretation	Model treatment
Q4 2026	Jabil beta builds and customer qualification; LiDAR production-order/ramp window	Q4 revenue inflection; no Jabil volume-revenue allocation in 2026
H1 2027	Jabil initial production orders expected	Small initial shipment allocation; purchase orders are not automatically recognized sales
H2 2027	Jabil production ramp; additional pluggable conversion potential	Larger pluggable output, supported by assumed foundry ramp
H1 2027	U.S. listing readiness work targeted	Preparation milestone; no guaranteed listing date or automatic multiple uplift
Q4 2027	Glasgow expansion expected to become operational	Incremental internal capacity first contributes a full modeled quarter in Q1 2028
2028 onward	Optical-I/O and wider CPO/customer deployment	Ayar and other optical-I/O capacity allocations become active
November 26, 2026	Next scheduled interim report	Replace Q3 model with actuals and test order/qualification evidence

Serenity's preferred H1 2027 completed U.S. listing is recorded as a shareholder execution target. Management's readiness objective and conditional listing decision are recorded separately. The model does not invent a listing date, acquisition or associated share issue. R3, R4, R5, P2, P5

3. Supply evidence and the merchant-laser opening

Sivers CIOE products

ultimate beneficial owners are Independent Third Parties (to the best of the Directors' knowledge, information and belief, having made all reasonable enquiries). None of the s become a substantial shareholder (as defined in the Listing Rules) of the immediately after the completion of the Placing.

3 of 3

PROCEEDS FROM THE PLACING

The aggregate gross proceeds from the Placing are approximately HK$1,975.90 million, and the aggregate net proceeds from the Placing (after deduction of the placing commission and other relevant costs and expenses of the Placing) are approximately HK$1,966.97 million.

In light of the recent booming of AI applications, the demand for high-speed optical modules has been increasing significantly, which has resulted in the shortage of core components, such as high-speed DSP chipsets for 800G and 1.6T optical modules, 100G/lane and 200G/lane silicon photonics chipsets and 70mW-200mW CW laser devices. The lead time of such core components has increased significantly and deposits or down payments have been required to secure production capacity. In light of the above, the Company has been planning to further stockpile the core components in the coming years to ensure that the newly expanded production capacity can be fully utilized to meet customer demand. The Company considers that the proceeds from the Placing will be able to provide stable financial support for such purpose. Accordingly, 80% of the net proceeds from the Placing are expected to be applied to the strategic stockpiling of

CIG English placing evidence

截至2026年6月30日，本公司未使用的所得款項已存入中國內地信譽良好的銀行，已經並將以招股章程中披露的所得款項計劃用途一致之方式，按照上述擬定使用時間表繼續使用。

根據一般性授權配售新H股

於2026年5月28日(交易時段前)，本公司與聯席配售代理訂立了配售協議，並已於2026年6月4日成功按配售價每股H股126.66港元，向不少於六名承配人(據董事經作出一切合理查詢後所深知、全悉及確信，該等承配人及其最終實益擁有人均為獨立第三方)配發及發行合共15,600,000股新H股，佔經配發及發行配售股份擴大後的已發行H股總數約16.84%。於2026年5月27日(即簽訂配售協議前的最後交易日)每股H股在聯交所所報的收市價為139.00港元。配售所得款項總額約為1,975.90百萬港元，而配售所得款項淨額(經扣除配售傭金及其他相關成本及開支後)約為1,966.97百萬港元(即每股H股可得淨額為約126.09港元)。

鑒於近期人工智能應用的蓬勃發展，高速光模塊的需求顯著增加，導致核心元[illegible]出現短缺，例如800G及1.6T光模塊所需的高速DSP芯片組、100G／通道及200G／通道的硅光芯片組，以及70mW至200mW的連續波(CW)激光器件。該等核心元器件的交付週期大幅延長，且需支付定金或預付款以確保產能。鑒於上述情況，本公[illegible]一直計劃在未來數年進一步儲備核心元器件，以確保新擴充的產能得到充分利用，從而滿足客戶需求。本公司認為，配售所得款項將能為此目的提供穩定的財務支持。因此，配售所得款項淨額的80%預期將用於核心元器件的戰略性儲備；10%預期將用於補充本集團的營運資金；其餘10%預期將用於其他一般企業用途。截至2026

