# Jereh Group — a power-delivery window inside an established equipment company

002353.SZ / 002353.SZSE · Yantai Jereh Oilfield Services Group · 杰瑞股份. Currency: CNY. Initial coverage; no previous company target or Excel Base exists. The probability-weighted Q4 2027 rolling four-quarter operating-profit ceiling is about CNY108 per share at 20× attributable recurring operating profit, using 1,024 million issued shares. This is an operating-profit framework value, not a conventional after-tax P/E target.
Analytical score: 41/60, or 68%; initial Excel Base: 68. Watchlist. Classification: a TEMPORAL deployment and delivery opportunity within a diversified equipment and services group. The score does not set an event probability and was selected independently of the stock price. Position: not recorded; new tracked coverage.
Dated market snapshot only: TradingView SZSE:002353 returned CNY91.06 when observed on October 26, 2026; the response did not provide the exchange trade timestamp. Display approximately CNY91. The exact quote is retained separately. Quoted price is excluded from the operating model and the body’s economic assumptions.

## The investment case depends on delivery and economic capture

Jereh already sells high-end oil and gas equipment, engineering and technical services, field-development services, and recycling equipment. The new opportunity is to turn turbine-core access, packaging, controls and field-service capabilities into timely power supply for constrained data-center and industrial customers. Large prepaid orders provide a better signal than an undated total-addressable-market slide. They still have to become accepted equipment, revenue and cash.
The differentiated insight is the reconciliation: the July contract, the J&F/FTAI platform announcement and the cumulative customer figure are overlapping descriptions. Purchased turbine cores absorb a large share of gross invoice value. J&F is called a controlled subsidiary, but exact ownership, transfer pricing and profit-sharing rights remain unresolved. Neither consolidated sales nor a group order headline establishes that common shareholders retain all the associated profit.
The model therefore separates legacy earnings, signed order cohorts, conditional future orders, microgrid attachment and two proposed capital projects. It reserves factory capacity for Jereh’s own rental fleet, deducts core and support costs before attributing profit, and tests usable parent cash after deposits and minority claims. The upside is a bounded execution case, not an assumption of exclusive turbine technology or unlimited factory capacity.

## Latest results and the newest two management earnings records

Financial and business evidence cutoff: October 25, 2026. Report prepared October 26, 2026; the separately dated market snapshot is the October 26 observation.
The latest actual financial packet is the nine-month/Q3 2026 report published October 22, read with the 2026 interim report, Q1 report and 2025 annual report. Consolidated statements are distinguished from parent-only statements. Q2 and Q3 2026 figures and Q4 2025 figures are derived only from matching cumulative consolidated tables.
The newest earnings management record concerns the October 21, 2026 call, 19:30–20:30 in China, published October 22. The preceding earnings record concerns the August 13 interim-results call, 20:00–21:00 in China. Both complete issuer-written records were read. Full spoken transcripts and complete audio/replay were not obtained. Written summaries cannot establish complete spoken coverage; omitted questions and qualifications remain a specific completeness gap.
The investor visits and site tour on October 22–23, published October 24, add factory and product context. They are not a replacement for either earnings call. The July contract and October proposed-use-of-funds filing establish terms and capital requirements. Issuer and exchange originals, native-language records and preserved local material were used. Four owner-preserved industry screenshots support power-market context only: their cropped publisher/date fields do

not establish a Jereh order.

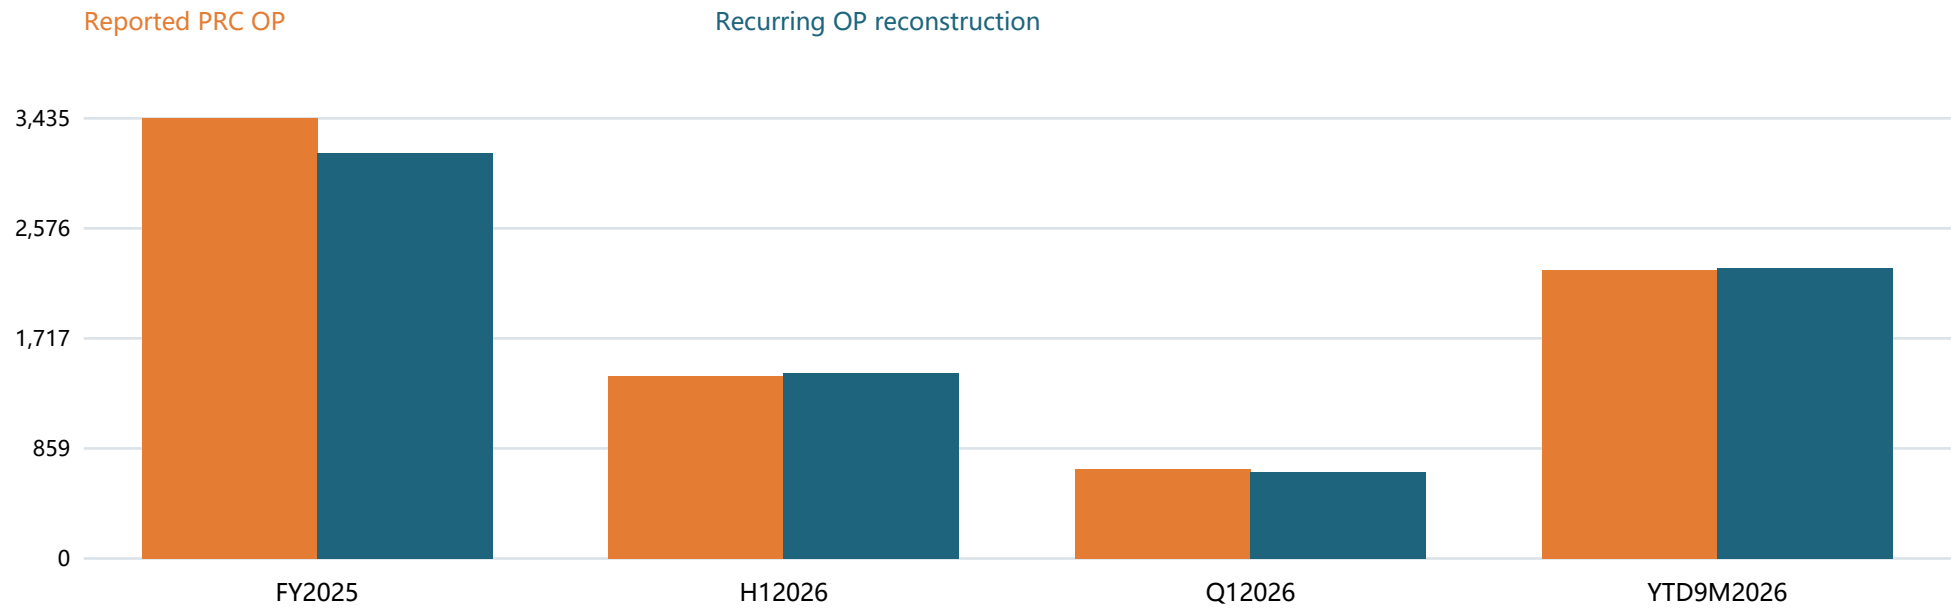

# Revenue accelerated; cash conversion and currency still matter

Q3 revenue was CNY4,328 million, up 22.97%; parent net income was CNY691 million, up 21.88%. Gross profit was CNY1,419 million, approximately 33% of revenue. Q3 operating cash flow of CNY3,161 million reversed the negative first-half cash result. Nine-month revenue was CNY11,974 million, up 14.91%, while parent net income rose only 4.36% to CNY1,887 million.

Nine-month reported PRC operating profit was CNY2,253 million. This is not the forecast valuation metric: the PRC operating-profit line includes finance, investment and other items. Nine-month finance expense was CNY283 million; the report identified approximately CNY373 million of exchange losses versus an earlier gain. The forecast starts with gross profit less operating expenses and a normalized credit reserve. It does not add FX back a second time after finance has already been excluded.

At September 30, cash equivalents were CNY8,866 million, compared with CNY9,411 million of monetary funds; the latter includes balances outside the cash-equivalent definition. Accounts receivable, bills and contract assets total CNY8,864 million. Inventory was CNY8,604 million, supplier prepayments CNY4,345 million, and customer deposits CNY7,051 million. Deposits are useful financing evidence, but they are obligations tied to execution rather than free profit.

The 2025 Russian Guangming subsidiary disposal removes a business that contributed CNY597 million of first-half 2025 revenue and CNY143 million of net income. It is not restored to current legacy growth. Forecast actuals and the live reconstruction bridge are clearly separate from previously published historical portfolio forecasts.

Reported consolidated actuals versus the separately labeled recurring-OP bridge. Q3 and nine-month figures share the same consolidation boundary; PRC reported OP is not the 20× valuation input.

# What the Chinese filings establish—and what they do not

The interim report reports product revenue and cost for equipment and engineering services, allowing their gross margins to be calibrated directly. Recycling profitability is reconstructed from the consolidated industry and product partitions and remains loss-making in the current calibration. Field-development and residual product margins require explicitly labeled assumptions.
Management confirmed receipt of the major contract advance and said the key Mod-1 prototype tests were proceeding according to plan. That supports an execution milestone. It does not establish the full integrated commercial fleet's operating hours, final accepted output or audited standalone generator margins. The October site record describes already operating rented factory space of more than 30,000 and 36,000 square metres. It does not publish an audited 3 GW factory rating or reported 200 MW delivery figure.
The October filing proposes changing the use of funds for named compressor and generator/rental projects. Shareholder approval, construction, qualification, utilization and cash absorption still matter. Source feasibility returns are retained as cross-checks, not substituted for the model's operating-profit law.

