Montage Technology | The CPU memory-bandwidth buildout

澜起科技 | 688008.SH | 23 October 2026 | Framework 8.0

BOTTLENECK - qualified global interface oligopoly

Analytical score: 48/60 = 80%

Retained Excel Base: 80%

Active operating window: Q4 2027 prices Q4 2027 through Q3 2028

20x forward-four-quarter recurring consolidated economic operating profit; starting-quarter gross forward diluted shares; CNY billions x 1000 / shares in millions

Retained workbook snapshot: CNY 215.520. This is a frozen quote, not a newly retrieved market price.

CNY 267.2448B at the frozen A-share quote and 1,240M forward share proxy. This is a proxy capitalization, not synchronized A+H market capitalization; no concurrent H-share quote was used.

T001 | Active result | model estimate; Q4 2027 prices Q4 2027-Q3 2028

Measure	Value	Unit
Operating-profit ceiling	103.36	CNY/share
Four-quarter economic OP	6.440	CNY billion
Multiple	20	x
Starting-quarter gross shares	1,246.2	million
Unit conversion	1,000	CNYB to CNY/share
Analytical score	48	points out of 60
Protected Excel Base	80	percent

Reading key: reported financial statements are Actual; Q3 aggregate revenue and interconnect margin are Preliminary. Product allocation, adoption, prices, costs, quarterly timing, probabilities and economic OP are Model estimates with LOW confidence where undisclosed. Money is CNY billion unless the table states another unit. Conditional paths are jointly evaluated before 25/50/25 weighting.

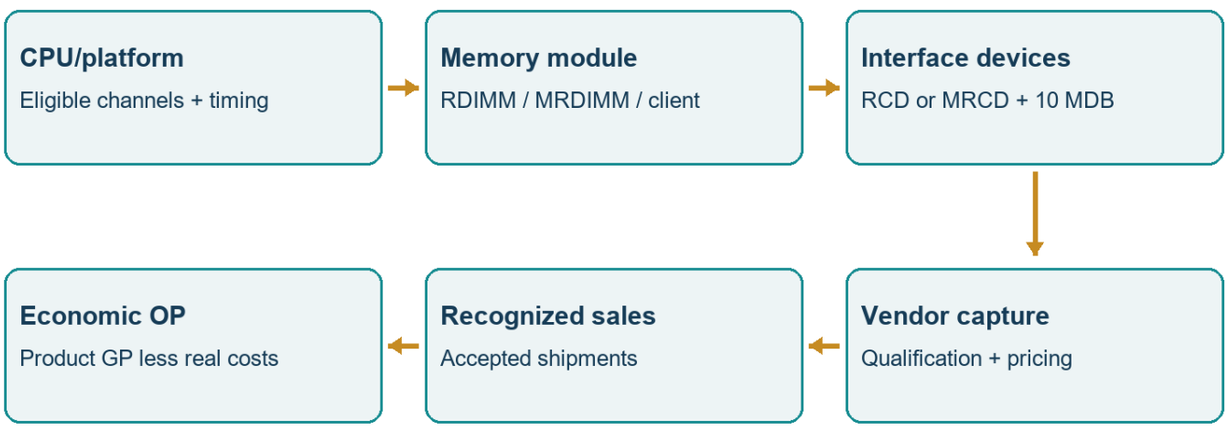

Contents: 1. CPU bandwidth creates more paid silicon per memory module; 2. The latest shipping evidence and the earnings measure being valued; 3. What management has actually said about deployment; 4. Count the correct devices on the correct modules; 5. China data packet and source calibration; 6. Use separate market wallets and show the normalization uncertainty; 7. Price the adoption before confirmation, with explicit limits; 8. Seven product vectors form the quarterly revenue build; 9. Fabless manufacturing still has real cost and delivery constraints; 10. Engineering, SBC and depreciation stay in economic profit; 11. Funding capacity and the all-share-class denominator; 12. The full quarterly operating-profit derivation; 13. The assumptions that move the result; 14. Thesis quality and the risks that can break the path; 15. Cross-book transmission and follow-up tests

CPU bandwidth creates more paid silicon per memory module

Montage supplies the logic that lets CPUs communicate reliably with high-speed memory. Inference, agents and data-intensive software increase the importance of memory bandwidth alongside processor throughput. More CPUs, richer channel configurations and faster memory generations enlarge the eligible interface wallet. Montage participates through qualified memory-interface products, client clock drivers, PCIe retimers and CXL memory-expansion controllers.

The most consequential architectural change is MRDIMM. Its interface uses one MRCD and ten MDB devices per module. A conventional RDIMM uses one RCD. That changes the paid interface content, while companion chips and DRAM belong to their own existing wallets. The revenue opportunity depends on adopted modules and negotiated component prices. Eleven devices do not establish an elevenfold price increase.

From CPU deployment to recognized interface sales

Our explanation | separate wallets; no implied vendor allocation

Our explanatory schematic. CPU eligibility and module architecture define an addressable pool; customer qualification, captured device content and accepted shipments turn that pool into Montage revenue. The schematic is not a customer order or an additional capex multiplier.

助现有的 LRDIMM 生态系统进行设计和测试。MRDIMM 未来将持续迭代升级，第一子代 MRDIMM 支持 8800MT/s 速率，第二子代 MRDIMM 支持 12800MT/s 速率，正在定义的第三子代 MRDIMM 支持的速率预计实现 16000MT/s。MRDIMM 需要搭配 1 颗 MRCD 和 10 颗 MDB 芯片，其设计复杂度和速率要求高于普通的 RCD 和 DB 芯片。

在 PC 端，随着 DDR5 传输速率持续提升，到 DDR5 中期，原本无需信号缓冲的 UDIMM、SODIMM（主要用于台式机和笔记本电脑），将需要配备一颗 CKD 芯片，对内存模组的时钟信号进行缓冲和重新驱动，从而提高时钟信号的完整性和可靠性。JEDEC 已制定了 CUDIMM 和 CSODIMM 内存模组相关标准，包括 CKD 芯片标准，将应用于支持 6400MT/s 及以上内存速率的台式机和笔记本电脑。

	内存模组	RCD	DB	SPD	TS	PMIC	MRCD	MDB	CKD
服务器	RDIMM (DDR4)	1	-	1	-	-	-	-	-
	LRDIMM (DDR4)	1	9	1	-	-	-	-	-
	RDIMM (DDR5)	1	-	1	2	1	-	-	-
	LRDIMM (DDR5)	1	10	1	2	1	-	-	-
	MRDIMM (DDR5)	-	-	1	2	1	1	10	-
PC端	UDIMM/SODIMM (DDR4)	-	-	1	-	-	-	-	-
	UDIMM/SODIMM (DDR5)	-	-	1	-	1	-	-	-
	CUDIMM/CSODIMM/CAMM (DDR5)	-	-	1	-	1	-	-	1
	LPCAMM (DDR5)	-	-	1	-	1	-	-	-

图：内存互连芯片在不同类型的内存模组中的应用及配比数量

附注： (1)UDIMM(Unbuffered Dual In-line Memory Module):无缓冲双列直插内存模块；(2)CUDIMM(Clocked Unbuffered Dual In-line Memory Module):时钟无缓冲双列直插内存模块；(3)SODIMM(Small Outline Dual In-line Memory Module):小型双列直插内存模块；(4)CSODIMM(Clocked Small Outline Dual In-line Memory Module):时钟小型双列直插内存模块；(5)CAMM(Compression Attached Memory Module):压缩附加内存模块；(6)LPCAMM(Low Power Compression Attached Memory Module):低功耗压缩附加内存模块。

根据弗若斯特沙利文的数据，内存互连芯片市场规模预计将从 2025 年的 15.79 亿美元增长至 2030 年的 50.05 亿美元，期间年均复合增长率高达 25.9%。中国占全球市场的份额，预计到 2030 年将占约 30%。

V10 | Required interface and companion-chip content per module, issuer H1 page 19. English reading: DDR4 RDIMM: 1 RCD+1 SPD; DDR4 LRDIMM: 1 RCD+9 DB+1 SPD. DDR5 RDIMM: 1 RCD+1 SPD+2 TS+1 PMIC; DDR5 LRDIMM adds 10 DB; DDR5 MRDIMM uses 1 MRCD+10 MDB+1 SPD+2 TS+1 PMIC. Clocked client CUDIMM/CSODIMM/CAMM has 1 CKD+1 SPD+1 PMIC. Limit: These are total module requirements, not Montage captured BOM. MRDIMM interface replaces conventional RCD/DB; CKD is not all PC memory. LPCAMM and LPDDR need separate scope. Source: https://static.cninfo.com.cn/finalpage/2026-08-29/1225530486.PDF PDF page 19; printed 19/196.

The investment edge comes from following CPU and memory architecture into the specific component bill of materials, then paying for the supplier's captured operating profit. HBM and accelerator spending can dominate headlines while CPU-side bandwidth grows. Qualified suppliers still compete: Renesas, Rambus and other interconnect vendors provide credible alternatives. Montage's standards work, analog design, customer integration and validation history create entry barriers; they do not establish sole-source control.

The latest shipping evidence and the earnings measure being valued

The newest company financial update is the 21 October preliminary result for July through September 2026. It gives revenue of approximately CNY 2.079B, including CNY 2.047B of interconnect products, and an interconnect gross margin of 68.0-68.5%. Management expects the relevant fourth-quarter product demand to increase further. The release remains unaudited preliminary information. Full third-quarter operating expenses, cash flow, balance sheet and individual family sales were unavailable at this research cutoff.

The preliminary attributable net-profit range is CNY 1.20-1.30B; regulatory recurring attributable net profit is CNY 0.95-1.05B. These measures include accounting and ownership effects that differ from the operating-profit basis used here. The model anchors the reported aggregate revenue and interconnect GP, then separately estimates expenses and economic OP. The modeled third-quarter OP must retain its Model label even though revenue is Preliminary.