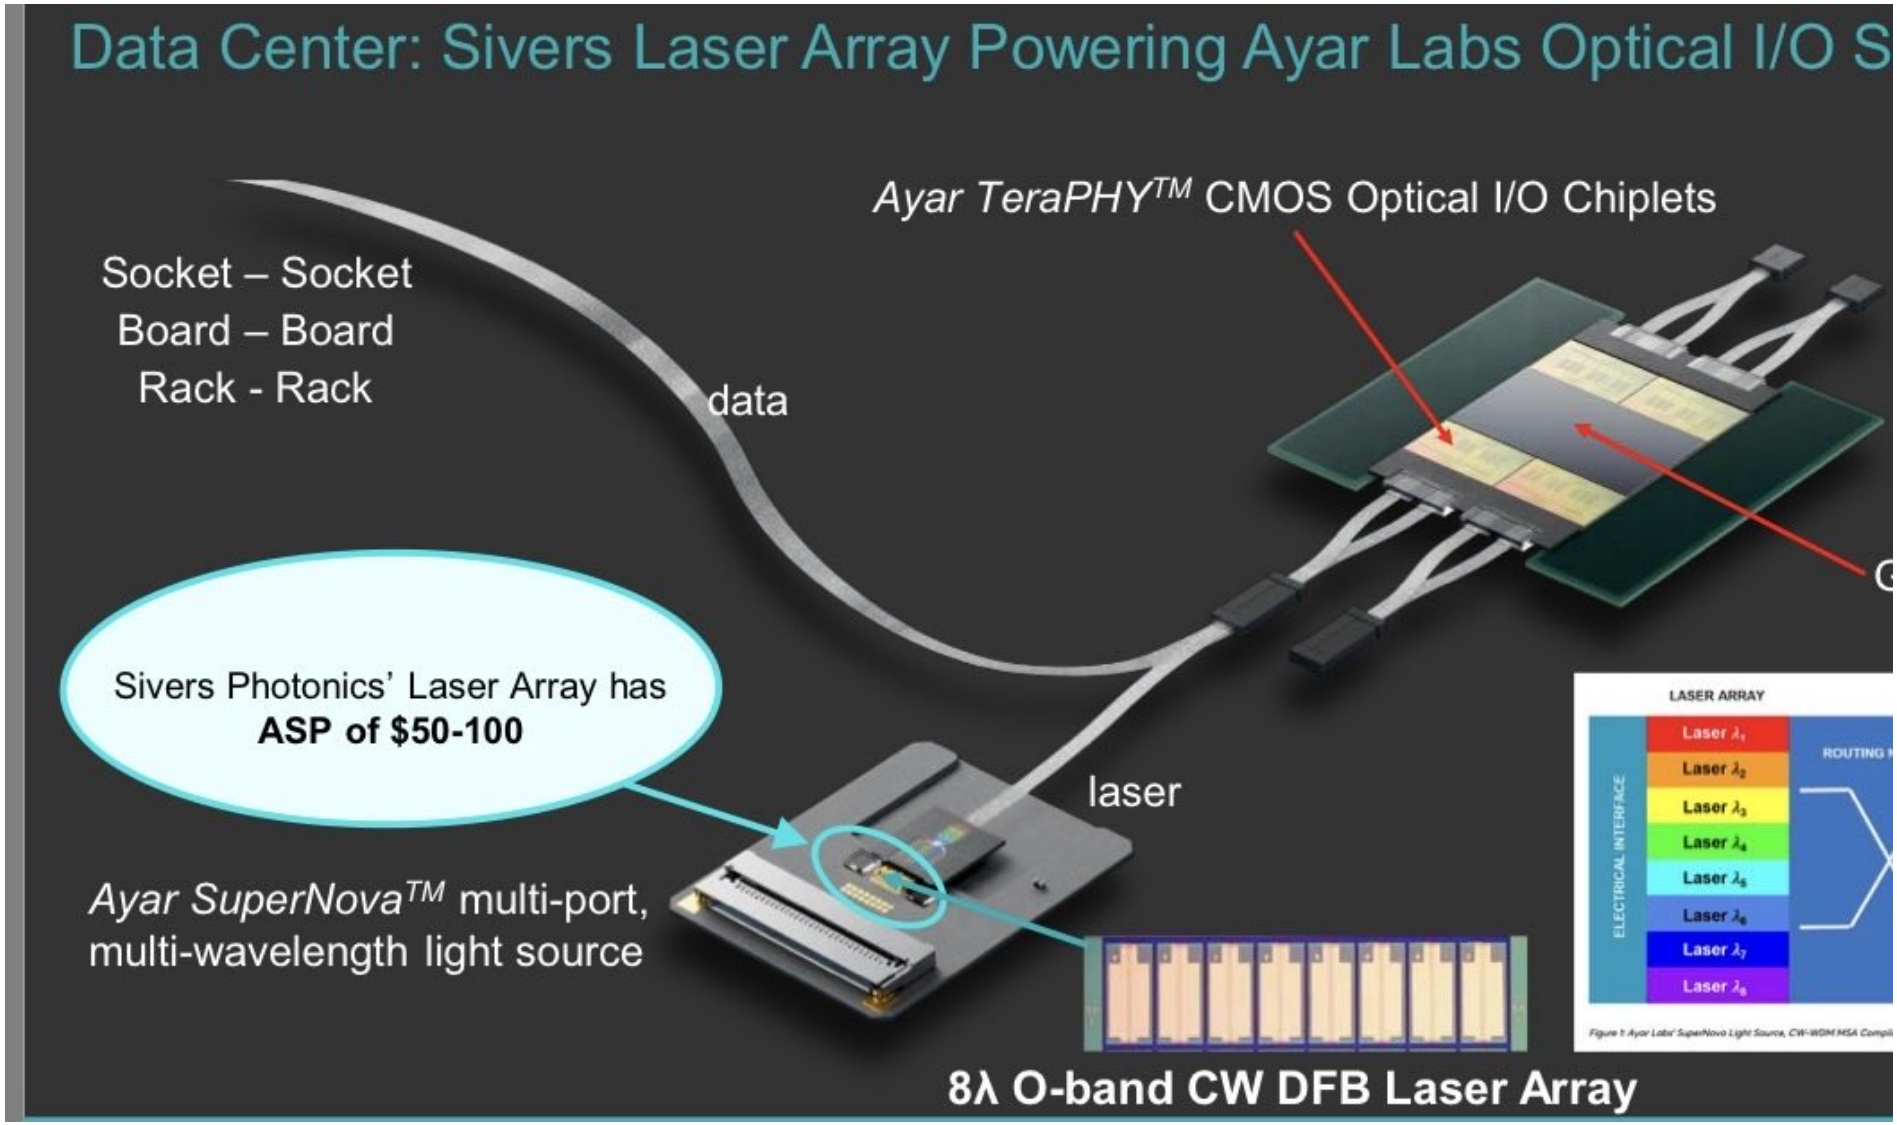

CIG Chinese interim-report evidence

Evidence	What is incorporated	Effect on the model / limits
CIG Chinese interim-report screenshot, page 92	70-200 mW CW lasers are among constrained core components; longer delivery and deposits to secure capacity	Strong demand and procurement signal. The source leaves Sivers supplier status unverified. U1
CIG English placing screenshot and June 4 exchange filing	Same shortage mechanism; 80% of approximately HK$1,966.97M net proceeds allocated to strategic component stockpiling	About HK$1,573.58M is allocated across the named component basket. Laser-only spend and any Sivers allocation remain unquantified. U2, P6
Sivers CIOE image	Booth 4C216; 70mW/100mW 1310nm CWDM4 CW DFB products	Direct power-range overlap at 70/100mW. This image alone does not show a 200mW product. U3
Sivers earnings commentary	200mW singles and 100mW arrays for NPO; higher power combinations for CPO	Completes the power-range map beyond the CIOE crop. Product suitability still depends on customer specifications. R5, P2
COHR	Serenity reports external InP availability constrained by internal transceiver demand, and prospective use of outside suppliers	Opens merchant-supply space; it does not establish that COHR buys from Sivers. R1, R7
AAOI	Serenity reports laser capacity prioritized for internal modules and external demand turned away	Supports a supply opening. AAOI's revised module model and module ASPs do not set Sivers' laser prices. R1, R7
LITE	Serenity reports CW premiums, urgent sourcing and willingness to use available qualified sources	Supports stable component pricing and stronger conversion weights, without assigning LITE's margins to Sivers. R1
MTSI	Serenity reports limited meaningful new capacity in the relevant window and urgent customer approaches	MTSI remains a potential future competitor alongside this evidence of current scarcity. R1
Innolight / other module makers	Serenity reports multi-supplier procurement and LTAs	Strengthens the multi-customer pool. No named Sivers award is inferred. R1
AMD / hyperscaler procurement and Broadcom shortage commentary	Reported by Serenity as additional downstream pressure	Included in the demand thesis, without adding a separate customer revenue line. R1, R2

The two CIG screenshots describe the same issuer and a closely related disclosure chain, providing corroboration within that chain. The English filing corroborates the substance of the supplied Chinese text. China exposure changes the demand opportunity, potential lead times and geographic sales mix; it does not by itself establish Sivers supplier status.

Serenity's conjecture that some of the six additional pluggable engagements could be Chinese is an active research hypothesis. CIG, Innolight and Eoptolink remain candidate names for supplier-identity research. CIOE attendance and product fit support that investigation; neither assigns an undisclosed vendor's identity. R1, R7

4. Hybrid manufacturing and capacity economics

Sivers Ayar array and pricing

KISTA, Sweden, Sept. 3, 2026 /PRNewswire/ -- **Sivers Semiconductors** AB (STO: SIVE) today announced a USD 30 million strategic investment to significantly expand its Indium Phosphide (InP) manufacturing facility in Glasgow, Scotland, as the company prepares for anticipated customer production ramps driven by growing AI datacenter and optical networking demand.

Upon completion, the expanded facility is expected to support annual production of more than 100 million CW DFB lasers, while adding new process capabilities, increased automation and greater manufacturing flexibility. The expansion program will begin in the second half of 2026 and is expected to become operational in the fourth quarter of 2027.

Glasgow capacity announcement

The controlling interpretation

The Glasgow statement describes **more than 100M CW DFB lasers annually** at that facility. The company-wide envelope combines the 100M internal floor with external foundry capacity. The long-term internal-to-foundry model is **1:2**. Combining those statements implies:

Internal >100M + external >200M = total >300M annual lasers, provided the ratio applies to comparable output units and a common operating date. Tom expressly adopts this interpretation, consistent with Serenity's capacity analysis. The working numerical floor is **100 + 200 = 300M**; this 300M combined envelope contains each foundry layer once. U4, R1, R2, R5; Tom's clarification

Glasgow's date is company-stated. The exact date and product mix of a >200M external allocation are inferred from the hybrid model; neither foundry's numerical split is disclosed. The second foundry is unnamed. No identity or 100M-each allocation is assigned. Management's statement that substantial partner capacity is available now is economically meaningful, but does not by itself provide a quarterly quantity schedule.

The >100M statement describes the expanded Glasgow facility's total annual capability. Existing Glasgow output is not added again on top of that figure. The numerical model moves from an external-only capacity envelope to the combined envelope, with legacy products accommodated within the separate reserve described below.

Reference pricing evidence: the historical array prices and inherited ASP assumptions are retained below. The current model policy premium is modeled separately and does not change the status of these source quotations.

Laser, array and module units

The supplied Sivers/Ayar slide identifies an **eight-wavelength CW DFB laser array** with historical **$50-100 ASP per array**. For capacity illustration only, treat eight emitters as one eight-laser equivalent array:

- $50 / 8 = **$6.25** per emitter equivalent.
- $75 / 8 = **$9.375** per emitter equivalent, the midpoint.
- $100 / 8 = **$12.50** per emitter equivalent.

Mapping a discrete 70mW laser to one-eighth of an array requires explicit pricing assumptions. Die size, yields and backend requirements also vary across announced capacity. The model makes that conversion explicit. Array assembly, testing and packaging can change realized economics. U5

Illustrative annual output	At $50/eight-laser equivalent	At $75	At $100
100M emitters / 12.5M equivalent arrays	$625M	$937.5M	$1,250M
200M emitters / 25M equivalent arrays	$1,250M	$1,875M	$2,500M
300M emitters / 37.5M equivalent arrays	$1,875M	$2,812.5M	$3,750M

These full-output pricing illustrations show three arithmetic outcomes. Recognition timing and valuation follow the operating model. Do not multiply 300M by $50-100 without the eight-laser conversion. Do not add laser sales, array sales and the downstream ELS/module sale for the same delivered light source.

Inherited capacity and loading schedule

The following **Plan-B quarterly schedule** is an analyst reconstruction. It uses the inferred 200M foundry floor ahead of the Glasgow contribution and a 300M combined floor from Q1 2028. All intermediate capacity and loading figures are analyst assumptions. Moving the external ramp later must move the revenues later.

Quarter	Annual capacity M emitters	Quarter capacity M	Scheduled loading	Pre-conversion allocation M	Expected sold M	Expected use of nameplate
Q3 2026	25	6.25	2.0%	0.12	0.10	1.6%
Q4 2026	50	12.50	6.0%	0.75	0.60	4.8%
Q1 2027	100	25.00	12.0%	3.00	2.33	9.3%
Q2 2027	150	37.50	18.0%	6.75	5.23	14.0%
Q3 2027	200	50.00	28.0%	14.00	10.64	21.3%
Q4 2027	200	50.00	36.0%	18.00	13.68	27.4%

Q3 2030	300	75.00	79.0%	59.25	41.77	55.7%
Q4 2030	300	75.00	80.0%	60.00	42.30	56.4%

Scheduled loading describes the portion offered to the modeled incremental customer cohorts after ramp planning. Customer conversion probabilities then determine expected shipments. Loading and customer conversion are separate assumptions, and no additional revenue haircut is applied. At least 20% of the

nominal envelope is left outside these cohorts for legacy output, SOA/process mix, manufacturing constraints and other capacity needs. This reserve provides a modeling buffer. Relative wafer-area demand for SOA dies and CW emitters remains unmeasured. A full mixed-product wafer and backend model remains an open engineering input.

The capacity audit covers expected DFB emitter-equivalent shipments. Yield, single/array throughput equivalence and measured SOA capacity remain separate engineering inputs. The latest company and Serenity evidence supports a materially larger supply envelope. Usable product mix, qualification and timing govern its realization.

5. Customer map and probability ledger

Commercial relationships, downstream users and revenue forecasts are different claims. The confirmed partner relationships below carry their proper status; the numerical shipment size of each remains a model input.

Route / program	Current relationship and scope	Treatment in the financial model
Jabil	Named 1.6T LRO collaboration; beta builds Q4 2026, initial orders H1 2027, production ramp H2 2027	Dedicated pluggable allocation; 85% conversion weight. Hyperscaler identities not assigned. R3, R5
Three additional alpha-stage pluggable makers	Management-reported evaluation cohort, outside Jabil	One cohort at 75%; all three engagements share the same finite capacity model. R5
Three technical/supply-assessment pluggable makers	Management-reported earlier cohort, outside Jabil	One cohort at 55%. Candidate Chinese identities remain hypotheses. R1, R5, R7
O-Net / Enablence	Documented OEM/ODM ELS relationship using Sivers laser arrays and Enablence coupling technology	Shares the ELS cohort with POET; no downstream module revenue is assigned to Sivers. P7, P8
POET	Publicly announced strategic collaboration on light engines / external light sources	Same ELS capacity pool, 80% combined conversion weight. Lumilens and hyperscaler routes form Serenity's downstream map within this same sales pool. R3, P9
Ayar Labs	Named strategic customer and documented partnership toward volume optical I/O	Dedicated array allocation from 2028, 80% weight. The historical slide shows real product fit; exclusivity and production allocation are not asserted. R3, U5, P10
GlobalFoundries SCALE	Named reference-design / platform route	Embedded in the customer allocations above. No additive GFS laser-revenue line for the same device sold to a module or engine customer. R3, P11
SemiNex	Announced approximately $3.4M initial InP light-source program; established partner	Separate finite program schedule plus a distinct probability-weighted SOA follow-on pool. P12

