Sinocera / 国瓷材料 · current assessment

October 23, 2026 · 300285.SZ · Framework 8 · CNY amounts unless stated otherwise.

Watchlist / materials-platform beneficiary. Qualified powders, ceramic processing and accepted formulations provide routes to higher-value external sales. Customer uptake, ordinary costs, finite capital charges and parent ownership constrain the current operating-profit ceiling.

Sinocera has a qualified materials platform, established MLCC relationships, a growing dental franchise and several credible routes into higher-value thermal/electrical formulations. The economic opportunity comes from selling a better qualified powder, purchased-and-metallized ceramic substrate, or accepted filler formulation at a profitable external invoice. Material content, qualified purchase share and repeat orders determine retained earnings. The company does not own a complete capacitor, TEC, optical module, data-centre rack or glass-cloth invoice.

The active Q4 2027 modeled ceiling is CNY 26.20 per share, using expected recurring prefinance parent operating profit for Q4 2027 through Q3 2028. It is a model estimate. No verified dated market snapshot supports a current-price return comparison.

T001 · Current model and score

Measure	Value	Unit / scope
Active Q4 2027 ceiling	26.20	CNY/share
Forward parent OP	1.32	CNY billion; Q4 2027–Q3 2028
Operating-profit multiple	20.00	times
Gross forward shares	1,010.00	million shares
Currency unit factor	1,000.00	CNY billion × 1,000 / shares in millions
Current analytical Base	68.00	Framework 8
Protected Excel Base	72.00	Separate owner-protected input

Funding is a decisive limit. Baseline quarter-end essential-funding gaps are zero, while disruption has a CNY 70.04 million principal-first intraquarter gap. The trade-credit no-renewal, earliest bank-maturity and combined stresses fail the positive-probability funding test. Conditional quarter-end support does not establish daily or legal-entity liquidity.

1 · Published actuals and earnings definitions

H1 2026 revenue was CNY 2.513 billion, gross profit CNY 946 million and recurring prefinance group operating profit CNY 405 million. Statutory operating profit was CNY 440 million; parent-attributable net income was CNY 363 million. These are rounded historical figures, with exact reconciliation in the appendix.

H1 is the latest recovered published actual period as of October 23. Q3 results are scheduled for October 27. Recurring prefinance group OP retains ordinary share compensation and impairments while separating other income, investment/disposal items and finance. Parent net income is an after-tax measure; it does not establish actual parent prefinance OP.

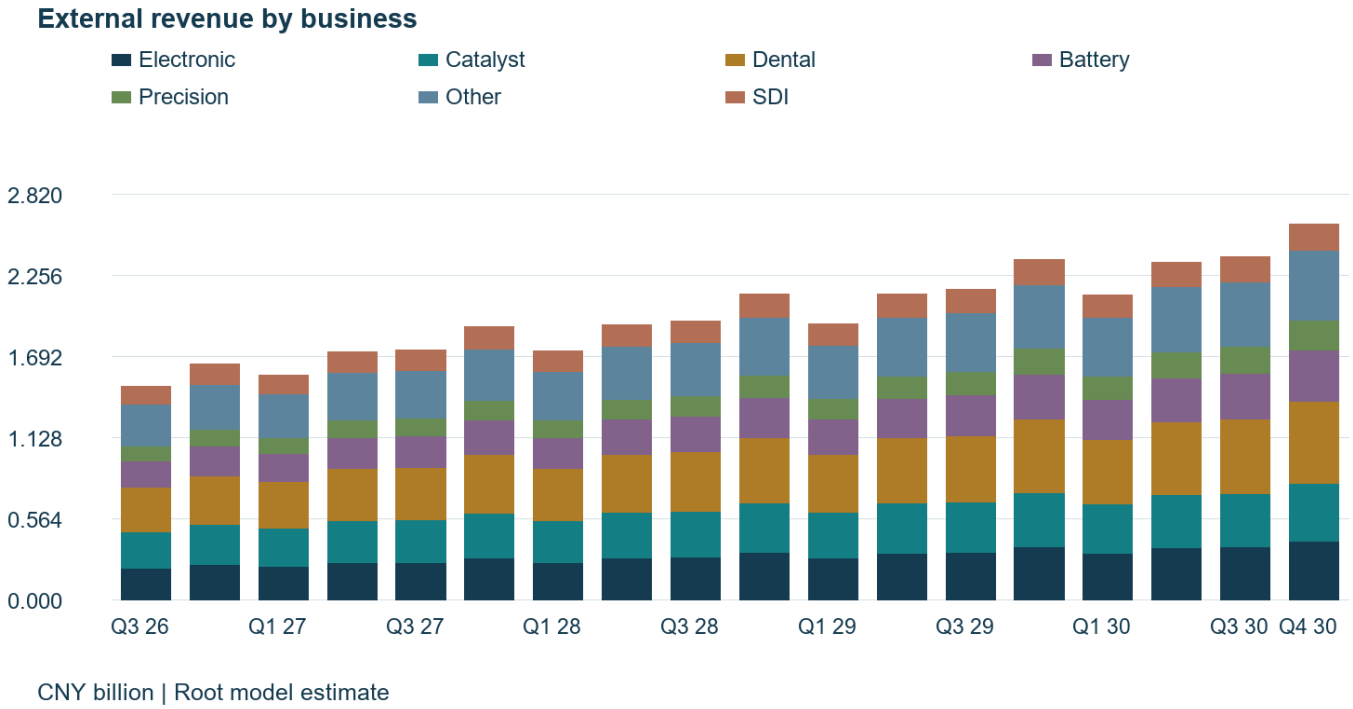

T002 · H1 2026 published actuals

Measure	CNY billion
Revenue	2.513
Gross profit	0.946
Recurring prefinance group OP	0.405
Statutory group operating profit	0.440
Parent-attributable net income	0.363

The two newest dedicated earnings-result communications are August 5 H1 and May 8 annual results, fully read in their preserved issuer-authored written form. May 15's chronologically newer collective reception and April 27 Q1 communication are additional evidence. These records contain issuer-selected prepared material and Q&A, not verified complete event audio/verbatim transcripts. May 8's primary host has now been recovered byte-identical to its mirror; May 15 remains mirror-hosted. That source limitation is retained without treating missing audio as a reason to set every conditional opportunity to zero.

2 · Operating outlook · H2 2026 through 2030

All 2026 forecast rows below are H2 only (Q3–Q4). H1 actuals remain separate. Seven disjoint external vectors capture legacy operations and SDI from closing; internal turnover is eliminated. Forecasts are conditional model estimates, with LOW unit/mix/capture calibrations rather than disclosed physical shipment guidance.

CNY billion | Root model estimate

3 · Joint regimes and programme conversion · Rule 16b

The mutually exclusive joint regimes carry LOW judgment weights of 10% disruption, 25% slow, 45% orderly and 20% rapid. They jointly cover qualification, eligible customer uptake, competing supply, costs, working capital, commissioning and ordinary financing. Their active Q4 2027 conditional ceilings are CNY 1.23, 16.81, 30.08 and 41.72 per share, respectively. Expected operating profit is weighted before the unchanged share, multiple and currency-unit bridge. These weights are judgments rather than measured statistical frequencies.

For 2027, expected residual overlays are CNY 19.96 million for filler, CNY 3.79 million for TEC, CNY 30.14 million for multilayer and CNY 8.14 million for sulfide. Related commercial growth already included in the base is removed through overlap. Only the 20% rapid regime contributes realized multilayer increment in 2027; the 45% orderly regime also contributes in 2028. Sulfide contributes in the 65% orderly-plus-rapid cases in 2027. The tables distinguish gross adoption support, positive residual after overlap and realized receipts after capacity.

T004 · Coherent joint regimes

Regime	Weight	Q4 2027 ceiling	Commercial rationale
Disruption	10.00%	1.23	Qualification and demand disappoint; no short-bank refinancing. Ordinary aggregate trade credit retained, working-capital days worsen, costs inflate and CIP commissioning is late.
Slow	25.00%	16.81	Partial customer uptake and slower capacity conversion; existing short-bank debt rolls at the same face with no new free facility.
Orderly	45.00%	30.08	High-grade powder/dental demand advances; small programmes convert gradually. Ordinary funding, competition and cost recovery remain assumptions.
Rapid	20.00%	41.72	Several new qualified programmes convert earlier and existing grades gain share, with higher engineering/support, cash investment, tax, outside claims and competitive response.

T005 · Programme support and expected incremental receipts

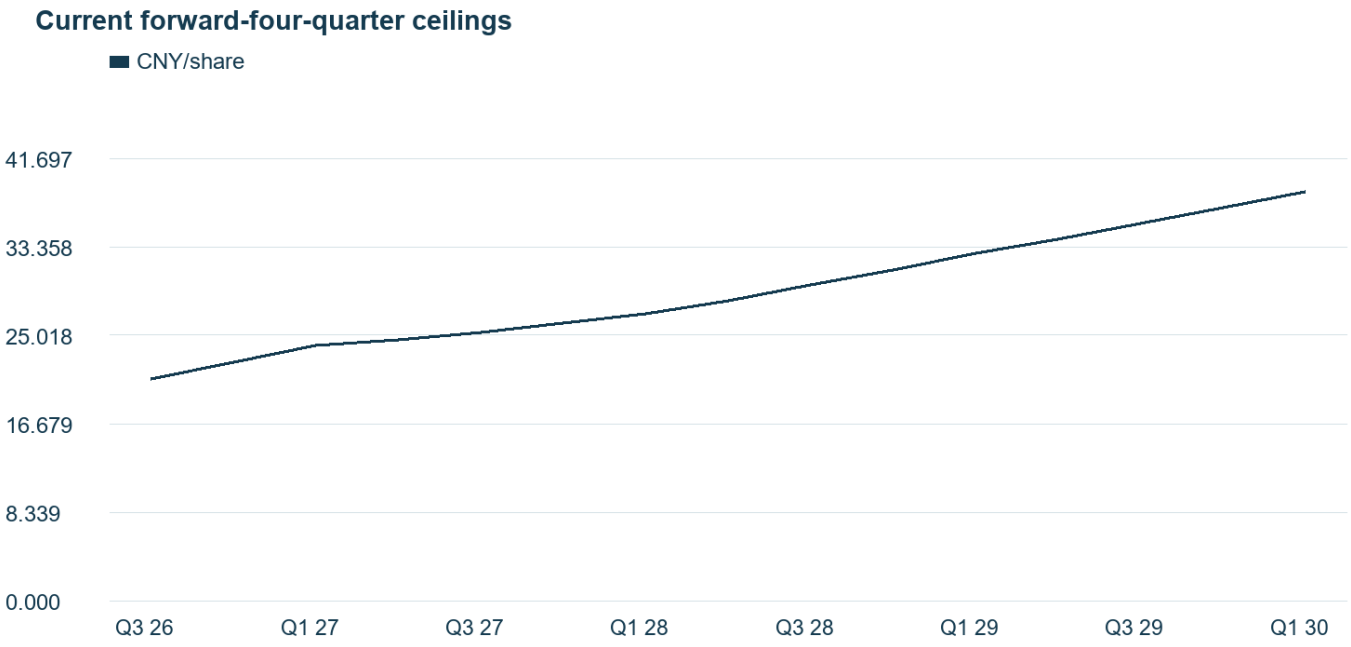

Period	Programme	Gross-positive support	Positive after overlap	Positive after capacity	Expected realized CNY B
H2 2026	filler	90.00%	0.00%	0.00%	0.000000

2030	filler	100.00%	100.00%	100.00%	0.260533
2030	TEC	100.00%	100.00%	100.00%	0.021198
2030	multilayer	100.00%	100.00%	100.00%	0.259669
2030	sulfide	100.00%	100.00%	100.00%	0.067278

Gross adoption support, positive residual after overlap and positive realized increment after capacity describe different model events. A case can have gross commercial activity with zero residual because base growth already contains it. The percentage retaining a positive residual is not a standalone commercial-success confidence estimate. Shared-state costs and risks are weighted once.

4 · Current forward operating-profit ceilings

For each row, the forward window comprises that quarter and the following three quarters. Ceiling = 20 × forward recurring prefinance parent OP in CNY billion × 1,000 ÷ native gross forward shares in millions. The linked model retains the complete quarter windows. Cash is not added to this operating-profit valuation.

CNY/share | Root model estimate

Canonical current active bridge; negative signs are mechanical plot transformations.

5 · Cash, repayment timing and failed financing stresses

The baseline depends on ordinary trade-credit renewal, the modeled bank repayment clocks and cash collection before the relevant intraquarter payments. Its disruption case has only a narrow cash buffer. The explicit failed tests below remain failed; they are not assigned plausible-looking model prices.