证券代码：688008　　证券简称：澜起科技　　公告编号：2026-057

澜起科技股份有限公司

2026 年第三季度业绩预增的自愿性披露公告

本公司董事会及全体董事保证本公告内容不存在任何虚假记载、误导性陈述或者重大遗漏，并对其内容的真实性、准确性和完整性依法承担法律责任。

一、本期业绩预告情况

（一）业绩预告期间

2026年7月1日至2026年9月30日。

（二）业绩预告情况

经澜起科技股份有限公司（以下简称“公司”）财务部门初步测算：

1．预计2026年第三季度实现营业收入约为20.79亿元，较上年同期增长约46.0%；

2．预计2026年第三季度实现归属于上市公司股东的净利润12.00亿元~13.00亿元，较上年同期增长153.6%~174.7%；

3．预计2026年第三季度实现归属于上市公司股东的扣除非经常性损益的净利润9.50亿元~10.50亿元，较上年同期增长152.6%~179.2%。

（三）本期业绩预告未经注册会计师审计。

二、上年同期业绩情况

公司2025年第三季度营业收入为14.24亿元，归属于上市公司股东的净利润为4.73亿元，归属于上市公司股东的扣除非经常性损益的净利润为3.76亿元，基本每股收益为0.42元/股。

V01 | Montage Q3 2026 preliminary results, announced 21Oct 2026, page 1. Figures are unaudited preliminary estimates. English reading: Revenue approximately CNY 2.079bn; parent net profit CNY 1.2-1.3bn; parent profit excluding non-recurring items CNY 0.95-1.05bn; period 1Jul-30Sep 2026. Limit: These are net-profit measures, not recurring pre-financing economic OP. No individual product-family split or operating-cost detail is provided. Source: https://static.cninfo.com.cn/finalpage/2026-10-21/1225612915.PDF PDF page 1; printed 1.

三、本期业绩变化的主要原因

今年以来，随着AI推理及Agent应用快速发展，服务器CPU需求持续增长，并进一步带动内存模组及内存互连芯片整体需求量上行。2026年第三季度，公司依托行业龙头地位，DDR5内存接口及模组配套芯片出货量大幅增加，DDR5第三、第四、第五子代RCD芯片出货占比进一步提升，推动公司经营业绩同比大幅增长。

2026年第三季度，公司预计实现营业收入约为20.79亿元，同比增长约46.0%，环比增长约10.9%；预计实现归属于上市公司股东的净利润12.00亿元~13.00亿元，同比增长153.6%~174.7%，环比增长4.3%~13.0%；预计实现归属于上市公司股东的扣除非经常性损益的净利润9.50亿元~10.50亿元，同比增长152.6%~179.2%，环比增长32.2%~46.1%。

2026年第三季度，公司预计互连类芯片产品线销售收入约为20.47亿元，同比增长约49.3%，环比增长约20.9%，预计今年第四季度相关产品需求将进一步提升；预计2026年第三季度互连类芯片产品线毛利率为68.0%~68.5%，同比增加2.31～2.81个百分点，环比增加0.57～1.07个百分点。

四、风险提示

本次业绩预告是公司财务部门基于自身专业判断进行的初步核算，未经注册会计师审计。公司尚未发现影响本次业绩预告内容准确性的重大不确定因素。

五、其他说明事项

本公告所载 2026 年第三季度主要财务数据仅为初步核算数据，具体准确的财务数据以公司正式披露的 2026 年第三季度报告为准，提请投资者注意投资风险。

特此公告。

V02 | Q3 preliminary interconnect revenue and margin; issuer explanation,21Oct 2026, page 2. English reading: Interconnect revenue approximately CNY 2.047bn, +49.3% YoY/+20.9% QoQ; GM68.0-68.5%. DDR5 Gen 3/4/5 RCD shipment mix increased. The issuer expects related demand to improve further inQ4. Limit: The exact Q4 growth percentages, Q3 family allocations, margin midpoint and forward GM paths are root assumptions. Preserve the preliminary-results warning below the figures. Source: https://static.cninfo.com.cn/finalpage/2026-10-21/1225612915.PDF PDF page 2; printed 2.

The latest full statements are H1 2026. Revenue was CNY 3.335497522B and GP CNY 2.178503319B. Subtract selling, administration, R&D, business surcharges and credit/inventory impairment to derive CNY 1.351769558B of recurring pre-financing economic OP. Ordinary SBC and depreciation remain expenses. Reported Chinese operating profit also includes finance credits, other income and CNY 0.681961504B of investment and fair-value gains. Those gains do not enter the recurring operating-profit valuation. Minority losses are not added back to inflate the valued profit.

FY2025 and Q1 2026 provide accounting and calibration context. Use the exact source table for revenue, product costs, expenses, CFO and cash capex. H1 less Q1 derives Q2 revenue, rather than fabricating a quarterly history. Investment gains, foreign-exchange movements and statutory recurring net profit stay separate from the economic operating measure.

T003 | Financial anchors | CNY billion; actuals except derived Q2 revenue

Measure	FY2025	Q1 2026	H1 2026	Q2 derived
revenue	5.456	1.461	3.335	1.875
cost of sales	2.061	0.441	1.157	-
taxes surcharges	0.007	0.002	0.004	-
selling expense	0.120	0.029	0.059	-
administration expense	0.526	0.127	0.288	-
R&D expense	0.915	0.188	0.453	-
finance expense negative is credit	-0.228	0.025	-0.029	-
investment income	0.097	0.011	0.252	-
fair value income	0.026	0.222	0.430	-
other income	0.116	0.003	0.008	-
credit impairment signed P&L	-0.001	-0.000	-0.002	-
asset impairment signed P&L	0.028	-0.006	-0.021	-
reported operating profit	2.322	0.877	2.071	-
attributable net profit	2.236	0.847	1.997	-
CFO	2.022	0.627	1.328	-
capex cash PPE intangible other long term assets	0.266	0.103	0.255	-

These anchors are transcribed from the canonical financial fact ledger. Figures display CNY billions to three decimals; the full source precision and exact PDF pages are retained in the source register. Q2 revenue is derived as H1 less Q1. A negative financing expense is a credit; signed impairment rows retain the source sign.

T004 | H1 exact reported OP to recurring economic OP | CNYB

What management has actually said about deployment

The newest two reporting-period earnings records reviewed are the FY2025/Q1 results explanation covering 12-15 May and the H1 results explanation covering 4-9 September, including the 8 September earnings event. Full published main-question activity records were preserved. The H1 phone-meeting record for 28/31 August and the latest located September 15-16 investor record add relevant timing and cost detail. These are issuer-authored written activity summaries with all their published Q&A, rather than verbatim transcripts of every event. The latest H1 records were retrieved as full issuer PDFs through mirrors; a separate complete formal-event transcript/audio was unavailable.

Management links inference and agents to CPU demand, more memory modules and richer channels. It also says second-generation MRDIMM is in trial use and that large-scale adoption depends on the next CPU platforms entering production in 2027. There is no historical adoption curve that makes the modeled penetration certain. The four newer families produced CNY 538M in H1 and approximately CNY 269M in each of Q1 and Q2; stable sequential sales make a straight-line explosive ramp inappropriate.

PCIe retimer shipments were mainly Gen 5. Gen 6 production-version tapeout and an Integrators List entry establish development progress while customer qualification continues. Management expects supporting standard-server platforms to ship in volume in 2027. CXL commercialization language also points toward 2027 and includes next-generation Samsung and SK hynix integration. Engineering tapeouts for PCIe 7, switches and Ethernet PHY parts remain distinct from accepted commercial sales. Absolute R&D spending is expected to rise as projects expand.

Count the correct devices on the correct modules

DDR5 RDIMM requires an RCD and companion functionality; LRDIMM adds data buffers. MRDIMM replaces the interface logic with its MRCD/MDB set. A PMIC or temperature sensor needed by the module is not automatically supplied by Montage. The current Micron process-code tables show Montage and competing options; the MRDIMM table establishes Gen 1 options, rather than validating Montage's entire Gen 2 forecast. Use the source tables to keep the interfaces, companion chips and competing suppliers distinct.

CKD serves eligible clocked client modules. LPDDR, soldered-memory and alternative module architectures limit the eligible PC pool. Counting all PCs or all PC DRAM as CKD demand would exaggerate sales. A CXL MXC controller enables memory expansion and pooling; its controller revenue is separate from DRAM, CXL switches and an entire memory-pool system. PCIe retimers restore signal quality, while PCIe switches route connectivity and occupy a different wallet.

Platform support is generation-specific. AMD's July 2026 EPYC9006 announcement already identifies JEDEC MRDIMM: 12800, up to sixteen DDR5 channels and PCIe 6 on relevant configurations. An older generic AMD FAQ discusses limitations of the Intel Gen 1 format. That limitation cannot be generalized to all future AMD MRDIMM support. Product-family specifications also do not apply uniformly to every CPU SKU or prove a Montage vendor allocation.

The September RCD05 and CK01P production releases corroborate readiness of products already described in prior company materials. They occupy the existing traditional and CKD vectors. Gen 6 RCD sampling, competing Renesas MRDIMM samples and Rambus's current product families explain the next-generation race. Their maximum interface rates are not automatic CPU operating speeds, market share or customer orders.

Process Codes: DDR5

The following tables provide the process code options for DDR5 RCD, PMIC, HUB, and temperature sensor/ EEPROM devices.

Table 14: DDR5 Process Code Options – Client SODIMMs and UDIMMs

Description

The M88DR5CK01P is a clock driver (CKD) chip for use in the client memory to buffer the clock between the Host controller and DRAMs, and enhance the speed and stability of memory data access.

The M88DR5CK01P has three clock driving modes: Single PLL Mode, Dual PLL mode and PLL Bypass Mode (Legacy mode). In Single PLL mode, the device uses one input clock pair to produce four separate output clock pairs to the two DRAM channels. In Dual PLL mode, the device uses two input clock pairs to produce four separate output clock pairs to the two DRAM channels. In PLL Bypass mode, the device uses four input clock pairs to produce four separate output clock pairs to the two DRAM channels.

By configuring the control register settings, the device can change its output characteristics to match different DIMM net topologies. By disabling unused outputs the power consumption is reduced.

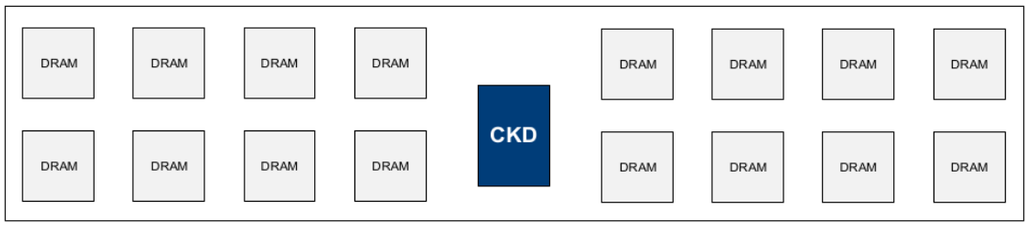

Features

- Compliant with JEDEC DDR5 Clock Driver Definition (DDR5CKD01) standard
- Speed up to DDR5-9200
- 1.1V VDD voltage support
- Output characteristics configurable through control registers
- Clock driver with zero phase delay
- Programmable latency per channel
- I^2C and I3C Basic interface
- Dual-sideband bus address
- Ultra-low power consumption
- RoHS compliant
- Green package: 35-ball Fine-Pitch Ball Grid Array (FPBGA)

Applications

- DDR5 CUDIMM, CSODIMM, CQDIMM and CAMM

Application Example (for CUDIMM)

Description

M88DR5RCD05 is a two-channel, single-ended DDR5 Registering Clock Driver (RCD) with parity for driving and buffering the Command/Address (CA) bus, Chip Selects, and clock between the host controller and the DDR5 SDRAMs.