# Where Jereh participates in the power value chain

The physical chain runs from turbine cores and balance-of-plant suppliers to packaging and assembly, electrical controls, logistics, customer acceptance and ongoing field support. Jereh's strengths are integration, manufacturing and delivery experience. Core ownership and access remain dependencies. The Siemens A05 authorized-packager history supports relevant capability; it does not confer exclusive rights to all future architectures.
FTAI's primary platform description identifies a 25 MW Mod-1 unit and a target of 100 units in 2027. That is a 2,500 MW global platform plan, not an allocation of all slots to Jereh. Direct FTAI downloads were unavailable; clearly labeled primary web captures are retained rather than described as downloaded original filings or complete calls. Dynamis' disclosed multi-year SGT-400 program is a concrete reminder that competing packagers can address similar demand.
A microgrid can combine gas generation, batteries and solid-state electrical equipment. Claimed 98% electrical conversion, 3–5% system gains or a smaller footprint are marketing metrics with their own boundaries. They are not turbine fuel efficiency, a company gross margin or automatically incremental project revenue. The model prices a narrow attachment wallet and removes overlap with the generator package.

Turbine cores → packaging/controls → physical assembly → delivery/acceptance → field support. Economic capture follows costs and ownership rights; gross invoice value is not attributable profit.

# Count the same order once

The July USD1,465 million agreement, the J&F/FTAI event and its customer announcements describe the same major order. The cumulative CNY11,681 million figure for the customer and affiliates since November 2025 includes that July agreement. The interim publication's power orders exceeding USD3,100 million also include it. These values cannot be added together. Nor can the later power-order total simply be added to the CNY13,995 million first-half backlog: date, tax, advance and recognition definitions differ.

The July contract calls for batch delivery in 2027. FTAI's counterparty account describes delivery through November 2027 and payments tied to production, testing and commissioning. A final-output adjustment can reduce the settlement by up to 10%. The forecast separately models zero, 2% and 5% invoice haircuts in fast, normal and slow states, while preserving physical costs before the haircut. A 10% adjustment is a sensitivity, not the default.

The reference FX assumption of CNY6.8 per dollar converts the signed USD1,465 million cohort to CNY9,962 million. The difference from the source's

approximate CNY9,949 million translation is a currency-date boundary, not a new contract. After removing that cohort from USD3,100 million and deducting estimated 2026 non-JV recognition, the model carries the remaining non-JV signed face value. These are distinct physical cohorts with their own implied ASPs. Conditional future pipeline is identified separately and never relabeled signed backlog.

Nested announcements: the July USD1,465m agreement is included in customer cumulative orders and in power orders exceeding USD3,100m. Different-date backlog and later order totals are not additive.

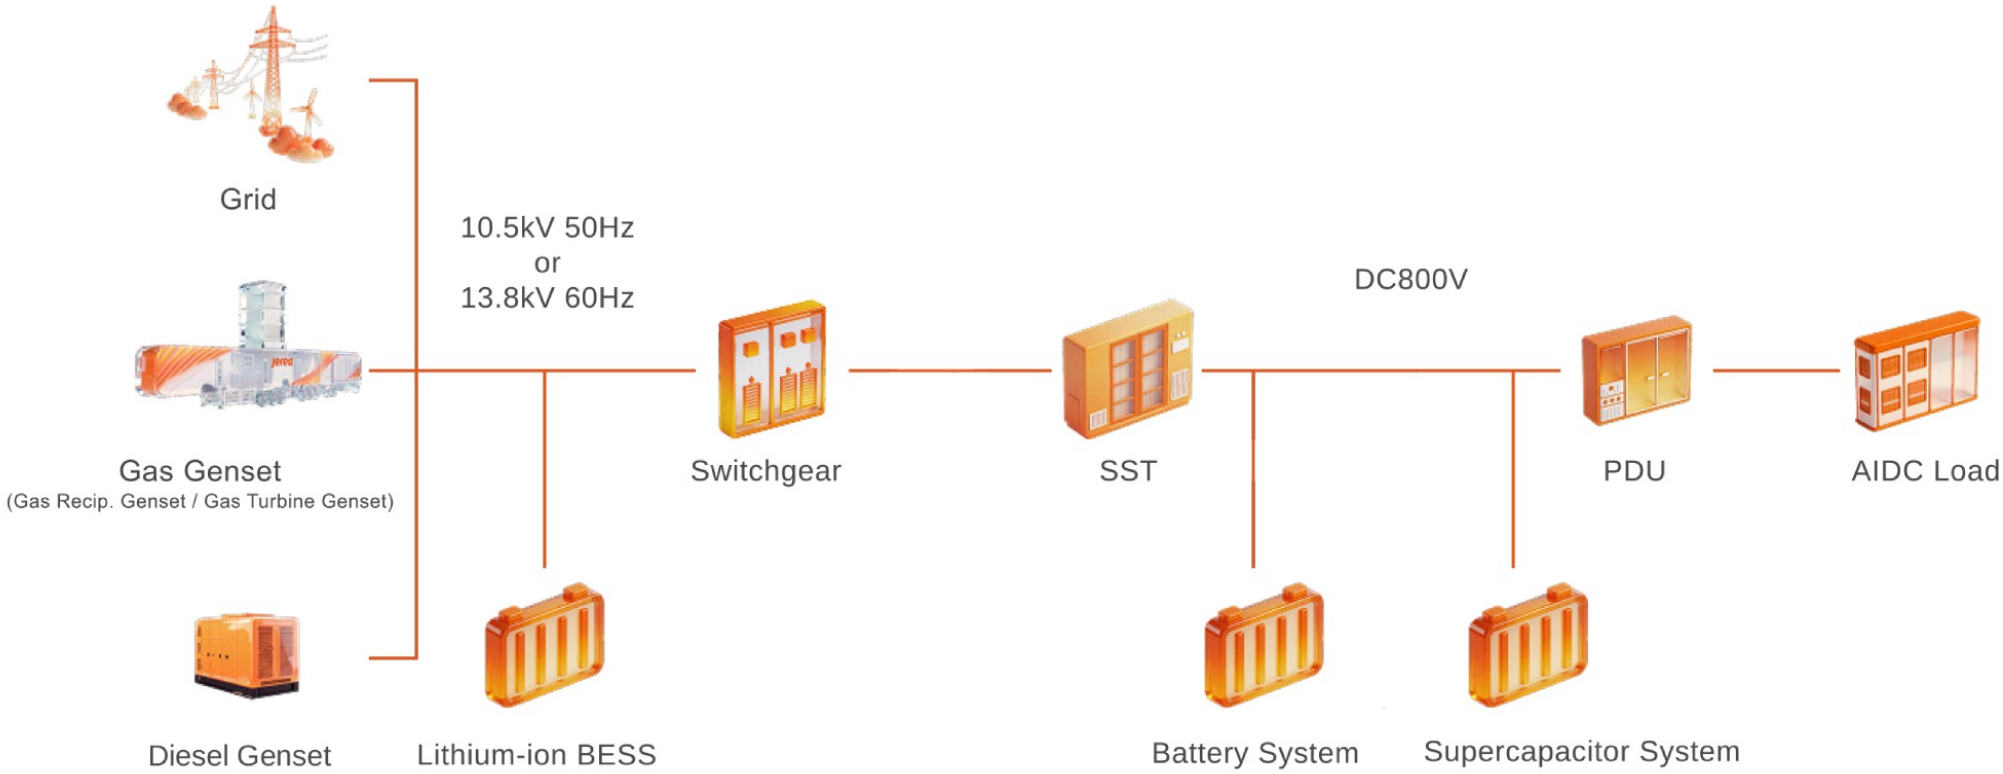

Issuer illustration of modular mobile generation presented with the July 2026 order announcement. It does not identify accepted units or prove current customer-site delivery.