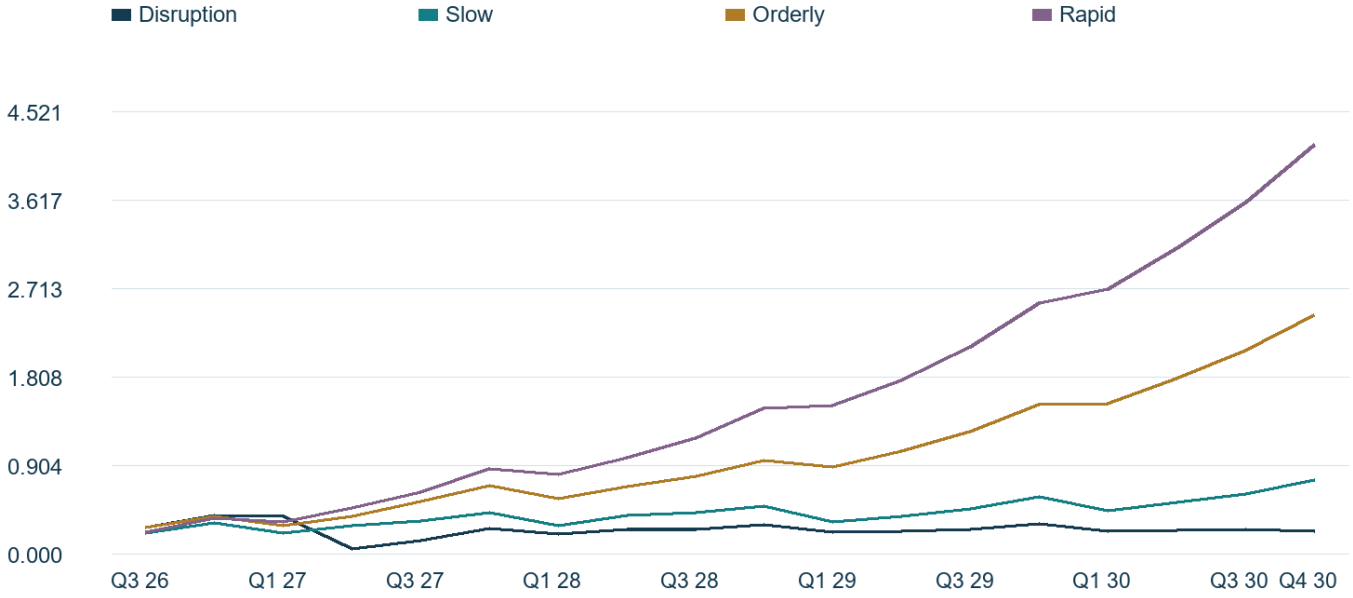

T007 · All eight financing tests

Test	Model status	Q4 2027 CNY/share	Disruption min cash CNY B	Essential gap CNY B
Baseline	Accepted	26.20	0.052656	0.000000
No trade-credit renewal	BLOCKED	BLOCKED	-0.096962	0.197147
Earliest short-bank maturity	BLOCKED	BLOCKED	-0.105274	0.204797
No renewal + early maturity	BLOCKED	BLOCKED	-0.155225	0.254748

Test	Model status	Q4 2027 CNY/share	Disruption min cash CNY B	Essential gap CNY B
Additional all-in fee shock	Accepted	26.20	0.050157	0.000000
CNY 100M hard cash floor	BLOCKED	BLOCKED	0.100000	0.047344
CNY 150M hard cash floor	BLOCKED	BLOCKED	0.102842	0.097344
Zero-weight disruption diagnostic	Accepted	28.62	-0.096962	0.197147

Baseline disruption principal-first sequencing produces a CNY 70.04 million funding gap before the quarter's receipts. Quarter-end funded status therefore relies on payment/collection timing and group cash fungibility. Exact bank/bill maturity dates, bill-specific fees and entity cash-transfer limits remain unverified. The zero-weight diagnostic removes disruption risk only to demonstrate the support rule; it is not the baseline probability judgment.

Conditional closing cash

6 · Current framework score and evidence to watch

T008 · Analytical score components

Component	Points	Maximum	Current rationale
Core	16	20	Qualified multi-material platform and established customer relationships; incomplete new-grade entity/qualified-capacity visibility.
Cycle	8	10	High-end MLCC/dental mix offset printing demand and raw-material pressure; competitive expansion continues.
TAM	8	10	Several expanding material content opportunities, restricted to actual external powder/carrier/substrate/consumable invoices.
Catalyst	4	5	Qualification, commissioned equipment and acquired channel adoption can change receipts; no bulk AI multilayer award assumed.
Macro	8	10	AI infrastructure and selected supply diversification support demand, with auto mix, regulation, FX and complementary inputs at risk.
Alpha	2	5	The material opportunity is real but public product-stage evidence is less mature than investor-system revenue claims; no fresh dated market quote supports an excess-return claim.

Company-specific alpha

Sinocera's opportunity begins with the combination of powder control, formulation, customer qualification and downstream ceramic processing. An established materials supplier can extend a qualified relationship into a higher-performance grade, gain a larger share of customer purchases or earn more value through a downstream process. The evidence is strongest where the company already has external sales and repeat customer work: MLCC powders and pastes, zirconia, existing precision ceramics and early filler orders. The parent benefit depends on accepted external invoices after purchased inputs, development costs, working capital and subsidiary ownership.

AI and automotive demand can improve the electronic-material mix because Sinocera already supplies named MLCC makers and has completed part of its high-end expansion. Finished-capacitor contracts establish downstream demand; the powder receipt depends on material content, qualified allocation and realized grade price. Competing suppliers are also expanding, and Sakai describes both high-end capacity pressure and input-price pass-through. The attractive mechanism is continued qualification and commercial mix improvement supported by process consistency. Its failure condition is slow accepted volume or weak net pricing after the full cost of the grade.

Precision and filler programmes can extend the platform into higher-value applications. TEC already has small-batch customers, while AI multilayer substrates remain in joint development and validation. Spherical silica has early sales; hollow silica is still validating. These stages allow conditional commercial paths with explicit timing and cost. The January metallization filing supplies a physical panel envelope across multiple uses; it does not allocate capacity to an AI customer. Xuguang's actual sales of bare substrates to Ceratron also show that downstream value can rely on externally purchased ceramic inputs.

Dental materials have two distinct earnings mechanisms. Selective zirconia repricing can recover value on eligible external grades, with raw-input inflation and customer response assessed alongside it. SDI broadens the clinical product range and distribution reach of the existing laboratory-side business. Its historical organic sales and product transition deserve their own attention: fiscal 2025 revenue declined slightly, amalgam fell sharply and newer restorative products had a smaller actual sales base. Cross-selling can improve reach, with distributor support, registration, marketing, employment and inventory carried as operating requirements.

Catalysts that can change the evidence

The next scheduled company results release is October 27. It can add actual revenue, margins, cash collection, acquisition accounting and operating commentary. As of October 23, Q3 actual results have not been recovered and must remain outside the actual financial anchor. A single consolidated growth figure will still need a product and acquired-business bridge before it can verify an emerging programme.

The most useful commercial milestones are repeat accepted orders, grade-specific capacity release and cash conversion. For MLCC, the test is qualified high-end sales and realized mix. For TEC, it is movement from small batches toward sustained customer purchases, with the actual panel/part invoice and process cost identifiable. For

multilayer, it is accepted production after joint validation, supported by compatible commissioned resources. For fillers, it is repeat orders in a qualified laminate formulation. For sulfide, it is customer industrialization and recognized electrolyte sales beyond line readiness. These observations can update a conditional case without requiring a public named award as the sole permitted evidence.

Dental follow-through should be visible in eligible zirconia price realization, retained volume, SDI channel sell-through and replacement-product uptake. Acquisition inclusion supplies an accounting step from the July closing; organic improvement requires additional customer evidence. Integration commentary is most useful when it identifies a concrete product, market, cost or inventory effect rather than an unmeasured group-wide synergy.

Risks and decisive failure tests

Competition and complementary inputs can limit the conversion of demand into Sinocera sales. Nippon Chemical plans expanded dielectric-material capability, Tokuyama plans more AIN powder and Denka is developing different low-loss formulations. The customer can change grade, loading or supplier as performance and price evolve. Denka's glass-cloth constraint also shows how another laminate input can delay adoption even when filler performance is acceptable.

Physical readiness and customer acceptance have different clocks. The proposed DPC increment, existing nameplate and deferred phase-two equipment plan cannot all be treated as newly qualified AI output. A panel count needs compatible process, eligible use, usable cut area and accepted net price. The EIA's assumed 80% factory-pass rate is already incorporated in its output/processed-area check, while actual operating yield remains undisclosed. Failure to turn new equipment and qualification spending into repeat external sales can leave depreciation, staffing, utilities and working capital ahead of receipts.

Parent capture can differ from group growth. Ceratron has a reported 88.89% direct holding, and Kanglitai has a direct 60% holding under its exact Chinese legal name. The filler producer is unassigned in the recovered sources, and some other holdings are reported indirectly. The parent's earnings depend on the operating profit pool, minority rights and corporate-cost allocation across the relevant entities. Purchases within the group also eliminate before external sales.

SDI carries product, channel, currency and integration risk. Amalgam demand is eroding under regulation and customer substitution; replacement sales may retain only part of that demand. The older scheme's EU date is superseded by the current regulator summary, while product geography and medical exemptions still matter. Distributor dependence, receivables, employment and marketing can absorb a stronger gross margin. Current post-close accounts, purchase-price allocation and closing-balance gaps require explicit assumptions until disclosed.

Source quality is a final discipline. Investor questions about NVIDIA, Phononic, Rubin, CPO, HBM, exclusivity, order sizes and capacity are preserved separately from the company's replies. Generic progress statements do not confirm those assertions. The written management records have been read in full as published; complete session audio and verbatim coverage remain unverified. A repeat of an earlier milestone changes confidence only to the extent that it adds commercial information.

Business evidence · How the materials platform can earn more

Sinocera sells engineered materials whose value depends on particle control, formulation, process consistency and customer qualification. Its established customer relationships create a route from a laboratory result to repeat external sales. The most relevant opportunities are higher-grade MLCC powders, selected zirconia products, metallized ceramic substrates and low-loss fillers. Each route has a different customer, manufacturing step and commercial timetable.

The earnings mechanism is specific: a qualified grade can gain a larger share of a customer's purchases, serve a higher-value application or support a selective price increase. Greater sales can then absorb the engineering and manufacturing resources that support the grade. The evidence currently supports a mixture of established sales, small-batch orders, validation and proposed capacity. The eventual earnings estimate must assign those stages separately and charge the resources required to move between them.

The company also has substantial conventional businesses: automotive catalyst carriers, battery-coating materials, ceramic balls, dental materials and printing inks. These businesses supply the revenue base and carry their own competitive and cost cycles. SDI adds an acquired clinical-consumables operation from its July closing. Its existing sales, integration work and any later cross-selling should be tracked separately.

T010 · The external sales boundary

Business	What Sinocera sells	Relevant limit
Electronic materials	MLCC dielectric powders, electrode pastes and consumer zirconia	Finished capacitors and their contract value belong downstream.
Catalyst materials	Carriers, ceria-zirconia chemistry and zeolites	A material or carrier invoice captures part of the aftertreatment system.
Legacy biomedical	Dental powders, blocks, equipment and related channels	Powder transferred into the group’s own blocks eliminates on consolidation.
New-energy materials	Coating powders/slurries, additives, grinding media and electrolyte materials	Existing coating sales and a future sulfide order are different demand pools.
Precision ceramics	Balls, ferrules, structures, substrates and RF packages	Mixed piece counts do not identify TEC or AI substrate shipments.
Printing and other	Inks, glazes, CCL fillers and optical dispersions	New filler sales remain within the existing external business boundary.
SDI	Clinical restorative consumables, whitening and equipment	Acquired revenue enters once from closing; synergies require additional evidence.

Approved source-only business table; original sources and stage constraints appear with the adjacent exhibits and linked source register.

Business evidence · Use the physical units that the company actually reports

The 2025 volume table is a useful operating anchor because it identifies the company's real units. It also shows why a broad volume cannot establish an emerging product's addressable market. Electronic-material tonnage combines powders, pastes and consumer zirconia. Precision-ceramic pieces combine products with very different sizes and prices; the issuer attributes the year's volume growth to ceramic balls. New-energy tonnage combines established materials rather than identifying sulfide electrolyte sales.

A broad revenue-to-volume ratio is therefore a diagnostic of the reported mix. A grade-level forecast needs a separate eligible share, physical content and net external price. The same invoice cannot be added again through a technology overlay. This boundary matters most when a familiar material appears in a faster-growing end application.