The two separate channels have some common logic but operate independently. Each has a DDR/SDR CA bus input, a single parity input, two Chip Select (CS) inputs, and produces two copies of SDR CA bus outputs and four copies of CS outputs.

M88DR5RCD05 supports DDR and SDR on the Host Command/Address signals, with a maximum speed up to 8000 MT/s. The Chip Select is SDR for both settings on DCA and QCA. Commands are sent to a single rank or multiple ranks, and the ODT control is encoded into Chip Selects.

M88DR5RCD05 supports register access mechanisms through a sideband bus or in-band channel commands. Control Word registers (CW) are configurable to optimize the RCD properties for different DIMM raw card designs.

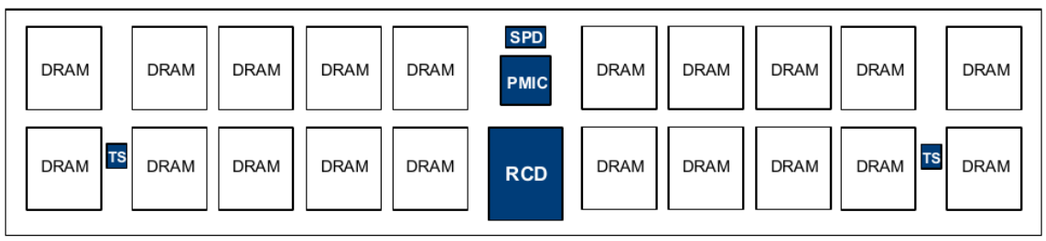

Features

- Compliant with JEDEC DDR5RCD05 specification
- Speed up to 8000 MT/s
- 1.1V V_{DD} and 1.0V V_{DDIO} Voltage
- Two-channel 1:2 registering buffer for DDR or SDR Command/Address inputs and control signals
- Integrated PLL clock driver distributing one differential clock input to eight differential clock pairs per channel
- Dual chip selects
- Scrambling on DCA
- Parity checking across CA and DPAR inputs separately on two sub-channels
- Output characteristics configurable through Register Words
- Continuous Time Linear Equalization (CTLE) to improve signal margins
- CS/CA/DFE training, DESTM for DFE and enhanced CTLE training, HIT-SR
- Dual Frequency support
- ZQ calibration
- Latency equalization
- Output delay control
- Sideband bus interface
  - I^2C FM+ mode (1MHz)
  - I3C basic mode (up to 12.5 MHz)
- Power saving modes
  - Self Refresh mode with Clock Stop
  - Self Refresh mode without Clock Stop
- Green package: 264-ball Flip-Chip Fine-Pitch BGA
- RoHS compliant

Applications

- High-performance DDR5 RDIMMs

RDIMM Application Example

PCIe/CXL interconnect chip market: The PCIe interconnect chip market is relatively mature and demonstrates a high level of concentration, with the top five companies collectively holding over 90% of the market share. In 2024, the top two vendors in the PCIe Retimer segment alone captured 96.9% of market share, while the PCIe Switch segment is primarily dominated by a single vendor. These leading companies possess advanced high-speed SerDes design capabilities and extensive experience in PCIe protocol iteration and commercialization – some have already mass-produced PCIe 5.0 products and begun sampling PCIe 6.0 chips. Their ability to support complex system-level interconnect topology further reinforces their market competitiveness. Meanwhile, CXL interconnect technology remains an emerging field. Although adoption and ecosystem development are gradually progressing, chips based on CXL have yet to reach mass production, and the market is still in its early stage.

Ethernet and optical interconnect chip market: A few global giants dominate the Ethernet and optical interconnect chip segments, leveraging their technological leadership and early-mover advantages tosecure major market shares.

Ranking and Market Share

The Company currently derives its primary revenue from memory interconnect chips and PCIe Retimers.

Memory Interconnect Chips

In 2024, the market remained highly concentrated, with the top three companies collectively accounting for 93.4% of the total market share. Among them, the Company ranked first with revenue of USD0.43 billion, representing a 36.8% market share.

Ranking of Memory Interconnect Chip Companies, Global, 2024

Ranking	Company	Revenue	Market Share
		(in billions of USD)	*(%)*
1.	The Company	0.43	36.8
2.	Company A	0.42	36.0
3.	Company B	0.24	20.5
	Others	0.08	6.6
Total		**1.17**	**100.0**

Notes:

(1) Company A is a listed company, founded in 2002 and headquartered in Tokyo, Japan. It specializes in embedded semiconductor solutions, including MCU, SoC, and analog chips, etc., primarily for automotive electronics, industrial automation, and consumer electronics.

(2) Company B is a listed company, founded in 1990 and headquartered in California, USA. It specializes in high-speed memory and chip-to-chip interconnect technologies, focusing on IP licensing and interconnect solutions for computing and storage.

Source: Frost & Sullivan

V17 | 2024 broad memory-interconnect market shares in the prospectus: Montage 36.8%,CompanyA36.0%,CompanyB20.5%. English reading: The table is broad memory-interconnect revenue, not RCD alone. Notes describeCompanyA as aTokyo 2002listed embedded-semiconductor supplier andCompanyB as aCalifornia 1990listed interface/IP firm; mapping toRenesas/Rambus is an identified inference. Limit: Do not relabel 36.8% as 2026traditional/RCD/MRDIMMshare or 58.25% fitted index. Older upper-pageCXL commercialization wording should not be used to override later 2026sources. Source: https://www1.hkexnews.hk/listedco/listconews/sehk/2026/0130/2026013000007.pdf PDF page 149; printed 139.

PCIe Interconnect Chips

PCIe Retimer

This sector also exhibited a similarly high level of market concentration in 2024. We ranked the second globally among PCIe Retimer providers in terms of market share in 2024. As a new entrant to this market, the company achieved rapid shipment growth in 2024 through continuous product development and iteration, generating revenue of USD0.04 billion and securing a 10.9% market share, ranking second.

Ranking of PCIe Retimer Companies, Global, 2024

Ranking	Company	Revenue	Market Share
		(in billions of USD)	*(%)*
1.	Company C	0.34	86.0
2.	The Company	0.04	10.9
	Others	0.01	3.1
Total		**0.39**	**100.0**

Note:

(1) Company C is a listed company, founded in 2017 and headquartered in California, USA. It specializes in data center connectivity semiconductors, including PCIe/CXL Switches/Retimers, smart cables, etc., targeting AI servers, cloud infrastructure, and high-performance computing.

Source: Frost & Sullivan

PCIe Switch

The PCIe Switch market is highly concentrated, with a single global vendor accounting for over 90% of market share. The core barrier lies in the complexity of high-speed SerDes and switching-fabric design, which has historically limited players' participation. Leveraging its independently developed SerDes IP, the engineering know-how and similar market resources accumulated from PCIe Retimer development, the Company is among the few enterprises capable of developing advanced PCIe Switch products, and is currently in the progress of developing such products.

CXL Interconnect Chips

CXL interconnect chips are designed based on the emerging CXL high-speed interconnect protocol. As CXL adoption and ecosystem development are still in an early stage, large-scale commercial deployment has yet to materialize. Consequently, the market remains nascent, and an objective, complete competitive landscape has not yet taken shape. As industry standards mature and application scenarios expand, enterprises represented by the Company that have already established early technical capabilities and product reserves in CXL interconnect chips are expected to gain competitiveness as the market develops.

V18 | 2024 PCIe-retimer market in the prospectus: largestvendor 86.0%,Montage 10.9%,others 3.1%. English reading: CompanyC is described as aCalifornia 2017listed connectivity-semiconductor firm, consistent withAsteraLabs; the name mapping is inference. The adjacent switchsection says that is a different concentratedmarket. Limit: No 2026marketshare or proprietarycustomer allocation follows from this 2024table. Do not apply 10.9% to the entire PCIeSwitchmarket. Source: https://www1.hkexnews.hk/listedco/listconews/sehk/2026/0130/2026013000007.pdf PDF page 150; printed 140.

China data packet and source calibration

The primary modeling packet uses Chinese exchange/company annual and interim reports, the Q3 preliminary announcement, issuer management records and capital-action notices. Independent CPU, memory-module and competitor sources test architecture and qualification claims. Native-language filings provide the correct all-share-class denominator and distinguish financial gains from recurring operations. Company source material takes priority over translated search summaries.

Demand enters through memory-module attachment and scoped interconnect wallets; margin enters through product mix and foundry/assembly/test costs; timing enters through CPU production, customer qualification and accepted shipments. Counter-evidence includes credible competing suppliers, alternative memory architectures, product-mix pressure and external supply constraints. Missing family ASPs and volumes lead to labeled bounded proxies rather than zeroing every developing opportunity.

The model exactly retains H1 reported totals and Q3 preliminary aggregate revenue and interconnect GP. Individual H1 and Q3 family allocations remain LOW estimates. The latest Q3 traditional residual is normalized using a 26% quarterly weight as a forward planning index; it is not backcast across earlier reported quarters. The comparison with a full FY2026 build using H1 actual aggregates, Q3 preliminary residual and Q4 model is within the framework's ten-percent calibration check. The table states the precise residual assumptions and variance.

T012 | Reported / modeled calibration and normalization controls

Control / measure	Exact approved value

其他说明：

V04 | H1 revenue and cost by business and region, page 160; amounts are CNY. English reading: Interconnect revenue 3.111291902bn/cost 0.955362281bn; Jintide revenue 0.220013632bn/cost 0.198720262bn. Domestic revenue 1.011414820bn and overseas 2.319890713bn. The source defines domestic as Mainland China plus HongKong. Rental revenue is outside the product subtotal. Limit: Do not use geography as end-customer/hyperscaler exposure or call domestic Mainland-only. Margins derived from these rows are calculations, not individual new-family margins. Source: https://static.cninfo.com.cn/finalpage/2026-08-29/1225530486.PDF PDF page 160; printed 160/196.

Use separate market wallets and show the normalization uncertainty

The market spine is the July 2025 Frost & Sullivan study commissioned for the Hong Kong listing and reproduced in the issuer's H1 report. The issuer explicitly presents it as industry background. Its later publication in a company report does not turn 2025-2030 forecast values into newly measured industry actuals. Show the original market dates, USD units and each non-overlapping wallet beside the source charts.

