Company deep dive

Beijing Ingenic: specialty-memory pricing, paid supply and new sockets

300223.SZ / 03223.HK | Research date: 22 October 2026 | Framework 8.0 | CNY millions unless specified.

Ingenic combines ISSI specialty memory with embedded computing and analog/connectivity chips. Automotive and industrial qualification, long product lives and overseas customer relationships support retention. Faster DRAM repricing and higher-density products can lift profit, while foundry and purchased-die costs, limited allocation and customer acceptance determine how much reaches the company.

The Q4 2027 operating-profit ceiling is CNY 197 per ordinary share. It uses the selected quarter plus the next three quarters of operating profit, a 20x multiple and 516,744,601 ordinary-share claims. This is an analytical estimate. The saved market quote is undated and has no fresh verification; no price-dependent upside is asserted.

Measure	Current research basis
Q4 2027 earnings window	Q4 2027 through Q3 2028
Forward four-quarter operating profit	5,101
Native multiple	20x core OP
Ordinary-share proxy	516,744,601
Analytical score	46/60 = 77% | High Conviction
Protected Excel Base	78%
Latest actual	H1 ended 30 June 2026; Q2 derived from H1 less Q1
Next results boundary	27 October board meeting; Q3 actuals not released in the reviewed sources

The expected operating case prices four specific opportunities: a finite DRAM tight-price regime, additional outsourced DRAM allocation, incremental Flash server/optical capture and emerging compute/wide-I/O products. Ongoing engineering and capacity-support expenses remain in delayed outcomes. The opportunity is constrained by qualified wafers, packaged devices and commercial demand; industry AI spending is not a separate sales line.

Business economics and the supply chain

Product family	Customer value	Company capture and constraint
DRAM	Long-lived automotive/industrial memory and higher-density DDR4/LPDDR4	Design and qualified customer sockets; outsourced wafer, packaging and test availability.
Flash	NOR and medium/small-capacity NAND for industrial systems, servers and optical equipment	Accepted devices and customer pricing; server use is inside the Flash pool.
SRAM	Specialty embedded memory and selected substitutes for DRAM	Moderate unit/price path; no universal content doubling assumed.
Embedded compute	Processors and edge-AI control	Purchased-die availability, product qualification, software and support.
Analog / connectivity	Additional chips around embedded systems	Product breadth and accepted units; pricing held broadly flat in the selected proxy.
Other residual	Small technical/property/service activities	Historical revenue/cost residual carried separately.

Ingenic operates a fabless model. Manufacturing is purchased through foundries and package/test providers. ISSI is an owned business inside the group. H1 Beijing ISSI revenue and operating profit are legal-entity totals and include transactions requiring group elimination; they are not an extra memory revenue vector. Direct and indirect holdings give the group full ownership of Beijing ISSI, while smaller entities contribute reported minority interests.

Large suppliers shifting priorities can open sockets and improve niche pricing. Competition remains from alternative qualified memory vendors and embedded-compute suppliers. Customer quality, long qualification cycles, lifecycle support and intellectual property matter; no sole-source monopoly or quantified universal market share is assumed. Wafer allocation limits the ability to accept every new customer.

TAM expansion with one receipt ledger

Company market group	Opportunity	Receipt boundary
Established markets	Automotive, industrial, medical and existing embedded devices	Reference units and prices represent the existing qualified product base.
Adjacent applications	Server and optical NOR, higher-density specialty memory and new computing sockets	Incremental capture is attached to existing Flash/DRAM/compute products. Ordinary growth is already in their reference unit paths.
Emerging applications	AI MCUs, robotics, wide-I/O and stacked memory for edge systems	Finite compute and wide-I/O receipt curves have explicit joint success/delay weights and manufacturing/support costs.

The framework assigns application confidence to AI data centers at 100%; physical AI, including robotics, autonomous vehicles and edge systems in 2026-2030, at 50%; and ubiquitous compute in space, defense, quantum and augmented reality in 2027-2035 at 20%. Ingenic's established automotive/industrial business remains an ordinary product forecast. Its AI-related receipts use the distinct commercial probabilities, finite amounts and costs below. Application confidence is not a second multiplier on sales or the ceiling.

The new-business division and server/optical customer activity support a broader addressable wallet. The source does not quantify signed customer order values, usable wafers, exact subtype prices or a long-range company revenue forecast. The model therefore uses labeled LOW-confidence indices and programme endpoints. It retains the expense and qualification risks needed to capture them.

S-curve and supercycle assessment

Specialty-memory repricing is in a ramp. Server NOR already has commercial shipments, while the incremental capture modeled here remains uncertain. Emerging compute and wide-I/O are pre-ramp opportunities that still require qualification and accepted production.

The memory cycle and broader AI deployment can support demand, but supplier allocation, automotive/consumer demand and pricing normalization prevent a perpetual peak-margin assumption. Tight-price confidence declines over the forecast while purchased manufacturing, engineering and customer-support costs remain. No unsupported percentage of peak demand or additional sector-wide revenue pool is assigned.

Actual earnings: product profit and the accounting bridge

CNY millions	H1 2026	Q2 derived
Revenue	3,957	2,397
COGS	1,909	1,028
Gross profit	2,048	1,369
Selling / admin / R&D / turnover tax / impairment	775	437
Core product OP before finance/other/investment/fair value	1,273	933
Reported statutory operating profit	1,338	975
Parent net income	1,198	879

The modeled operating basis retains manufacturing costs, selling, administration, expensed R&D, turnover taxes and impairment reserves. Treasury finance income, investment gains and fair-value changes are excluded. Parent net income includes tax and other items and is not substituted for operating profit.