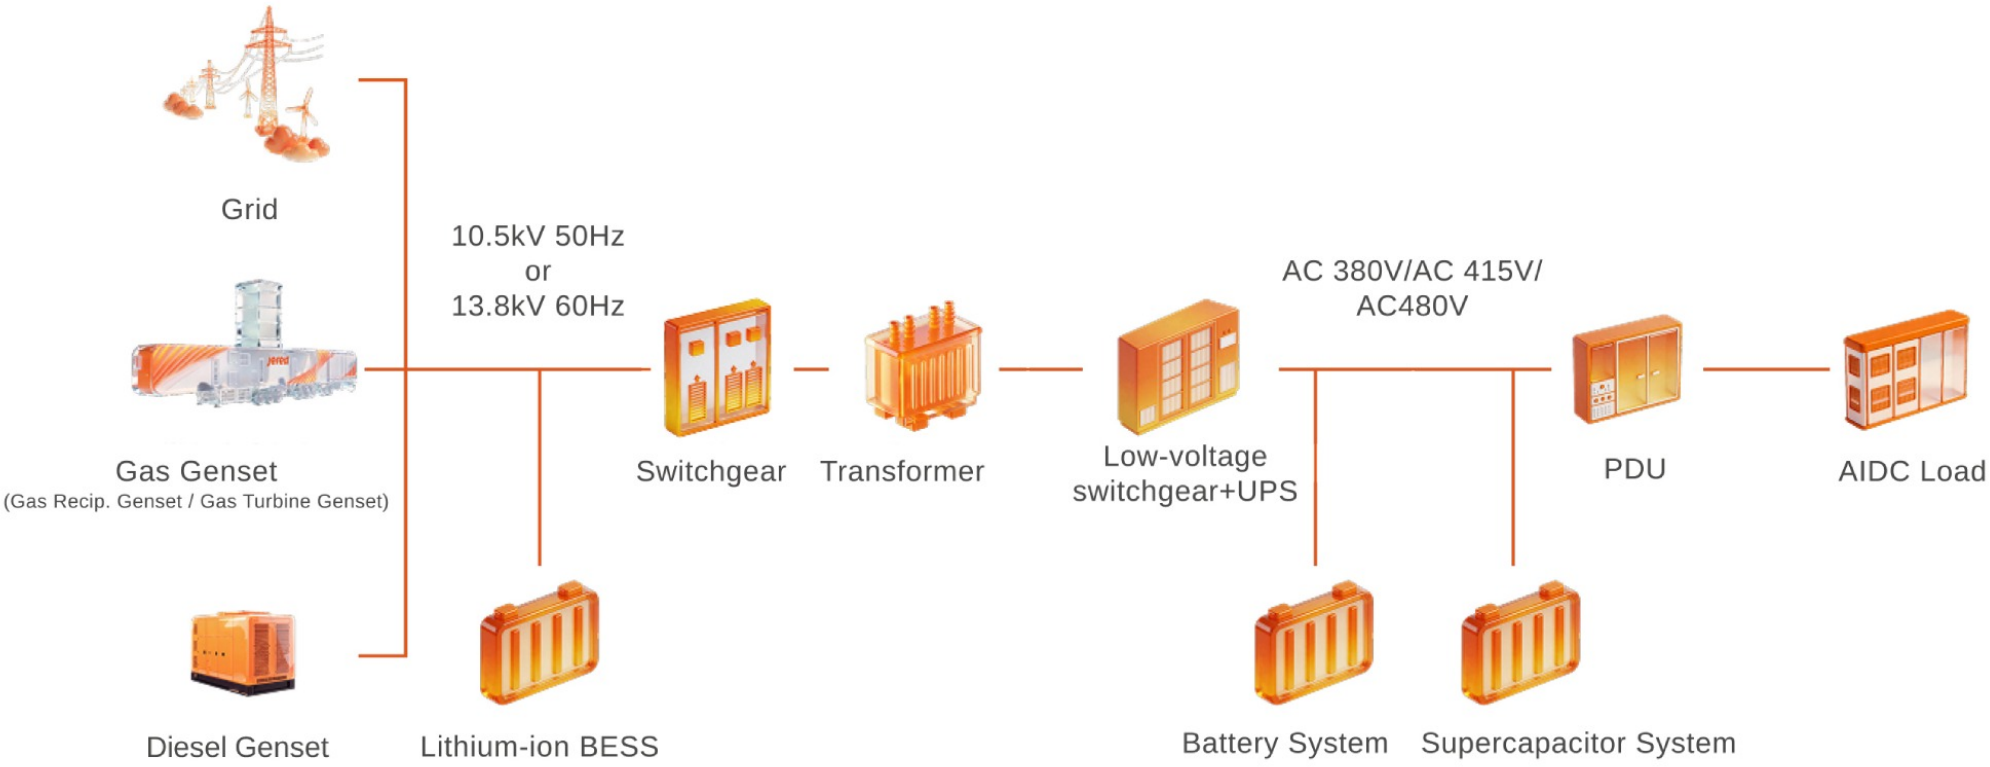

# Capacity constrains invoice value

The major JV cohort uses an assumed USD1.465 million per MW, giving a fixed 1,000 MW physical cohort. This is a LOW-confidence unit-price conversion, not a disclosed contract unit count. The estimated current 2026 non-JV cohort has CNY525 million of remaining invoices at CNY7.5 million per MW, or 70 MW. The future signed non-JV cohort begins at CNY9,618 million and CNY8 million per MW, or 1,202.25 MW. Currency changes retranslate money; they do not create additional units from a fixed signed physical cohort.

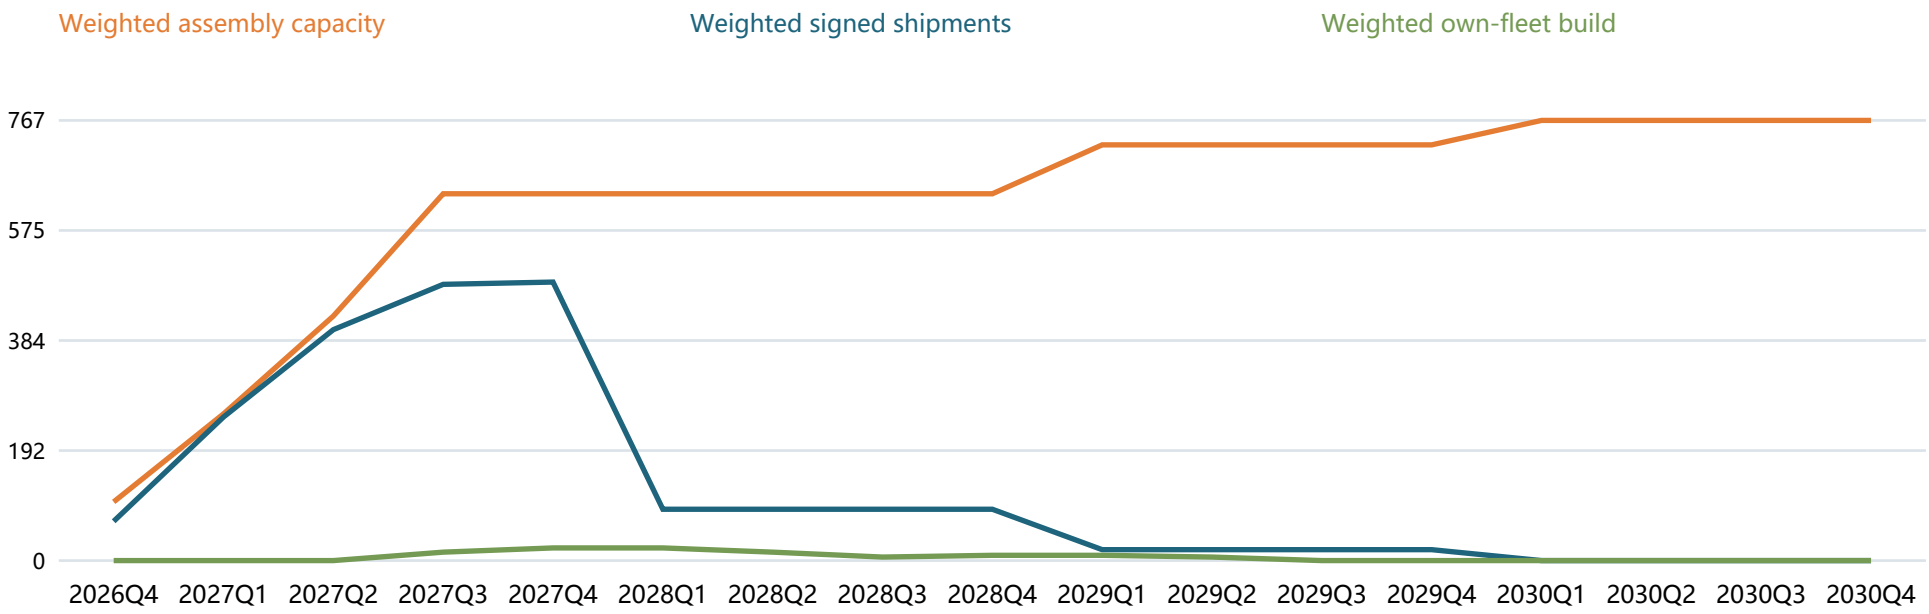

Planning capacity is 120 MW in Q4 2026; 300, 500, 750 and 750 MW in the four quarters of 2027; 750 MW per quarter in 2028; 850 MW in 2029; and 900 MW in 2030 before state multipliers. These are Root capacity assumptions, not reported rated output. Signed cohorts compete pro rata for available external capacity. Unfilled signed units carry forward with their own prices. Conditional new orders use only remaining capacity.
Internal rental production comes first: CNY735.0048 million of fleet capital divided by an assumed CNY6 million per MW gives 122.5008 MW. In fast and normal states, 20%, 30%, 30% and 20% are produced from Q3 2027 through Q2 2028. The slow state delays this by four quarters; the stress state does not build the proposed fleet. Internal production is capitalized, consumes factory slots and is not external equipment revenue. Estimated 2026 non-JV power revenue of CNY1,500 million and approximately 200 MW is a LOW proxy, not official guidance.

Issuer 800V DC architecture: generation/grid, switchgear, SST, PDU and data-centre load, with storage branches. Electrical conversion efficiency differs from turbine fuel efficiency and operating margin. Source page undated.

Issuer conventional UPS architecture for comparison with its 800V DC design. Shared generation/storage components are not separate incremental revenue. Source page undated.

Root planning MW by quarter. Internal rental-fleet production reserves capacity first, signed cohorts share remaining slots, and conditional new demand receives only residual capacity. No reported factory-rating claim.