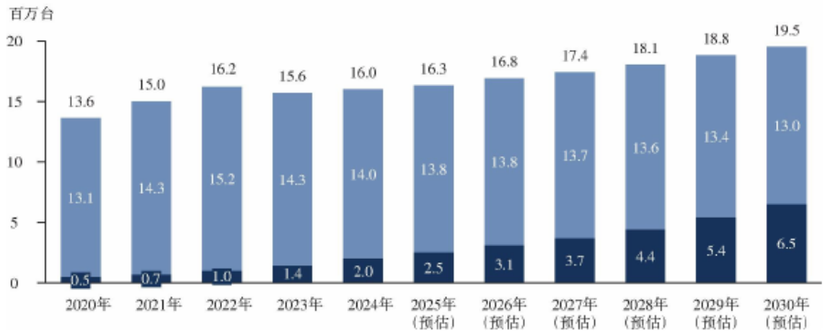

Traditional interfaces use the relative growth of RCD/DB plus companions. The normalized Q3 traditional revenue divided by the dated 2026 wallet implies a fitted index of approximately 58.2548%. This LOW coefficient contains the assumed family split, quarterly normalization, product mix and forecast-vintage error. It is not a verified commercial market share and cannot be equated with the different 2024 broad-memory share of 36.8%.

The conditional paths explicitly revise the old server-memory wallet for inference, channels and architecture adoption. Those drivers are already present in the industry forecast to some degree, so they are modeled as bounded deviations from that spine. They are not multiplied a second time as independent CPU, channel, memory-content and capex factors. A SpaceX compute or capital-spending headline supplies no identified Montage allocation; its possible CPU-demand effect overlaps the same deployment pool.

In the accelerated 2030 path, traditional revenue can exceed the unadjusted old forecast wallet. The relevant denominator in that conditional path is the explicitly enlarged market, not the unadjusted reference. Show both denominators. The enlargement is a subjective future market hypothesis, not evidence that Montage currently has more than 100% share. MRDIMM, CKD, retimer and MXC revenue use their own wallets and effective company capture; no broad PCIe-switch or CXL-switch total is assigned to those products.

要高速互连芯片来提升数据访问稳定性，其增速虽不及 AI 服务器，仍是相关市场的重要支撑。

复合年增长率	2020年至2024年	2025年至2030年（预估）
AI服务器	45.2%	21.2%
通用服务器	1.6%	-1.2%
总计	4.2%	3.6%

资料来源：弗若斯特沙利文，2025 年 7 月[1]

此外，弗若斯特沙利文预计全球 PC 出货量总体呈平稳增长趋势，预计出货量将从 2025 年的 2.63 亿台增长至 2030 年的 2.98 亿台，年均复合增长率 2.5%。

（2）内存模组行业情况

内存模组是计算机架构的核心组成部分之一，主要作为 CPU 与硬盘的数据中转站，用于临时存储数据，其存储和读取速度远高于硬盘。根据应用领域不同，内存模组可分为以下几类：①服务器内存模组，目前主要包括 RDIMM 和 LRDIMM 等类型，随着服务器数据存储和处理负载的不断增加，对服务器内存模组的稳定性、纠错能力以及低功耗的要求也日益提高；②普通台式机、笔记本内存模组，主要类型为 UDIMM、SODIMM 等。全球 DRAM 市场中，90%左右的市场份额由三星电子、海力士及美光科技占据，这三家公司也是公司内存接口芯片及内存模组配套芯片的主要下游客户。

内存模组的发展遵循清晰的技术升级路径，相关标准由 JEDEC 组织定义，涵盖内存模组的组成构件、性能指标和具体参数等。近年来，服务器内存模组行业正经历从 DDR4 世代向 DDR5 世代的切换，目前 DDR5 第一子代至第四子代内存产品已实现量产，JEDEC 已完成 DDR5 第五、第六子代标准制定。为满足传输速率提升及新的产业需求，JEDEC 还陆

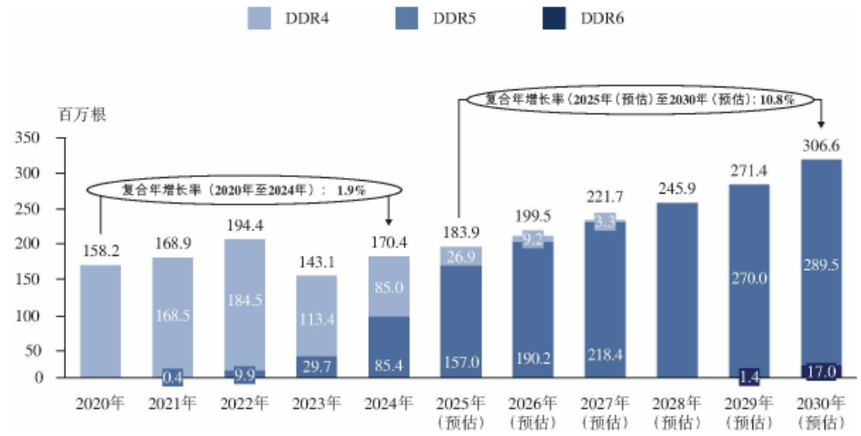

[1] 本半年度报告引用了来自弗若斯特沙利文的多项行业数据，均来自于弗若斯特沙利文于 2025 年 7 月为公司发行 H 股股票并在香港联交所上市的招股章程编制的独立市场研究报告，相关详情请参阅公司于香港联交所网站披露的招股章程（链接：https://www1.hkexnews.hk/listedco/listconews/sehk/2026/0130/2026013000007.pdf）。相关数据仅作为行业背景参考，既不代表公司的业务预测，也不构成对业绩达成或投资回报的任何明示或暗示保证，请投资者注意识别相关风险并理性决策。

V14 | Source-vintage note: the issuer attributes industry data to an F&S report prepared in July 2025 for its HongKong prospectus. English reading: The footnote identifies the July 2025IPO industry study, links the prospectus, and says the figures are industry background rather than the issuer business forecast or an investment-return assurance. Limit: Do not use the page genericPC/server forecast as an additional independent source of growth if already embedded in wallet figures. Source: https://static.cninfo.com.cn/finalpage/2026-08-29/1225530486.PDF PDF page 16; printed 16/196.

续定义了多种新型内存模组架构，例如用于服务器的 MRDIMM，以及用于台式机/笔记本电脑的 CUDIMM、CSODIMM、CAMM、LPCAMM 等。目前，JEDEC 正在开展对 DDR6 相关标准的讨论。

内存模组与 CPU 是计算机的两个核心部件，是计算机生态系统的重要组成部分。随着支持更高速率 DDR5 的 CPU 的持续迭代，DDR5 内存模组的渗透率将提升，同时其子代的更新迭代也将持续推进。

根据弗若斯特沙利文的数据，2030 年服务器内存模组出货量预计将攀升至 3.07 亿根，2025 年至 2030 年间的年均复合增长率约为 10.8%，呈现良好增长态势。从产品结构上看，目前 DDR5 已成为行业主流。DDR6 内存模组有望在 2029 年前后实现商业化应用，为市场注入新的增长动力。驱动服务器内存模组需求量增长的核心因素，在于全球服务器出货量的增长，以及单台服务器内存模组配置数量的增加。

图：全球服务器内存模组出货量

资料来源：弗若斯特沙利文，2025 年 7 月

（3）内存互连芯片行业情况

内存互连芯片包括内存接口芯片、内存模组配套芯片等。内存接口芯片是服务器内存模组的核心逻辑器件，其主要作用是提升内存数据访问的速度及稳定性，满足服务器 CPU 对内存模组日益增长的高性能及大容量需求。

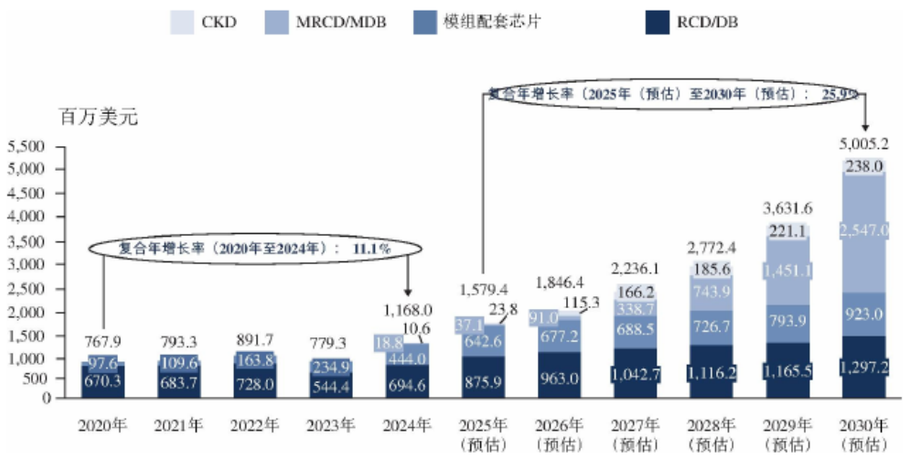

内存接口芯片的发展演变情况如下：

内存接口芯片世代	技术特点	主要厂商	研发时间跨度
DDR2	最低可支持 1.5V 工作电压	TI（德州仪器）、英特尔、西门子、Inphi、澜起科技、IDT 等	2004 年-2008 年

V09 | Global server memory-module shipments by generation; F&S July 2025 forecast reprinted in H1 2026. Unit: million modules. 图：全球内存互连芯片市场规模

资料来源：弗若斯特沙利文，2025 年 7 月

当前，随着 AI 推理及 Agent 应用的快速发展，AI 工作负载正在从训练端大规模向推理端及智能体迁移，这一转变对系统的逻辑判断、任务调度与实时交互能力提出了更高的要求，使得 CPU 的通用计算架构价值凸显，在 AI 系统中的重要性正在加强。行业预期 AI 服务器中 CPU 与 GPU 的配置比例将持续提升，CPU 需求增加将推动内存模组用量增加。此外，服务器 CPU 支持的内存通道数也在持续演进，当前主流服务器 CPU 支持 8 个或 12 个内存通道，新一代 CPU 支持的内存通道数或将增加至 16 个，内存通道数增加意味着每个 CPU 最多可搭配的内存模组数量将相应增加。由于内存互连芯片数量与内存模组用量呈正相关，因此，以上产业趋势将有望推动内存互连芯片市场进一步扩容。