The mainland CAS H1 filing is unaudited. The later audited HK IFRS interim report presents the same profit-before-tax result at displayed thousand-CNY precision, with classification differences. CAS inventory impairment is placed in IFRS cost of sales; development impairment appears in other income/loss. Combining

IFRS COGS with the full separate CAS impairment line would double-charge the same loss. The small published classification and rounding residuals are preserved in the source packet.

H1 manufacturing calibration

Product	Revenue	Wafer	Package	Test	Other mfg	COGS	GP
Memory	2,632	777	246	242	102	1,367	1,265
Compute	1,043	337	63	6	0	406	637
Analog	270	67	50	13	5	135	134

These product costs are sourced. The DRAM/Flash/SRAM revenue split of 55%/33%/12% and the same split of the memory cost pool are analytical allocation proxies. The company disclosed only approximate mix ranges and no subtype gross margins. One cent of the printed analog component sum is reconciled to its reported COGS inside other manufacturing; it is not a measured change in production cost.

Issuer H1 product sales and outsourced manufacturing costs. The English table above translates the relevant categories; original source uses CNY yuan. Original source page 21; source units and decimals retained.

Management evidence and dated source limits

Event	Complete available written scope	Economic evidence
1 July 2026; posted 2 July	All 13 published topics over three PDF pages	KGD/foundry costs rising; customer repricing; supply constraint; possible H2 2027 resources; AI-MCU samples and planned production-version tape-out.
28 August 2026; posted 31 August	All 13 published topics over six PDF pages	DRAM pricing and mix; Flash largely unit-driven; approximately 20% 2026 memory unit growth viewed achievable; extra H2 2027 capacity only possible.
October individual replies	Relevant company answers preserved with question/update dates	Q4 DRAM prices continued to rise; 2027 supply expected tight; NOR supplied to multiple global server companies; ongoing T-series R&D and sample availability.

The two management documents are company-written Q&A summaries. No complete spoken prepared remarks, audio, call duration or operator closing was verified. Later individual replies are supplementary written company answers. Investor questions naming customers do not establish those customers as company-confirmed accounts.

The approximately 20% unit-growth comment is year over year for 2026. Every model unit and ASP index instead uses its H1 quarterly-average product pool as the reference. A chip count, bit capacity, price, content and revenue index are separate measures. The company says its inventory planning tracks chips rather than bits.

	的产能。明年有希望会在下半年有新的产能资源落地，但也只是预估的可能性。我们整个存储，尤其是 DRAM，是根据现有的存货和后面的生产计划来调整我们每个季度的出货，今年全年我们预计销量增长 20%左右应该问题不大，明年我们也会努力实现一个销量的稳定增长。另外我们也在密切跟进境内境外的产能资源。 **6、车规 DRAM 和消费级 DRAM 的价格差异是怎样的？后续我们怎么去看这两者之间的一个这种价格走势变化？** 看整个涨价趋势，肯定是消费级涨的更快。大家可以看到，我们开始涨价比消费大概晚了 2 个季度到 4 个季度，我们是从今年第一季度开始陆续涨价的，消费级 DRAM 有的已经涨了几倍了。我们调价以后，有可能会逐渐接近消费的价格，不过很难有一个特别稳定对比。我们现在调价是按照季度调，但是消费级可能就比较灵活，所以有可能在一段时间内我们接近了，但是很快消费又开始涨上去了。目前来说我们的价格没有消费级贵，但是在此轮涨价前车规是比消费要贵的。 **7、关于存货 Q2 比 Q1 只增加了 2 亿，能否做个说明？另外关于 DRAM 产能方面，今年明年预计会增加多少？** 我们存货不会一直能增长的，因为我们也在消耗。尤其现在产能非常紧张。我们基本上是按照我们的规划，像 DRAM 产品，我们能保证到明年年底的持续供应。那后续随着新的产能落地，我们会有希望有更多的产品供应给客户。我们会持续生产保持一个安全的存货规模。截止到上半年，我们其实存储每个产品线的销量都有增长，DRAM 在目前非常紧缺的情况下，上半年也有 20%出头的增长。 **8、从上半年的表现当中，哪些是行业涨价带来的，哪些是公司产品迭代进步带来的？** 确实，这两个因素叠加了我们一、二季度的收入增长。实际上如果看我们整个存储芯片业务的话，我们上半年销量还是比 ASP 的增长会更高一点，因为 Flash 的销量增长很高。但是如果细分下来的话，DRAM 主要是 ASP 的增长，Flash 销量占了很大一部分。如

28 August written management record: potential new supply, customer repricing and planned inventory/production. The source explicitly qualifies H2 2027 resources as a possibility. Original source page 3; source units and decimals retained.

Pricing power has a supplier-cost counterweight

Automotive pricing began to adjust in early 2026 after a two-to-four-quarter lag behind consumer markets. Customer prices can rise while foundry and KGD costs also rise. The selected model applies separate supplier-cost indices to accepted physical activity, so a pure selling-price reduction does not automatically reduce manufacturing cost.

Memory wafer-cost indices reach 125% of the H1 base through 2028 before moderating; package, test and other memory costs use their own common non-wafer index. Computing wafer/KGD proxy costs reach 135% in the near period, then ease. These are LOW analytical cost paths. The filings do not isolate KGD as a separately priced cost component, so the entire wafer category is not described as an observed KGD bill.