T011 · 2025 reported sales volumes and usable interpretation

Reported family	Sales volume	Interpretation
Electronic materials	9,921 tonnes	Mixed powders, pastes and consumer zirconia; Al-grade tonnes undisclosed.
Honeycomb catalyst carriers	19.10 million litres	Carrier volume; excludes the value of a complete exhaust system.
Biomedical materials	3,268 tonnes	Mixed biomedical products; no single dental-grade ASP follows.
New-energy materials	48,247 tonnes	Mixed established materials; no sulfide allocation disclosed.
Precision ceramics	1,109.07 million pieces	Mixed pieces; ceramic-ball growth does not create a TEC unit base.
Architectural printing and other	72,016 tonnes	Includes glaze growth; unsuitable as a filler-only denominator.

Approved source-only business table; original sources and stage constraints appear with the adjacent exhibits and linked source register.

Source: https://static.cninfo.com.cn/finalpage/2026-04-21/1225126921.PDF | 2026-04-21 | Physical PDF page 31 | Stage: Historical actuals; mixed-product volume

Business evidence · MLCC: qualified powder exposure to a stronger downstream mix

Sinocera supplies both basic and formulated MLCC dielectric powders and identifies Samsung Electro-Mechanics, Yageo, Fenghua and Microgate among its customers. The August 5 written results communication says part of the high-end AI-server and automotive powder expansion has been completed. Subsequent replies describe continuing expansion and a demand-led release of capacity. These statements support an operating customer base and a route to higher-grade sales. Qualified tonnes, grade-specific utilization, yield, customer allocation and realized prices remain undisclosed.

Samsung Electro-Mechanics provides independent evidence of demand downstream. Its July 30 release reports second-quarter component-unit sales of KRW 1,649.4 billion, up 29% year over year, with AI-server, network and automotive MLCC demand. Its September 1 release announces a KRW 1.0722 trillion AI-server MLCC contract for calendar 2027. The component sales and contract are downstream demand signals. They contain no allocation to Sinocera or disclosed powder content per capacitor. Samsung's aggregate contract figures also overlap individual awards and include silicon capacitors in some totals.

Competing supply is responding to the same opportunity. Nippon Chemical's August 18 announcement targets expansion completion and operation in fiscal 2027. Its approximately 1.5-times AI-response capability includes barium titanate and high-purity barium carbonate together. Sakai's August results discussion describes strong high-end SKUs, nearly full capacity and expansion being considered concretely. Sakai also says customer AI end-use is largely inferred from SKU growth. These disclosures support high-end demand while leaving room for competitive capacity and uncertain application attribution.

Sinocera's opportunity depends on grade qualification, consistent electrical performance and external purchase share. Published particle size alone cannot establish exclusivity: competing suppliers publish nanoscale dielectric materials too. A useful failure test is whether high-end sales and realized mix improve after new capacity becomes available, while qualification delays, input inflation and competing supply remain visible in costs and working capital.

T012 · Demand evidence and the invoice it can support

Evidence	Supported reading	Still required for a Sinocera receipt
Named MLCC customers	Existing commercial relationships	New-grade qualified allocation, purchase volume and realized powder price.
Partial high-end expansion completed	Additional supply capability is being developed	Operating output, yield and customer acceptance by grade.
Samsung 2027 finished-MLCC contracts	Customers see substantial downstream demand	Powder mass/content, eligible grade and Sinocera capture.
Sakai/Nippon competing expansion	Supply response is active	Relative performance, timing and sustainable customer share.

	3	覆铜板用填充材料	主要为球形氧化硅等，填充于覆铜板的多种有机树脂基材料中，是决定覆铜板性能的关键材料	
	4	膜用填充材料	主要为氧化锆、氧化钛分散液，应用于 LCD、OLED、AR 光学调节涂层、光学镜头、AI 眼镜等领域	

（二）经营情况分析及业绩驱动因素

1、电子材料板块

公司是全球领先的 MLCC 介质粉体生产企业，依托多年技术积累与沉淀，已实现对各类基础粉及配方粉的全面覆盖，并与客户建立了长期稳定的合作关系。通过横向拓展布局，公司目前已掌握介质粉体、内外电极浆料、研磨用氧化锆微珠等多种 MLCC 制备关键原材料，能够为电子元器件领域客户提供系统化的技术解决方案与产品服务。

报告期内，受益于下游需求回暖以及 AI 服务器、汽车电子等新兴应用领域需求的快速增长，公司 MLCC 介质粉体及电子浆料销量快速增长。报告期内，公司充分利用自身 MLCC 领域的资源和优势，重点聚焦 AI 服务器及车规用 MLCC 介质粉体，持续开发相应产品并推进验证；与此同时，公司积极推进 AI 服务器及车规用 MLCC 介质粉体扩产，目前部分产能已完成扩产。公司 MLCC 用电子浆料业务进展顺利，产品销量及销售收入实现快速增长，并持续配合客户成功开发了多种规格型号的高容浆料、车规级专用浆料、射频专用浆料等新产品。

公司生产的纳米级复合氧化锆具有卓越的综合性能，主要用于智能手表、手机背板等领域。公司针对纳米级复合氧化锆积极配合客户需求，开发出了多种定制化的新产品。

2、催化材料板块

V03 · English reading: the electronic-materials business covers basic/formulated MLCC powder, electrode paste and consumer zirconia. Some high-end AI/automotive powder expansion is complete; development, validation and demand-led release continue. No grade-specific capacity or customer allocation is disclosed. Source: https://static.cninfo.com.cn/finalpage/2026-08-06/1225459777.PDF | 2026-08-06 | Physical PDF page 12 | Stage: Operating sales plus partial expansion/validation

applications within our Electronic Ceramic Materials business is expected to increase by approximately 1.5 times compared with the current level. This estimate includes both barium titanate and high-purity barium carbonate, a raw material used in the production of barium titanate.

Barium titanate is one of our key strategic products based on the materials technologies that we have cultivated over many years. Through both innovation driven by research and development and continuous investment in our production foundation, we will fulfill our responsibility as a reliable supplier to the expanding AI server-related and electronic components markets, while aiming for sustainable growth and enhancement of corporate value over the medium and long term.

◆Overview of the Expansion
(1) Factory location: Koriyama City, Fukushima Prefecture
(Fukushima No.1 Factory, Nippon Chemical Industrial Co., Ltd.)
(2) Expansion of production facilities for barium titanate
(3) Scheduled completion of expansion: Fiscal 2027
(4) Scheduled start of operation: Fiscal 2027

Business evidence · Precision ceramics: follow the powder, substrate and metallization steps

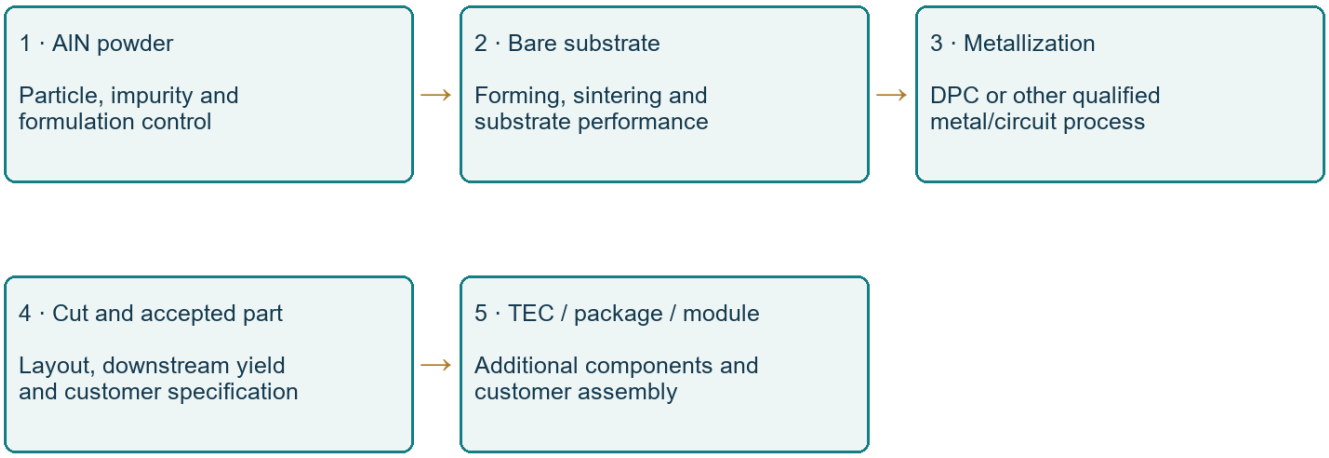

Aluminium-nitride powder, bare ceramic substrates and metallized substrates are separate products. Each step changes the process, equipment, customer specification and saleable value. Xuguang Electronics' August 11 inquiry response is particularly useful because it describes a real two-way relationship with Ceratron. Xuguang buys qualified Ceratron AlN powder for selected specifications; Ceratron buys Xuguang bare AlN substrates for downstream metallization. Sinocera also has its own powder and substrate capabilities. The operating chain therefore combines internal production and external purchases.

The counterparty reports 2025 purchases of Ceratron AlN powder of CNY 13.0522 million and bare-substrate sales to Ceratron of CNY 25.6465 million. These are actual external commercial flows. The filing does not allocate them to TEC, AI systems or a named end customer. It also explains that bulk substrate pricing can be lower than small-sample pricing. A sample price needs its own volume and specification context before it can inform a commercial assumption.

Xuguang describes supplier audit, sample testing, small-batch trials, batch-stability review and end-application validation before bulk supply. Those stages explain why a building, an environmental approval and a technically successful sample can precede sustained customer receipts. Tokuyama's announced 30% AlN-powder expansion, with commercial operation planned for April 2028, adds another competitive constraint. Grade purity, particle characteristics, sintering conditions and qualified performance must be compared together.

Sinocera's value can rise when its powder formulation and downstream process solve a customer's thermal, electrical or reliability problem. Parent earnings then depend on the operating entity, purchased-input cost, manufacturing yield, engineering support and customer uptake. A complete TEC device or optical module contains additional components and processes beyond Sinocera's substrate invoice.

The AIN process and commercial boundary

Source-based process diagram | Root model estimate

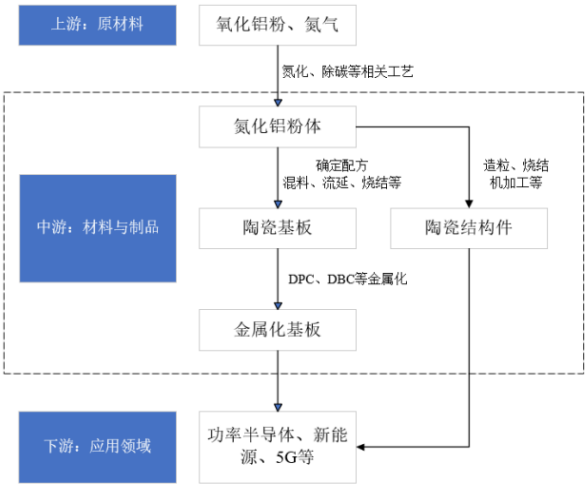

C05 · Source-based explanatory chain. Xuguang confirms purchases in both directions at the powder and bare-substrate steps. No fixed panel-to-part ratio or end-system revenue entitlement is disclosed. Explanatory geometry based on the cited counterparty process; no unreported financial content.

C05_data · The AIN process and commercial boundary — process boundaries

Connection	Process	Invoice / qualification boundary
Powder → bare substrate	Material processing and sintering	Can be internal or externally purchased.
Bare substrate → metallized substrate	Metal deposition, patterning and finishing	Ceratron purchases some bare AIN substrates from Xuguang.
Panel → cut customer part	Usable area, cut layout and downstream yield	Conversion and customer mix remain undisclosed.
Part → TEC/package/module	Customer assembly and additional content	End-system sales exceed the substrate invoice boundary.

Explanatory geometry based on the cited counterparty process; no unreported financial content.