此外，JEDEC 组织正持续对 DDR6 内存互连技术以及产品标准进行讨论，主流趋势是：DDR6 内存模组将配置数量更多、设计更复杂的内存互连芯片。

（4）PCIe 互连行业情况

PCIe 协议是一种高速串行计算机扩展总线标准，自 2003 年诞生以来，其互连技术在近几年发展迅猛，传输速率基本每 3-4 年翻倍增长，并保持良好的向后兼容特性。从 PCIe 4.0 到 PCIe 5.0，传输速率已从 16GT/s 提升至 32GT/s；到 PCIe 6.0 和 PCIe 7.0，传输速率将进一步提升至 64GT/s 和 128GT/s。凭借强大的生态系统，平台厂商、芯片厂商、终端设备厂商和测试设备厂商深度合作，PCIe 已成为主流互连接口，全面覆盖了 PC 机、服务器、存储系统等各种计算平台，广泛服务于云计算、企业级计算、人工智能和物联网等应用场景。

V11 | Memory-interconnect revenue by product; July 2025 F&S forecast reprinted in H1 2026. Unit: USDmillion. English reading: For 2026/2027/2028/2029/2030: RCD+DB963.0/1042.7/1116.2/1165.5/1297.2; companions 677.2/688.5/726.7/793.9/923.0; MRCD+MDB91.0/338.7/743.9/1451.1/2547.0; CKD115.3/166.2/185.6/221.1/238.0. Limit: Traditional is the sum of RCD/DB and companions only. Do not multiply broader memoryTAM by each family share or repeat CPU/channel multipliers already in this spine. Root market multipliers and 58.2548% fitted index are not drawn from this image. Source: https://static.cninfo.com.cn/finalpage/2026-08-29/1225530486.PDF PDF page 20; printed 20/196.

T014 | Scoped industry wallets | USD million; July 2025 forecast vintage

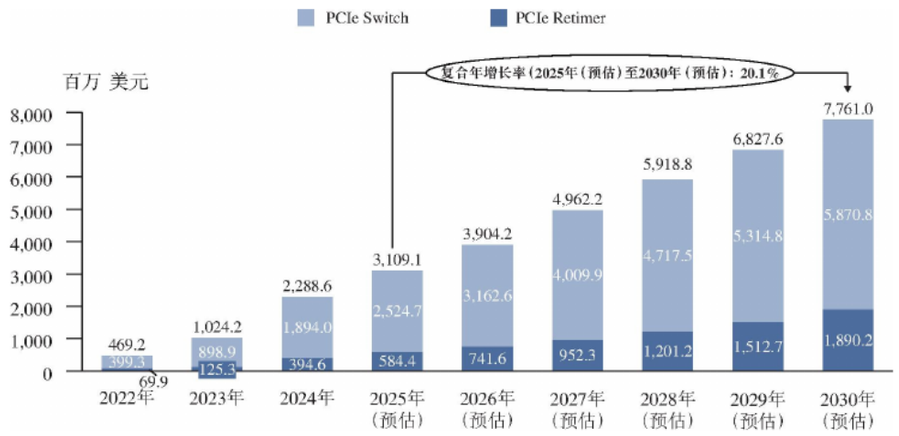

Year	Traditional	MRCD/MDB	CKD
2026	1,640.200000	91.000000	115.300000
2027	1,731.200000	338.700000	166.200000
2028	1,842.900000	743.900000	185.600000
2029	1,959.400000	1,451.100000	221.100000
2030	2,220.200000	2,547.000000	238.000000

局域网（Vlan），可将多台机器连接到同一片 PCIe Switch，并进行分区配置，把某些端点设备分配给特定服务器，实现统一管理和灵活分配，避免多个操作系统枚举同一堆 PCIe 总线内的角色时出现访问地址冲突；d. 支持 NTB（Non-Transparent Bridge）技术：通过地址翻译实现不同分区或系统中的设备通信。例如传统存储系统中的多个控制器，可利用 NTB 技术通过 PCIe 链路直接通信，实现数据和控制信息的同步。

PCIe Switch 芯片可以突破主机有限 PCIe 接口的制约，实现更多设备的高密度 PCIe 互连，显著提升系统扩展性和资源利用率，在数据中心、云计算、存储系统、网络设备中有广泛的应用，尤其适用于对带宽和延迟敏感的场景。比如在数据中心和云计算中，PCIe Switch 芯片可以连接多块 GPU/AI 加速卡进行并行计算，也可以构建 GPU/AI 加速卡集群进行超大规模计算；在存储系统中，PCIe Switch 芯片可以连接大量 NVMe SSD，构建高速存储池；在网络设备中，PCIe Switch 芯片可以连接多块 100G/400G 网卡，管理高速端口的数据转发。

AI 服务器的快速增长显著拉动了 PCIe Retimer 芯片和 PCIe Switch 芯片的需求。以配置 8 块 GPU 的典型 AI 服务器为例，通常需配备 2 至 4 个 PCIe Switch 实现拓扑扩展，同时需要 8 至 16 个 Retimer，以延长 CPU 与外设间的有效传输距离。目前，根据部分国内 8 卡 GPU 服务器的方案，需要 24 个 Retimer 芯片。因此，PCIe 互连芯片已成为 AI 服务器中不可或缺的核心器件，其需求量与 AI 服务器出货量呈正相关。

根据弗若斯特沙利文的数据，PCIe 互连芯片市场规模将持续高速增长，预计 2030 年市场规模将达到 77.61 亿美元，2025 至 2030 年间的年复合增长率高达 20.1%。中国占全球市场的份额，预计到 2030 年将占 30%以上。

图：全球 PCIe 互连芯片市场规模

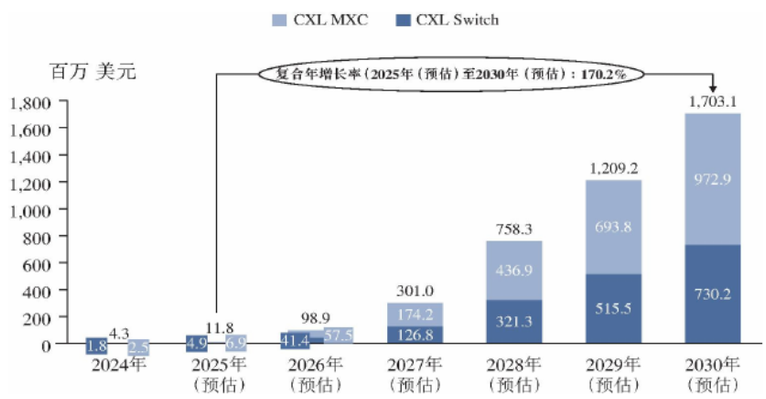

资料来源：弗若斯特沙利文，2025 年 7 月

（5）CXL 互连行业情况

V12 | PCIe interconnect market split between retimers and switches; July 2025 F&S forecast. English reading: Retimer 2026E741.6,2027E952.3,2028E1201.2,2029E1512.7,2030E1890.2 USDmillion. The much larger upper segment is PCIeSwitch, not retimer. A typical 8GPU example uses 8-16retimers and 2-4switches; selected configurations can differ. Limit: The model retimer capture and ASP are assumptions. Do not turn the typical-server example into universal attachment or attribute the entire switchwallet to Montage. Year	Retimer
2026	741.600000
2027	952.300000
2028	1,201.200000
2029	1,512.700000
2030	1,890.200000

资料来源：弗若斯特沙利文，2025 年 7 月

当前，产业界正积极推进 CXL 技术的落地与商业化，多家云服务提供商正在积极试用相关产品。未来，随着支持 CXL 3.x 的服务器 CPU 平台量产，内存池化方案有望逐步落地；同时，基于目前存储价格高企的背景，多家云服务提供商也在探索使用 CXL 技术利旧使用（reuse）老代际的 DRAM 产品。在 AI 领域，目前部分 TPU 和 GPU 产品也开始支持 CXL，通过 CXL 的内存扩展为 TPU/GPU 提供大容量高带宽的内存资源，支持大语言模型推理场景中超长的上下文及静态知识库。因此，行业预计未来几年 CXL 产品在数据中心的渗透率有望快速提升。

（6）以太网及光互连行业情况

① 以太网互连芯片

以太网互连芯片是数据中心、云计算及 AI 基础设施的核心硬件，实现设备间高速数据交换与低时延通信。主要分为三类：（i）以太网交换芯片（Ethernet Switch），用于数据包的转发和网络流量的调度，是数据中心网络的骨干器件；（ii）NIC（网卡芯片），部署于服务器端，是主机接入以太网并实现数据传输的关键接口；及（iii）Ethernet Retimer 芯片，解决长距离高速信号传输中的时序失真与信号衰减，保障数据传输的完整性与系统稳定性，尤其适用于 AI 服务器与云计算节点。未来随着 AI 大模型部署加速，AI 服务器、超大规模数据中心及高带宽存储系统对高速低延迟网络的需求激增，400G/800G 以太网方案逐步落地，并向 1.6T 演进，驱动以太网互连芯片需求量和价值量同步提升。

公司目前在研以太网 PHY Retimer 芯片，该芯片主要用于保障 AI 服务器与交换机之间高速互连信号的完整性和可靠性。

② 光互连芯片

V13 | CXL controller and switch market forecast; F&S July 2025. 2026	57.500000
2027	174.200000
2028	436.900000
2029	693.800000
2030	972.900000

Key Growth Drivers in the Server Segment

Growth in Memory Module Demand Drives Expansion of the Market

Memory interconnect chips have a well-defined deployment ratio with memory modules, making their demand closely correlated. According to Frost & Sullivan, server memory module demand will grow from 183.9 million units in 2025 to 306.6 million units in 2030. This significant growth directly drives a proportional increase in memory interconnect chip shipments, laying a solid foundation for market expansion.

Product Upgrades Create a New Growth Opportunity

- **DDR5 technological advancements increase chip value**: With higher technical complexity and enhanced performance, DDR5 RCD and SPD chips offer significantly higher unit value than their DDR4 counterparts. Additionally, DDR5 server memory modules require new supporting chips such as TS and PMIC. These upgrades not only boost per-unit pricing but also expand the chip variety, driving growth in the DDR5 era.

- **Emergence of MRDIMM unlocks incremental market potential**: Driven by the rising need for memory bandwidth in AI applications, MRDIMM, known for its superior bandwidth performance, is expected to become the preferred main memory in mainstream AI servers. Commercial adoption will begin in 2025, with a projected penetration rate of 30% in AI servers by 2030 and shipments reaching 53.4 million units, with a CAGR of 148.0% from 2025 to 2030. Compared to the widely applied RDIMM, which requires only one RCD, MRDIMM requires a higher-value MRCD and ten additional MDB chips, significantly boosting the total market value as its penetration rises.