	政策要到三季度才能确定，不过目前看四季度供应仍然较为紧张，存在继续调价的可能性。随着客户用部分 SRAM 产品来代替 DRAM 方案，部分 SRAM 芯片二季度价格也有所上涨。NOR Flash 一、二季度都有涨价，涨价幅度总体来说比 DRAM 要小，NOR Flash 虽然产能也在趋紧，但比 DRAM 要好很多，一季度公司 Flash 产品线实现了很好的收入增长，其中销量的增长占比较大。三季度的价格是根据具体产品和具体客户情况确定的，不一定都会调价。 由于公司存储芯片持续在涨价，预计各季度毛利率会环比有所增长。 **3、DDR4 和 LPDDR4 的收入占比情况？价格和消费是否持平？** 今年一季度 DDR4 和 LPDDR4 合计收入占 DRAM 收入的比例已经超过 40%，和消费的价格相比要看具体产品类型，通常还是消费类的芯片涨价更频繁。 **4、目前 DRAM 产能情况如何？** 目前整个产业链的产能都很紧张，去年我们提前增加了备货，包括基于新制程的 20、18、16 纳米的 DDR4 和 LPDDR4 的产品，同时目前也在持续生产，预计现有存货和持续生产的部分保证今明两年的稳定供货问题不大，同时公司高层也在密切跟进国内、国外代工资源。明年下半年可能会有产能释放出来。 **5、下游客户对涨价的接受程度？** 目前客户对涨价基本是接受的，主要还是供应。 **6、DRAM 代工厂的价格是否在涨？** 有涨价，每个代工厂不太一样，不过我们可以完全顺价，毛利率预计会持续提升。 **7、明年存储的涨价趋势？** 目前无法预估，要看市场供求情况，总的来看，明年传统 DRAM 产品的产能情况可能不会有大的改善，预计供需还是会比较紧张。 **8、3D DRAM 的进展情况?** 3D DRAM 我们在紧密的研发中。DRAM 颗粒方面的设计主要

1 July written management record: rising foundry costs, expected pass-through, customer acceptance and constrained supply. Expected pass-through remains an outlook rather than a contracted fixed margin. Original source page 2; source units and decimals retained.

Engineering optionality has paid failure risk

The selected compute programme begins recognized sales in Q4 2027 only in successful launch outcomes. Wide-I/O receipts begin in 2029 only in the joint compute-and-wide-I/O outcome. These are LOW qualified-product proxies. Their mapping to the named 3D-DRAM proceeds project, whose planned readiness is May 2030, is not disclosed. The model does not claim that specific project commissions early.

A development impairment was recognized after persistent yield difficulties and weak commercial prospects for certain projects. The source does not identify the charge as the new 3D-DRAM project. The operating build retains a development-failure reserve and continuing R&D in all outcomes. Announced tape-out, samples and customer cooperation do not by themselves establish production acceptance or paid volume.

19. INTANGIBLE ASSETS (CONTINUED)

The trademarks have a legal life of 10 to 20 years but can be renewed every at a minimal cost. The directors of the Company are of the opinion that the Group would renew the trademark continuously and has the ability to do so. Various studies including product life cycle studies, market, competitive and environmental trends, and brand extension opportunities have been performed by management of the Group, which supports that the trademark has no foreseeable limit to the period over which the trademarked pro ducts are expected to generate net cash flows for the Group.

As a result, the trademark is considered by the management of the Group as having an indefinite useful life because it is expected to contribute to net cash inflows indefinitely. The trademark will not be amortised until its useful life is determined to be finite. Both trademark with an indefinite useful life and development expenditure will be tested for impairment annually, irrespective of whenever there is an indication that it may be impaired. Particulars of the impairment testing on trademark and development expenditure are disclosed in Note 18.

As at 30 June 2026, the management of the Company concluded that certain projects were not expected to generate future economic benefits, giving rise to impairment indicators due to (i) persistent yield issues during product validation and production testing, which adversely affected the technical feasibility and commercial viability of the relevant projects; and (ii) unfavourable market prospects, since the expected commercialisation could no longer be achieved and no viable alternative commercial opportunities were identified. Accordingly, the Group recognised an impairment loss of approximately RMB22,772,000 (six months ended 30 June 2025: RMB12,065,000) in respect of development expenditure that was individually assessed as fully impaired during the six months ended 30 June 2026.

20. INTERESTS IN ASSOCIATES

	As at 30 June 2026 RMB'000	As at 31 December 2025 RMB'000
Share of net assets	**792**	843

Particulars of the Group's associates, which were established and operate in the PRC, are as follows:

Name of entity	**Proportion of registered capital/ voting rights held by the Group**	**Registered capital RMB'000**	**Principal activities**
Beijing Juncheng Yiheng Technology Co., Ltd.* 北京君誠易恒科技有限公司	40.00%	4,000	Technical services
Beijing Yiming Intelligent Technology Co., Ltd* 北京益鳴智能科技有限公司	25.00%	2,000	Technical services

Audited English interim note: development impairment from persistent yield issues and unfavorable commercial prospects. The note does not identify the affected projects as the new 3D-DRAM proceeds project. Original source page 85; source units and decimals retained.

Specialty DRAM: all eighteen product-cost rows

Legacy revenue equals allocated H1 quarterly revenue x accepted unit index x the selected price path. Additional units occur only in the capacity-success branch. Wide-I/O revenue and its manufacturing cost are shown inside this vector once. Amounts are probability-weighted CNY millions. Wafer, package, test and other costs follow physical activity and supplier indices; emerging manufacturing is a separate cohort cost.

Analog and connectivity: all eighteen product-cost rows

Analog growth is modeled through accepted units with a flat ASP index. The cost indices and product-development budget allow for competition and product mix. Amounts are probability-weighted CNY millions. Wafer, package, test and other costs follow physical activity and supplier indices; emerging manufacturing is a separate cohort cost.