Route / program	Current relationship and scope	Treatment in the financial model
Strategic LiDAR customer	Disclosed lasers/amplifiers production vector, identity unnamed	Separate $109M modeled Q4 2026-2030 lifecycle stream, inside the disclosed $53-138M opportunity. Aeva is Serenity's plausible mapping. R3, R6, P13
Celestial / Marvell, Lightmatter, Lightelligence	Serenity's potential customer map from earlier disclosures	One other-optical-I/O pool from 2028 at 40%; no three-way duplication and no sole-source claim. R3, R6
Lightium / TFLN, potential Apple	Technical partnership path plus speculative consumer end-user identification	One small consumer/TFLN pool from 2028 at 25%. No guaranteed wearable launch, glucose application or named Apple order. R3, R6, P14
Wireless: ALL.SPACE, Tachyon, defense / NEMC and telecom	Existing product/NRE businesses with named order and development evidence	Separate RF hardware and Wireless NRE pools. No sum of overlapping award scopes. P1, P2, P15

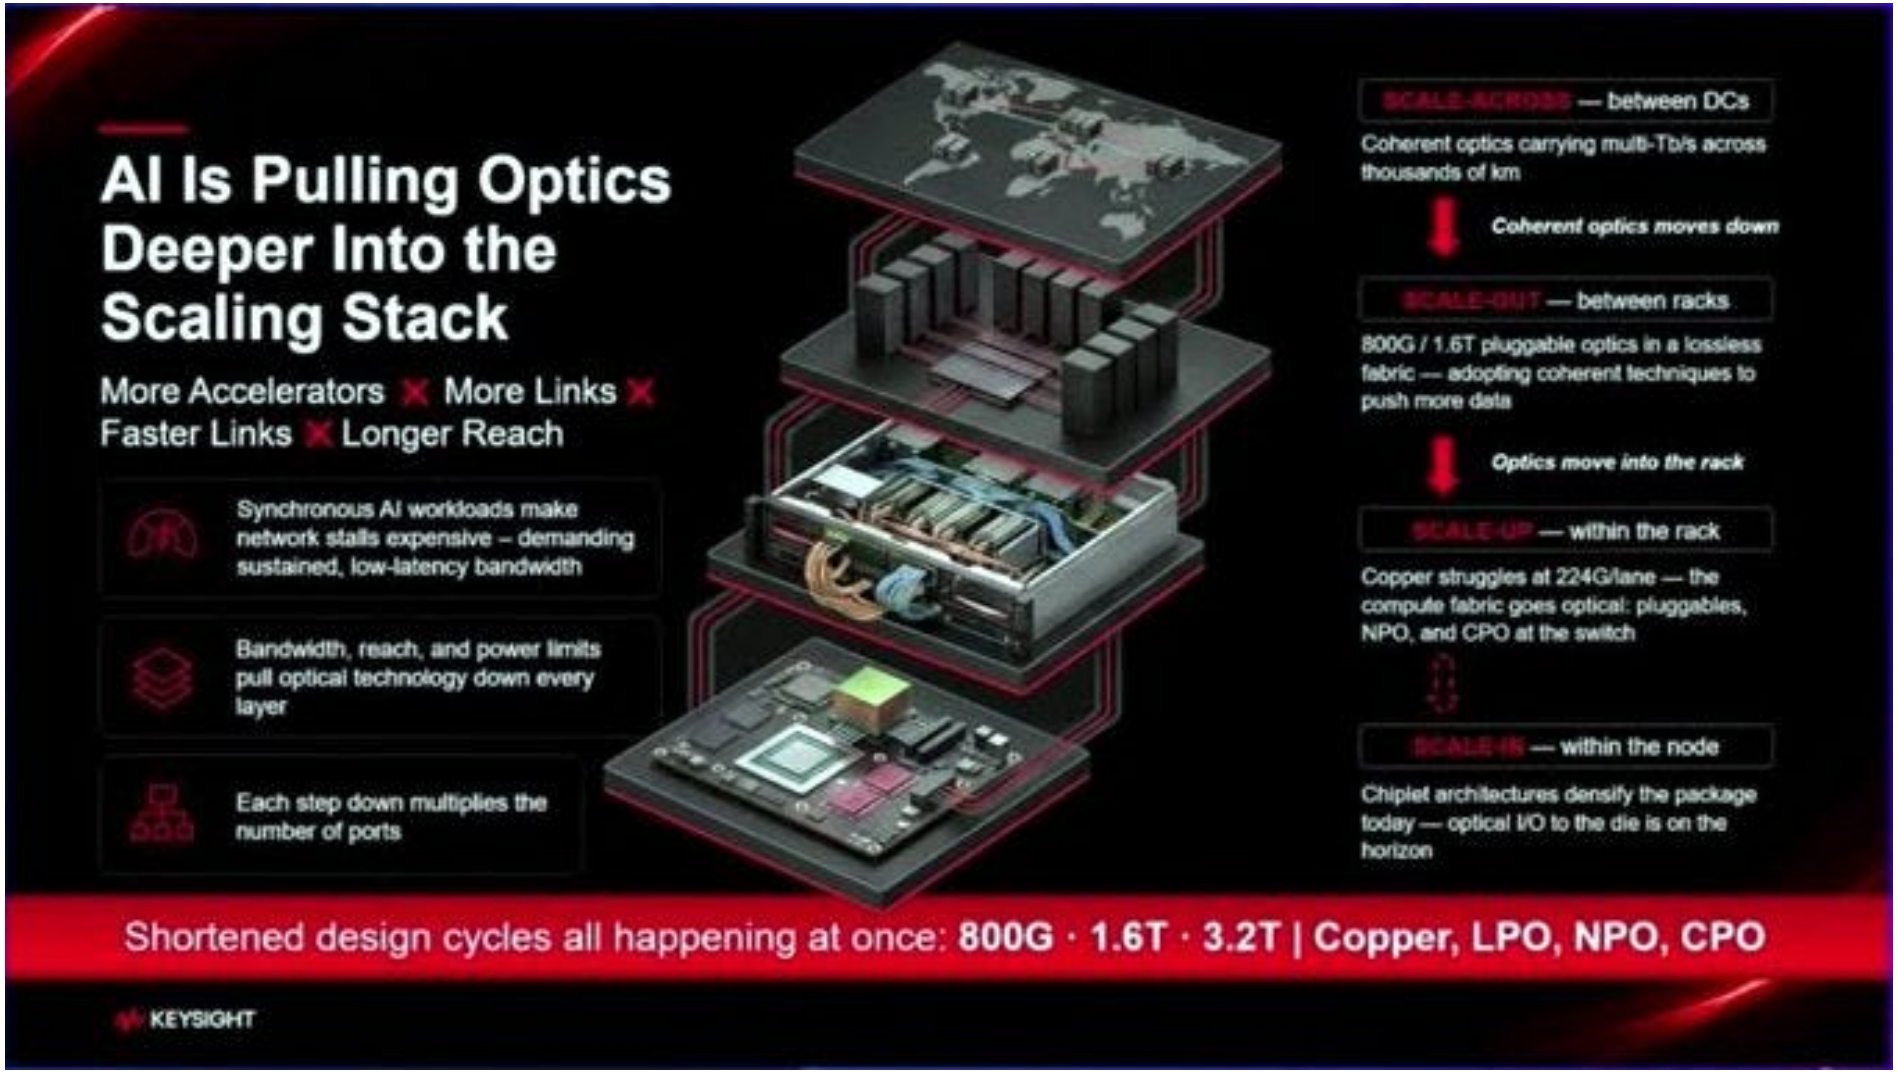

Downstream routing: AMD, NVIDIA/NVLink, Alchip and hyperscaler ASIC programs are demand exposures through the respective ecosystems. Direct Sivers supply relationships require customer-specific evidence. Aeva-related datacenter SOA activity, if ultimately tied to Sivers, belongs in the existing SOA follow-on pool unless demonstrated to be incremental. Optical-I/O products already appear in the Ayar/other-I/O allocations; a rack-content calculation cannot be added again as an unmodeled bonus.

Numerical conversion ledger

Cohort	Inherited conversion probability	Evidence rationale
Jabil	85%	Named product and management schedule; qualification/volume still ahead
Three alpha-stage pluggable makers	75%	Management-reported advanced engagement plus Serenity's shortage-based conversion thesis
Three supply-assessment makers	55%	Real engagement, earlier qualification state
O-Net / POET ELS	80%	Named partner products and routes; annual volume not disclosed
Ayar optical I/O	80%	Named customer, public hardware and manufacturing partnership; 2028 timing remains modeled
Other optical I/O	40%	Highest-ranked Serenity mapping, but identities/awards not fully established
Lightium / consumer	25%	Credible technical adjacency, speculative consumer timing and allocation
Initial SemiNex program	100% of disclosed approximate program size across assumed acceptance quarters	Does not turn its phasing into contracted quarterly guidance
Incremental SOA follow-on	50% of the conditional opportunity schedule	Separate from initial SemiNex and LiDAR revenue