发行人与国瓷赛创电气（铜陵）有限公司（国瓷材料（300285）的控股子公司）均从事精密陶瓷相关业务，但在产业链具体环节、产品结构方面各有侧重。发行人电子材料业务主要从事氮化铝粉体及氮化铝陶瓷基板、结构件等陶瓷制品的研发、生产和销售；国瓷赛创及其母公司在氮化铝领域，除了生产粉体、基板，其核心业务主要为陶瓷基板金属化（基板溅射覆铜）。双方在产业链上存在一定的上下游配套关系。氮化铝陶瓷产品的主要产业链环节如下：

由上图可知，氮化铝粉体、陶瓷基板和金属化陶瓷基板分别对应不同技术体系，不同产品的生产工艺、技术要求及产品形态均存在明显差异，且均有较高的技术壁垒。

此外，各产业环节进入下游客户的供应商体系通常需要履行较为严格的认证程序，相关产品通常需要依次经过供应商资质审核、送样检测、小批量试用、批次稳定性考察及终端应用验证等环节，验证通过后方可进入合格供应商名录并逐步实现批量供货，认证程序较为复杂、周期通常较长。因此，客户与合格供应商之间的合作关系相对较为稳定。

（2）发行人向国瓷赛创采购粉体的合理性

1）氮化铝粉体根据不同应用需求存在多种规格

V14 · English reading: powder production, bare-substrate forming/sintering and metallization have different technologies and customers. Supplier audit, samples, small-batch trials, batch stability and end-application validation precede bulk supply. This is independent counterparty evidence of process and qualification stages. Source: https://static.cninfo.com.cn/finalpage/2026-08-11/1225466734.PDF | 2026-08-11 | Physical PDF page 133 | Stage: Independent counterparty process/qualification evidence

氮化铝陶瓷产品的性能直接取决于原料粉体的特性。根据下游产品用途、成型及烧结工艺、导热性能等需求的不同，氮化铝粉体在比表面积、粒径大小、粒度分布、氧含量以及碳、钙、硅、铁等杂质含量方面存在不同的性能指标和细分规格。一般生产企业会根据不同应用需求提供多种参数指标的氮化铝粉体，如全球主要氮化铝粉体生产企业日本德山，其公开销售的 H-Grade 和 E-Grade 氮化铝粉体在比表面积、粒径及碳、钙、硅、铁等杂质含量方面均存在差异。

2）发行人基于综合效率最优原则，补充采购部分粉体具有合理性。

发行人综合考虑订单规模、客户需求、产线切换及交付周期等因素，制定生产及采购计划。主要产能优先投向对于发行人而言需求量较大、综合效益较高的粉体品种；对于需求量较小或非主力规格的粉体，则通过向合格供应商采购的方式予以补充，以实现规模化生产效益与产品线覆盖的兼顾。

为补充上述粉体需求，发行人从国瓷赛创、九方新材料等粉体供应商购买粉体，国瓷赛创所供粉体已经过发行人认证，并纳入合格供应商体系。发行人根据实际生产计划向国瓷赛创采购氮化铝粉体，有利于提高整体生产效率并保障下游订单及时交付，具有合理性。

（3）国瓷赛创向发行人采购基板的合理性

在氮化铝陶瓷制品的生产方面，发行人与国瓷赛创分别侧重于陶瓷基板制造和陶瓷基板金属化，二者属于不同的加工生产环节。国瓷赛创向发行人采购金属化加工所需的氮化铝陶瓷基板，属于产业链不同环节之间的正常合作，具有合理性。

另外，氮化铝陶瓷基板为非标准化产品。根据下游应用场景、金属化工艺及客户要求的不同，陶瓷基板在导热性能、产品规格尺寸和机械强度等方面存在差异，由此形成多种规格型号。不同规格产品在材料配方、成型及烧结工艺、加工精度和质量控制等方面亦存在不同要求。发行人向国瓷赛创销售的陶瓷基板能够满足其对产品性能、规格型号、质量稳定性及交付周期的要求。因此，国瓷赛创根据自身需求向包括发行人在内的合格供应商采购陶瓷基板，具有合理性。

V15 · English reading: Xuguang confirms purchases of qualified Ceratron AlN powder for selected specifications. Ceratron purchases Xuguang bare AlN substrates for downstream metallization. The chain combines internal manufacturing with external purchases; no TEC/AI award is identified. Source: https://static.cninfo.com.cn/finalpage/2026-08-11/1225466734.PDF | 2026-08-11 | Physical PDF page 134 | Stage: Actual two-way customer/supplier relationship; no end-customer award

Business evidence · The DPC panel envelope and the separate customer-adoption gate

The January 2026 environmental filing gives a physical boundary for Ceratron's metallization project. It describes phase-one DPC nameplate capacity of 1.8 million panels per year after a 2024 upgrade and proposes an additional 0.2 million panels per year, bringing that phase to 2.0 million. The proposal uses the original phase-two building. It explicitly says there is no current implementation plan for the separate phase-two production program; the product table labels that older 2.0–2.6 million-panel program as approved and unbuilt.

The product table specifies panels commonly ranging from 2 × 2 to 6 × 6 inches and thicknesses of 0.25–1.5 mm. It lists multiple uses, including LED, ceramic packages, thin-film circuits, laser heat sinks and isolator-related applications. The incremental route uses Ti/Au/Pt metallization and photolithography, while existing Ti/Cu products use dry film. The filing provides no allocation to TEC or AI multilayer substrates. Compatibility with an AI multilayer process requires its own technical evidence.

The engineering calculation converts 2.0 million product panels into approximately 45,000 square metres of product area: 40,500 existing and 4,500 incremental. It applies an assumed 80% qualified rate to obtain 56,250 square metres of required processed area. The declared 0.2 million-panel increment is already the product-output nameplate used in that process check. Applying the same 80% reject adjustment again would count that assumption twice. Actual factory yield, utilization and accepted customer shipments are undisclosed. A separate eligible-customer or adoption fraction measures another risk and must remain explicitly labelled.

A sound receipt boundary begins with compatible panel output, then applies the eligible product mix, customer adoption and net whole-panel value. A cut-piece approach also needs usable area, cut layout, downstream yield and the actual invoiced unit. Those inputs have not been published. Reallocating the existing 1.8 million panels to a higher-value use requires accounting for displaced legacy invoices; it cannot all become new incremental AI output.

The filing lists a CNY 100 million total project budget, a 12-month construction period and a not-started status at compilation. It plans 30 additional staff, 210 total staff, 300 working days and two 10-hour shifts, with certain plating and surface processes operating 12 hours. Planned additional water use is 149.823 tonnes per day. These disclosures identify capital, staffing, utilities and wastewater obligations. They do not certify current completion, qualified customer capacity, actual spending or a realized unit cost.

T013 · Physical capacity: exact scope and stage

Item	Disclosed amount	Meaning
Existing phase-one DPC	1.8 million panels/year	Design/nameplate after the 2024 upgrade; actual output undisclosed.
Proposed increment	0.2 million panels/year	Declared product-output nameplate across multiple uses.
Phase-one total after proposal	2.0 million panels/year	Existing plus proposed increment, not all new output.
Older phase-two production plan	2.0–2.6 million panels/year	Approved/unbuilt; no current implementation plan stated.
Engineering qualified-rate assumption	80%	Used in the area/process check; not observed actual yield.
TEC / AI eligible share	Undisclosed	Requires compatible process, customer adoption and net invoice value.

Approved source-only business table; original sources and stage constraints appear with the adjacent exhibits and linked source register.

本项目新增陶瓷基电路板产能20万片/年，与一期工程现有产品区别在于陶瓷基板表面镀膜金属不同、线路图形成像技术不同，本项目产品镀膜金属为钛-金-铂，采用光刻工艺使导电线路图形转移到基板上。现有产品镀膜金属为钛-铜，采用干膜显影技术转移导电线路。

项目建成后，产品方案见下表。

表2-5 项目产品方案（单位：万片/年）

产能匹配性分析：

本项目新增陶瓷电路板产能20万片/年，建成后一期项目总产能达到200万片/年。项目新增4#电镀铜线和5#电镀铜线，沉铜、阻焊、表面处理（沉银、化镍金、镀镍金）和成品清洗环节与现有一期项目共线生产，主要设备加工能力及设施参数匹配性分析如下：

表2-8　主要设备设施参数与加工能力分析

主要生产单元	主要工艺	生产设施	设施参数	处理能力	单位	设备数量	年加工时间	最大加工能力万m^2
沉铜	沉铜	沉铜生产线	沉铜速度	20	m^2/h	1	7200	14.4
电镀铜	电镀	自动电镀铜线（现有	镀铜速度	10	m^2/h	3	6000	18
		4#自动电镀铜线	镀铜速度	12	m^2/h	1	6000	7.2
		5#自动电镀铜线	镀铜速度	12	m^2/h	1	6000	7.2
表面处理	沉银	沉银生产线	沉银速度	15	m^2/h	1	3600	5.4
	化镍金	化镍金生产线	沉镍金速度	20	m^2/h	1	3600	7.2
	电镀镍金	电镀镍金生产线	沉镍金速度	30	m^2/h	1	3600	10.8

根据现有工程运行经验，现有180万片电路板总面积约40500m^2，本次新增20万片电路板总面积约4500m^2，按照产品合格率80%计，每年需加工处理的陶瓷基板面积约5.625万平方米，实际生产中根据产品用途选择需采取的表面处理工艺（沉银、化镍金、电镀镍金），综合分析，本项目新增设备及现有设施能够满足200万片电路板加工处理需求。

6、公用工程

（1）供水

厂区用水来自铜陵市经开区市政管网，本次扩建用水包括员工生活用

V44 · English reading: approximately 45,000 m² of annual product area requires 56,250 m² of processed area at the assumed 80% qualified rate. The declared 0.2 million-panel product increment already incorporates that factory-yield assumption in this check. Actual yield is undisclosed; customer eligibility/adoption is a separate factor. Source: https://jjjskfq.tl.gov.cn/tlsjjjskfq/c00029/2018240242722332672/eA2djxf2.pdf | 2026-01-29 | Physical PDF page 43 | Stage: Planned capacity calculation

81	电子元件及电子专用材料制造398	半导体材料制造；电子化工材料制造	**印刷电路板制造**；电子专用材料制造（电子化工材料制造除外）；使用有机溶剂的；有酸洗的 以上均不含仅分割、焊接、组装的	其他

根据《固定污染源排污许可分类管理名录（2019年版）》，本项目排污许可分类情况如下。

表2-2　项目排污许可类别判定情况表

项目类别 \ 排污许可类别		排污许可类别		
		重点管理	简化管理	登记管理
三十四、计算机、通信和其他电子设备制造业 39				
89	计算机制造391，电子器件制造397，电子元件及电子专用材料制造398，其他电子设备制造	**纳入重点排污单位名录的**	除重点管理以外的年使用10吨及以上溶剂型涂料（含稀释剂）的	其他

根据《关于铜陵市2025年度环境监管重点单位名录企业名单的公告》，国瓷赛创电气（铜陵）有限公司被纳入铜陵市环境监管重点单位，因此本项目属于排污许可重点管理范畴。

2、项目建设内容

本次扩建项目建筑面积约27939.72平方米，分为两部分，具体如下：

1、对一期DPC生产线的改造，新增1条自动电镀铜线用于现有产品精细化加工，同时将现有手动电镀线改为备用；

2、建设2#生产厂房、综合楼B座以及2#辅助用房，新建陶瓷基板金属化生产线1条，扩大产品产能，新增陶瓷电路板产能20万片/年。

建成后一期项目总产能达到200万片/年。由于建设单位发展战略调整，暂无二期项目的实施计划。受1#厂房空间限制，本次利用原计划于二期建设的2#生产厂房、综合楼B座以及2#辅助用房用于设备布局和生产，同时在2#厂房内预留约10288.64m²面积用于后期规划实施。本次扩建不涉及二期项目规划建设内容及产品产能调整，仅为一期项目的扩充和改造。

本项目主要建设内容及规模见表2-3。

V42 · English reading: the new work uses the original phase-two building to supplement phase one. The filing states there is no current implementation plan for the separate phase-two production program. Reserved floor area and building completion do not establish operating output. Source: https://jjjskfq.tl.gov.cn/tlsjjjskfq/c00029/20182402427223326 72/eA2djxf2.pdf | 2026-01-29 | Physical PDF page 30 | Stage: Building vs production-program distinction

Business evidence · Commercial stages: small-batch TEC sales and earlier AI multilayer work

The May 15 collective reception already reported small-batch TEC sales to some customers, with other customers still validating. September replies added that North-American customer validation was progressing and small-batch sales had occurred. The October 18 reply repeated that stage. The later geographic detail is useful, while the small-batch milestone itself was already established in May.

AI-data-centre multilayer ceramic substrates have an earlier commercial status. The September 16 original reply says Sinocera is working with customers on joint research and product validation and has not shipped in bulk. Satellite RF packages and LED substrates have separate operating histories. The H1 report describes stable satellite-package deliveries and rising LED substrate share; those statements should retain their own product and customer boundaries.

The full investor question must remain separate from the company's answer. Questions name Phononic, Rubin, CPO, HBM, NVIDIA, exclusivity, large order amounts and specific capacity figures. The captured company replies do not confirm those assertions. Some questions received only thanks or remained unanswered. Conditional opportunity can exist before a public award, with customer capture, timing and manufacturing costs carried as assumptions.