Quarter	Sales	Wafer	Package	Test	Other mfg	Emerging mfg	Total COGS	GP
Q3 2026	139	37	27	7	3	0	74	65

Other residual: all eighteen product-cost rows

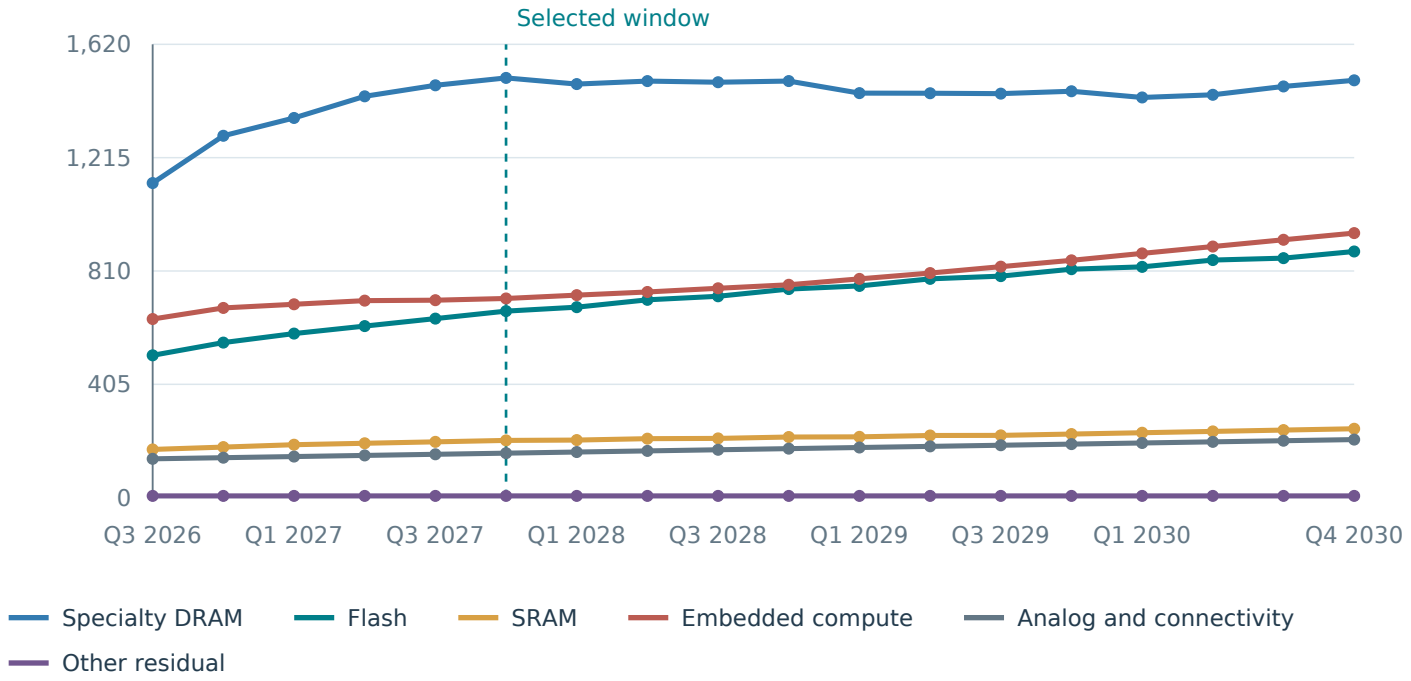

Other preserves the historical residual revenue and aggregate cost. No wafer/package/test decomposition is reported for this pool; the zero component columns denote the absence of that allocation, while the total COGS column retains its full cost. Amounts are probability-weighted CNY millions. Wafer, package, test and other costs follow physical activity and supplier indices; emerging manufacturing is a separate cohort cost.

Paid operating costs

Selling starts from the latest derived Q2 budget. A 60% fixed portion grows with the SG&A budget; the 40% variable portion follows physical activity, independently of ASP. Administration follows the same budget growth rate, shown in the technical inputs. Existing R&D grows by 3% per quarter. Additional R&D begins at CNY 6 million and rises by five hundred thousand yuan each quarter. The technical schedule preserves the exact half-million step.

Capacity-support spending begins as additional allocation is pursued and continues if receipts are delayed. Emerging customer support is 3% of its receipts. Turnover tax follows revenue; inventory-failure reserves follow memory manufacturing cost; development-failure reserves grow with the R&D budget. Depreciation and share compensation are included in these operating/manufacturing totals once.

Rule 16b: the numerical probability ledger

Hypothesis and evidence	Probability / timing	Conditional amount and cost	Overlap / failure treatment
DRAM tight pricing; July/August written records and October repricing reply	90% through 2026; steps down during 2027, then 65% in 2028, 60% in 2029 and 55% in 2030	Reference and tight price-index schedules are explicit. Manufacturing follows accepted units and separate costs.	One shared price-duration quantile across all quarters; other cost budgets continue.
Additional outsourced DRAM allocation; August management possibility	55% from Q3 2027	Successful extra unit index ramps from 5% to 70% of the H1 base; cost and working capital scale with accepted units.	Only the added cohort is weighted. Failure has no extra units; R&D and support remain.
Server/optical Flash capture; established unnamed NOR customers	80%	Adds 2% to 36% of the H1 quarterly unit base, beyond ordinary reference growth.	Ordinary Flash growth already belongs to the reference path. No full AI-server wallet is added.
Emerging compute and wide-I/O; tape-out, samples and engineering activity	25% both; 25% compute only; 50% delayed receipts	Successful compute sales rise from CNY 10 million in Q4 2027 to 270 million in Q4 2030; wide-I/O from 20 million in Q1 2029 to 170 million in Q4 2030.	Compute manufacturing: 55%; wide-I/O: 60%; support: 3%. Development costs continue in all outcomes.

These probabilities are analytical judgments about specified commercial outcomes. The evidence supports pricing and commercial relevance, while uncertain supplier allocation, unnamed customer spending, qualification and longer timing limit conviction. The operating case weights only incremental amounts beyond the reference product pool. Base score is not another probability multiplier.

The bridge switches on pricing, then additional DRAM allocation, then incremental server Flash capture, then emerging products. Interactions are assigned to the later step once. The reference includes planned

incumbent growth and continuing programme costs. It is a no-increment control within the same current operating model, not a historical report comparison.