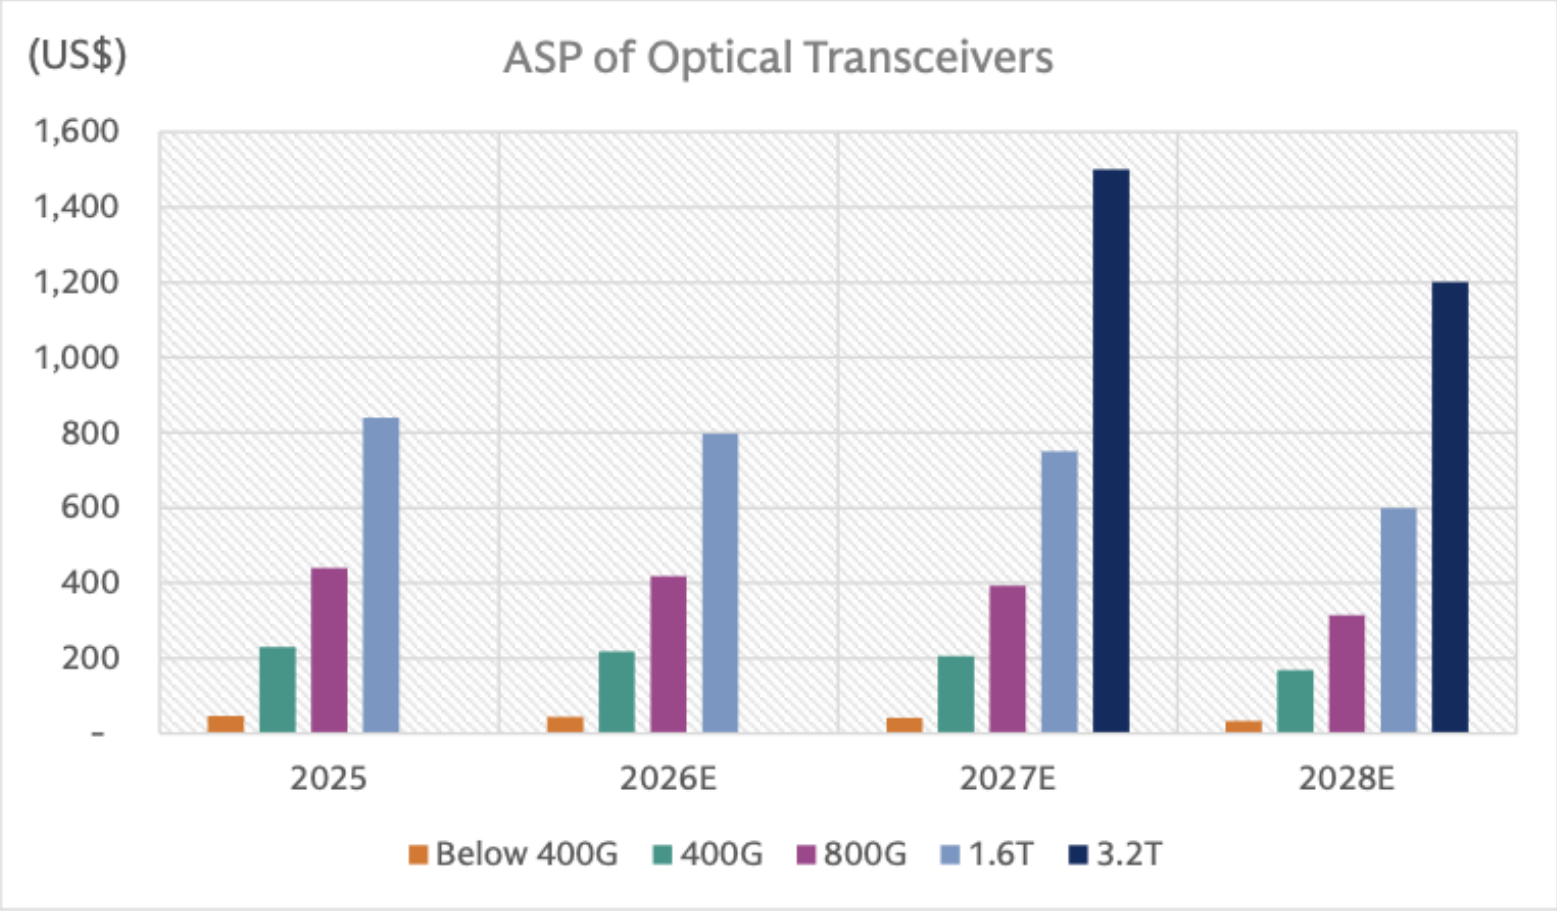

The probabilities are analyst selections under Tom's source ruling. Serenity supplies the underlying research evidence. The artifact Base score remains separate from the probability calculation. The six pluggable engagements describe demand breadth within a finite supplier opportunity.

6. Industry TAM, price and architecture checks

Public ECOC figure 3: scale-out, scale-up and scale-in architectures have different link and adoption requirements. Source: FUNDA free excerpt.

Exhibit 4: Global Optical transceivers: Assuming ASP decline YoY for like-for-like products

Source: Company data, Goldman Sachs Global Investment Research

Goldman module ASP chart

The current DB1 baseline is the September optical-market forecast reported by Serenity: global optical modules/transceivers of **$67.7B in 2026, $131.4B in 2027 and $148.5B in 2028**. The reported upward revisions are 33%, 81% and 115%, respectively. These are industry forecasts. A laser-wallet estimate requires a component-content bridge from that industry scope. R8

The same update uses two 1.6T and five 3.2T optical modules per Rubin Ultra GPU as broker model assumptions. It reports a 61% upward revision to 2027 1.6T-and-above shipments and an 80% silicon-photonics penetration estimate for the higher-speed categories. The module counts are broker assumptions. NVIDIA's production BOM and Sivers purchase commitments require separate verification. R8

Approximate GS module ASP	2026	2027	2028
800G	$420	$400	$320
1.6T	$800	$750	$600
3.2T	Not shown	$1,500	$1,200

The chart is a rounded visual reading. Missing 3.2T data for 2026 do not establish zero shipments. Module pricing can decline while a scarce CW laser retains pricing power. This model therefore does not impose AAOI's finished-module ASP reductions on Sivers' component prices. It uses the supplied array-price evidence and explicitly assumed product mapping. U6, R1

Serenity reports CPO shipment revisions of **-33% for 2026, +35% for 2027 and +105% for 2028**. The direction supports pluggables/NPO first and a larger later CPO opportunity. Those percentages compare revised forecasts with their prior vintages. Their application to Sivers follows the cohort-specific revenue model. R9

There is one current module-market baseline here. No separate legacy CPO-dollar estimate is added to it. CPO, optical engines, ELS, lasers, substrates and foundry services occupy overlapping parts of the same value chain. The exact market inclusion boundaries and a current standalone laser TAM are not established by the supplied GS excerpts.

The Q2 call also identifies an approximately **$4B SOA serviceable opportunity in optical circuit switches**. It is a management market estimate with unresolved realization timing. The $4B opportunity provides a plausibility check for the small SOA follow-on capture model. P2

Optical-I/O content and the rack-level opportunity

The supplied Ayar slide demonstrates the external-laser-array role in TeraPHY/SuperNova systems and socket, board and rack links. Serenity maps Ayar to AMD, Alchip, hyperscaler ASICs and NVIDIA's NVLink ecosystem. This strengthens the optical-I/O route and its 2028 research horizon. The model values the Ayar allocation using explicit conversion probabilities before production disclosure. U5, R3, R6

Maximum light-source counts describe specific reference racks. Production BOMs depend on the selected architecture. Assemblies, arrays, emitters and optical lanes are separate units. More bandwidth per rack need not translate linearly to more Sivers dies because optical power, laser sharing, loss budgets and architecture differ. No separate rack-multiplier revenue is added to the already modeled optical-I/O cohorts.

Inherited reference ASP path. The discrete-laser ASP is an explicit $6.25 proxy, anchored to the low end of the supplied $50-100 array range divided by eight. A disclosed discrete-laser selling price remains an open input. The array ASP uses the $75 midpoint. Both are held through 2028 under Serenity's

component-shortage interpretation, then reduced 5% in 2029 and another 5% in 2030. The current model adds only the explicitly probability-weighted policy premium described above to this reference ASP path. **Inherited allocation interpretation.** These allocation shares total 100% of the scheduled incremental pool; 100% of company revenue or industry TAM describes a separate denominator. They represent a diversified analyst allocation across Serenity's identified routes. No numerical customer allocation was disclosed in the supplied posts. The H2 2026 ELS amount models qualification and early shipments. Hyperscale CPO launch timing remains unverified.

The three-point risk adjustment is fully allocated across the three scored classes. The detailed risks below explain those deductions. No share-price performance or analyst target contributes to the score.

R1: Conversion and economics

The six engagements carry individual qualification and production-conversion risk. Additional customers may qualify rapidly in a shortage, as Serenity argues, but test, reliability, power and platform requirements still determine timing. The inferred 200M external capacity and intermediate annual ramp schedule are not numerical foundry disclosures. A nominal emitter count does not prove an array yield or SOA output figure. Substrates, epitaxy and backend capacity remain dependencies even if management sees no near-term wafer-capacity bottleneck.

The model requires business beyond the currently quantified opportunity register and assumes strong product margins. Some forecast revenues can fail to materialize without disproving the general optical shortage. Foundry pricing, labor, yield loss, discounts or a slower NRE transition can absorb the expected profit.

R2: Capital, governance and execution choices

Serenity argues for faster U.S. listing execution, clearer communication of the economics of capacity/customer engagements and consideration of downstream acquisitions. Those views are part of this artifact's capital-allocation assessment. The criticism is that management could remain a component supplier while customers acquire more of the optical-engine/module wallet. It is not evidence that an acquisition has been agreed or that a particular private company is purchasable.

The $30M Glasgow program also improves control, proprietary process capability and long-term supply resilience. Its economic merits depend on throughput, utilization, return on invested capital and forgone alternatives. The model remains an organic component business. It adds no Cloud Light-, Celestial-, Ayar- or Lumilens-style acquisition revenue, no M&A multiple and no assumed acquisition financing. Serenity's examples and rhetoric describe strategic proposals whose transaction terms remain open. R4

Serenity's stated $5.5B valuation for Lumilens over roughly two years serves as a strategic analogy. Sivers valuation uses the operating-profit model; the transaction price behind the analogy remains independently unverified. Serenity also cites Morgan Stanley identifying Sivers alongside Lumentum and Coherent as CPO laser participants. That recognition supports the ecosystem map; it supplies neither a new customer award nor a separate revenue forecast. R3, R4

The latest reporting includes revenue-recognition/accounting corrections, significant adjustments and listing-readiness work. Those deserve review alongside growth evidence. They are not resolved merely by raising equity. No future dual-listing date is guaranteed and no blanket geographic valuation discount is applied.

R3: Competition and architecture

The merchant opening can narrow if COHR, LITE, AAOI, MTSI or Asian suppliers add qualified external supply, or if customers internalize more laser production. Multi-sourcing may accelerate Sivers' entry during scarcity while limiting its mature pricing power. Technical qualification creates switching friction. Customers can continue qualifying alternative suppliers.

VCSEL-based approaches, alternative light-source architectures and increased laser sharing can contest parts of short-reach scale-up optics. SOA-based systems can add a product opportunity while changing the number and power of seed lasers. No product family is declared universally immune. The watch focuses on design-specific production adoption, optical power and supplier allocation. A new architecture or executive hire becomes relevant through those operating mechanisms.