# Consolidation does not establish common-share profit rights

The issuer describes J&F as a controlled subsidiary. The model therefore does not automatically treat its gross sales as equity-method revenue. Yet the exact ownership, governance, transfer-pricing and economic profit-sharing arrangement was not resolved from the available primary records.
After purchased cores, assembly, factory overhead, freight, warranty and allocated support costs, only 60% of modeled J&F recurring operating profit is attributed to Jereh common shareholders in the active case. This is a LOW-confidence economic-retention proxy. It is not a claim that legal ownership is 60%. Sensitivities show 40%, 60%, 80% and 100% retention. The non-retained balance cannot be valued twice or assumed available as parent cash.
Legacy attributable operating profit uses a 98.5% retention proxy informed by the current minority share of reported net income. That calibration does not establish 98.5% legal ownership of every business. The proposed wholly owned compressor and rental assets use their separately specified 100% capture. The model keeps consolidated operating cash, parent-attributable earnings and deployable parent cash distinct.

Jereh and Siemens Energy signing the SGT strategic cooperation agreement; issuer article dated May 15, 2026 describes the May 14 event. The photograph establishes the relationship, not binding turbine slots or unit economics.

# From revenue to attributable recurring operating profit

The first-half revenue calibration is CNY7,646.27845177 million. Estimated power revenue of CNY450 million is carved out of the existing equipment partition, leaving CNY7,196.27845177 million of legacy revenue. The legacy equipment gross margin is solved so the five product partitions plus the estimated power component reconcile to reported first-half gross profit of CNY2,368.42040359 million. Power is not added on top of reported equipment sales.

Q4 2026 total revenue is initially anchored to 110% of Q4 2025 revenue. It includes CNY525 million of estimated non-JV power invoices. The 2026 annual legacy reference removes estimated power recognition from nine-month actual revenue and from that Q4 reference. Later legacy revenue follows disclosed product mix and 2025 seasonality, with fast/normal/slow/stress growth of 8%/4%/0%/−8%; product-margin repair follows explicit state paths. The first-half recycling margin is approximately −6.65%, so a recovery assumption is not presented as current profitability.

For new generator equipment, the default purchased-core cost is 55% of pre-settlement package value, balance of plant 10%, assembly 3%, freight 2.5%, and

warranty 2% for non-JV or 3% for JV units. Materials and expediting pressures are additional state assumptions. The 3% assembly cost includes 1% old-line depreciation. Fixed factory cash cost rises from CNY100 million annually to CNY160, 200, 220 and 240 million. New factory depreciation is separate. Physical pre-haircut production value allocates shared factory cash and new-factory depreciation only. Revenue-based support and operating expenses retain their revenue basis. Invoice haircuts do not make the underlying equipment cheaper to build.
Selling, administration, R&D, surcharges, support and normalized credit costs are deducted in the linked schedules. The forecast valuation metric is attributable recurring OP before finance and income tax. Reported PRC operating profit, group pretax income and parent net income are reconciled separately. Exchange losses, interest and tax affect cash and net income; they do not become a second deduction or add-back inside the already pre-finance operating-profit ceiling.

Issuer illustration of gas generation, hybrid storage and SST components. Shows the system scope; no independently validated performance, bill of materials or extra order value is implied. Source page undated.

Generator value bridge before settlement: cores55%, balance of plant10%, assembly3%, freight2.5%, warranty2–3%, then factory/support/opex and JV retention. These are Root cost proxies, not disclosed standalone margins.

# Proposed compressors and rental assets have different clocks

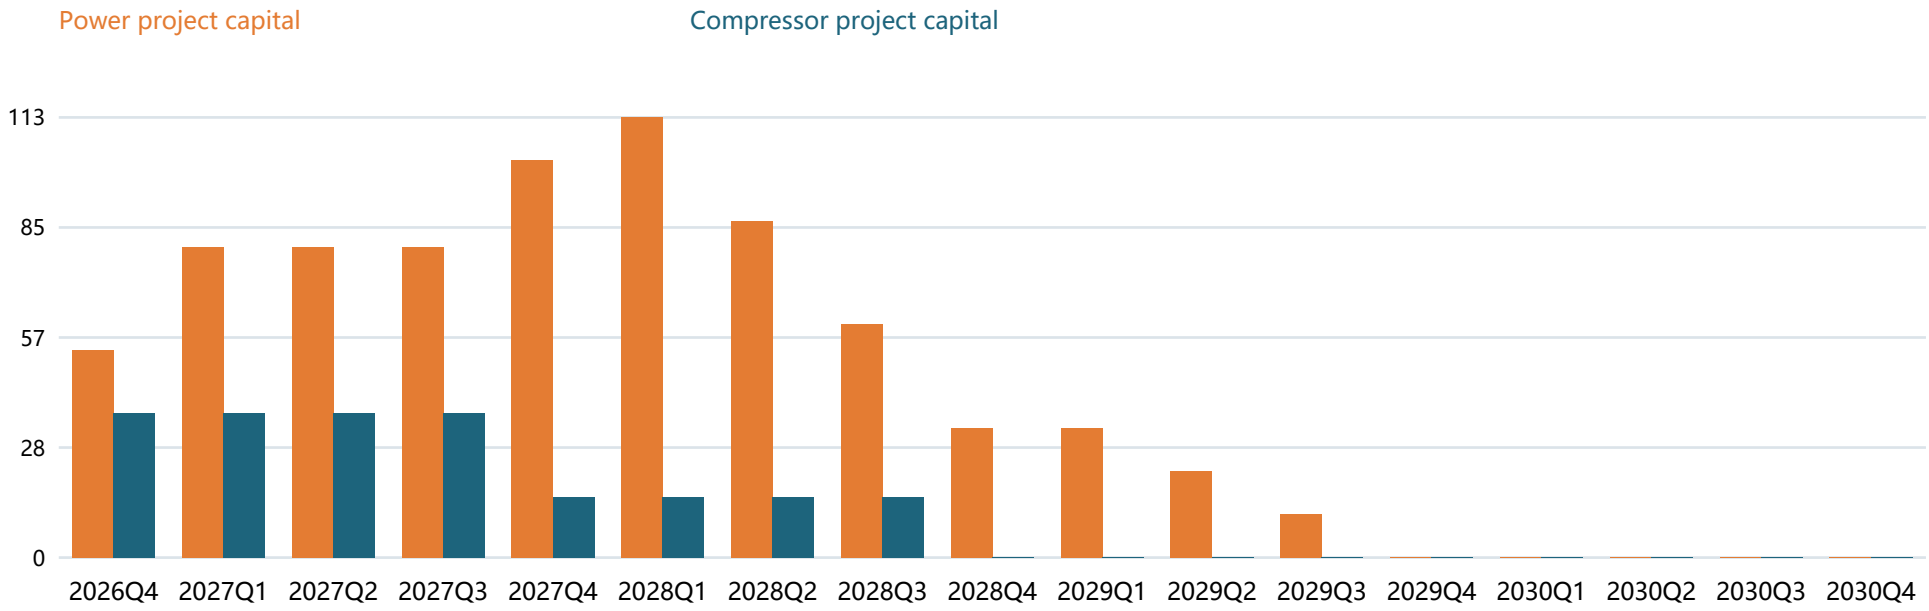

The compressor project totals CNY262.95 million: CNY248.1322 million of capital and CNY14.8178 million of working capital. The filing describes a 12-month build and full-capacity annual revenue of CNY714.2857 million, with feasibility net income of CNY131.5238 million. Fast and normal model states begin in Q4 2027; slow begins in Q4 2028; stress does not proceed. A 15% annual utilization assumption in 2027 means 60% utilization in its single operating quarter, not four quarters of revenue. The model uses 38% gross margin and full installed depreciation over 20 years.

The generator/rental proposal totals CNY1,319.9134 million, including CNY889.8885 million of capital and CNY430.0249 million of working capital, with a 21-month overall schedule. Of the capital, CNY735.0048 million funds the rental fleet. Full rental annual revenue of CNY391.68 million is separate from the source’ s CNY2,642.7 million equipment-capacity sales figure. That capacity-sales figure overlaps generator production already modeled and is not incremental revenue.

New production-asset depreciation on CNY154.8837 million starts when the factory becomes ready: Q3 2027 fast/normal or Q3 2028 slow, over 20 years. Rental revenue starts only in Q3 2028 fast/normal or Q3 2029 slow. Full installed fleet depreciation over 10 years starts at readiness regardless of utilization. No utilization-only depreciation shortcut is used. Project working capital is a floor over incremental generic working capital, not an additive duplicate. Source feasibility net income/IRR are cross-checks; the model uses its own operating-cost, depreciation and tax bridge.

Issuer rendering for an anonymous 100MW-class US data-centre case. Customer identity, project date, acceptance and recognised revenue are not established. Illustration, not a verified photograph of an operating project.

Compressors and rental have separate approval, build, readiness and utilization clocks. Full installed depreciation begins at readiness; internal equipment does not become external sales.