T014 · Dated product-stage timeline

Date	Issuer statement or event	Commercial interpretation
May 8, 2026	Spherical silica small-batch sales; Ceratron phase-two building complete	Early sales and a building milestone; production ramp remains separate.
May 15, 2026	TEC small-batch sales to some customers; others validating	Small-batch commercial activity already exists.
August 5, 2026	Partial high-end MLCC expansion complete; demand-led release	Additional capability with qualification and demand constraints.
September 15, 2026	Spherical silica small-batch sales and expansion	Existing early-commercial stage repeated.
September 16, 2026	AI multilayer joint R&D/validation; no bulk shipments	Pre-bulk customer development.
September 19–21, 2026	North-American TEC validation and small-batch sales	Geographic specificity; no disclosed volume ramp.
October 18–19, 2026	TEC stage repeated; sulfide initial capability; powder expansion	Continuing programs; no new quantified receipt disclosed.
October 27, 2026	Scheduled third-quarter report disclosure	Future release as of the October 23 research date.

Approved source-only business table; original sources and stage constraints appear with the adjacent exhibits and linked source register.

	回复：尊敬的投资者，您好。公司是全球领先的MLCC介质粉体生产企业，客户涵盖国内及国际头部企业，下游客户包括三星电机、国巨、风华高科等。目前MLCC行业发展趋势良好，行业有望延续复苏趋势。受益于下游需求回暖以及汽车电子、AI服务器等新兴应用领域需求的快速增长，MLCC介质粉体的需求不断增加，公司正加快车规级、AI服务器MLCC粉体的产能扩产，致力于市场份额的持续提升；同时公司也在密切关注相关行业市场动态，积极把握增量、提价机会。 **9、请问：①目前公司光模块用陶瓷基板的在手订单情况如何？是否有长期框架协议？订单能见度到什么时候？②该业务的毛利率水平大概是多少？是否高于公司传统业务？③市场传闻公司1.6T光模块用TEC基板已通过头部客户验证并批量供货，请问是否属实？对公司2026年业绩的贡献预期如何？** **回复：**尊敬的投资者，您好。公司子公司国瓷赛创具有光模块用陶瓷基板的技术储备，光模块用的陶瓷基板主要用于散热，TEC产品前期部分客户实现小批量销售，部分新客户仍在推进产品验证。国瓷赛创二期新厂房建设已完成，后续产能会逐步爬坡。 **10、请问：①公司子公司国瓷赛创的光模块用陶瓷基板（含TEC制冷片基板、氮化铝/氧化铝基板）当前的月产能、良率、2026年预计出货量和收入占比分别是多少？②二期工厂的投产进度如何？投产后氮化铝基板的产能规划是多少？目前是否已经批量供应800G/1.6T光模块客户？③目前该业务的主要客户包括哪些头部光模块厂商？是否已进入华为、中际旭创等核心供应链？** **回复：**尊敬的投资者，您好。公司子公司国瓷赛创具有光模块用陶瓷基板的技术储备，光模块用的陶瓷基板主要用于散热，TEC产品前期部分客户实现小批量销售，部分新客户仍在推进产品验证。国瓷赛创二期新厂房建设已完成，后续产能会逐步爬坡。 **11、公司的陶瓷基板现在有没有开始放量？** **回复：**尊敬的投资者，您好。国瓷赛创已在基板金属化领域建立起显著的技术优势。LED陶瓷基板业务方面，产品性能实现进一步提升，核心

V39 · English reading: the May 15 issuer-authored collective-event record already reports small-batch TEC sales to some customers, with others validating. The phase-two building is complete and future capacity release depends on progress. The later North-American statement adds geography to an existing small-batch stage. This PDF is preserved on a mirror host. Business evidence · Low-loss fillers: a formulation and complementary-input opportunity

Sinocera reports small-batch spherical-silica sales and an expansion program. Hollow spherical silica remains in customer validation. Spherical and angular titanium dioxide are additional formulated-material offerings. These products serve high-speed copper-clad laminates, but the customer's laminate design determines which material, particle characteristics and loading qualify.

The annual and half-year reports place fillers in the ‘other business’ subsection, separately from the printing subsection that explicitly names Kanglitai. They do not identify the legal producer of spherical or hollow silica. The subsidiary ownership table cannot resolve that product-to-entity link by itself. Any assignment of the new filler receipts to a wholly owned entity therefore remains an assumption until a primary source identifies the producer and its profit rights.

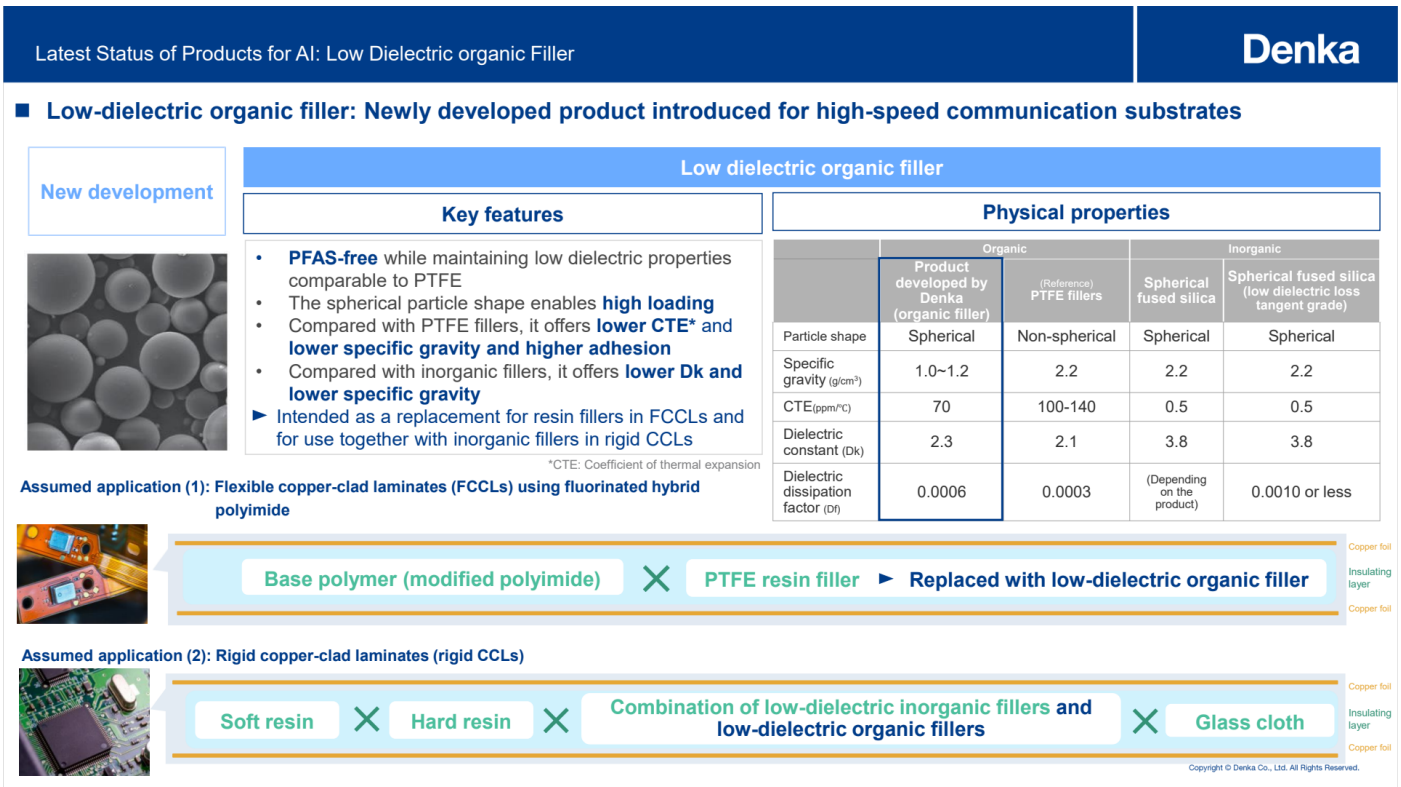

Denka's August presentation shows copper-clad laminate as a system of resin, inorganic filler, glass cloth and copper. It reports growing low-loss silica sales and customer certification of a new soft-resin product. Its M9 standardization and M10 evaluations concern its resin system. Those grade labels cannot establish Sinocera's silica qualification. A filler supplier earns its material content and accepted price within the customer's formulation.

Substitution also occurs within that system. Denka's low-dielectric organic filler targets selected flexible-laminate uses and combinations with inorganic fillers in rigid laminates. Density, dielectric constant, dielectric loss and thermal expansion create design trade-offs. Sinocera's silica opportunity therefore depends on accepted formulations and relative performance, with changes in filler loading or material choice carried through the receipt estimate.

Complementary inputs can delay uptake. Denka's written August Q&A identifies low-dielectric glass-cloth shortages affecting some next-generation laminate launches, with launch around the end of 2026 and phased customer adoption into 2027 and later. This is independent timing evidence for a shared supply chain, rather than a Sinocera customer award. Ceramic printing ink is a separate product: Sinocera expressly says it is not electronic glass-cloth material.

V20 · English reading: a laminate contains resin, filler and glass cloth between copper layers. Denka reports growing low-loss silica sales and certification of a new soft resin. Its M9/M10 references describe the resin system, without establishing Sinocera filler qualification. Source: https://www.denka.co.jp/eng/storage/news/pdf/596/20260807_denka_ir_materials_en.pdf | 2026-08-07 | Physical PDF page 2 | Stage: Competitor actual sales vs sample/certification

V21 · English reading: Denka compares low-dielectric organic filler with alternatives. Flexible-laminate substitution and rigid-laminate combinations depend on density, dielectric constant/loss and thermal expansion. The technical trade-off changes eligible formulation content; no Sinocera lost order is disclosed. Source: https://www.denka.co.jp/eng/storage/news/pdf/596/20260807_denka_ir_materials_en.pdf | 2026-08-07 | Physical PDF page 3 | Stage: Development/specification comparison; no Sinocera lost award

FY2026 1Q Financial Results Presentation
Summary of Q&A Session
(August 7, 2026)

Overall

Q1: In the first quarter, Denka recorded extraordinary losses totaling ¥4.7 billion in connection with DPE. Although the Company expects to record extraordinary losses in the second quarter and later, do you think these losses will again be offset by extraordinary gains as was the case in fiscal 2025?
A1: Yes. We plan to offset DPE-related extraordinary losses by posting extraordinary gains, such as gain on sale of strategically held shares.

Q2: Inventory effects amounted to a positive ¥6.0 billion in the first quarter. What is your outlook for these effects for the first half of fiscal 2026?
A2: We anticipate that the total for these effects will be approximately ¥6.0 billion for the first half. In its second quarter, our Singapore-based subsidiary, whose fiscal year ends in December, will record positive inventory effects in connection with its resin products. On the other hand, lower raw material prices may lead to the recording of negative inventory effects for certain products. Thus, these positive and negative inventory effects are likely to offset each other.

Q3: In its initial forecast for fiscal 2026, Denka estimates a negative impact of ¥5.0 billion on operating income from reduced production volumes due to restrictions on raw material procurement caused by the situation in the Middle East. What is your current outlook for this impact?
A3: Initially, we anticipated that acetylene black manufactured in Singapore would continue to be negatively impacted until the end of September. And, with the present outlook remaining uncertain, the negative impact could exceed our initial forecast. On the other hand, other products have not been significantly affected. Taking these factors into account, we currently expect around a half of this ¥5.0 billion impact to materialize.

Electronics & Innovative Products

Q4: What is your future outlook for soft-type SNECTON?
A4: The shortage of low-dielectric glass cloth, which is a raw material for copper clad laminates (CCL), now constitutes a risk for certain users who are planning to launch next-generation grades. However, glass cloth produced by Taiwanese and Chinese manufacturers is being adopted by a growing number of users. Accordingly, we expect that the production of CCL incorporating this glass cloth will launch at around the end of 2026. Based on this expectation, we believe that soft-type SNECTON will be adopted by users in a phased manner in 2027 and beyond.

Q5: With regard to hard-type SNECTON, Denka has stated that the Company is “considering high-value-added applications that can best leverage the advantages of SNECTON.” Please share the status of discussions now under way.
A5: There are a number of competing products in the field of hard-type resin. Therefore, instead of targeting the entire market, we are planning to narrow our marketing focus on specific applications that allow SNECTON to leverage its advantages, such as low CTE and superior dimensional stability.