12. Catalysts, counters and pre-registered model actions

Trigger / timing	Positive evidence	Counter	Model action
Q3 report, scheduled November 26, 2026	Product orders/shipments, improving hardware mix and cash visibility	NRE weakness without product conversion or elevated recurring costs	Record Q3 actuals separately; retain its historical forecast and revise current/future costs and ramp
Q4 2026 Jabil beta/customer testing	Qualification progress on schedule	Beta or reliability delays	Shift Jabil shipment allocation and rolling windows by the documented delay
H1 2027 Jabil initial orders	Accepted order with delivery schedule	No orders or smaller allocation	Jabil weight 85%→95% with orders/acceptance evidence; reduce and delay if milestones fail
Additional alpha cohort	Named qualification/order	Failed qualification or lost design	75%→85% for the affected portion; do not uplift all three automatically
Assessment cohort	Customer sampling and accepted evaluation	Assessment stalls or wrong product fit	55%→65% on sampling, then 80% on qualification/order; timing follows evidence
ELS and Ayar programs, 2027-2028	Customer-qualified module/engine production and identified Sivers content	Architecture redesign, supplier substitution or delays	ELS/Ayar 80%→90-95% for the supported share; reallocate only within the finite pool
Other I/O and consumer	Named Sivers linkage, credible production timing	Mapping contradicted	Other I/O 40%→60% on named linkage; consumer 25%→45%, then higher on award. Remove disproven portions
Glasgow Q4 2027	Commissioned qualified output and matched backend	Completion delayed, capex rises, lower yield	Shift the added 100M floor; update depreciation, capex and unit schedules together
External foundry disclosure	>200M-equivalent allocation, product mix and availability date substantiated	Smaller allocation, costly contracts or qualification limits	Replace the inferred numerical capacity schedule with disclosed values; do not stack it on the existing 200M
Pricing / prepayments	Pricing evidence that raises or lowers the already modeled policy-premium probability, LTA or customer prepayment	Component ASP cuts or demand normalization	Revise actual ASP/margin and analytical score once; CIG's deposits to unnamed suppliers do not count as Sivers cash
Pipeline replenishment	New quantified programs / repeat production beyond current register	Calendar roll with little new business or poor conversion	Test the explicit cumulative revenue gap; revise long-horizon loading downward if unsupported

Trigger / timing	Positive evidence	Counter	Model action
P11 approvedOctober 22; grants expected afterQ3report	Actual grant counts/VWAP and employee allocation	Changed terms, incomplete allocation or staggered grants	Keep approval100%; replace grant value and service dates; reconcile expense and delivery together
U.S. listing / M&A	Readiness, formal transaction and terms	Conditional progress without execution, dilutive low-return deal	Update only known timing, financing and economic scope. Do not invent acquired revenue

Source independence matters: Serenity quoting a company call and the transcript of that call belong to one underlying disclosure. A named customer order, later recognized revenue and a foundry output update are distinct evidence milestones.

13. Cross-book implications and research coverage

Paired watch	Relevant read-through	Boundary
SIVE ↔ LITE / COHR / AAOI / MTSI	Merchant availability, CW power-specific pricing and competitor capacity	Internal allocation can help Sivers, but does not prove a purchase from Sivers
SIVE ↔ WIN Semi	InP front-end output, allocation and qualification	The unnamed second foundry is not assigned to WIN; no double counting of the 200M external floor
SIVE ↔ GFS / TSEM / SOI	SiPh adoption, laser/PIC integration and substrate demand	PIC wafer revenue and Sivers laser revenue are different layers of overlapping systems
SIVE ↔ POET / PCL / FOCI / ShunSin / ASE	ELS, engines, coupling and packaging readiness	Count Sivers component content once within the packaged module's full ASP
SIVE ↔ MRVL / AVGO / NVDA / AMD	Customer architecture and deployment timing	End-customer exposure does not itself establish a direct supply award
SIVE ↔ CIG / Innolight / Eoptolink	Shortage, prepayment and qualification evidence	Candidate customer identities remain unassigned
SIVE ↔ Aeva / SemiNex	SOA and LiDAR product convergence	Preserve the existing LiDAR stream; add datacenter content only when distinct
SIVE ↔ ALL.SPACE / Tachyon / defense programs	Production acceptance and RF repeat business	Funding announcements, NRE and hardware deliveries are not interchangeable revenue

Rule 19 input treatment: the supplied information raises confidence in manufacturing access and customer conversion, changes capacity and timing assumptions, and expands the research map for the unnamed foundry and six pluggable vendors. New-screen candidates are the unidentified foundry, qualified merchant-laser alternatives and independent optical-engine assets. No score or valuation is assigned to a new ticker without its own model. **Inherited**

integration history: These cross-watches identify developments to monitor. This update's authority covers Sivers and its linked portfolio results. The Sivers workbook integration preserves the AAOI, SKHY, 000660 and all other company models; only Sivers and its linked portfolio results are refreshed.

14. Source register and supplied-image record

Highest-weight source: Serenity, supplied by Tom

- **R1 - September 8:** merchant CW shortage, CIG procurement, integrated suppliers and CIOE. Includes the possible Chinese identity of some pluggable engagements as speculation.
- **R2 - September 3:** Glasgow capacity and eight-laser-array revenue illustration. The illustrative $625M-$1.25B annual scale is not management guidance.
- **R3 - August 30:** full partner and 2027-2028 route map. Includes confirmed relationships, inferred end customers, possible optical-I/O customers and consumer optionality.
- **R4 - August 29:** capital allocation, U.S. listing, communication and downstream M&A criticism. Strategic opinions are recorded as opinions.
- **R5 - supplied earnings-transcript recap:** six non-Jabil pluggable engagements, available second-foundry allocation, Jabil timing and the 1:2 hybrid model. No exact post permalink supplied; its text is the source. Related management content was checked in P2.
- **R6 - August 27:** ecosystem and qualification breadth.
- **R7 - August 28:** merchant supply withdrawal, multi-sourcing and qualification-to-order interpretation.
- **R8 - September 8, earlier in this chat:** updated GS module TAM, Rubin Ultra assumptions and 1.6T+ forecast revision.
- **R9 - September 8, earlier in this chat:** ASP context and CPO shipment revisions.

The user-provided post text and images were read directly; live X access is not claimed. Repeated recaps from the same researcher remain one research stream. Tom's explicit internal-plus-external capacity clarification is controlling for the interpretation used here.

Company, partner and filing evidence

- **P1:** Sivers Q2 2026 interim report, August 27, financial tables, segment/revenue-type notes, capital events and reporting calendar. The Swedish and English release totals were checked.
- **P2:** Sivers Q2 2026 management call, August 27, transcript. Management statements only; no analyst target used. The transcript is hosted by a third party and numerical transcription ambiguities are resolved against filings where possible.
- **P3:** August 31 share and vote filing, Swedish original.
- **P4:** September 3 Glasgow investment and >100M annual laser target.
- **P5:** Company reporting calendar.
- **P6:** CIG June 4, 2026 placing-completion filing, page 2. The English screenshot corresponds to this disclosure; the Chinese interim screenshot is U1.
- **P7:** Sivers-O-Net strategic OEM relationship.

- **P8:** Sivers, O-Net and Enablence ELS architecture.
- **P9:** POET's own September 29, 2025 collaboration announcement, and Sivers' November 6, 2025 detail.
- **P10:** Sivers/Ayar partnership and strategic customer disclosure, December 19, 2024. A planned pre-purchase is not evidence of a newly received deposit this quarter.
- **P11:** Sivers Q2 company release, including GFS collaboration.
- **P12:** SemiNex initial $3.4M program, August 13, 2026.
- **P13:** Strategic LiDAR production opportunity, also carried in the supplied artifact and reaffirmed in the Q2 timing discussion.
- **P14:** 2025 annual report, Lightium technical relationship; consumer identity comes from R3/R6.
- **P15:** Q2 report/order discussion in P1/P2. Initial ALL.SPACE and Tachyon order totals are not new additions to the RF schedule.
- **P16:** Sivers Q1 2026 management call, May 29, product-margin aspiration, pipeline conversion method and qualification/cost context. Older quarter forecasts do not supersede Q2 reporting.
- **P11-A - September 29, 2026:** Issuer notice for the October 22 EGM. Number of shares/votes; proposed P11; distribution, expense and linked Series C resolutions. Original local retrieval lines49-50,65-110,125-150 in the October2 earnings packet. The 7.28M option pool and supporting Series C authorization are not additive; no grant or option fair value is established by this notice.
- **R11 - October 2, 2026:** Serenity's Lumentum shortage post, citing the September24 Optica CEO video. Attributed 70% undersupply/30% of requested demand; precise product scope and long-range context remain unresolved. One source chain; supports existing Sivers cohorts without a second revenue addition.

Supplied images - included with this artifact

U1 - Chinese CIG interim-report crop, page 92. Meaning: rapidly growing AI-related optical demand has produced shortages in high-speed DSPs, silicon-photonics chipsets and 70-200mW CW devices; delivery periods lengthen and deposits/prepayments secure capacity. Translation summarizes the visible passage. The full report requires separate translation.

U2 - English CIG placing crop. Same issuer's procurement/stockpiling evidence within the existing disclosure chain. Sivers contract status remains unverified.

U3 - CIOE exhibit crop. 70mW/100mW, 1310nm, CWDM4 CW DFB laser products, booth 4C216. The visible crop does not establish 200mW production status.

U4 - Glasgow announcement crop. USD 30M investment, more than 100M annual CW DFB lasers, Q4 2027 operational target. External capacity follows the separately stated 1:2 hybrid interpretation.

U5 - Sivers/Ayar product slide. Historical $50-100 per eight-wavelength array and its place in the external-light-source architecture. Its date is not visible in the supplied crop; current contracted ASPs are not established by it.

U6 - GS Exhibit 4 supplied earlier in this chat. Approximate module ASP evidence; source scope and component-price distinction are set out in section 6.

The current PDF embeds all retained source images, the historical foundry exhibit, and the current model charts. It opens without separate image files. Numerical chart readings, modeled probabilities and derived capacity implications are labeled in the main text.

Revisit probabilities and operating inputs as evidence changes. A quantified breadcrumb can support valuation before official confirmation; source uncertainty remains explicit.