# Deposits fund execution; not all cash is freely deployable

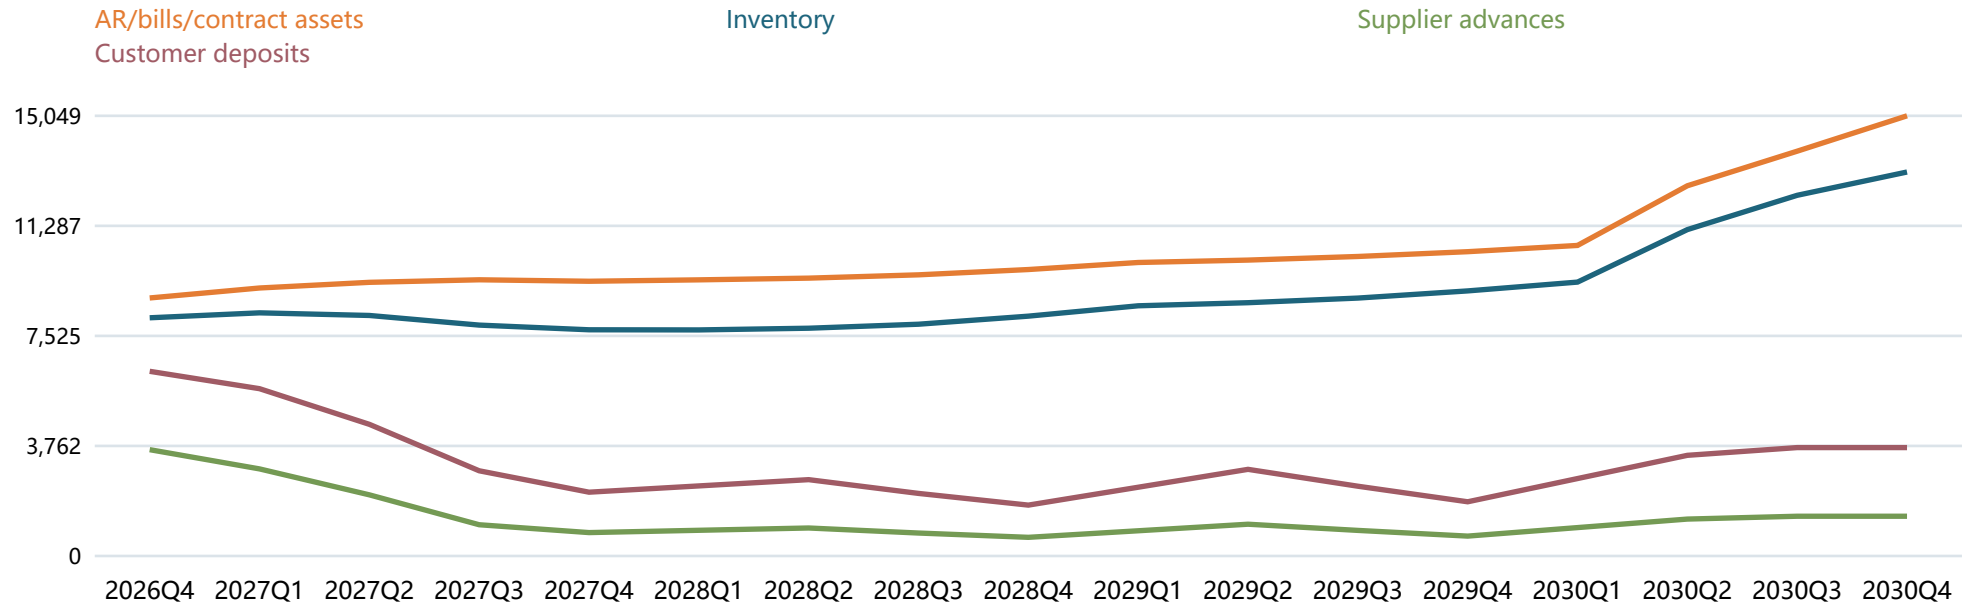

Opening net operating working capital is CNY7,762.457977 million: receivables, bills, contract assets, inventory and prepayments less trade payables, bills payable and customer deposits. The model blends the disclosed opening position into forecast working-capital targets over four quarters, avoiding an artificial immediate release. Legacy/customer receivable assumptions are 150/60 days; inventory 120/150 days; payables 90 days. Supplier advances reserve 20% of core cost on remaining backlog and customer deposits equal 30% of remaining backlog. Future conditional orders are assumed two quarters ahead of delivery and are not treated as existing cash receipts.

Cash-flow depreciation is calibrated to the actual first-half noncash reconciliation: CNY463.70257111 million less the estimated power allocation, divided by legacy revenue. The COGS noncash portion uses 90% of source plant depreciation/depletion after the carve-out. The 90% functional allocation is LOW confidence, tested at 80% and 100%. Expense depreciation is not stripped from inventory or payables costs. Depreciation is added back once, and normalized legacy cash capex remains a separate CNY423.87514452 million first-half-based ratio. That source total is a steady-state cash proxy, not reported pure maintenance capex.

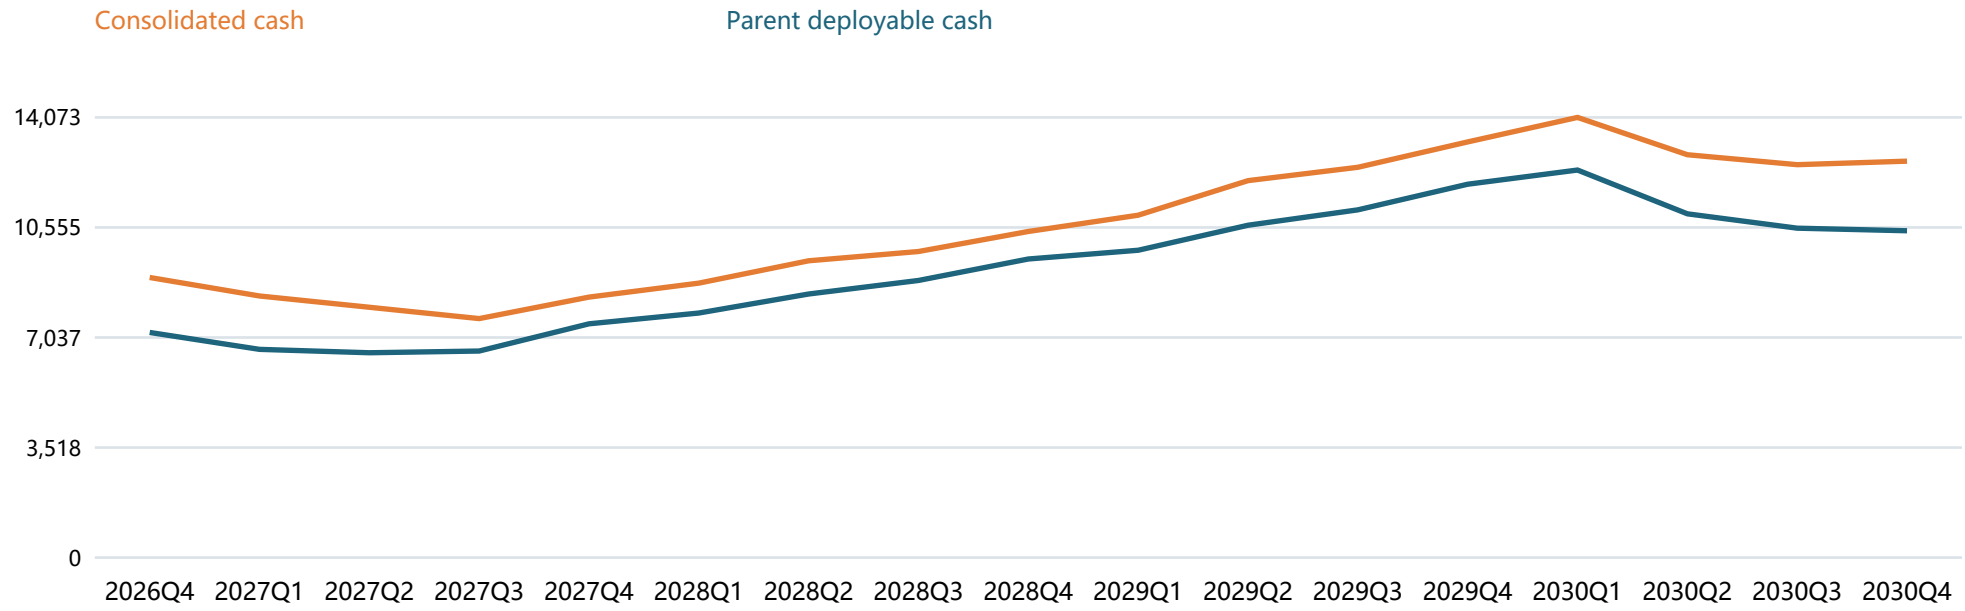

Opening current/short obligations of CNY1,613.69829777 million are repaid in four equal quarters from Q4 2026. Long bank, noncurrent lease and long-payable balances of CNY2,520.09219539 million are repaid in 16 equal quarters starting Q4 2027. Interest is 4% of beginning balances, with a separately controlled nonbank rate. Tax is an effective 15% proxy; parent dividends are 30% of positive parent net income. No automatic debt rollover, uncommitted facility or unannounced share issuance funds the default forecast.

A JV cash subledger distinguishes consolidated cash from partner and unearned-deposit reserves. The opening JV net-deposit proxy is CNY1,892.78 million. Deployable parent cash deducts unearned net deposits, 40% of positive earned JV cash and a legacy minority reserve. These are availability estimates, not extra

expenses or claims of legally restricted balances. A canceled major order refunds deposits through working capital once and recognizes a supplier-advance impairment once.
Default branch minimum parent-deployable cash remains positive: approximately CNY4,711 million fast, CNY5,673 million normal, CNY7,302 million slow and CNY7,819 million stress. Parent funding of JV execution is already included in group cash uses; it is not assumed partner financing. Higher receivable and inventory sensitivities can create required uncommitted funding. Those outputs are unfunded stress diagnostics, not fully financed realizable targets.

Actual opening working capital blends into modeled receivable, inventory, payable and contract-advance balances over four quarters. Project working-capital floors are not added twice.

Consolidated cash and deployable parent cash are different. Unearned deposits and economic minority reserves reduce availability; debt, capex, refunds and impairments enter cash once.