- **Successive generational iterations sustain ASP**: DDR5 RCD chips are expected to roll out in six product generations, while MRCD/MDB chips will have three. These continuous generational upgrades will leverage innovation and performance optimization to sustain average selling prices and profit margins, ensuring long-term stable growth for the memory interconnect chip market.

Key Growth Drivers in the PC Segment

- **Transition from DDR4 to DDR5 Adds New Chip Requirements:** In the PC segment, DDR5 memory modules (including UDIMM, SODIMM, CAMM, and LPCAMM) require a higher-spec, higher-value SPD chip and an additional PMIC, collectively driving up per-unit chip value in the DDR5 era.

- **Enhanced Data Rate Support of DDR5 Further Drives the Expansion of Chip Demand:** The first generation of DDR5 supports speeds of 4,800 MT/s. As data rates reach 6,400 MT/s and beyond, PC memory modules (including CUDIMM, CSODIMM, and CAMM) will require the addition of a CKD chip. This chip is expected to begin penetrating the market from 2025 and achieve near-total coverage in PC memory modules by 2029, opening a new growth avenue in the consumer segment.

V15 | Prospectus industry forecast: MRDIMM 2030 shipments 53.4M and 30% penetration inAIservers; CKD penetration forecast, printedpage 130. English reading: The prospectus projects MRDIMM: 53.4M units in 2030,148.0% CAGR2025-2030 and 30% AIserver penetration. It expects CKD near-total coverage in PC memorymodules by 2029. Limit: Dated July 2025 forecast, not factorycapacity or accepted Montage volume. Compare old 53.4M and regime-adjusted globalmodule proxy separately. PC eligibility excludes soldered/LPDDR forms. Source: https://www1.hkexnews.hk/listedco/listconews/sehk/2026/0130/2026013000007.pdf PDF page 140; printed 130.

Entry Barriers and Key Success Factors in the Memory Interconnect Chip Market

- **Technological Accumulation Creates High Industry Barriers:** Memory interconnect chips fall under the category of high-speed, nonlinear analog and mixed-signal circuits, making their R&D extremely complex. Success in this field requires not only profound technical expertise but also long-term accumulation of intellectual property and design experience. Products in this domain adhere to JEDEC industry standards. To establish a competitive edge, companies must actively participate in or even lead the development of these standards, which involves close collaboration and technical exchanges with major CPU, memory, server, and cloud computing vendors, all while advancing product R&D in tandem. This closed-loop system of "standards — technology — industry chain" creates significant barriers for new entrants, as they must not only overcome technical challenges but also deeply understand industry standards and rapidly introduce competitive next-generation products in line with standard updates.

- **Ecosystem Collaboration Builds Competitive Moats:** Memory interconnect chips are primarily used in servers, where product reliability requirements are stringent, leading to high commercial entry barriers. A company's core competitiveness largely stems from the collaborative barriers formed through partnerships with leading ecosystem players. To maintain their advantage, industry leaders must meet two key criteria: (i) continuously securing certifications from industry giants across multiple industry chain links (including memory and CPU manufacturers) for new product generations; and (ii) maintaining a long track record of stable, high-quality product deliveries. Once established, these deep partnerships enable leading companies to form a stable ecosystem closed-loop with industry chain partners in standard-setting and collaborative development, reinforcing their market position.

GLOBAL PCIe/CXL INTERCONNECT CHIP MARKET

PCIe Interconnect Chip Market Overview and Market Size

Definition and Classification of PCIe Interconnect Chips

PCIe interconnect chips serve as core components for high-speed data interconnection in data centers and servers, adhering to the PCI-SIG standard system. Their main products are categorized into two major types:

- PCIe Retimer chips are ultra-high-speed signal conditioning devices designed for the PCIe protocol. They primarily address issues such as timing skew, severe signal loss, and poor signal integrity in high-speed, long-distance data transmission scenarios. These chips play a critical role in interconnections between the CPU and high-speed peripherals such as GPUs, AI accelerators, SSDs, and NICs. From a pricing perspective, different product types show significant variation. The average industry ASP in 2024 was ranged from approximately USD25.0 to USD50.0 per chip.

V16 | Prospectus describes a 2024 industry PCIe-retimer ASP range ofUSD25-50 per chip, printedpage 132. English reading: The lower paragraph describes retimers and reports a 2024 industry range ofUSD25.0-50.0 per chip. Limit: Historical industry range, not Montage ASP, customer quote or PCIe 6/7 future price. CNY 245 atplanningFX7 is a root-selected midpoint diagnostic. Price the adoption before confirmation, with explicit limits

One active model weights three coherent conditional paths: delayed 25%, continued 50% and accelerated 25%. These are subjective investment judgments. Management direction, realized Q3 demand and independent evidence of usable products support a material participation probability. Competing suppliers, uncertain customer allocation, qualification timing, alternative architectures and supplier costs preserve a meaningful delay path. A product's existence can be certain while a large future revenue endpoint remains uncertain.

Each conditional path calculates its own product sales, manufacturing costs, operating support, D&A, working capital and cash uses before its economic OP is weighted. Correlated deployment and capture evidence is considered jointly. The ledger identifies the reference amount, conditional amounts, active contribution, affected quarters, overlap and the evidence that would change probability. No additional score multiplier is applied to forecast revenue or the resulting ceiling.

The no-growth control holds future annual product revenue at the latest Q3-normalized levels while retaining the same future cost and timing laws. It is a diagnostic control rather than a current-profit valuation. The ordered vector contribution table telescopes from that control to the active value. Because support-cost floors and product economics interact, its marginal contributions depend on the stated vector order. They cannot be recombined as independent upside options.

Already modeled product releases receive an explicit zero extra-wallet disposition. The separate proposed repurchase receives a numerical conversion probability for cash feasibility, with a full-budget cash test as well. No official contract requirement is imposed on the qualified future opportunities; the uncertainty remains in amounts, weights, costs and timing.

Seven product vectors form the quarterly revenue build

Traditional revenue begins with the Q3 residual after the modeled new-product allocation, then follows the scoped wallet index and the selected conditional demand multiplier. MRCD/MDB sales use the standalone wallet, company capture and company recognition factor. The latter describes supplier-specific participation and timing, not another forecast of global market adoption. F&S's traditional/MR segmentation already accounts for interface substitution, so no extra blanket cannibalization factor is applied to the same modules.

CKD follows its eligible client wallet and company capture without a server multiplier. Retimers follow the retimer wallet and generation/capture path. MXC follows the controller wallet, capture and company-specific recognition. The combined adjacent-products allowance uses a current clock-sales proxy plus prospective design programs, units per program and content. Those hypothetical programs are not reported design wins. The Jintai and other noninterconnect residual is normalized as a lower-margin, lumpy business anchored by the H1 results and small Q3 residual.

A traditional 21/24/26/29% annual quarter shape is retained as a planning assumption for conventional products. MRDIMM and MXC use a back-loaded 2027 recognition shape; later years use a less steep shape. The table exposes every timing weight. No quarterly seasonality is described as management guidance. The Q4 2026 interconnect paths all exceed Q3 demand, consistent with the latest qualitative outlook.

Illustrative ASPs translate money into implied quantities: CNY 400 per MRCD-plus-ten-MDB set, CNY 10 per CKD, CNY 245 per retimer and CNY 600 per MXC. Only the retimer diagnostic has an industry price-range cross-check, using a USD 35 midpoint inside the issuer's cited 2024 USD 25-50 range. The other prices remain LOW assumptions. At fixed market revenue, a different diagnostic ASP changes implied units rather than automatically adding revenue. MR set counts are compared with both the dated 53.4M 2030 industry forecast and the consistently revised conditional market; neither forecast is a manufacturing capacity limit.

Probability-weighted model revenue. Q3 2026 aggregate revenue is preliminary; family allocations and later quarters are LOW model estimates. Exact product values follow immediately.

Fabless manufacturing still has real cost and delivery constraints

Montage designs the silicon and outsources wafer fabrication, assembly and testing. Its supplier network is an operating dependency. The filings warn about schedules, input prices, quality and availability; they do not disclose a quantitative current wafer-allocation bottleneck, company-specific yield curve or reserved annual capacity. The model therefore cannot claim that announced foundry capacity has already become accepted Montage product sales.

Each product carries its own cost fraction and trajectory. Modeled interconnect COGS is separated into raw-content/foundry and processing components using the FY2025 aggregate 61.15/38.85 split as a LOW within-family allocation. Jintai uses the distinct source raw/processing split 99.49/.51. Conditional procurement multipliers and field-quality costs are applied once. Product GP sums to consolidated GP before R&D, administration, selling, surcharges, impairment and D&A reconciliation.

Higher generations can carry richer prices and mix, while new products, external processing, validation and supplier pressure can offset that benefit. Management explicitly cited product mix in Q2 gross-margin changes. The model avoids a generic scarcity premium and a second automatic gross-margin uplift. Its numeric manufacturing assumptions and the resulting product margins remain visible beside the operating-profit bridge.

QUALITY CONTROL

We have established a comprehensive set of quality control and assurance procedures to monitor our operations to ensure compliance with the regulatory requirements and quality requirements during the entire development, manufacturing, delivery and services processes.

We strictly comply with the requirements of the ISO 9001 Quality Management Systems. Meanwhile, we have established robust internal quality management procedures which consist of written policies such as quality manual, new product development process, and reliability certification requirements, which systematically define quality control requirements for all stages, including IC design, development, outsourcing, manufacturing, and sales. We have also set certain targets for our quality management work, requiring a DPPM (Defects Per Million) to be ≤100.

We adopt a fabless model to focus on design and R&D, while manufacturing, packaging, and testing are outsourced. The quality of our products therefore also depends on the production management standards of our foundry partners. We will continue to enhance our R&D and design capabilities and minimize design-related quality risks by implementing rigorous design verification and testing processes to reduce design defects. Meanwhile, we maintain strict supplier management systems, clearly defining the allocation and assumption of product quality responsibilities, establishing quality standards and certification systems for foundries and packaging and testing service providers, in order to further enhance overall quality control.

We have established a comprehensive product recall process, which primarily includes the following steps: problem identification and risk assessment, recall decision-making and plan development, internal communication and customer notification, supply chain tracing and product recovery/isolation, defect analysis and corrective actions, and recall verification and record-keeping. The product recall process emphasizes rapid response, accurate tracking, and proper handling to ensure efficiency and effectiveness.