Tight DRAM pricing: active quarterly contribution

Probability-weighted increments in CNY millions. Cost and expense changes are already included in the operating model. Applying the same probability to these amounts again would double-discount the programme.

Coherent outcomes and dependence

The model contains 108 coherent operating and cash paths. One uniform price-duration variable is drawn for the full eighteen-quarter horizon. A path uses tight DRAM prices while its draw is below that quarter's tight-price probability; as confidence declines, a path can leave the tight regime without randomly restarting it every quarter.

Nine price intervals combine with two allocation states, two Flash-capture states and three joint emerging outcomes: 9 x 2 x 2 x 3 = 108. Allocation and Flash capture are factorized analytical proxies relative to price duration. Emerging compute and wide-I/O use joint outcomes: wide-I/O requires the compute-success state. A separate correlation diagnostic tests the factorization assumption.

State factor	Probability / weight	Interpretation
Price interval	Interval width	Midpoint draw determines tight/reference price each quarter.
DRAM allocation success / absent	55% / 45%	Added units only; planned supply remains in either state.
Flash extra capture / absent	80% / 20%	Increment above the incumbent Flash unit schedule.
Compute and wide-I/O	25%	Both finite launch curves.
Compute only	25%	Compute receipts, no wide-I/O receipts.
Delayed emerging receipts	50%	No emerging receipts within the selected curve; continuing development and support costs.

For each path, calculate product receipts and costs, operating budgets, taxes and cash first. Weight every path by interval width x allocation-state weight x capture-state weight x emerging-state weight. All path weights sum to 100%. Quarter-level expected OP and cash are weighted outputs of those coherent paths. A path recipe and complete primitive schedules follow in the technical supplement.

Annual business trajectory

Calendar year	Revenue	COGS	GP	Opex	OP	OP margin
2027	12,512	5,374	7,137	1,961	5,176	41%
2028	13,311	6,120	7,191	2,203	4,987	37%
2029	13,852	6,764	7,088	2,448	4,641	34%
2030	14,670	7,475	7,195	2,718	4,476	31%

Revenue can grow while operating earnings moderate as the tight-price regime becomes less persistent, supplier costs remain elevated and R&D/support budgets rise. Annual totals are sums of the same quarterly operating case. They are not company guidance or additional revenue. The forward ceiling uses its precise rolling quarter window.

All fifteen current-plus-next-three-quarter valuations

Each complete row adds the named quarter's operating profit and the next three quarter terms, then multiplies by 20 and divides by 516,744,601 ordinary shares after converting CNY millions to yuan. Unit factor is 1. The technical supplement gives the equivalent million-share units. This preserves the starting-quarter full-issuance proxy and the native OP method.

Valuation quarter	OP0	OP1	OP2	OP3	Four-quarter OP	CNY / share
Q3 2026	1,039	1,174	1,223	1,303	4,739	183

Capital, share classes and known claims

Source fact / convention	Ordinary shares
Gross A shares issued	483,664,367
H shares issued	31,287,300
Gross A plus H	514,951,667
Treasury A inside the gross total	1,018,300
Outstanding A plus H excluding treasury	513,933,367
Remaining new-A award rights	1,792,934
Live overallotment option	0
Selected forward full-issuance proxy	516,744,601

The proxy retains gross issued A/H shares plus all remaining disclosed new-A awards. Treasury shares are counted once inside gross A because they are available for future employee reissue. The expired H-share overallotment option creates no future shares. Treasury is not a second new issue, and no future cancellation or evergreen repurchase benefit is assumed. This is a fully issued analytical convention, separate from outstanding stock or EPS weighted-average diluted shares.

H1 equity-award cash proceeds, compensation expense and future issuance are separate. Share compensation remains an operating cost. The published HK EPS denominator/award-ratio inconsistencies are not used to select the valuation denominator; the later share returns, vesting notice and prospectus establish the count bridge.

(Stock Code: 3223)

STABILIZING ACTIONS, END OF STABILIZATION PERIOD AND LAPSE OF THE OVER-ALLOTMENT OPTION

STABILIZING ACTIONS AND END OF STABILIZATION PERIOD

The Company announces that the stabilization period in connection with the Global Offering ended on Saturday, September 19, 2026, being the 30th day after the last day for the lodging of applications under the Hong Kong Public Offering. Further information of the stabilizing actions undertaken by Guotai Junan Securities (Hong Kong) Limited as the stabilizing manager (the "**Stabilizing Manager**"), its affiliates or any person acting for it, during the stabilization period is set out in this announcement.

LAPSE OF THE OVER-ALLOTMENT OPTION

The Sponsor-Overall Coordinator (for itself and on behalf of the International Underwriters) did not exercise the Over-allotment Option during the stabilization period, and the Over-allotment Option lapsed on Saturday, September 19, 2026. Accordingly, no H Shares were or will be issued under the Over-allotment Option.

Overallotment-lapse announcement: the option expired unexercised and creates no additional H shares. Existing secondary-market stabilization purchases are not new company issuance. Original source page 1; source units and decimals retained.

Finite cash and resource execution

June cash equivalents of CNY 3,954 million are the starting group balance. Restricted cash is excluded. The H-share offering net proceeds are HKD 3,056 million; the cash scenario translates them once at a LOW proxy of 87 CNY cents per Hong Kong dollar. Fees are already netted. The completed treasury buyback is deducted once in Q3 2026.

Trade working capital is modeled from receivable, advance, inventory, prepayment and payable days. Positive OP is taxed at 20%; dividends are 10% of after-tax positive OP. Cash capex includes capitalized development. Lease principal and interest are separate cash uses; the cash-interest proxy follows the H1 interest expense with budget growth, without an assumed tax shield. D&A and SBC are embedded in OP and added back once in this cash proxy. Inventory/development-failure charges receive no extra addback, conservatively retaining funding for replenishment and unsuccessful engineering.