# Probabilities are attached to defined outcomes, once

Four coherent joint operating states carry weights of 15% fast, 45% normal, 25% slow and 15% stress. These are Root judgments about bounded outcomes, not measured frequencies or the analytical Base score. Every state contains its own delivery, cost, ownership, cash and timing path. The weighted result is formed once; no second breadcrumb haircut is applied.

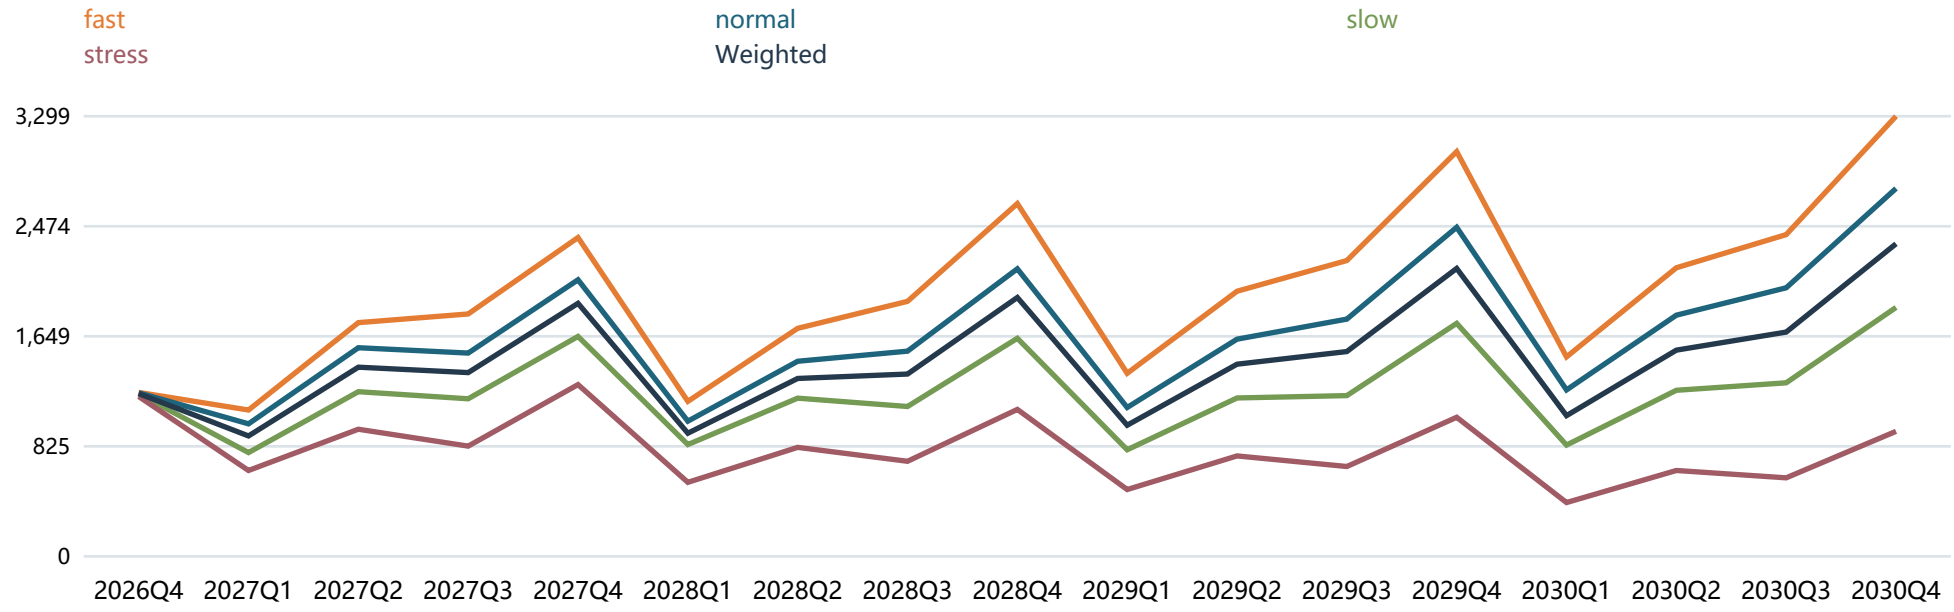

The defined major-order realization probability is 85%. The 60% event is at least 90% of the initial JV order scheduled in 2027 in the selected fast and normal states. Physical acceptance can differ after capacity limits; this is not a guarantee of actual 90% delivery. The slow state's 55% scheduled fraction does not satisfy that event. Conditional 2028 new-pipeline demand of at least 1,400 MW also has a 60% judgment, as do positive new-pipeline pricing and on-time named-project completion under their specified state definitions. A probability is not a substitute for the amount retained after costs or a guarantee of financing.

Six disjoint component bridges explain incremental operating profit: ordinary legacy demand and recycling margin repair; the named JV generator order; other signed and conditional new generator sales; incremental microgrid attachment; compressors; and rental. Capacity, pricing, settlement, cores, approvals and FX are explanatory signals inside these bridges, not additional independent profit rows. Microgrid attachment begins from a 10% gross wallet, removes 80% overlap, and applies state attach rates of 50%/30%/10%/0%, with 25% gross margin and 8% operating expense.

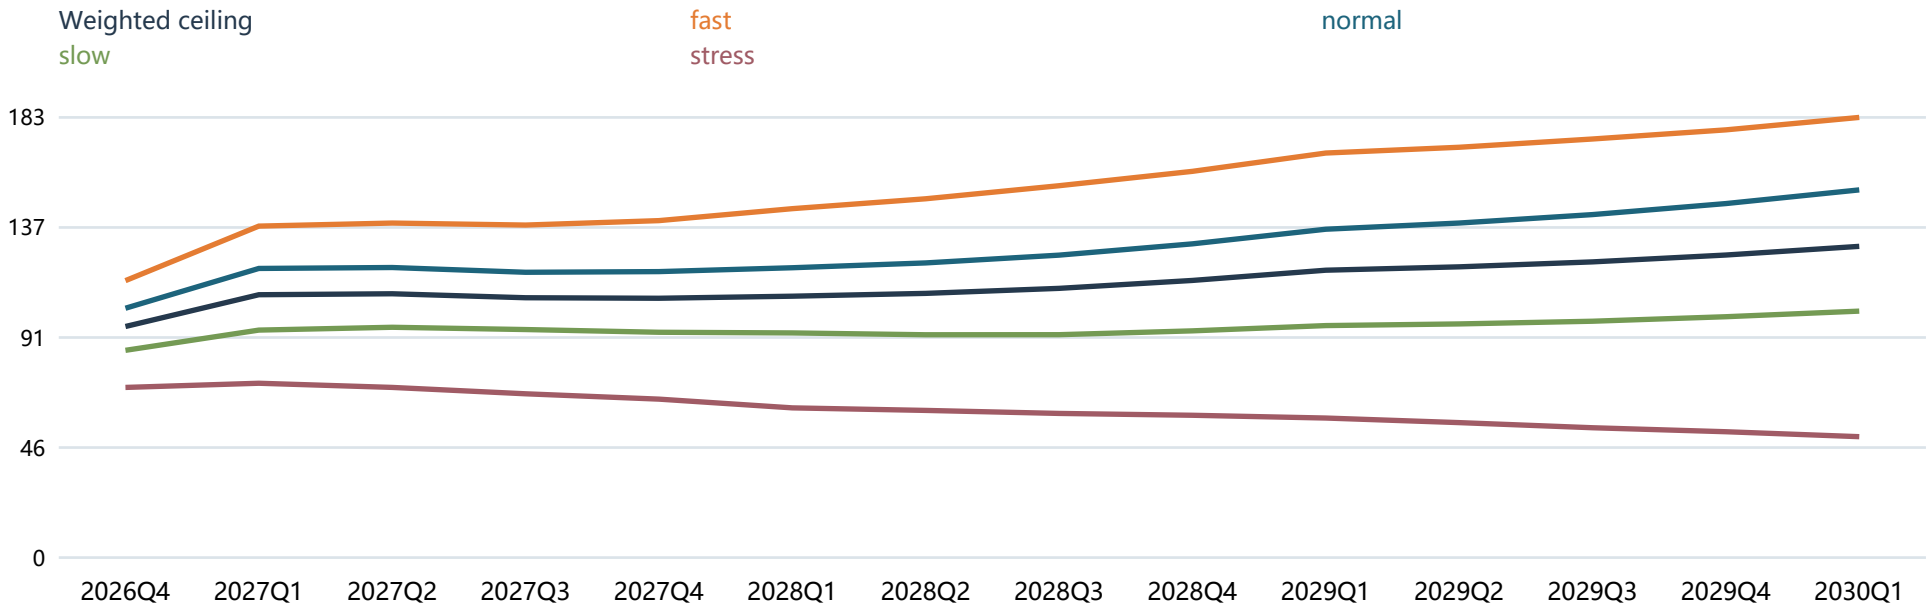

The reference counterfactual retains current 2026 activity and its carry-forward, freezes subsequent legacy growth/margin improvement, and removes future named expansion opportunities and their capital requirements. It has no status as a previous portfolio forecast. Full quarter-by-quarter conditional revenue, cost, capture and incremental attributable-OP reconciliations accompany the source-bound ledger.