During the Track Record Period, we have not experienced significant product returns, replacements, or customer complaints. In 2022, 2023 and 2024 and the nine months ended September 30, 2025, the amount of product return in each year/period of the Track Record Period were nil, RMB0.5 million, RMB3.0 million, and nil, accounting for nil, 0.0%, 0.1% and nil of our total revenues for the respective years/period.

DATA PRIVACY AND INFORMATION TECHNOLOGY SYSTEMS

As our customers are corporates rather than individual consumers, we do not collect personal information from third parties for our research and development purposes. See "Risk Factors — Risks Related to Our Business and Industry — We are subject to evolving and changing regulations of privacy and data protection, which may impact our legal, financial and operational behavior." for further detail describing the data privacy risks associated with our operations.

Engineering, SBC and depreciation stay in economic profit

Fixed R&D and administration start from twice the H1 reported amounts and grow explicitly with the expanding engineering program. Variable support is charged on annual revenue above the latest normalized annual reference, then allocated to quarters by revenue. Selling costs, business surcharges and expected credit/inventory impairment use separate actual-calibrated ratios. The product and cost schedules show meaningful operating leverage while absolute R&D rises.

Ordinary SBC remains expensed. The cash forecast allocates H1 aggregate equity SBC proportionally across fixed R&D/admin, a LOW assumption because the full expense-bucket allocation is not reported. Variable-support cash language concerns SBC attribution. It does not remove the separate D&A normalization from the operating model. The cash addback follows the modeled embedded fixed-cost SBC and is never added to economic OP.

H1 reports D&A within R&D, administration and selling, while the cash-flow total is larger. The remaining CNY 29.18121678M is unallocated by those expense notes. Assigning that residual proportionally to modeled COGS is a LOW attribution proxy, not a reported product-cost fact. The model measures the D&A already implicit in its cost build, removes that proxy and reintroduces an explicit D&A target based on H1 and a 10% annual activity assumption. The separate reconciliation expense can be negative when costs already include more D&A than that target; it is a cost normalization, not cash income.

The same D&A expense is added back once in cash flow. Changing the D&A-growth control changes OP by the opposite depreciation amount and cancels in pretax cash flow before the related tax/dividend effects. Show the direct sensitivity and the attribution limitation. This keeps economic profit after depreciation while avoiding double charging the embedded expense.

Funding capacity and the all-share-class denominator

H1 cash and cash equivalents were CNY 15.011597968B. The higher monetary-funds balance also contains accrued interest and restricted funds; those exclusions are made once. Trading financial assets are excluded from deployable cash. Part of the cash build came from the Hong Kong offering, so total cash does not prove that every funding purpose is interchangeable. The designated R&D, expansion and strategic-investment uses remain relevant.

The cash bridge uses gross receivables and gross inventory, with current modeled provisions added back once. Opening employee, tax and other payables settle once; the prior final dividend is separately paid once. Future operating accruals are treated as paid within each quarter as a conservative liquidity convention. Product cash costs, engineering support, taxes, working capital, capex, leases, debt, dividends and repurchases all enter before the minimum-cash test. A separate acquisition reserve includes reported investment commitments plus an explicit contingency, not a claimed transaction.

The new CNY 300-500M repurchase remains an unapproved proposal at the cutoff, with an intended 29October board discussion. Its 70% conversion assumption affects modeled cash, and a full 500M test checks feasibility. The earlier program had already spent CNY 410.228M by September 30. Its completion confirmation adds no new Q4 cash deduction. The October 23-captured completion record has a printed 24October date; both the original date and the exchange index's publication timestamp are retained.

The A-share interim cash dividend is separate from the H-share distribution. Their scheduled payment dates do not establish bank settlement. A treasury transfer to vested employees also differs from new gross issuance. The current known gross shares include both A and H classes, while treasury-held shares are separately identified.

The valuation retains the native forward share schedule beginning at 1,240M and increasing 0.5% annually. Treasury stock is not subtracted from this gross forward proxy; completed H issuance is not added again; proposed repurchases do not automatically reduce it. No minority-loss uplift, financial-asset value or surplus cash is added to the 20x OP calculation. Every positive-weight cash path is funded under the disclosed assumptions. A stress that breaches the buffer requires explicit financing review and cannot receive free equity cash at an unchanged denominator.

The 12.5% future cash-tax rate is a LOW blended assumption. H1's accounting ETR was lower; parent qualification, Kunshan's first-five-profitable-years holiday and its undisclosed exact expiry, and Macau's rate affect the future mix. The higher-tax/full-buyback test is shown. Cash and tax feasibility are separate from the sanctioned pre-financing operating-profit valuation.

The H1 tax note applies a conditional 10% parent-company rate under the integrated-circuit qualification assessed annually. Kunshan's separate high-technology certificate supports a 15% rate for 2024-2026, while its more favorable key integrated-circuit policy gives 0% for its first five profitable years and then 10%; the first profitable year and zero-rate expiry were not disclosed. The Shanghai electronic subsidiary also has a separate 15% high-technology certificate for 2024-2026. Macau applies 12% from January 2021. The model's 12.5% cash-tax assumption and 20% stress case are LOW blended cash-flow estimates, distinct from these entity-specific statutory rates and qualifications.

六、税项

1. 主要税种及税率

主要税种及税率情况

√适用 □不适用

税种	计税依据	税率
增值税	集团内一般纳税人按销售额和适用税率计算的销项税额，抵扣准予抵扣的进项税额后的差额；集团内小规模纳税人按照销售额和增值税征收率计算的增值税税额，不得抵扣进项税额	免税、0%、3%减按 1%、6%、9%、13%
城市维护建设税	实际缴纳的流转税	5%、7%
教育费附加	实际缴纳的流转税	3%
地方教育费附加	实际缴纳的流转税	2%
企业所得税	应纳税所得额	详见下表
房产税	从价计征：房产原值一次减除 30%后余值 从租计征：租金收入	从价计征：1.2% 从租计征：12%
土地使用税	实际占用的土地面积	每平方米 6 元和 1.5 元

注 1：Montage Technology Macao Commercial Offshore Limited 注册地为澳门。根据澳门特别行政区颁布的第 21/78/M 号所得补充税法律制度，2021 年 1 月 1 日起该子公司符合 A 类纳税人的组别条件，根据其税前利润规模适用税率 12%。

注 2：Montage Technology Holdings Company Limited 注册地为英属开曼群岛，不征收企业所得税；Montage Real Estate Holding I Limited 和 Montage Real Estate Holding II Limited 注册地为英属维尔京群岛，不征收企业所得税。

注 3：Montage Hong Kong Holdings Company Limited、Montage Real Estate Holding I (Hong Kong) Limited 和 Montage Real Estate Holding II (Hong Kong) Limited 注册地为香港特别行政区。根据香港利得税两级制的相关规定，同一集团内的有关连实体于同一课税年度仅可由其中一家选择适用两级制利得税率。本年度 Montage Hong Kong Holdings Company Limited 适用两级制利得税率，其首 2,000,000 港元应评税利润按 8.25% 的税率计征，超过 2,000,000 港元的部分按 16.5%的税率计征；Montage Real Estate Holding I (Hong Kong) Limited 和 Montage Real Estate Holding II (Hong Kong) Limited 适用 16.5%的标准利得税税率。

注 4：Montage Technology Inc.、Mont Acquisition Sub, Inc.、Montage, Inc.、3955 Johns Creek Inc.、Montage Semiconductor Inc.、Montage Technology Holdings Inc.和 Montage Technology Holdings II Inc.注册地为美国，执行美国联邦企业所得税税率 21%。前述子公司在执行美国联邦企业所得税的同时，需执行其注册地所在州相应的企业所得税政策。

2. 税收优惠

√适用 □不适用

（1）增值税

根据《财政部国家税务总局关于全面推开营业税改征增值税试点的通知》财税（2016）36 号，纳税人提供技术转让服务免征增值税。本集团收取特许权使用费免征增值税。

（2）企业所得税

根据《关于促进集成电路产业和软件产业高质量发展企业所得税政策的公告》（财政部 税务总局 发展改革委 工业和信息化部公告 2020 年第 45 号）及《国家发展改革委等部门关于做好 2026 年享受税收优惠政策的集成电路企业或项目、软件企业清单制定工作有关要求的通知》（发改高技〔2026〕487 号），本公司符合国家鼓励的重点集成电路设计企业条件，可减按 10%的税率缴纳企业所得税，本公司会按照法律法规要求进行各项申报工作。

本公司的子公司澜起电子科技（昆山）有限公司（“澜起昆山”）于 2024 年 12 月 24 日取得江苏省科学技术厅、江苏省财政厅、国家税务总局江苏省税务局颁发的高新技术企业证书，证书编号：GR202432016754，澜起昆山可于 2024 年至 2026 年按 15%税率征收企业所得税。同时，根据《关于促进集成电路产业和软件产业高质量发展企业所得税政策的公告》（财政部 税务总局 发展改革委 工业和信息化部公告 2020 年第 45 号）及《国家发展改革委等部门关于做好 2026 年享受税收优惠政策的集成电路企业或项目、软件企业清单制定工作有关要求的通知》（发改高技〔2026〕487 号），国家鼓励的重点集成电路设计企业，可自获利年度起，第一年至第五年免征企业所得税，接续年度减按 10%的税率征收企业所得税。本公司的子公司澜起昆山符合国家鼓励的重点集

V27 | H1 2026 tax note, PDF/printed page 125. English reading: Macau applies 12% from 1 January 2021. The parent meets the key integrated-circuit 10% condition. Kunshan holds its separate 2024-2026 high-tech 15% certificate and also qualifies for the more favorable first-five-profitable-years integrated-circuit exemption, followed by 10%. The continuation is preserved on the next source page. Published 28 August 2026 / CNINFO 29 August 2026. Source: https://static.cninfo.com.cn/finalpage/2026-08-29/1225530486.PDF

成电路设计企业的认定标准，本年度可免征企业所得税，澜起昆山会按照法律法规的要求进行各项申报工作。

本公司的子公司澜起电子科技（上海）有限公司于 2024 年 12 月 26 日取得由上海市科学技术委员会、上海市财政局和国家税务总局上海市税务局颁发的高新技术企业证书，证书编号：GR202431005429，澜起电子科技（上海）有限公司可于 2024 年至 2026 年按 15%税率征收企业所得税。

根据《关于进一步支持小微企业和个体工商户发展有关税费政策的公告》(财政部 税务总局公告 2023 年第 12 号)的规定，对小型微利企业减按 25%计算应纳税所得额，按 20%的税率缴纳企业所得税政策，延续执行至 2027 年 12 月 31 日。于本报告期，本公司的子公司澜起电子科技（海南）有限公司、西安澜起电子设计有限公司及澜起电子设计（上海）有限公司属于小型微利企业，可适用小型微利企业的优惠税率。