P11 compensation and treasury: current economic treatment

Shareholders approved P11 on October 22, 2026. The maximum 7.28M options cover employees in the United States, Scotland, Sweden, India and China. Each option can deliver one ordinary share. The exercise price is 110% of the five-day pre-grant VWAP. Vesting occurs on the third grant anniversary subject to continued service and the documented good-leaver provisions. Exercise runs from years 3 to 6. The linked C-share authorization supports delivery and social charges for the existing incentive programs. The employee award pool and its settlement shares are counted once. P11-F

Approval now carries 100% probability. Actual grants, country allocations and grant-date fair value remain open. The existing assumed November 27, 2026 grant follows the scheduled November 26 Q3 report. Expense accrues over 1,096 actual days to November 27, 2029. Actual staggered grants will replace this one-cohort schedule when disclosed.

Probability / economic control	Active assumption	Basis
Adoption	100%	Approved October 22; replaces the 75% pre-vote estimate
Conditional grant utilization	90%	Model allowance for incomplete allocation and later hiring
Expected service retention	90%	Model fraction ultimately vesting after service losses
Expected P11 awards	5.896800M	7.28M x 100% x 90% x 90%
Expected older award delivery	90% of 15.929025M	Retained allowance for forfeiture, performance and expiry
Incremental P11 overlap	0%	Existing staffing build already retains legacy compensation

The approval revision adds 1.4742M expected P11 awards to the prior 4.4226M estimate. Expense changes begin in the current quarter. The retained vesting convention adds expected delivered shares from Q4 2029. The commercial conversion probabilities and Base scores remain unchanged.

Grant value, social cost and accounting distinction

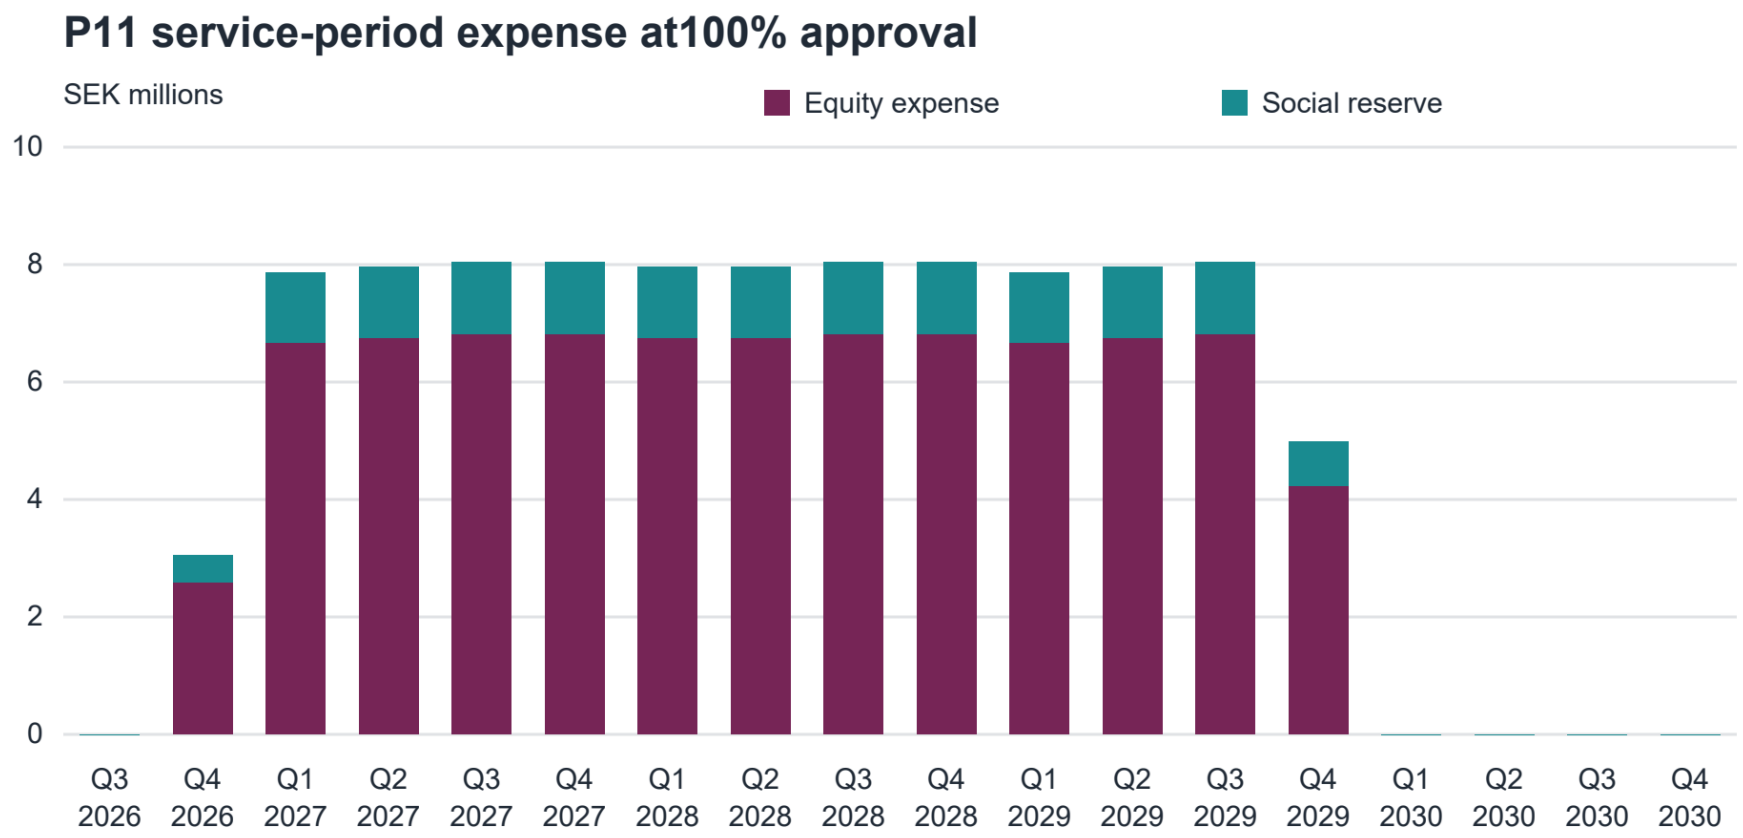

Use Black-Scholes with share price SEK 34.50, strike SEK 37.95, volatility 53%, expected term four years, risk-free 1.99% and zero dividends. The share price is the October 5 completed close from S&P data displayed by StockAnalysis; the Master benchmark remains 40.40. The volatility, term and rate use issuer prior-grant inputs. Actual P11 grant-date fair value awaits the allotment terms. Actual future five-day VWAP and grants are unknown. P11-B, P11-C

Option value is **SEK 13.772719**, giving **SEK 81.214972M** weighted equity expense. Add an **18% social-cost reserve, SEK 14.618695M**, for total **SEK 95.833667M**. The 18% proxy is rounded from group payroll contributions/payroll of 22.509/127.194. Actual option-related statutory rates depend on employee geography. Country allocation is undisclosed. The stress range is 5%-31.42%, with the upper endpoint anchored to the full Swedish employer rate.

Employee-country allocations determine the relevant charges. P11-D

Equity compensation is noncash and uses grant-date value; actual social provisions are remeasured to reporting-date option fair value. The forecast holds a bounded social reserve. Actual reporting-date option values will determine remeasurement. Q2's SEK 50.3M option-related adjustment includes 42.9M social remeasurement and must not be annualized as recurring equity SBC. Its 7.4M residual differs from the 5.1M cash-flow equity-SBC addback; the 2.3M scope/timing difference is unresolved and not used to value P11. [P 1]

Add only P11 to SG&A. Generic fixed and revenue-linked staffing costs remain, with no second addition of old award costs. Functional allocation could later move expense between R&D and SG&A; consolidated OP is unchanged. This P11 cohort completes its modeled service period in 2029. Future grants would require a separate compensation schedule.

Modeled P11 equity compensation and social-cost reserve during the three-year service period; analyst estimates with retained grant and service assumptions.

Quarter	Equity cost SEK M	Social cost SEK M	Total cost USD M	OP change USD M
Q3 2026	0.000000	0.000000	0.000000	-0.000000

Shares and treasury counted once

The notice's 356.740332M gross ordinary shares include 12.872916M treasury; actual non-treasury basic shares are 343.867416M. Retain gross ordinary as the economic floor, then add **MAX(0,15.929025M ×90% -12.872916M) =1.4632065M** of uncovered legacy awards. The active divisor is therefore **358.2035385M**, rising to **364.1003385M** at the modeled P11 vesting inQ4 2029. Older awards are reserved economically now; this does not invent their exact legal delivery dates. Prior P10 has annual one-third vesting, unlike P11's full cliff. P11-E

New C shares are subscribed and repurchased at the same SEK 0.50 quota before fees. C issuance itself does not constitute ordinary employee delivery or ordinary basic-EPS dilution. Any conversion must be reconciled to this same reserve; do not add C shares plus the same option delivery. Full maximum older-plus-P11 delivery would imply 367.076441M non-treasury ordinary shares and leave 3.056109M awards beyond existing treasury plus the authorized C pool, before tax hedges. That endpoint needs forfeitures, purchases, further authorization or another settlement route.

June-to-September treasury declined 2.556969M; exact employee-delivery versus tax-hedge allocation is undisclosed. FY 2025 Note 26 also differs by 30,000 between cohort and aggregate totals; the later 15.929025M September count controls. These gaps limit a legal cohort reconciliation but do not prevent a bounded economic reserve.

Central social settlement is cash-funded, provisionally in Q4 2030 at a four-year exercise assumption. No tax-hedge shares are additionally assumed. Static future exercise-price cases use observed SEK 34.50 only: social cash is zero below strike,14.647651M at SEK 51.75 and 32.957215M at SEK 69. These diagnostics use observed 34.50 SEK and the stated price sensitivities. Share-funded tax payment would replace cash financing and add the corresponding shares once; actual reporting-date provision remeasurement can differ.

Target-quarter span	Economic shares M	Treatment
Q3 2026-Q3 2029	358.2035385	Gross ordinary floor plus net legacy reserve
Q4 2029-Q4 2030	364.1003385	Adds 5.896800M expected vested P11 shares

Bounds and revision triggers

The selected option value remains SEK 13.772719 using the retained grant-price proxy 34.50, strike 37.95, volatility 53%, four-year expected term and 1.99% risk-free rate. Approval is fixed at 100% in current diagnostics. Remaining economic uncertainty concerns actual allotment, grant-date VWAP, employee geography, service losses, social provisions and settlement timing. The prior pre-vote diagnostics remain in the preserved October 10 edition.