# The Q4 2027 ceiling uses Q4 2027 through Q3 2028 earnings

For each ceiling quarter, sum the next four quarters of attributable recurring OP, multiply by 20 and divide by the selected full issued share denominator at the start of that ceiling quarter. Apply a zero floor to each complete conditional ceiling, then weight the branches once. No cash or NAV is added. No Base score is used as an event probability. The selected full issued share denominator is 1,023.855833 million, including treasury shares, as a conservative initial convention; it is not a GAAP diluted-share measure. Employee-plan treasury transfers do not automatically create new shares.
For Q4 2027, the four-quarter window is Q4 2027, Q1 2028, Q2 2028 and Q3 2028. Weighted attributable recurring OP is approximately CNY5,519 million, giving a ceiling of approximately CNY108. Conditional ceilings are approximately CNY140 fast, CNY119 normal, CNY94 slow and CNY66 stress. They are bounded conditional outcomes, not additional price objectives to average with the weighted output.
All 14 rolling ceilings from Q4 2026 through Q1 2030 are shown with their four-quarter derivations. The operating model extends to Q4 2030, so these 14 windows require no invented later quarters. For cash diagnostics alone, any later forward tail uses the disclosed constant Q4 2030 run-rate convention. A current reconstruction of earlier operating inputs does not overwrite historical Excel forecast vintages.

Seventeen quarterly attributable recurring-OP outcomes. Weighted results use the four joint-state weights once; Base68 is not an event probability.

Fourteen rolling four-quarter ceilings at 20× attributable recurring OP using the selected full issued share denominator of approximately 1,024m. Q4 2027 uses Q4 2027–Q3 2028; no cash/NAV is added.

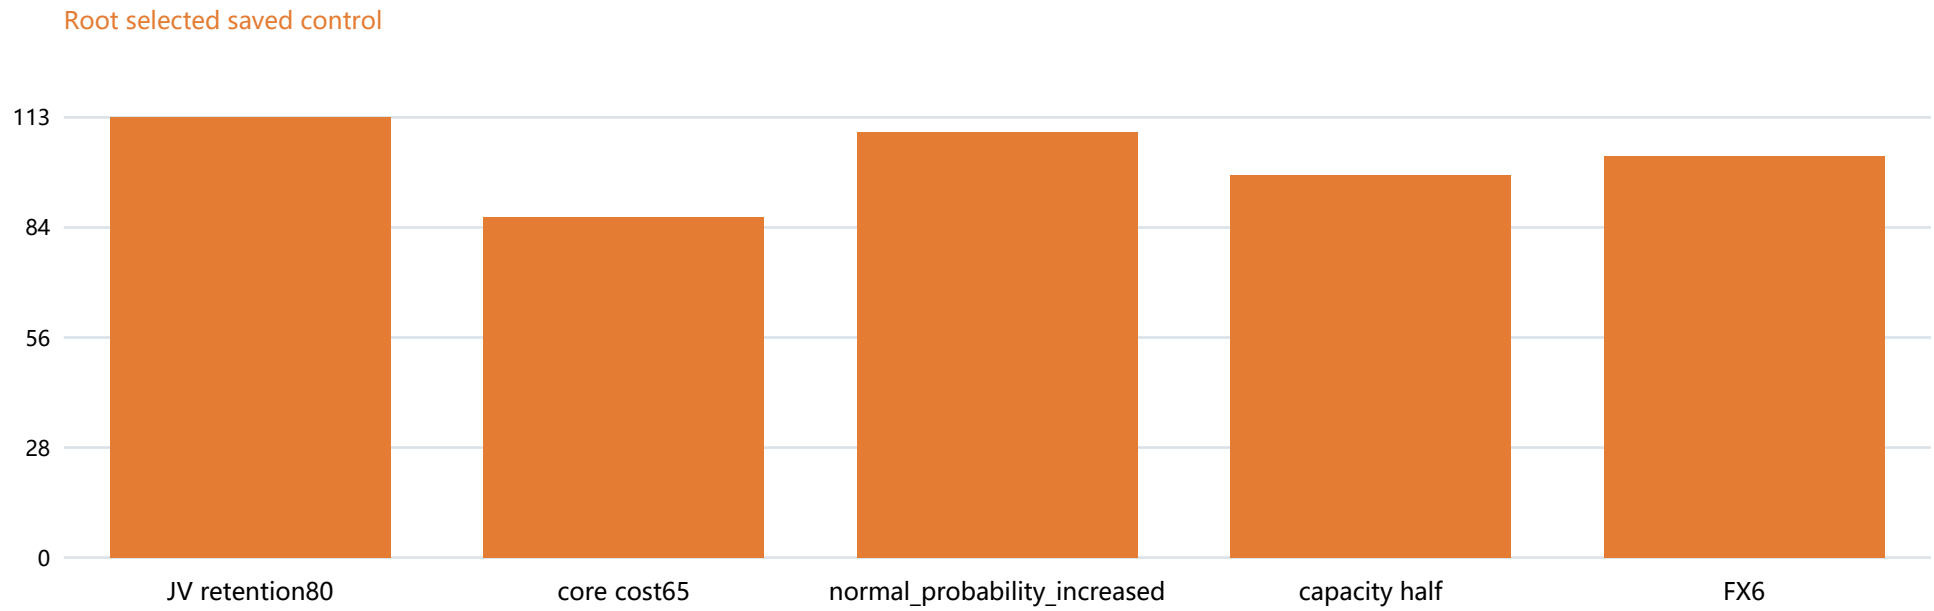

# Core costs, profit rights and execution capacity dominate

The linked model exposes economic-retention, core-cost, production capacity, FX, probability, cost/support, working-capital, project-timing, tax, debt and share-count controls. They change operating and cash schedules, rather than only multiplying a finished ceiling. Tests restore every source, formula and value after each change.

At the Q4 2027 window, increasing JV economic retention from 60% to 80% raises the working ceiling to approximately CNY113; 40% and 100% retention give approximately CNY103 and CNY117. Raising core costs from 55% to 65% lowers it to approximately CNY87, while 45% produces approximately CNY128. Halving available capacity gives approximately CNY98. Revaluing the dollar to CNY6 changes money, not fixed signed physical MW, and produces approximately CNY103. These are one-control diagnostics with the other active assumptions retained.

Changing the raw normal-state weight from 0.45 to 0.55 renormalizes all four weights: the resulting normal probability is 50%, not 55%, and the ceiling is approximately CNY109. A cash sensitivity named for zero bank/current-pool interest leaves the separately controlled known nonbank rate at 4%; it must not be described as all interest being zero.

The no-increment counterfactual is approximately CNY64 at the same 20× law and share basis. It is a diagnostic of what the modeled expansion adds, not an old target being upgraded to CNY108. Five and ten percent additional share issuance are explicit denominator sensitivities; the default does not assume an undisclosed ATM or rights issue. Funding-stress cases disclose their financing gaps alongside any arithmetic ceiling.

One-control operating and financing diagnostics. Higher core costs, lower economic retention and slower capacity can change both profit and cash. Cases requiring uncommitted funding remain explicitly unfunded.

# What would change the view

The principal upside verification is timely accepted delivery with defensible per-unit economics: core receipt, integrated operating evidence, production throughput, customer acceptance, invoice collection and disclosed economic rights. Exact J&F profit-sharing terms could materially change common-share capture without changing consolidated sales. Factory or rental-project readiness alone does not prove utilization.

Five risk classes reduce the score: turbine/core and technical delivery; competitors and OEM dependence; customer concentration and acceptance; FX, export and geopolitical exposure; and capital allocation, governance and JV economic capture. New information about an already modeled contract changes its probability, economics or timing rather than creating a second revenue row.

Core Thesis scores 14/20, including one first-confirmed-prepayment point; Cycle Stage 9/10; TAM Expansion 7/10; Catalysts 5/5; Macro 8/10; Alpha 3/5; Risks −5. Total: 41/60, 68%, Watchlist. The deployment window can be valuable without being a permanent component bottleneck. Rival access to suitable turbines, a lost customer or a slower delivery schedule can shorten it.

Exact JV rights, undisclosed standalone generator margins/unit counts, allocated opening cash/working-capital rights, full spoken call coverage and final capital-project approval remain unresolved. They are carried as explicit limitations and sensitivities. The absence of a new official confirmation is not a reason to suppress analysis or force an arbitrary numerical change.

# Complete operating, capital and valuation bridges

The supporting tables retain full-precision inputs, units and source links. Actual revenue and gross profit reconcile to the consolidated reports. Revenue equals legacy product volumes/value plus external JV and non-JV generator invoices plus non-overlapping attachments, compressors and rental. Internal fleet manufacture consumes slots and capital but does not enter external revenue. Signed physical cohorts, remaining invoice face and conditional pipeline are separately tracked.
Gross profit subtracts physical core, balance-of-plant, assembly, freight, warranty, materials, factory cash overhead and installed depreciation. Recurring OP then subtracts selling, administration, R&D, service/support, surcharges and normalized credit cost. Attributable OP applies the appropriate economic retention by business. Reported PRC OP is bridged separately through finance and other statement items; group net income, parent net income and minority income reconcile without using net income as operating profit.
Operating cash flow starts from net income, adds noncash items once and deducts the change in working capital. Cash after capex, principal and dividends reconciles to closing consolidated cash; the JV and minority reserves reconcile that balance to deployable parent cash. Proposed-project working capital is incremental only where its positive floor exceeds the generic model. Source-funded advances, cancellation refunds, impairment and principal repayment are not duplicated.
The appendices show all 17 forecast quarters, each conditional operating/cash schedule, weighted ratios calculated from weighted numerators and denominators, all 14 four-quarter OP windows and ceilings, and the six-component incremental bridge. The companion formula workbook owns the same raw inputs and formulas. Main displays use whole values; very small nonzero values are identified rather than rounded into a misleading zero. Exact working amounts and complete formula dependencies remain available with the original-named calculation graph.
Exact working inputs and calculation: Exact working result: CNY107.81121152594727 using the selected full issued share denominator of 1,023.855833 million shares. Weighted attributable recurring OP is CNY5,519.156889181897 million. The exact ceiling is 20 × 5,519.156889181897 / 1,023.855833 = CNY107.81121152594727, displayed as CNY108.