V34 · English reading: Denka identifies low-dielectric glass-cloth shortage as a complementary-input constraint. Its August 7 event Q&A, published August 19, expects some next-generation laminate launch around the end of 2026 and phased user adoption from 2027. This is a competitor expectation. Source: https://www.denka.co.jp/eng/storage/news/pdf/600/20260807_denka_ir_conference_qa_en.pdf | 2026-08-19 | Physical PDF page 1 | Stage: Competitor expected timing; no Sinocera award

Business evidence · Dental pricing, acquired distribution and replacement risk

Legacy zirconia powder and blocks provide established dental exposure. The July 20 issuer notice announced product-specific zirconia price adjustments of 10–40%, effective July 27, in response to higher raw and auxiliary-material costs. Dental powder is included, while the realized mix, customer uptake, duration and volume response remain uncertain. Price recovery should be evaluated together with input inflation and internal transfers into the group's own downstream products.

SDI extends the business into clinical restorative consumables, whitening and equipment. Its scheme describes manufacturing mainly in Victoria and distribution in more than 100 countries. This can broaden market access and product coverage. Channel integration, registrations, sales support, employment, marketing and local currency costs remain economic requirements. The scheme describes product, channel and R&D synergies as intentions after a detailed review, without a quantified recurring saving or completed cross-sale award.

SDI's historical mix creates a concrete transition risk. Fiscal 2025 sales were AUD 110.384 million, down 0.7%; amalgam sales were AUD 14.405 million, down 21.9%, and represented 13% of sales. The half-year to December 2025 amalgam share fell to 9.8%. Stela's fiscal 2025 sales of AUD 2.5 million provide an actual replacement-product anchor, while customer conversion and retention remain uncertain. Higher gross margin coexisted with employment and marketing-cost pressure.

Regulatory dates require care. The scheme's EU amalgam date is superseded by the European Commission's current final-rule summary: the general phaseout and export prohibition began in January 2025, with a temporary derogation ending June 30, 2026 and medical-need exceptions. The Commission separately describes a global phaseout in 2034. The applicable product mix, geography and exemptions determine the acquired operation's exposure.

Yttrium export licensing can alter qualification and sourcing decisions for zirconia products. The current official clarification says compliant civilian applications are reviewed. The recovered primary sources do not establish a complete shutdown of every relevant competing grade or a transferable quantity of displaced tonnes. The commercial opportunity remains conditional on licences, supply, customer acceptance and net price after input costs.

T015 · Dental mechanisms and required offsets

Mechanism	Potential receipt route	Cost or failure condition
Selective zirconia repricing	Higher realized price on eligible external products	Input inflation, volume response and intra-group eliminations.
SDI clinical distribution	New products sold through qualified channels	Registration, sales support, inventory and integration cost.
Amalgam replacement	Retained customers adopt alternative products	Regulatory erosion, competing alternatives and conversion uncertainty.
Supply-chain diversification	Customers qualify alternative zirconia suppliers	Licensing, qualified grade performance and competitive response.

Approved source-only business table; original sources and stage constraints appear with the adjacent exhibits and linked source register.

The table below sets out revenue by segment over the Historical Period.

Table 6 Revenue by segment

Revenue $('000)	FY23 *Audited*	FY24 *Audited*	FY25 *Audited*	HY26 *Reviewed*
Aesthetics	51,108	55,324	57,785	29,449
% of revenue	*47.4%*	*49.7%*	*52.3%*	*55.6%*
Whitening	31,303	31,002	31,995	15,644
% of revenue	*29.0%*	*27.9%*	*29.0%*	*29.6%*
Amalgam	18,977	18,348	14,405	5,206
% of revenue	*17.6%*	*16.5%*	*13.0%*	*9.8%*
Equipment	6,467	6,532	6,199	2,629
% of revenue	*6.0%*	*5.9%*	*5.6%*	*5.0%*
Total revenue	**107,855**	**111,206**	**110,384**	**52,928**
Revenue Growth rate %	*n/a*	*3.1%*	*-0.7%*	*n/a*

Source: SDI Limited audited and reviewed financial statements and RSM Analysis

We make the following comments in relation to the financial performance set out above:

- Revenue over the 3 years to 30 June 2025 grew by a compound annual growth rate ("**CAGR**") of 1.2% (3.9% excluding amalgam).
- Revenue growth of 3.1% in FY24 was primarily driven by the expansion of the aesthetics product group with the release of new products from prior periods gaining momentum in the market. Growth in FY24 was partly offset by a structural decline in amalgam sales and a decline in whitening sales as a result of strong competition and a decline in discretionary spend.
- Gross margin in FY24 increased to 62.1% as a result of operational efficiencies driven by in-housing of warehousing activities at the Montrose site and geographic and product mix (sales growth in the European market generating higher product margins).
- Revenue declined slightly in FY25 driven by continued declines in amalgam sales (decline of 21.9% on FY24) partly offset by an increase in aesthetic and whitening sales of 4.5% and 3.2%, respectively. Stela sales in FY25 represented $2.5m.
- Gross margin in FY25 increased to 62.9% as a result of efficiencies from new plant and equipment and product and geographical sales mix.
- Revenue of $52.9 million in the first half of FY26 was up 1.5% on the previous corresponding period ("**PCP**") following strong growth in the Australian Direct Export markets driven by the Middle Eastern market, however offset by the continued decline in Amalgam product sales.
- The Company generated a gross margin of 65.6%, reflecting operational efficiencies, geographical and product mix, and favourable currency movements.
- Operating costs increased as a percentage of revenue over the period, primarily as a result of inflationary impacts on employment costs and increase marketing costs in relation to new product releases.
- HY26 operating costs included a $724k doubtful debt provision.

For personal use only

V19 · English reading: SDI fiscal 2025 sales were AUD 110.384 million; amalgam was AUD 14.405 million and fell 21.9%, while Stela sales were AUD 2.5 million. The half-year to December 2025 amalgam share was 9.8%. Employment and selling costs remain operating requirements; the table does not quantify an acquisition synergy. Source: https://announcements.asx.com.au/asxpdf/20260518/pdf/06zq7hxl57khnb.pdf | 2026-05-18 | Physical PDF page 102 | Stage: Historical audited/reviewed operating evidence; no synergy forecast

Business evidence · Established materials have separate cycles and constraints

Catalyst materials serve combustion and hybrid vehicles, heavy-duty and non-road equipment, ships and industrial applications. Honeycomb carriers and catalyst chemistry capture different parts of those systems. The issuer reports broad domestic automaker coverage and continuing international customer work. Higher oxygen-storage ceria-zirconia remains at an initial validation stage. Battery-only vehicle growth changes the eligible exhaust-treatment pool, while regulation, vehicle mix and customer platform qualification affect the remaining demand.

Battery-coating alumina and boehmite are established new-energy products. The issuer says alumina grew faster than boehmite in the first half and describes powders suitable for coatings of one micrometre or less. These existing sales should retain their own price, competition and cost path. The sulfide automatic line is complete and has initial production capability, with sampling and customer validation continuing. A completed line does not disclose a commercial order, recognized new-family revenue or the 30/100-tonne figures posed in investor questions.

Idemitsu's January 29 investment decision provides a useful independent comparator for sulfide commercialization. It plans a large pilot of several hundred tonnes per year, completion in 2027 and a Toyota-related battery commercialization goal in 2027–28, supported by lithium-sulfide feedstock capacity. This is a staged, customer-specific program with verification and capital needs. It provides context for the development process, without assigning any Toyota demand or competitor economics to Sinocera.

Ceramic inks faced domestic demand pressure and raw-material inflation in the first half; the issuer describes efforts to pass costs through and build overseas local production. Optical zirconia dispersion already has stable bulk supply, while AR-waveguide titanium dioxide has small-batch sales. Ceramic balls have a different competitive and cost cycle again. The common materials platform supports development across these businesses, while their customer stages and external invoices remain distinct.

Business evidence · Resources and ownership determine the parent’s share

Manufacturing and qualification use real resources. In 2025, materials represented 61.07% of industrial cost. That is a historical manufacturing-cost share across a mixed portfolio. New-grade marginal cost still depends on raw materials, process yield, power, labour, depreciation and customer specifications. Group gas and electricity use provide resource context, while the published totals cannot establish a per-tonne or per-panel cost.

The first-half R&D expense was fully expensed and includes payroll, experimental materials, depreciation and services. The reporting structure therefore already carries some development cost. An incremental receipt estimate needs engineering, customer support and working capital where they arise, with existing amounts and new additions reconciled once. The same principle applies to manufacturing depreciation and purchased substrates.

Consolidation also differs from parent economic ownership. Reported holdings include Ceratron at 88.89%, Jiangsu Sinocera at 55%, DEKEMA at 74.90% reported indirect holding and Kanglitai (山东国瓷康立泰新材料科技有限公司) at 60% direct reported holding. Many other operations are wholly owned. A new receipt belongs to its operating entity before tax, minority interests, service allocation and financing. Applying one group minority ratio across unrelated new products would hide those differences.

Customer exposure is material but diversified across businesses. The top five customers represented 28.53% of 2025 sales and the largest 9.06%; their ranked identities are undisclosed. Named MLCC customers cannot be assigned to those ranks. Direct sales represented 92.70% of 2025 revenue, while SDI's distributor network introduces a distinct channel and receivables profile.

V12 · English reading: the reported ownership table includes Ceratron 88.89%, Jiangsu Sinocera 55% and Dekema 74.90%, among other subsidiaries. Consolidation does not assign the parent all subsidiary profit; the final allocation requires the entity and actual minority-interest bridge. Source: https://static.cninfo.com.cn/finalpage/2026-08-06/1225459777.PDF | 2026-08-06 | Physical PDF page 144 | Stage: Reported holding atJune30

Business evidence · Evidence that would strengthen or weaken each opportunity

The most useful next observations connect capability to a paying customer and then to retained parent earnings. Repeat orders, higher qualified production, realized prices and cash collection can strengthen a receipt path. Qualification delays, weaker utilization, adverse input pricing, incremental capital requirements and competitive substitutions can weaken it. An opportunity can carry a positive conditional path before a formal award; its uncertain inputs should stay visible.

The strongest practical tests use the same product and time boundary as the proposed benefit. Group revenue growth alone cannot verify a TEC ramp, and a larger precision piece count can reflect ceramic balls. A higher dental price needs a matched eligible product mix and input-cost bridge. A completed production building needs commissioned equipment, qualified output and customer adoption before it supports the full operating claim.

T016 · Product-specific confirmation and failure tests

Opportunity	Useful confirming evidence	Observable failure or constraint
High-end MLCC powders	Qualified grade sales, repeat orders, utilization and realized mix	Validation delay; competing capacity; weak net price after inputs.
TEC ceramic substrates	Repeat accepted shipments, disclosed customer uptake and net panel economics	Small-batch stage persists; purchased inputs/yield absorb value; displaced legacy sales.
AI multilayer substrates	Development moves to accepted production with compatible capacity	Joint validation remains pre-bulk; process/capital needs exceed existing DPC capability.
Low-loss silica / hollow silica	Accepted formulation, repeat orders and capacity release by grade	Glass-cloth/resin delays; lower filler loading; competing formulations.
Zirconia / SDI	Net price retention, channel sell-through and replacement-product adoption	Cost inflation, regulatory erosion, conversion loss or integration spending.
Sulfide electrolyte	Customer industrialization, accepted output and recognized sales	Line readiness precedes battery qualification; feedstock/process/capital constraints.
Parent capture	Entity profit, minority allocation and cash collection reconcile	Lower-owned entities or working capital absorb apparent group benefit.

Approved source-only business table; original sources and stage constraints appear with the adjacent exhibits and linked source register.

Business evidence · Reading the written records and source limitations

The latest recovered dedicated earnings-result records are the August 5 half-year communication and the May 8 annual-results communication. The May 15 collective reception and April 27 first-quarter record add context. These are issuer-authored written records of selected questions and answers. They have not been verified against complete event audio. The August, April and May 8 records are preserved on the primary disclosure host. The recovered May 8 original is byte-identical to the previously read mirror. The May 15 record remains an issuer-authored PDF on a mirror host, with its original-host gap retained.

Original exchange data preserve the full question and answer, including exact reply dates. The capture contains 68 returned pairs and 33 individual reply details. It supports the statements cited here without establishing an exhaustive history. The latest published actual financial report recovered as of October 23 is the first-half report; the third-quarter report is scheduled for October 27.

Long documents have explicit reading limits. The 293-page Ceratron environmental filing is image-only, and the source itself redacts some raw-material and process information. The relevant capacity, product, area, staffing and resource pages were visually read; the complete legal and environmental appendix was not. The SDI scheme and Xuguang reply were read for the cited business sections, while the financial source review covers their accounts and transaction terms.