The minimum modeled future quarter-end cash across all paths is CNY 6,390 million after the opening June balance and Q3 financing events. The opening June cash itself is lower than that future minimum. No path has a negative modeled quarter-end balance. This finite group execution check does not prove that all cash can be remitted by every subsidiary or that funded supplier allocation and customer qualification are assured. No cash NAV is added to the operating-profit target.

USE OF NET PROCEEDS FROM THE GLOBAL OFFERING

31,287,300 H Shares were issued and allotted at the offer price of HK$100.00 by way of Global Offering, and were listed on the Main Board of the Stock Exchange on the Listing Date. The net proceeds from the Global Offering (the "**Net Proceeds**") (after deducting underwriting fees and related expenses) amounted to approximately HK$3,056.03 million.

No adjustment has been made to the intended use of the Net Proceeds as set out in the section headed "Future Plans and Use of Proceeds" in the Prospectus.

The use of Net Proceeds is as follows:

Unit: HK$ million

Intended use of Net Proceeds	Approximate % of Net Proceeds	Net Proceeds from the Global Offering	Amount utilized from the Listing Date to the Latest Practicable Date	Amount unutilized as of the Latest Practicable Date	Expected timeline of full utilization
Enhance technological innovation and product development across our three core product lines	50.0	1,528.02	0	1,528.02	December 31, 2031
Strategic investments and/or acquisitions to capture growth opportunities	25.0	764.01	0	764.01	December 31, 2031
Expand our sales network and promote our products	15.0	458.40	0	458.40	December 31, 2031
Working capital and other general corporate purposes	10.0	305.60	0.62	304.98	December 31, 2026
Total	**100.0**	**3,056.03**	**0.62**	**3,055.41**	**–**

The Company will use the unutilized Net Proceeds for the intended purposes disclosed in the Prospectus. The expected timetable for the unutilized Net Proceeds is based on the best estimates of the future market conditions made by the Group. It may be subject to change based on the current and future development of market conditions.

Audited English interim report: net HKD offering proceeds, earmarks and the latest-practicable-date use schedule. These financing proceeds are not new product revenue. Original source page 30; source units and decimals retained.

Actual cash and noncash costs

H1 source amount	CNY millions
Operating cash flow	959
Cash purchases of long-lived assets	84
Staff cash payments	413
Lease cash payments	7
Lease interest expense	<1
Cash dividends paid	72
Equity-award cash proceeds	34
Share compensation expense	15
Capitalized development additions	7
D&A across the three reported categories	87

Reported operating cash flow is distinct from core OP. Actual tax, finance items, noncash charges and working-capital movements explain the difference. The future cash schedule uses the explicit execution budgets below; it is not an extrapolation of reported CFO or a claim that the entire group cash balance is freely remittable.

Q3 2030	189	223	89	70	4	<1	0	0	17,705
Q4 2030	193	223	89	71	5	<1	0	0	18,313

Expected cash is a weighted scenario estimate, not reported future CFO. Loan financing, owned foundry capex or automatic supplier capital injections are absent from this fabless-company scenario. The procurement guarantee supports outsourced processing payment obligations without a quantified wafer allocation. Current October cash and exact net-CNY IPO settlement were not disclosed in the reviewed sources.

Cash outcomes under the same operating hypotheses

Expected and conditional quarter-end group cash

CNY millions

Finite analytical group-cash scenarios. June opening cash and legal remittance/commitment limits remain separate.

Quarter	Expected	Lowest path	Highest path
Q3 2026	6,427	6,390	6,442
Q4 2026	6,833	6,685	6,872
Q1 2027	7,496	7,211	7,561
Q2 2027	8,281	7,835	8,386
Q3 2027	9,095	8,420	9,292
Q4 2027	9,885	8,952	10,192
Q1 2028	10,677	9,487	11,098
Q2 2028	11,422	9,988	11,955
Q3 2028	12,164	10,479	12,803
Q4 2028	12,870	10,934	13,678
Q1 2029	13,732	11,526	14,741
Q2 2029	14,407	11,955	15,629
Q3 2029	15,057	12,337	16,507

Quarter	Expected	Lowest path	Highest path
Q4 2029	15,685	12,691	17,379
Q1 2030	16,474	13,225	18,432
Q2 2030	17,094	13,619	19,313
Q3 2030	17,705	13,983	20,181
Q4 2030	18,313	14,338	21,045

Sensitivity: price, paid manufacturing and dependence

Each test changes the named input or interaction inside the same operating equations. These are alternatives to the selected case, not additional opportunities or a probability-weighted sum of targets. CNY per ordinary share uses the same 20x method and full-issuance denominator.

Q4 2027 case	Ceiling	Change	Cost / probability boundary
Selected case	197	0%	All selected inputs.
DRAM tight-price probability 10 percentage points lower	190	(4%)	Only the pricing weight changes; supplier costs and accepted units remain.
DRAM tight-price probability 10 percentage points higher	205	4%	Pricing probability is capped at 100%; no probability is applied to the final target again.
Legacy DRAM prices 20% lower	151	(23%)	Accepted units and wafer/package/test bills remain unchanged.
Memory and compute wafer costs 20% higher	169	(14%)	No customer pass-through; memory inventory reserve also increases.
New DRAM allocation four quarters later	188	(5%)	Added volume and its physical costs move; continuing R&D and capacity-support budgets stay paid.
Highest feasible price/allocation dependence	199	1%	Preserve each marginal probability; alter their interaction once.
Lowest feasible price/allocation dependence	196	(<1%)	Preserve each marginal probability; alter their interaction once.
DRAM receives 45% of the starting memory cost pool	195	(1%)	Flash cost share becomes 43%; SRAM stays 12%; starting total memory cost is unchanged.
DRAM receives 65% of the starting memory cost pool	200	1%	Flash cost share becomes 23%; SRAM stays 12%; starting total memory cost is unchanged.
Paid R&D 20% higher; failure reserve unchanged	189	(4%)	Existing and incremental engineering rise without added receipts; the development-failure reserve stays unchanged.