Reserving all 5.8968M expected P11 awards economically from grant would give a Q4 2027 diagnostic target of SEK 198.197465, at the same compensation expense. The active convention adds delivered shares at the modeled vesting date. Actual share-funded social settlement would require a matched cash/share revision once.

Replace the November 27 proxy after actual grants and update expense, treasury delivery, social provision and cash settlement together. The next scheduled company report is November 26. Published Q3 2026 and earlier forecasts retain their original values and information vintage.

October 2 shortage read-through: support for existing customer cohorts

Serenity's October 2 post, citing an Optica September 24 CEO video, attributes a **70% undersupply / 30% of requested demand** observation to Lumentum. The exact product denominator and the surrounding 2029-30 supply-balance context remain unresolved in this source chain. The observation concerns attributed Lumentum supply. Sivers retains its own 85%/75%/55% customer-conversion assumptions and existing shipment allocations. [R11]

The signal supports the existing merchant-laser opportunity, the **75% alpha-customer conversion weight**, **55% supply-assessment conversion weight**, and the existing **40% FCC policy scenario**. It does not add a customer cohort, qualified capacity or a second copy of scarcity revenue. Existing qualified-unit, ASP

and cost assumptions remain the active inputs. A claim of market undersupply alone cannot identify Sivers' additional accepted volumes or price capture. The policy premise remains prospective, with source and eligibility limitations already documented in this artifact.

Complete current operating model

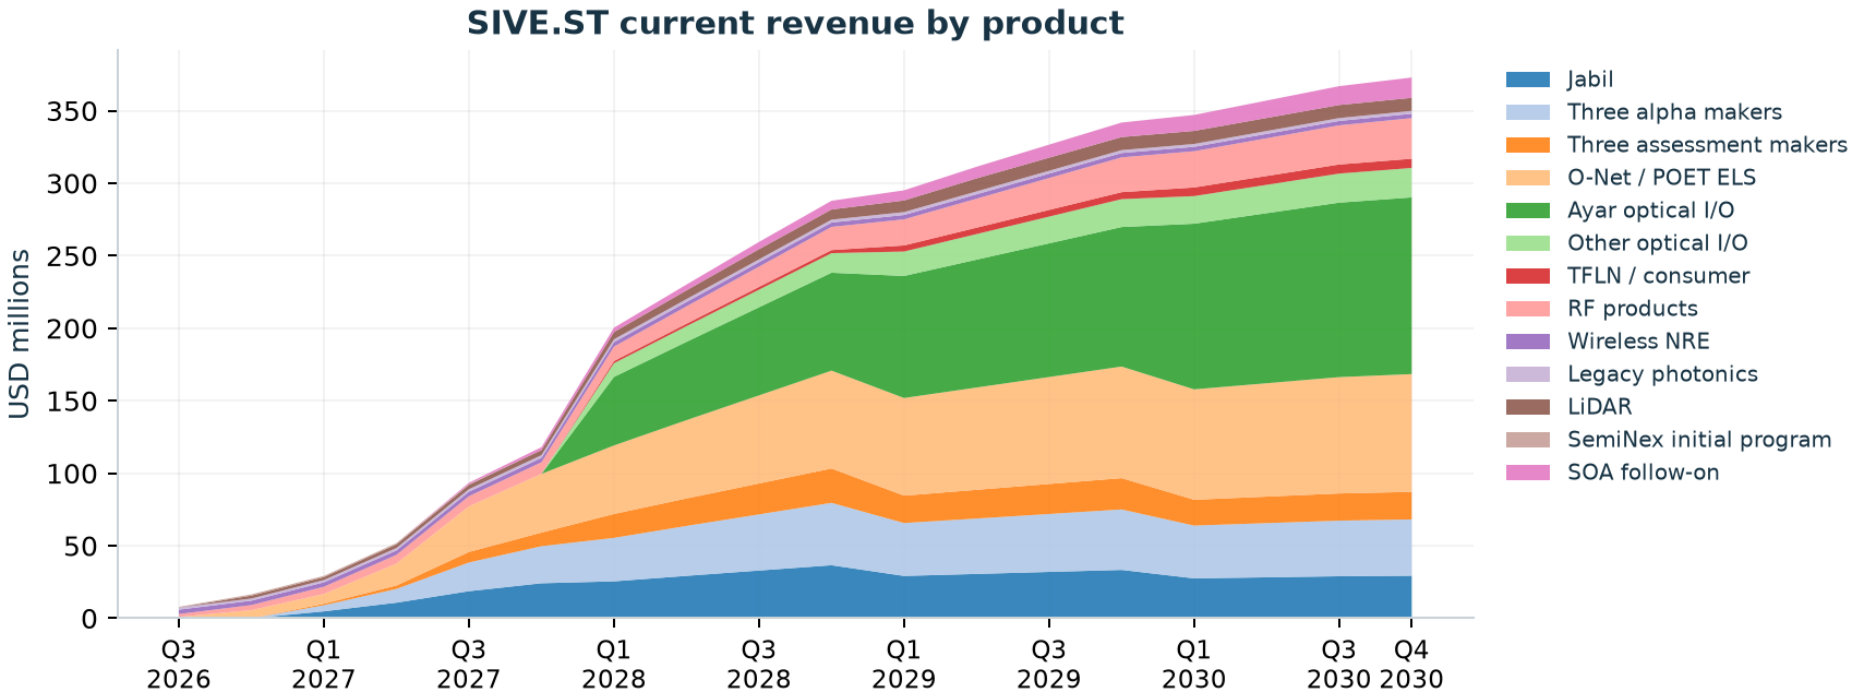

Figure 4. Current quarterly revenue by product, USD millions. All inherited Sivers product vectors and the weighted policy premium are retained.

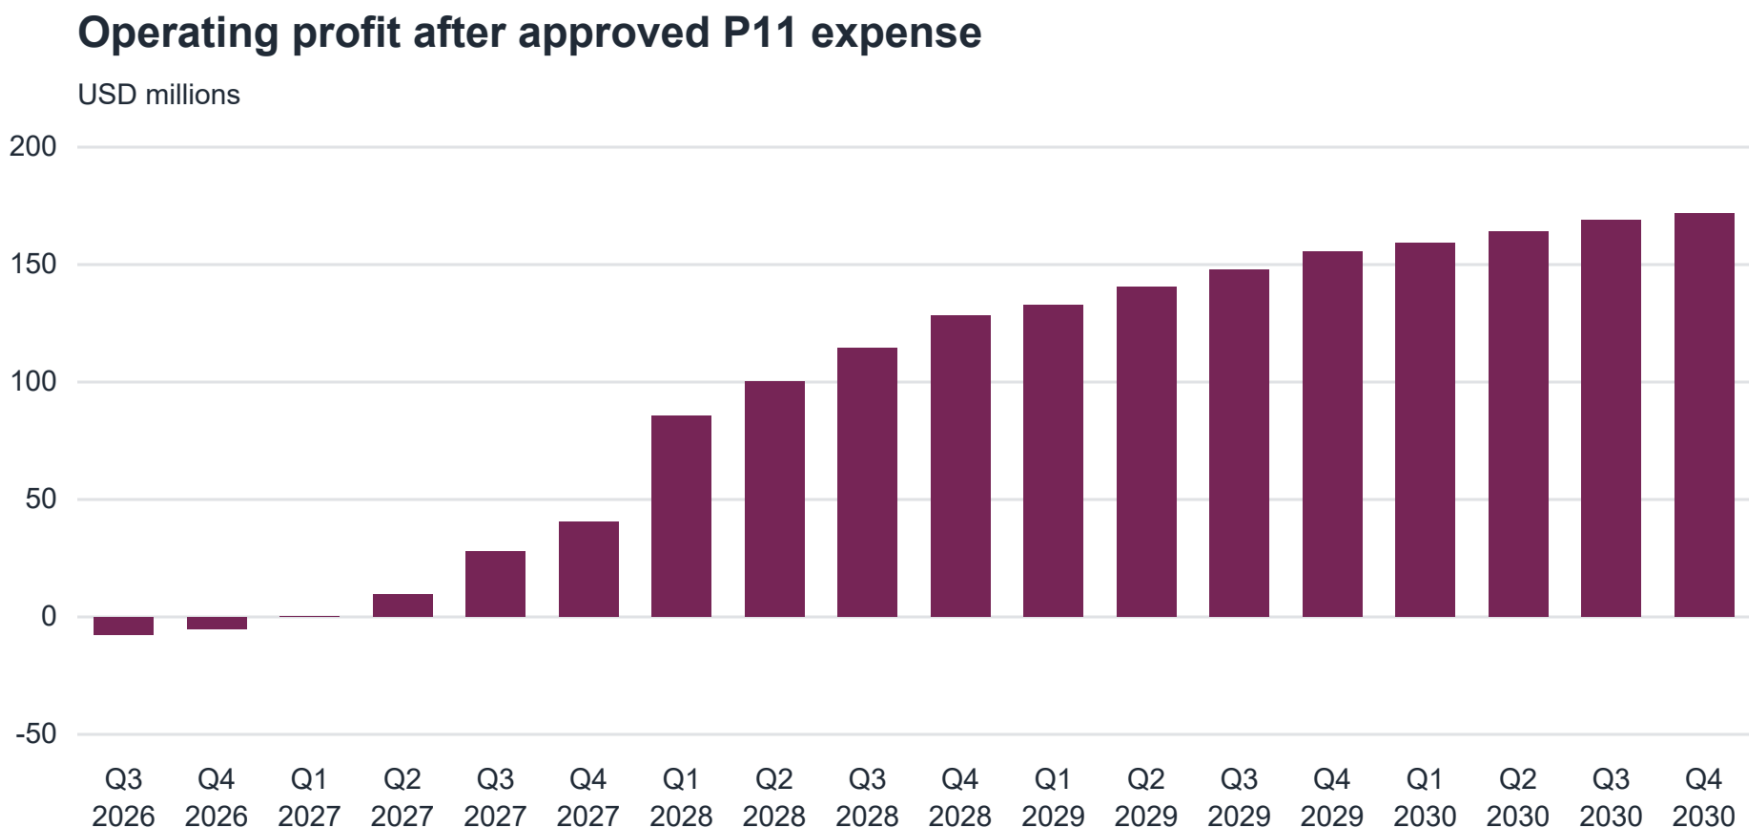

Figure 5. Current consolidated operating profit after P11 expense, USD millions. The underlying revenue and gross-profit schedules are retained; margins are shown in the table.