Source conflicts remain visible. Xuguang's 2024 powder amount differs slightly between a table and prose, while its 2025 amount agrees. The SDI scheme's EU amalgam timing is superseded by the current regulator summary. A Tokuyama technical deck has a September 26, 2025 cover date despite a misleading path or initial filename. MARUWA's site returned a maintenance page, and some legal originals could not be archived. Search snippets and failed downloads have not been promoted into completed primary evidence.

	（3）生物医疗材料板块：牙科氧化锆粉体产销水平快速提升，结合供需变化适时调整氧化锆粉体价格；对外投资并购澳大利亚SDI公司，完善产品布局；重点推进高端瓷块市场开拓； （4）新能源材料板块：氧化铝及勃姆石产销水平进一步快速提升，市占率不断提高；硫化物固态电解质量产能力初步构建； （5）精密陶瓷板块： 国瓷金盛陶瓷球通过积极降本增效，进一步提高市场竞争力，销量稳定增长；国瓷赛创LED基板业务向全球头部企业稳定供货；陶瓷管壳稳定交付；TEC半导体制冷片紧密配合国际客户验证；数据中心用多层陶瓷基板配合客户开展联合研发和产品验证； （6）数码打印及其他材料板块： 数码打印材料：陶瓷墨水国内市场承压，上游原材料成本上涨压缩毛利率空间，产品价格上调传导成本压力，积极开拓海外市场；新产品纺织墨水销量快速增长。 **二、投资者问答交流** **1、公司MLCC介质粉体半年度业务情况？** 回复：受益于行业景气度持续回升以及AI服务器、汽车电子等新兴应用领域需求的拉动，公司上半年MLCC介质粉体销量实现稳步增长；为更好满足下游客户需求，公司针对AI服务器及车规级MLCC粉体，已完成部分高端产线的扩产工作。后续，随着新增产能逐步释放，MLCC粉体的产销量有望进一步提升；同时，公司将持续跟踪市场需求变化，适时推进扩产计划，确保供给能力与市场节奏相匹配。 **2、公司氧化锆产品今年预期怎么样？** 回复：上半年公司氧化锆粉体销量保持稳定增长；受益于国家稀土出口管控政策，公司氧化锆粉体的市场开拓迎来新的发展契机；与此同时，公司密切跟进市场供需变化，对氧化锆粉体的价格进行了适时调整。今年氧化锆粉体有望实现量价齐升的良好局面，公司也将紧抓这一战略机遇，

V36 · English reading: the August 5 written results record describes partial AI/automotive powder expansion and precision products at different stages. Ceramic inks face input-cost pressure. The selected written record is preserved in full; no audio verification is claimed. Source: https://static.cninfo.com.cn/finalpage/2026-08-06/1225460933.PDF | 2026-08-06 | Physical PDF page 2 | Stage: Issuer-authored written communication; audio not verified

	进一步提高市场占有率。 **3、上半年公司投资并购澳大利亚SDI公司对未来发展有何影响？** 回复：澳大利亚SDI公司深耕行业超50年，主营复合树脂、粘接剂、水门汀、牙齿美白等临床端耗材，是澳大利亚专业牙科材料领域的领先制造商，与公司原有以氧化锆瓷块为核心的技工端义齿材料形成高度互补，能够进一步补充产品线，完善产品布局；SDI公司拥有完善的海外渠道资源，能够帮助公司进一步开拓海外市场，促使公司全球化布局升级；并购后双方可在技术研发、产品生产等领域实现资源互通、优势互补，持续提升公司整体技术实力与市场运营能力。 **4、公司球形二氧化硅的业务进展如何？** 回复：随着AI服务器、5G通信、高性能计算等新兴领域的快速发展，高端覆铜板市场需求呈加速增长态势，进而带动上游球形二氧化硅等关键填充材料的旺盛需求。球形二氧化硅因其优异的介电性能、低热膨胀系数及高填充率，已成为高端覆铜板不可或缺的核心材料之一，市场对其性能与供应能力的要求也日益提升。 目前，公司正紧密协同下游客户推进球形二氧化硅产品的验证工作，整体进展顺利，部分规格产品已实现小批量供货。与此同时，公司积极推进球形二氧化硅产线的扩产项目，以充分把握行业发展带来的增长机遇。 **5、目前公司固态电池项目的进展？** 回复：随着全固态电池产业化进程推进，硫化物固态电解质因其高离子电导率等优势，成为核心关键材料。目前公司已建成硫化物固态电解质自动化生产线，量产能力初步构建，产品品质得到客户的高度认可，公司正在密切配合下游重点客户的产业化进程，后续将根据市场需求变化及下游客户的产业化进度，合理规划扩产节奏，协同推进全固态电池的商业化落地。

Appendix · exact H1 actual reconciliation

The latest recovered published actual report is H1 2026, not Q3. Q3 disclosure is scheduled October 27 and remains future at this review date. H1 revenue 2.51275056808 B less COGS 1.56637588193 B gives GP 0.94637468615 B. Selling 0.13195575530 B, administration 0.19001493791 B, R&D 0.16497565915 B, surtax 0.02414700108 B, credit losses 0.01752287934 B and asset losses 0.01314916098 B leave recurring prefinance ordinary OP 0.40460929239 B. That measure retains recurring share compensation. Adding other income 0.06431383926 B and investment income 0.01046351709 B, subtracting disposal loss 0.00071139375 B and finance expense 0.03860657265 B reconciles statutory OP 0.44006868234 B. PBT 0.43581925011 B minus income tax 0.04964096322 B equals group NI 0.38617828689 B, split parent 0.36275660966 B/NCI 0.02342167723 B. Net income, comprehensive income, EBITDA and operating profit are not interchangeable.

T017 · H1 2026 actual cost anchors

Consolidated group measure	CNY billion
Revenue	2.51275056808
Cost of revenue	1.56637588193
Selling and administration	0.32197069321
R&D	0.16497565915
Credit and asset losses	0.03067204032
Taxes and surcharges	0.02414700108
Ordinary SBC retained	0.0271097

T018 · Historical source-derived earnings bridge

Measure	CNY billion
GP	0.94637468615
prefinance ordinary cost OP	0.40460929239

Source-only accounting derivations retain ordinary SBC and impairments; grants, investment/disposal and finance are separate. These group amounts do not establish parent prefinance OP.

Appendix · exact joint-outcome interpretation

The mutually exclusive joint regimes have root LOW weights 10% disruption/ 25% slow/ 45% orderly/ 20% rapid. These jointly cover qualification, eligible customer uptake, competing supply, costs, working capital, commissioning and ordinary financing. They are judgments, not measured statistical frequencies. Their Q4 2027 conditional ceilings are 1.232272336161344/16.806358529463324/30.0798278592396/41.719109608831225 CNY. Weight operating profit first, then apply the unchanged share/multiple/unit bridge. Do not independently multiply several correlated AI success probabilities again.

For 2027 the incremental gross/overlap/capacity tables give expected residual receipts of 19.955198450945007 M filler,3.7931339153802097 M TEC,30.138450129383723 M multilayer and 8.14147818806432 M sulfide. These are only the new residual overlays; related commercial growth already included in the base must not be added again. Gross-positive programme support and positive post-overlap residual are different concepts. A slow case can have zero residual because its entire gross overlay is already represented in broad growth. The 75% positive-residual figure for filler/TEC is not a claim of 75% commercial-success confidence. For pre-bulk multilayer 2027 only the

20% rapid regime contributes, after capacity;2028 also the 45% orderly regime contributes. Sulfide 2027 contributes in the 65% orderly-plus-rapid cases, remaining small. All conditional annual/quarterly values, overlap and expected weights remain in the linked model.

Financial derivation · Receipt Boundaries, Physical Capacity And Overlap

The model anchors all six external H1 product families and adds SDI only from July 6. Aggregate segment revenue 3.07313222692 B before eliminations, less intersegment eliminations 0.56038165884 B reconcile external revenue 2.51275056808 B. Fillers remain in the financial other/printing bucket despite qualitative discussion under electronics. The precision COGS anchor is explicitly a residual after the other reported families, not a disclosed stand-alone amount.

Reported electronic tonnes, precision pieces and new-energy tonnes mix many products. They cannot identify AI-qualified tonnes, TEC cut pieces or a commercial sulfide market share. The Ceratron EIA discloses existing 1.8 M DPCpanels/year plus a proposed 0.2 M, yielding 2.0 M total, across several uses. The separate older phase-two 2.0–2.6 M production programme was approved/unbuilt with no implementation plan in that filing; building completion is not production completion. The 0.2 M product-output increment already incorporates the filing's80% engineering qualified-rate assumption in its area check. It is not subjected to the same yield deduction again. Actual customer eligibility, cut layout, compatible AI multilayer process, output and ASP remain undisclosed. The EIA is preserved in full, with selected relevant pages read; no full 293-page appendix reading is claimed.

Forecast volume is therefore an explicitly LOW normalized external-invoice index. Legacy base receipts equal actual H1 annualized receipts times within-year phase, qualified volume index and realized price/mix. Incremental demand above the actual base is captured at 60/72/84/94% by regime, with annual competitive erosion after 2027. This is a bounded supplier-wallet calibration, not a physical shipment forecast. Opening headroom 1.15 x and commissioned capital-to-receipt turnover 1.8 x are LOW invoice-equivalent capacity proxies, not issuer qualified capacity. New cash investment requires a two-quarter commissioning lag and finite equipment/plant service life. Reported opening book CIP 435.11664823 M is treated as cash settled at opening under an explicit LOW proxy and commissioned in two staged halves by regime, with no second cash payment. Opening long-term asset advances 157.68075060 M are not treated as ready capacity or paid again. Future capital cash is an economic asset-cost proxy; closing VAT, payable and statutory asset-entry reconciliation remains incomplete.

Four new-programme ceilings sit inside the actual families: CCLfiller in other, TEC and AI multilayer in precision, sulfide in battery. Their gross LOW receipt calibrations are reduced for overlap with broad-base growth:50% of potentially overlapping other growth for filler and 35% of precision growth for TEC, capped by programme gross receipts. Shared capacity then scales the remaining invoice. New programme variable cash costs are 55% for other/filler,60% precision and 65% battery, including external bare components where relevant; qualification/support fixed expense remains even where orders fail. R&D/support, capex, depreciation, working capital, cash tax and outside claims also remain. No NVIDIA/Phononic/Rubin/HBM/exclusive award, investor-question volume or downstream contract is promoted into an issuer-confirmed Sinocera order.

Financial derivation · Manufacturing, Support And Capital Charges

H1 D&A 0.18561956201 B consists of PPE 0.16337087751 B, ROU 0.00672309459 B, intangibles 0.01016783198 B and deferred expenses 0.00535775793 B. Sales/admin D&A 0.02360478201 B and R&D D&A 0.01776886138 B are removed from their own cash cost bases. The remaining 0.14424591862 B is an unallocated residual that I assign to factory/support as LOW; it is not an issuer-reported factory-D&A line. Differences between CF and asset-note depreciation/amortization remain separate scope gaps. Residual family cash costs are 80% variable/ 20% fixed; selling/admin cash costs 60% fixed and R&D 70% fixed. Fixed costs follow time, not invoice phasing. Recurring credit/inventory loss and surtax ratios remain, with regime stress.

Variable cash input inflation is 7/5/3.5/2.5% annually by regime, accumulating for two years in baseline; permanent accumulation is a separate stress. Yield/productivity gains 0/1/1.8/2.5% and fixed-cost inflation 6/5/4/3.5% are LOW and explicitly distinct. No selective 10–40% zirconia notice is applied to the whole business: dental repricing equals 35% eligible external receipts times 40/65/85/100% uptake times 10/15/20/30% selective increase. SDI has its own price/channel growth and receives no duplicated zirconia uplift.

Opening depreciable bases decline finitely. New investment is 80% equipment/ 20% plant over 32/80 quarters. Maintenance restores retiring opening service and does not create immediate free capacity. CIP and new growth/maintenance service expire. New assets do not continue depreciating after their basis is exhausted. Lease assets/liabilities renew on explicit 14-quarter domestic/ 8-quarter SDI LOW clocks; each renewal creates a matching noncash liability, finite depreciation, principal and interest. A new lease asset is not free cash.

H1 ordinary share compensation 27.1097 M stays in OP. Remaining initial-grant H2 expense 43.0170 M is phased 21.5085 M Q3/21.5085 M Q4; reserved-award 2026 expense 2.6588 M is Q4 only after the October 19 grant. Known 2027/28 expenses 47.1399/6.8492 M are separate from a LOW 25 M annual replacement-award expense from 2028, inflated with operating costs. No award proceeds or gross-share changes are inferred from expense.