A pure price decline leaves physical procurement costs in place. The cost-allocation tests address undisclosed DRAM/Flash subtype margins; they do not assert different historical manufacturing totals. The dependence bounds test the interaction between scarce pricing and extra allocation while preserving their separate odds.

Sensitivity: ordinary claims and accessible funding

Extra ordinary claims	Whole shares	Q4 2027 ceiling
0%	516,744,601	197
5%	542,581,831	188
10%	568,419,061	179

The 5% and 10% claim tests change only the valuation denominator. They do not invent financing proceeds, alter operating receipts or cancel existing treasury claims. Future award authorizations beyond the disclosed remaining plan remain unresolved.

Accessible-pool test	Result
Opening resources	50% of June group cash and 10% of net IPO proceeds
Continuing uses	Actual buyback; paid R&D/support, working capital, capex, lease and dividend budgets retained
Lowest future quarter-end path cash	CNY 2,021 million
Weight of paths with negative modeled cash	0%

This tests a restricted resource envelope; it is not evidence that half the June cash is legally trapped or that only a tenth of IPO proceeds can fund operations. No liquidation value or extra cash is added to the earnings ceiling. Qualification and usable supplier allocation remain separate constraints even when a modeled cash balance is positive.

The complete analytical scorecard

Category	Points / range	Assessment
Core thesis	17/20	Qualified specialty-memory and embedded-compute relationships, product design and lifecycle support support durable capture; foundry access and alternatives limit exclusivity.
Cycle stage	9/10	H1 results and observed repricing support the current ramp; cost inflation and supply availability constrain continued growth.
TAM expansion	8/10	Server/optical memory and edge intelligence broaden eligible sockets, with finite receipt and qualification assumptions.
Catalysts	4/5	Price resets, H2 2027 allocation possibilities and product launches have defined timing and commercial tests.
Macro	7/10	Supplier capacity reallocation supports niche pricing, while cyclicality, FX and end-customer demand remain material.
Alpha	4/5	Automotive and specialty-memory customers reprice after consumer devices. Existing qualified sockets can capture that lag and higher-density Flash demand, subject to wafer allocation, procurement costs and customer acceptance.
Risks	-3 (0 to -5)	Three separately scored mechanisms: supplier/KGD allocation and cost; memory pricing/inventory; engineering and customer qualification.

The score is 46/60, rounded to 77%, classified High Conviction. Protected Excel Base remains 78%. Thesis score and programme probabilities measure different things; neither is multiplied into operating income again.

Risk class	Deduction	Economic mechanism
Supplier allocation and purchased-die cost	-1	Paid devices and pass-through can fail even when end demand is strong.
Memory cycle and inventory	-1	A reversal of scarcity prices and obsolete inventory compresses earnings.
Qualification and engineering	-1	Yield, product readiness, customer adoption and competitive alternatives can delay or remove programme receipts.

Evidence that would change the case

Test	Evidence and financial consequence
27 October board / subsequent Q3 results	Reconcile reported product mix, realized GP and cash against the current source-calibrated paths. The meeting date is not already-reported earnings.
Quarterly price realization	Compare accepted customer prices with foundry/KGD, package/test and inventory costs; adjust price-duration weights and cost indices jointly.
H2 2027 resources	Distinguish planned production and inventory from signed incremental allocation, usable devices and qualified shipments. Delay affects added units while paid support persists.
Server and optical capture	Identify socket revenue, accepted deliveries and customer concentration inside Flash; remove overlap with ordinary growth.
Emerging products	Track tape-out, acceptable yield, qualification, repeat orders and customer-support spending. Published samples and future project budgets are intermediate milestones.
Cash / claims	Reconcile inventory, receivables, supplier prepayments, net proceeds, treasury use, awards and ownership; retain the ordinary A/H method.

Micron, Samsung, Nanya and other specialty-memory suppliers influence available markets, but industry capacity headlines are not Ingenic allocation. NOR competitors and embedded-compute alternatives can also take sockets. The selected opportunity requires both engineering feasibility and commercial returns after purchased manufacturing and support costs.

Technical supplement: bases and precision

Main financial tables use whole CNY millions, with nonzero amounts below one shown as <1. Main probabilities are whole percentages. Original exhibit decimals remain unchanged. The following technical tables show six decimals to reconcile the arithmetic at displayed precision; full machine precision remains in the supplied model calculation and path data. Rounded terms can differ slightly from a separately rounded total.

H1 quarterly-average base	Revenue	Total COGS
Memory	1,315.808133	683.347648
Compute	521.702262	203.130635
Analog	134.803934	67.592304
Other	6.317393	0.630306

Allocate memory revenue and each cost component 55% to DRAM, 33% to Flash and 12% to SRAM. For product j in quarter i: legacy revenue = allocated base revenue x accepted unit index x ASP index. Each manufacturing component = H1 component /2 x allocation weight x accepted unit index x its supplier-cost index. Add successful emerging receipts and their separate manufacturing cost once. Other preserves its aggregate source COGS.

H1 manufacturing pool	Wafer	Package	Test	Other
memory	777.266990	245.769695	242.143550	101.515061
compute	337.351587	63.080320	5.829364	0.000000
analog	66.545556	50.267951	13.152263	5.218838

Technical inputs 1: accepted activity, prices and programme receipts

Indices are relative to the H1 quarterly-average pool. They are LOW analytical proxies and do not represent disclosed physical chip counts or measured ASPs. Successful emerging receipts are CNY millions; their joint probabilities are applied through the path weights.