Operating expenses include R&D, SG&A and retained other amortization of USD 1M per quarter. Operating profit equals gross profit less those operating expenses. Glasgow manufacturing depreciation is already included in gross profit.

Every revenue vector and product margin

Product GP = product revenue x the displayed modeled margin. Consolidated gross profit adds the unchanged source-model adjustment where applicable (including Sivers Glasgow depreciation). Product allocations and future margins remain LOW-confidence model assumptions unless specifically identified as historical or guided.

Full price target derivation

Valuation OP equals consolidated operating profit after P11 expense. For every price target, sum that quarter and its next three quarters, multiply by 20 and by SEK 10.6/USD, then divide by the target quarter-end economic-share proxy above. The proxy preserves the gross ordinary floor and counts each option/treasury pool once. No stock-price-dependent upside or ranking appears in this artifact.

Price target quarter / window	F4Q valuation OP	Multiple	Economic shares M	SEK/USD	Price target
Q3 2026 to Q2 2027	-2.936370	20x	358.2035385	10.600000	neg
Q4 2026 to Q3 2027	31.998087	20x	358.2035385	10.600000	18.937821
Q1 2027 to Q4 2027	77.618456	20x	358.2035385	10.600000	45.937884
Q2 2027 to Q1 2028	163.098910	20x	358.2035385	10.600000	96.528831

Q3 2028 to Q2 2029	515.621520	20x	358.2035385	10.600000	305.166618
Q4 2028 to Q3 2029	548.884375	20x	358.2035385	10.600000	324.852982
Q1 2029 to Q4 2029	575.908910	20x	358.2035385	10.600000	340.847244
Q2 2029 to Q1 2030	602.440899	20x	358.2035385	10.600000	356.549997
Q3 2029 to Q2 2030	626.044894	20x	358.2035385	10.600000	370.519840
Q4 2029 to Q3 2030	647.120895	20x	364.1003385	10.600000	376.790723
Q1 2030 to Q4 2030	663.365553	20x	364.1003385	10.600000	386.249290

Q4 2027 worked example: (40.339154 + 85.502731 + 100.127715 + 114.425513) x20 x10.6 /358.2035385 = **201.460221 SEK/share**. Full-precision forward-four-quarter operating profit is USD 340.395113343635M. The Q3 2026 row preserves its published negative ceiling and as-then forward-profit value; later expense revisions flow through the current and future quarters.

Annual cross-check

Calendar-year sums below include only the quarters in the saved model. Partial years are labeled. Revenue and profit are aggregated from the displayed quarterly forecasts.

Calendar year	Coverage	Revenue	Gross profit	Operating profit	OP margin
2026	2 quarters	24.338	7.939	-12.783	-52.52%

Calendar year	Coverage	Revenue	Gross profit	Operating profit	OP margin
2027	4 quarters	292.477	145.550	77.618	26.54%
2028	4 quarters	977.852	564.029	428.388	43.81%
2029	4 quarters	1,274.840	740.888	575.909	45.18%
2030	4 quarters	1,443.867	842.598	663.366	45.94%

Probability and dilution sensitivity

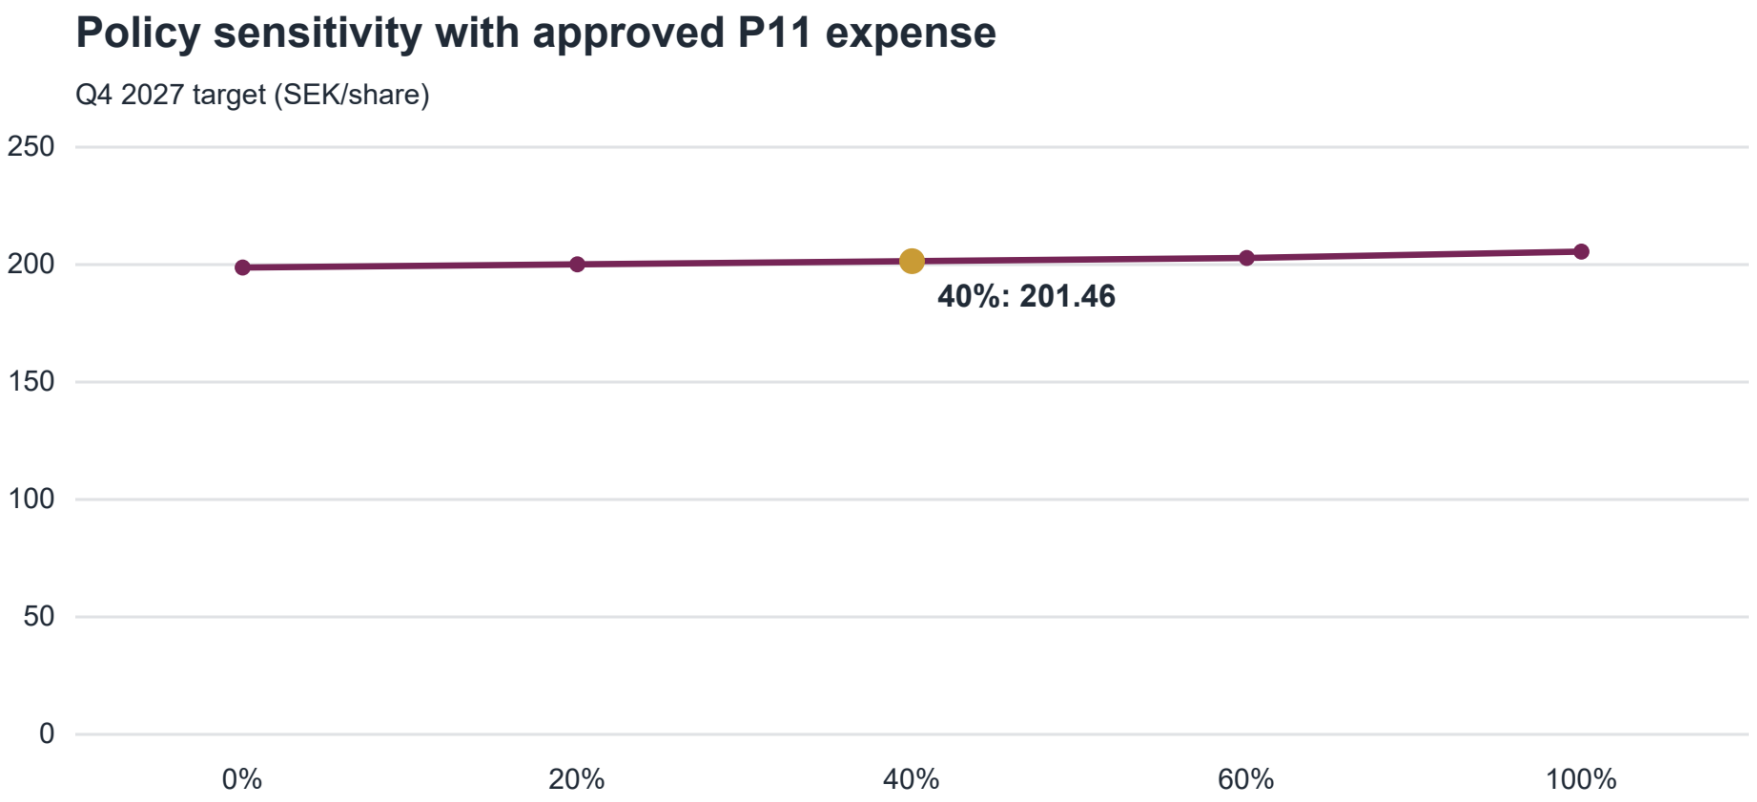

Figure 6. Q4 2027 policy-probability sensitivity with central P11 expense and the economic-share allowance fixed. Gold marks the selected 40% policy weight.

Policy probability	Q4 2027 price target	Change from zero-policy sensitivity
0%	198.7487	0.000%
20%	200.1044	0.682%
40%	201.4602	1.364%
60%	202.8160	2.046%

Policy probability	Q4 2027 price target	Change from zero-policy sensitivity
100%	205.5276	3.411%

Additional economic shares	Q4 2027 price target	Interpretation
0%	201.4602	Increase above the active allowance; operating case held
5%	191.8669	Increase above the active allowance; operating case held
10%	183.1457	Increase above the active allowance; operating case held

I assign40% probability to the incremental policy economics and timing. Because the nine companies share the same policy event, these increments should not be treated as nine independent sources of portfolio diversification. The next 12-16 months have the highest forecasting relevance; later continuation assumptions are progressively less reliable.

Validation and next evidence

This current artifact and the master model use the same selected 40% policy case. The 20x OP method, quarterly window and currency conversion are retained. P11 expense and the explicit economic-share allowance are integrated as described above. Every existing portfolio Excel Base is protected; the analytical score above is assessed separately.

The incremental ledger exposes revenue, production costs, gross profit and operating expense. A zero-policy sensitivity removes only that ledger's contribution. It measures the existing policy contribution while holding other assumptions constant. Reported facts and dated guidance retain their original dates; new pricing, exposure, costs and timing are labeled analyst assumptions.

The most useful next evidence is the proposed content definition, product-specific fabrication and assembly routes, contract repricing rights, delivered 3.2T qualification, accepted component premiums and unit-cost/yield data. Those observations can raise or lower the inputs and their probability; official confirmation is not a prerequisite for modeling this credible breadcrumb.

Current model: **SIVE_Q_Model** in **v3_2_master_portfolio.xlsx**. The full quarterly model includes all original product vectors, the policy bridge, and the incentive-cost/share ledger. Approval snapshots and change history retain each prior information vintage.

October 28 model status: P11 service-period expense and the bounded treasury/legacy-option allowance are integrated in all 18 operating quarters and 15 complete valuation windows. Product forecasts, commercial probabilities, 20x OP, analytical Base 90 and current Excel Base 90 are preserved. Grant, country-tax and legal delivery details remain monitored inputs within the explicit economic-cost allowance.