Financial derivation · Sdi Transaction, Ordinary Economics And Tax

ConsiderationAUD 166.411742 M equals 118,865,530 shares timesAUD 1.40 and is paid once at Julyclose. The H1 report'sAUD 66.411742 M is preserved as a source typo and explicitly corrected against the scheme/closing evidence. FY 25 AUD13.084 M is comprehensive income; audited PAT is 12.160 M. Latest reviewed half-year Dec 2025 revenue 52.928 M less COGS 18.232 M, SG&A 26.443 M, R&D 1.194 M, other expense 1.230 M and ordinary impairment 0.724 M gives prefinance ordinary OP 5.105 M. RSM EBIT 4.825 M also includes negative other income 0.280 M; its EBITDA definitions differ. These figures cannot be substituted for each other.

July 6 consolidation includes 87 of92 days in Q3 2026. Fixed modeling FX 4.9 CNY/AUD and December reviewed cash/debt/WC/PPE/intangible balances are LOW closing proxies because Julyclosing and post-delisting FYJune 2026 accounts were not recovered. SDI organic/channel growth is- 3/+2.5/+6.5/+12% by regime, with cash operating costs fixed 65%/variable 35%. Declining amalgam share and replacement adoption, sales support and employment inflation remain. Latest reviewed total intangibles 34.465 M AUD is exact; approximate 10.8 M WIP in RSM commentary supplies a LOW allocation, not an exact note amount. DevelopmentWIP does not amortize until a LOW Q127 ready date. New development uses a40-quarter lower-end policy life. Incremental PPA intangibles 180/130/90/60 M CNY and PPE 50/35/25/15 M are explicit LOW fair-value charges above book bases, not a second purchase cash outflow. First-quarter proration retains the full finite lifetime basis.

Cash tax uses separate LOW 15% legacy/ 30% Australian pools. SBC and ordinary reserves are added back to domestic taxable profit; SDI PPA/ordinary reserves are added back to its tax base. No automatic acquisition-PPA tax shield, future high-tech renewal, R&D credit or cross-entity loss transfer is granted. Interest and tax affect funding, while valuation retains sanctioned prefinance OP. Forecast tax is not the observed group historical tax rate.

Financial derivation · Parent Rights And Distributions

The source reports Kanglitai 60% direct ownership, SaiChuang 88.89% direct, Jiangsu 55% direct and DEKEMA 74.9% indirect. HongKong SINOCERACREATE-TIDE is a different 100% indirect entity; ambiguous English shorthand is removed. The ultimate DEKEMA chain remains unavailable, so 25.1% outside claim is a LOW proxy, not a verified ultimate fraction. SDI is 100% owned through the acquisition chain.

The parent-OP bridge uses disjoint pools: Kanglitai's ordinary printing pool with 40% outside claim; a LOW 70% of legacy precision plus the new precision programme assigned to SaiChuang at 11.11% outside; a LOW 12% of

dental operating profit assigned to the DEKEMA proxy; an explicit 10% outside-claim reserve on the residual new filler pool because its producer is unknown; and 1.5% positive-profit outside reserve on the remaining unassigned pool. Proportional corporate support and all costs stay in operating pools before claims. These allocations are stressable, not issuer entity guidance. Kanglitai's reported parent/NCI accounting mismatch and negative H1 operatingcash are retained. Aggregate 30% positive after-tax NCI cash payout is a LOW cash budget, not a verified legal-entity dividend schedule or proof that all subsidiary cash is freely transferable.

Financial derivation · Cash, Maturity And Funding Limits

JuneCCE 1.25092936935 B already includes the 800 M SDIpre-funding; restricted monetary amounts are excluded. Purchase cash at LOW 4.9 FX0.8154175358 B and assumed acquired cash 0.0223391 B leave modeled starting cash 0.45785093355 B. The 600 M acquisition-loan ceiling,480 M guarantee,180 M buyback line and 100 M FXmargin facility are not unrestricted new funding. H1 borrowing/repayment and the 98.8021599 M June dividend are already in June cash. Only the 49.40107995 M August 18 interim dividend is debited in Q3 2026; no second 100 M buyback charge appears.

Current domestic bank 422 M and long maturities 114.711368 M current,96.21597599 M one-to-two-year,225.50026022 M two-to-three-year and 321.31865532 M later are rolled/paid on explicit LOW quarter clocks. Current short-bank first maturity defaultQ 227 is a within 12 month assumption; earliestQ 326 is a separate stress. Disruption has no short-bank rollover; other cases renew only the existing 422 M face without extra cash. SDI current 1.105/noncurrent 14.050 M AUD proxies are repaid by the known December 2028 facility maturity. Lease principal is separate. The domestic 5.5/4.5/3.75/3.25% and SDI 8/7/6.5/6% annual cash financing rates are ALL-INLOW assumptions, covering ordinary interest, service/renewal fees and bill costs. They are not issuer nominal-rate guidance. No separate historical aggregate financial service fee is silently omitted or charged twice; a fee-runrate shock is tested separately.

Retained endorsed/discounted receivables 199.80353589 M carry a matching recourse liability. The assigned asset is carved out of total reported AR for diagnostics, not added a second time. The matching liability reduces both opening and every future operatingNWC. Baseline assumes a fixed aggregate rolling ordinary trade-credit balance, not the perpetual survival of the same bill or a committed facility. A constant subtraction cancels in deltaNWC and creates no one-time cash inflow. The no-renewal stress runs that balance off uniformly across four quarters, keeps total receivable days unchanged and therefore requires up to 199.80353589 M additional operating funding. Exact dated maturities and bill-specific fees are unavailable. Ordinary successful settlement of an old matched asset/liability is itself netzero; that does not finance replacement unencumbered invoices.

Operating cash equals group recurring prefinance OP plus finiteD&A and SBC, less all-in financing cash, separate cash tax and change in operatingNWC. Ordinary loss provisions remain as a prudential economic collection/inventory-loss allowance rather than being added back and then charged again. Maintenance, development, growth capex, principal, leases, actual/discretionary parent dividends and NCI payouts all use that cash. Growth/dividends are subordinated to essential investment and a forward-four-quarter known-principal reserve. A LOW 150 M normal spending reserve can be drawn toward 50 M hard cash only for essential investment/principal; discretionary spending waits for restoration. This two-level policy is a modeling assumption, not a company covenant or new facility.

Baseline conditional quarter-end essential-funding gaps are zero. Disruption's minimum end cash is 52.656254 M, leaving little buffer over the 50 M LOWminimum. Principal-first sequencing produces a70.03967952 M gap in that regime before the quarter's receipts arrive. Quarter-end funded status therefore depends on intraquarter collection/payment timing and group cash fungibility. Earlier bank maturity, loss of ordinary bill funding, permanent cost pressure, shorter asset lives and fee shocks remain separately quantified stresses. None is relabelled a guaranteed funded forecast. Invalid input domains and any positive-probability unsupported funding path must block an accepted model price rather than pass through a plausible-looking number.

Appendix · complete 18-quarter seven-vector economics

CNY billion. Forecast 2026 covers Q3–Q4 only. All seven disjoint external vectors retain revenue, cost of revenue and gross profit for every quarter.

The terminal forecast quarter does not erase later obligations. Lease renewal balances and forward principal reserves remain explicit; finite assets can retain future service and depreciation beyond the displayed horizon.

Short-bank continuation in the non-disruption cases is a refinancing assumption at unchanged face, with no extra free facility.

Appendix · complete assumption owners and calendar matrices

All input owners in the linked calculation graph are listed below. SourceActual and SourceDerived identify historical anchors or accounting derivations; LOW identifies an explicit forecast/calibration assumption; NativeConvention identifies the protected method, gross shares or calendar/measuring convention. Ratios are printed as ratios unless the table labels a percentage. Calendar index zero begins Q3 2026; 2026 calibrations feed H2 forecasts only. No row is an issuer forward guide unless explicitly identified as a source actual.

Appendix · reproducing formula families

T108 · Core financial laws

Family	Definition
Base external revenue	H1 external receipt × 2 × within-year phase ÷ annual factor × qualified volume index × realized price/mix; supply capture and competitive erosion constrain incremental demand.
Programme overlap	Programme gross minus MIN(gross, eligible broad-base growth × overlap fraction); negative residuals are floored at zero. Filler and TEC overlap fractions have separate owners.
Shared capacity	MIN(1, eligible capacity ÷ requested base-plus-programme invoices) scales both base and programme receipts; the capacity proxy includes commissioning/cash limits.
Manufacturing cash cost	Opening family variable cash cost follows volume, inflation, productivity and fill; fixed manufacturing support follows time. Incremental programme inputs have their own cash-cost fraction.
Finite assets	Opening PPE/ROU/intangible/deferred balances, staged CIP and each new equipment/plant/software/PPA cohort depreciate or amortize only during the specified finite service window.
Recurring support	Selling/admin and R&D cash bases remove their own source D&A; fixed/variable shares have separate owners. Corporate D&A, ordinary SBC, loss allowances and surtax remain once.
SDI ordinary OP	From actual July close/proration, acquired sales less ordinary cash costs, reserves, finite book/PPA D&A and continuing development amortization; closing stocks and FX use explicit LOW proxies.
Parent OP	Group recurring prefinance OP minus disjoint Kanglitai, Ceratron precision, DEKEMA proxy, filler and residual outside-owner operating-profit claims after allocated costs.
Cash tax	Separate domestic/Australian taxable pools; SBC, reserves and PPA adjustments follow the stated law. No automatic future qualification renewal, acquisition PPA shield or loss transfer.

Family	Definition
Working capital	Operating AR/inventory/advances less AP/accruals and matching recourse liability. Constant ordinary trade-credit subtraction cancels in delta NWC; runoff uses additional cash.
Operating cash	Group recurring prefinance OP + finite D&A + SBC − all-in cash financing − cash tax − delta NWC; ordinary loss provisions remain an economic collection/inventory allowance.
Spending and funding	Essential maintenance/development/principal/leases precede discretionary growth and dividends. Normal/hard cash buffers and forward known-principal reserve constrain spending.
Valuation and expectations	Within each coherent case, forward4quarter parent OP is multiplied by20×1000/grosssharesM. Expected OP is formed from the joint weights; correlated programme weights are not multiplied independently again.

Definitions summarize the exact selected graph and approved financial explanation. Every economic input owner is printed in the preceding matrices; full executable expressions, dependencies and values remain in the linked canonical model.

The following exact expressions illustrate each operating, asset, parent and cash formula family using the disruption case in Q3 2026. The preceding matrices supply all other case/year/calendar inputs. Cohort and later-quarter branches retain their full expressions in the linked model; the complete conditional outputs and terminal obligations are printed in this report.

Appendix · complete published financial statements

Amounts are CNY, except EPS in CNY/share. An em dash marks a blank original source cell; zero is an actual reported zero. All economically populated rows and structural headings are shown. All-null source form/regulatory rows and repeated headers are omitted; the complete original-row JSON remains linked.

Consolidated and standalone-parent tables retain their original scope. Parent-attributable net income and standalone-parent earnings are not relabelled as consolidated recurring prefinance parent operating profit. Q1 2026 contains only the consolidated statements actually published.

Appendix · SDI historical published statement tables

These are the complete available SDI published historical P&L, balance-sheet and cash-flow table facts preserved in the source ledger. Values are AUD thousands, except EPS in AUD cents/share. The latest half-year ends December 31, 2025. These historical stocks are not a verified July 2026 closing balance sheet; the model's closing/FX allocations remain LOW proxies. Source: May 18, 2026 scheme, https://announcements.asx.com.au/asxpdf/20260518/pdf/06zq7hxl57khnb.pdf .

Source register and remaining limits

Latest actual H1 2026; Q3 scheduled Oct 27 and not yet published as of review.

Newest dedicated results records Aug 5 and May 8 are issuer-authored written selected Q&A, not complete audio/transcripts. May 15 collective supplemental remains mirror-hosted.

No exact AI-grade qualified tonnage, TEC cut-piece conversion, application ASP, AI multilayer bulk award, exact filler producer or ultimate DEKEMA chain recovered.

EIA 293 pages retained; relevant pages visually read, full legal/environmental appendix not read. Process/redacted input gaps remain.

SDI June 2026 fiscal-year financials and Julyclosing/PPA not recovered; rounded latestWIP 10.8 M is not an exact note balance.

Exact bank/bill maturity dates, bill-specific fees, unrestricted committed liquidity and entity cash-transfer constraints unverified.

Complete financial statements, source facts, historical reconciliations, input classifications, dependencies and executable model expressions accompany this report in 300285SZ_Sinocera_DeepDive_model.json. Original source-page exhibits retain their full-page context, date, physical page and English reading. No source page is a customer award beyond its stated scope.