Quarter	DRAM units	Reference ASP	Tight ASP	Tight probability	Extra units if allocated

Technical inputs 2: accepted activity, prices and programme receipts

Indices are relative to the H1 quarterly-average pool. They are LOW analytical proxies and do not represent disclosed physical chip counts or measured ASPs. Successful emerging receipts are CNY millions; their joint probabilities are applied through the path weights.

Technical inputs: supplier costs

The non-wafer index applies separately to package, test and other components. Paid costs follow accepted physical activity, independently of customer ASP. Emerging compute manufacturing is 55% of its receipts; wide-I/O is 60%, with another 3% for customer support in selling.

Technical recipe: operating costs and cash

Let i = 0 for Q3 2026, with t = i + 1. SG&A budget factor = (1 + 0.015)^t; R&D budget factor = (1 + 0.03)^t. Fixed selling = latest Q2 selling base x 0.60 x SG&A factor. Variable selling = same base x 0.40 x activity index. Activity index is the sum of each base revenue x accepted unit index, plus the Other base, divided by total H1 quarterly-average revenue. ASP and emerging receipts do not inflate this legacy activity index.

Administration = Q2 admin base x SG&A factor. Existing R&D = Q2 R&D base x R&D factor. Incremental R&D = 6 + 0.5 x i. Emerging support = 0.03 x emerging receipts. Turnover tax = (H1 quarterly tax / total quarterly revenue base) x total receipts. Inventory reserve = quarterly inventory charge x memory COGS / memory COGS base, including emerging DRAM manufacturing. Development reserve = quarterly development charge x R&D factor. Add the capacity-support budget. GP minus these costs equals OP.

Operating / cash primitive	Value at technical precision
Q2 selling base	116.040858
Q2 admin base	58.334743
Q2 expensed R&D base	210.246341
Quarterly turnover-tax base	4.152206
Quarterly inventory reserve base	19.529928
Quarterly development reserve base	11.385954
Quarterly embedded D&A base	43.681306
Quarterly embedded SBC base	7.263914
Opening June net trade NWC	3,382.504116
Opening June cash equivalents	3,953.712084

Embedded D&A = 43.681306275 x 1.02^t; embedded SBC = 7.263914 x 1.03^t. These totals are already in OP, added back once for cash. Net trade NWC = R x (45-2) / 91.25 + COGS x (300+12-70) / 91.25. Cash tax = 20% x MAX(OP,0). Dividend = 10% x MAX(OP-tax,0). Capex including capitalized development = 50 x 1.02^t; lease principal = 3.2 x 1.02^t; cash lease interest = (0.35760745 / 2) x 1.02^t. In Q3 only, add 3056.03 x 0.87 net IPO cash and deduct 150.01182433 buyback cash. Closing cash = opening cash + OP - tax + D&A + SBC - change in NWC - capex - lease principal - lease interest - dividend + IPO - buyback. There is no extra inventory/development impairment addback or interest tax shield.

Technical path reproduction and all weights

For each price interval [lo,hi], use u = (lo + hi) / 2. Quarter i uses tight prices if u is below its tight-price probability, otherwise reference prices. Add successful allocation and server indices according to the binary state. Emerging receipts follow the named joint outcome. Calculate each path before weighting. Path weight = (hi - lo) x allocation weight x capture weight x joint-emerging weight. The 108 technical weights below preserve small positive states.

Path	Price u interval	Allocation	Flash capture	Emerging outcome	Weight

Technical valuation reconciliation at shown precision

Each row uses its four explicit OP terms, the same 20x multiple, unit factor 1 and 516.744601 million ordinary shares. Full precision is retained in the model. These six-decimal printed terms reconcile at shown precision rather than every last stored decimal.

Quarter	OP0	OP1	OP2	OP3	F4 OP	CNY/share

Sensitivity valuation windows: Q3 2026 to Q3 2027

Whole CNY per ordinary share. Each outcome uses the same named quarter plus its next three OP terms and the same 20x / 516.744601-million-share method. No cash or score multiplier is added.

Case	Q3 2026	Q4 2026	Q1 2027	Q2 2027	Q3 2027
Selected	183	194	200	202	201
DRAM tight-price probability 10 percentage points lower	180	190	195	196	194
DRAM tight-price probability 10 percentage points higher	187	199	206	209	208
Legacy DRAM prices 20% lower	143	151	156	157	155
Memory and compute wafer costs 20% higher	159	169	174	175	173
New DRAM allocation four quarters later	183	194	198	198	193
Highest feasible price/allocation dependence	183	194	201	203	202
Lowest feasible price/allocation dependence	183	194	200	202	200
DRAM receives 45% of the starting memory cost pool	182	193	198	200	198
DRAM receives 65% of the starting memory cost pool	185	196	203	205	204
Paid R&D 20% higher; failure reserve unchanged	176	187	193	194	193

Sensitivity valuation windows: Q4 2027 to Q4 2028

Whole CNY per ordinary share. Each outcome uses the same named quarter plus its next three OP terms and the same 20x / 516.744601-million-share method. No cash or score multiplier is added.

Full originals and hashes are preserved. The stated financial, business and accounting/cash/share pages were reviewed, rather than every page of the mainland and HK reports. Both newest management records were read in full as written Q&A; spoken/audio completeness is unverified.

Gaps include Q3 actuals, numerical forward company guidance, subtype costs, observed unit/ASP indices, firm added wafer quantities, customer-specific AI orders, current cash, net-CNY IPO settlement and future treasury allocation. Published inventory and HK EPS/award inconsistencies remain documented; filed balances and later share records control the relevant facts.