# Method boundaries and source quality

All monetary schedules are CNY millions unless specifically labeled USD, CNY per share, MW, days or percentages. Source yuan amounts are converted to millions once, with original strings retained. Disclosed actual facts, issuer feasibility estimates, third-party primary platform statements and Root LOW-confidence modeling assumptions are separately identified. An unreported figure is not converted into a disclosed fact by repetition.
The major original records include the October 22 nine-month report, the 2026 interim and 2025 annual reports, Q1 statements, the July contract, both newest written earnings records, the October investor visit and proposed use-of-funds filing. Source arrays identify exact publication/event dates, pages, URLs, asset hashes and claim boundaries. Primary web captures are labeled where original downloads were unavailable; owner screenshots with cropped provenance retain their exact limitations.
The portfolio’ s already-published Q3 2026 and earlier forecasts and their as-then rolling four-quarter ceilings are historical vintages. The current Q4 2026 and future forecast columns may be updated after validation. This initial company admission leaves the historical forecast displays blank; it does not manufacture an earlier forecast history. The method uses 20× attributable recurring OP and the current full issued-share basis, with no portfolio-wide multiple normalization or override changes.

002353SZ_JerehGroup_Model.json | 002353SZ_JerehGroup_FormulaModel.xlsx | 002353SZ_JerehGroup_CalculationGraph.json.gz

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.

Source-owned definitions; economic capture is not legal ownership

| Rule16 component | Exact definition/input |
|---|---|
| signal id | JEREH-LEGACY-20261025 |
| signal | Ordinary legacy demand and newenergy margin repair |
| defined outcome probability | 0.6 |
| defined event | Positive branch growth and margin-repair cohort |
| probability status | Root subjective joint-outcome judgment, not measured frequency; do not multiply again into alreadyweighted results |
| reference definition | Newcoverage has no previousforwardcompanymodel. This counterfactual retains2026actual/currentbaseline and removes subsequent new signals; it is not a priorportfolio target. |
| conditional bounds | The four complete branch schedules and cost/capacity/cash laws in financial_model bound outcome amounts/timing. |
| economic capture | 0.985 |
| overlap | Sixcomponent incrementalOP tables are disjoint. Pricing/settlement/capacity/newenergy sub-hypotheses are contained within them; neveraddtwice. |
| revision triggers | Raise/reduce defined probability on actual acceptance/core deliveries, independenttesthours, pipelinewins, cashmilestones or timingmisses. Revisit downside as well as upside. |
| reference control input | B207 |
| confidence | LOW prospective allocations; issuerorder/actual facts retained with their own source status. |

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.

Source-owned definitions; economic capture is not legal ownership

| Rule16 component | Exact definition/input |
|---|---|
| signal id | JEREH-JV-20261025 |
| signal | J&F generation: signed order and conditional future pipeline |
| defined outcome probability | 0.85 |
| defined event | Eventual realization of the defined current signed order;60pct at least90pct scheduled2027 |
| probability status | Root subjective joint-outcome judgment, not measured frequency; do not multiply again into alreadyweighted results |
| reference definition | Newcoverage has no previousforwardcompanymodel. This counterfactual retains2026actual/currentbaseline and removes subsequent new signals; it is not a priorportfolio target. |
| conditional bounds | The four complete branch schedules and cost/capacity/cash laws in financial_model bound outcome amounts/timing. |
| economic capture | 0.6 |
| overlap | Sixcomponent incrementalOP tables are disjoint. Pricing/settlement/capacity/newenergy sub-hypotheses are contained within them; neveraddtwice. |
| revision triggers | Raise/reduce defined probability on actual acceptance/core deliveries, independenttesthours, pipelinewins, cashmilestones or timingmisses. Revisit downside as well as upside. |
| reference control input | B207 |
| confidence | LOW prospective allocations; issuerorder/actual facts retained with their own source status. |

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.

Source-owned definitions; economic capture is not legal ownership

| Rule16 component | Exact definition/input |
|---|---|
| signal id | JEREH-NONJV-20261025 |
| signal | Other signed generation plus conditional follow-on units |
| defined outcome probability | 0.85 |
| defined event | Atleast65pct of remaining signed nonJVface accepted2027; later pipeline uses joint demand states |
| probability status | Root subjective joint-outcome judgment, not measured frequency; do not multiply again into alreadyweighted results |
| reference definition | Newcoverage has no previousforwardcompanymodel. This counterfactual retains2026actual/currentbaseline and removes subsequent new signals; it is not a priorportfolio target. |
| conditional bounds | The four complete branch schedules and cost/capacity/cash laws in financial_model bound outcome amounts/timing. |
| economic capture | 1.0 |
| overlap | Sixcomponent incrementalOP tables are disjoint. Pricing/settlement/capacity/newenergy sub-hypotheses are contained within them; neveraddtwice. |
| revision triggers | Raise/reduce defined probability on actual acceptance/core deliveries, independenttesthours, pipelinewins, cashmilestones or timingmisses. Revisit downside as well as upside. |
| reference control input | B207 |
| confidence | LOW prospective allocations; issuerorder/actual facts retained with their own source status. |

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.

Source-owned definitions; economic capture is not legal ownership

| Rule16 component | Exact definition/input |
|---|---|
| signal id | JEREH-MICROGRID-20261025 |
| signal | Incremental unbundled BESS/SST/control wallet |
| defined outcome probability | 0.85 |
| defined event | Any positive walletattach in fast/normal/slow;≥30pctattach probability60pct |
| probability status | Root subjective joint-outcome judgment, not measured frequency; do not multiply again into alreadyweighted results |
| reference definition | Newcoverage has no previousforwardcompanymodel. This counterfactual retains2026actual/currentbaseline and removes subsequent new signals; it is not a priorportfolio target. |
| conditional bounds | The four complete branch schedules and cost/capacity/cash laws in financial_model bound outcome amounts/timing. |
| economic capture | 1.0 |
| overlap | Sixcomponent incrementalOP tables are disjoint. Pricing/settlement/capacity/newenergy sub-hypotheses are contained within them; neveraddtwice. |
| revision triggers | Raise/reduce defined probability on actual acceptance/core deliveries, independenttesthours, pipelinewins, cashmilestones or timingmisses. Revisit downside as well as upside. |
| reference control input | B207 |
| confidence | LOW prospective allocations; issuerorder/actual facts retained with their own source status. |

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.

Source-owned definitions; economic capture is not legal ownership

| Rule16 component | Exact definition/input |
|---|---|
| signal id | JEREH-COMPRESSOR-20261025 |
| signal | Named new compressor project |
| defined outcome probability | 0.6 |
| defined event | Commercial launch byQ42027 in fast/normal |
| probability status | Root subjective joint-outcome judgment, not measured frequency; do not multiply again into alreadyweighted results |
| reference definition | Newcoverage has no previousforwardcompanymodel. This counterfactual retains2026actual/currentbaseline and removes subsequent new signals; it is not a priorportfolio target. |
| conditional bounds | The four complete branch schedules and cost/capacity/cash laws in financial_model bound outcome amounts/timing. |
| economic capture | 1.0 |
| overlap | Sixcomponent incrementalOP tables are disjoint. Pricing/settlement/capacity/newenergy sub-hypotheses are contained within them; neveraddtwice. |
| revision triggers | Raise/reduce defined probability on actual acceptance/core deliveries, independenttesthours, pipelinewins, cashmilestones or timingmisses. Revisit downside as well as upside. |
| reference control input | B207 |
| confidence | LOW prospective allocations; issuerorder/actual facts retained with their own source status. |

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.

Source-owned definitions; economic capture is not legal ownership

| Rule16 component | Exact definition/input |
|---|---|
| signal id | JEREH-RENTAL-20261025 |
| signal | Owned generation rental fleet |
| defined outcome probability | 0.6 |
| defined event | Commission byQ32028 in fast/normal |
| probability status | Root subjective joint-outcome judgment, not measured frequency; do not multiply again into alreadyweighted results |
| reference definition | Newcoverage has no previousforwardcompanymodel. This counterfactual retains2026actual/currentbaseline and removes subsequent new signals; it is not a priorportfolio target. |
| conditional bounds | The four complete branch schedules and cost/capacity/cash laws in financial_model bound outcome amounts/timing. |
| economic capture | 1.0 |
| overlap | Sixcomponent incrementalOP tables are disjoint. Pricing/settlement/capacity/newenergy sub-hypotheses are contained within them; neveraddtwice. |
| revision triggers | Raise/reduce defined probability on actual acceptance/core deliveries, independenttesthours, pipelinewins, cashmilestones or timingmisses. Revisit downside as well as upside. |
| reference control input | B207 |
| confidence | LOW prospective allocations; issuerorder/actual facts retained with their own source status. |

Exact canonical metric values and source units. Quarter panel 1 of3; the three ordered panels retain all17quarters. Weighted driver diagnostics are expectations, not a single achievable physical path.