本公司的子公司澜起创业投资（海南）有限公司注册于海南省三亚市。根据《财政部税务总局关于海南自由贸易港企业所得税优惠政策的通知》（财税〔2020〕31 号）文件，对注册在海南自由贸易港并实质性运营的鼓励类产业企业，减按 15%的税率征收企业所得税，该规定自 2020 年 1 月 1 日起执行至 2024 年 12 月 31 日。最新的鼓励类产业目录源自国务院审定印发的《海南自由贸易港鼓励类产业目录（2024 年本）》，其中创业投资已被纳入海南省鼓励类产业目录，拥有创业投资资质符合条件的企业可减按 15%税率征税企业所得税。根据《财政部税务总局关于延续实施海南自由贸易港企业所得税优惠政策的通知》（财税〔2025〕3 号），《财政部税务总局关于海南自由贸易港企业所得税优惠政策的通知》（财税〔2020〕31 号）规定的税收优惠政策，执行期限延长至 2027 年 12 月 31 日。根据《海南省发展和改革委员会创业投资企业备案通知书》（琼发改审批〔2021〕869 号）澜起创业投资（海南）有限公司已于 2021 年 11 月 9 日完成创业投资企业备案，本年度按 15%税率征收企业所得税。

The full quarterly operating-profit derivation

Each quarter combines the seven product revenues and their product GP, subtracts the distinct operating expenses and D&A reconciliation, and retains recurring consolidated economic OP. The active value is the probability-weighted result of the coherent conditional economics. The numerical build is the single source for every chart, table and linked company model.

For each of the fifteen ceiling quarters, sum that named quarter and the next three quarters of economic OP, multiply by the retained 20x and unit factor 1000, and divide by the share count at the starting quarter. List the four individual terms, their exact dates, sum, multiple, share denominator and unrounded result. The active Q4 2027 value prices Q4 2027 through Q3 2028. The final three operating quarters have no complete future four-quarter window in this model and therefore no invented terminal ceiling.

Annual 2027-2030 totals are trajectory and market-boundary cross-checks. Their long-range uncertainty rises as MRDIMM, CXL, competitors and platform choices compound. They do not replace the quarterly method or justify moving later profits into an earlier window. The rounded headline is a display of the full calculation, not an added optionality premium.

20 x current-plus-next-three-quarter recurring consolidated economic OP x 1000 / starting-quarter gross forward diluted shares. The weighted Q4 2027 result prices Q4 2027-Q3 2028. Conditional lines are diagnostics, not confidence bounds.

The assumptions that move the result

The largest economic uncertainties are the normalization of the latest traditional-memory run rate and the degree to which server deployment exceeds the old industry forecast. The model shows alternative probability weights, Q3 annual weights, the dated-TAM-only control, and a range for undisclosed new-family allocations. All dependent product costs and support expenses recalculate.

Q3 aggregate-margin endpoints move early operating profit and the early forward windows. They do not change the later cost targets by themselves. The family-allocation sensitivity holds the reported aggregate interconnect GP constant by solving the traditional residual margin again. This prevents a guessed mix split from rewriting a company-reported aggregate result.

The TAM translation sensitivity is a bounded unit-conversion diagnostic, not a complete company FX forecast. Diagnostic ASP changes affect implied units at fixed money wallets. D&A, capture, recognition/timing and gross forward dilution should remain independently inspectable. Cash-tax and proposed-repurchase tests affect funding capacity rather than adding a valuation method. The conditional range is neither a statistical confidence interval nor a promise of investment returns.

Thesis quality and the risks that can break the path

The analytical score is 48/60, or 80%. The retained Excel Base is also 80%; these remain separate concepts. The qualified oligopoly and standards history support a strong core score, while available competing suppliers prevent a sole-source claim. DDR5 migration and pre-ramp MRDIMM/CXL support the cycle score. Server/client memory, DDR6 and adjacent clock/SerDes engineering provide a broader expansion path without assuming every future application is won.

The TAM expansion lens begins with server and client bandwidth, then industrial/edge uses supported by clock/SerDes engineering at 50% expansion confidence. Ubiquitous compute, space or defense applications carry 20% expansion confidence and lack an identified Montage-specific qualified program quantity. A small attempted program proxy overlaps the combined adjacent-products allowance, so it is not added again. There is no standalone quantum or space contract in the forecast.

Four risk classes each receive a one-point deduction. Customer concentration exposes pricing and program changes; competition and architecture substitution affect capture; qualification, supplier schedules and quality affect execution; capital allocation, currency exposure and SBC/governance affect financial outcomes. The cash balance reduces financing pressure but does not eliminate these risks. Insider selling receives no negative scoring weight.

The thesis fails economically if customer/platform production repeatedly misses the modeled window, competing products erode capture or pricing, alternative architectures reduce eligible interface use, or required supplier/support costs consume the expected product profit. A growing market alone does not establish Montage's profit capture. The scoring table must show all categories, their evidence and the exact sum.

T096 | Root analytical scorecard | sum 48 / 60; retained Excel Base 80%

Category	Earned	Maximum	Evidence / reasoning
Core	17	20	Qualified global memory-interface oligopoly, standard-setting and customer testing barriers; competing qualified suppliers remain.
Cycle	9	10	DDR5 generation migration is shipping; MRDIMM/CXL move from trials into a conditional platform ramp.
TAM	9	10	Server and client memory, DDR6, plus engineering-grounded clock/SerDes extension into industrial and edge uses; emerging applications remain bounded.
Catalysts	5	5	Oct29 board/full Q3 follow-up, 2027 CPU production and MRDIMM/PCIe6 customer deployment, CXL qualification and collections.
Macro	9	10	Inference and agentic CPU bandwidth, richer memory attachment and global platform spending; deployment and financing remain conditional.
Alpha	3	5	Native-language management records and interface-content economics improve interpretation, while the large issuer and competitive field are widely covered.
Risks	-4	0	One deduction each: customer concentration; competition and architecture substitution; qualification/manufacturing execution; capital allocation, FX and SBC/governance.

Cross-book transmission and follow-up tests

CPU deployment links Montage to AMD, Intel, Arm-based platforms and the memory makers, while the component revenue remains distinct from CPU, DRAM and HBM revenue. MRDIMM and CXL can improve memory bandwidth/capacity economics and can also substitute for parts of an existing module architecture. Track those effects by eligible module and captured interface content rather than counting every memory layer twice.

Astera, Renesas and Rambus are competitive checks; DRAM makers and OEM/ODM partners are deployment checks. Their product pages, process-code lists and demonstrations establish available routes and alternatives, not automatic Montage allocation. Hyperscaler and SpaceX compute spending is an upstream demand clue whose company transmission remains conditional. No other company's model is revised as a side effect of this single-company review.

The next dated test is the full Q3 reporting process around the 29October board meeting. Replace provisional expense, cash and family assumptions when detail becomes available. In 2027, test CPU volume production, MRDIMM adoption and Gen 6 retimer/customer recognition. Revisit the probability weights on repeated commercial evidence or delays, not on repost counts. Monitor mix, R&D, supplier prepayments, working capital, warranty/quality costs and actual cash distributions.

Richer generation labels and faster data rates are insufficient on their own. The important evidence is recognized revenue, verified company participation, sustainable product GP after real support costs, and a funded ramp. Competitor names are supply-chain research leads; this review does not automatically add a new stock or expand the authorized backlog.

No full Q3 financial statements/cashflow or family sales split yet; full results subject to Oct 29 board.
Latest H1/September activity records retrieved as full issuer-authored PDFs via mirrors; separate formal-event verbatim transcript/audio unavailable.
No company-specific MR-set, CKD or MXC ASPs or quantities; forecasts use explicitly labeled diagnostic proxies.
No reported quantitative wafer/assembly/test allocation, yields or company-specific hyperscaler/SpaceX award.
F&S July 2025 commissioned forecasts are dated background; normalization/capture/demand revisions are subjective.
D&A residual cost attribution, SBC pro-rata allocation, future tax and liquidity laws are LOW model assumptions.
Source public-date/printed-date ambiguity for completion confirmation retained; no duplicate cash effect.

Montage Technology | 688008.SH | October 23, 2026 Toronto | Conditional model

Complete conditional operating and cash schedules

All values below are the three approved joint paths before weighting. Every path includes 18 operating quarters and 15 forward ceilings; the 54 cash rows are shown across matched field panels. All monetary values are CNYB, shares are millions, margin fields are ratios. Product vector order is Traditional / MRCD-MDB / CKD / retimer / MXC / clocks-adjacent / Jintai-other. LOW forecasts are retained at source precision in the embedded data contract; tables use consistent display rounding.

Delayed conditional path. Its probability is 25.0%.

Source register, calculation laws and completeness

Annual traditional revenue = Q3 modeled traditional revenue / 0.26 x dated traditional wallet(year) / dated wallet(2026) x joint demand multiplier. The fitted revenue/wallet index is not an observed share.

MRCD/MDB = scoped USDm wallet x planning FX /1000 x capture x company recognition x conditional server-memory multiplier. CKD = its own USDm wallet x FX /1000 x capture. Retimer uses its scoped wallet and capture. MXC uses its scoped wallet x capture x company recognition.

Adjacent revenue = current clock proxy normalized from Q3 plus prospective programs x prospective units(M) x CNY content /1000. These programs and unit prices are illustrative LOW assumptions. Jintai/other uses its own annual lumpy revenue input.

Product GP = product revenue - raw/foundry cost - assembly/test/processing cost - quality cost. Forward raw fraction = base product cost fraction x raw split x procurement multiplier. Processing uses the remaining split and its own multiplier. Quality is charged once.

Fixed R&D/admin begin at 2 x H1 actual, compound their annual growth controls, and include the selected path R&D multiplier. Additional support = 3% R&D + 1% admin on positive annual revenue above the Q3-normalized annual reference; allocation to quarters follows quarterly revenue. Selling, surcharge and impairments use their respective H1/revenue ratios.

Embedded D&A proxy = R&D x H1 R&D D&A/R&D + admin x H1 admin D&A/admin + selling x H1 selling D&A/selling + COGS x H1 unallocated D&A/COGS. Reconciliation = explicit D&A target - embedded proxy. Target = H1 total D&A /2 x 1.1^(year-2026). This is a LOW allocation proxy.

Economic OP = GP - R&D - admin - selling - surcharges - impairments - D&A reconciliation. Active values weight each complete conditional result 25/50/25. Ordinary SBC stays expensed; minority losses, finance credits and investment gains do not raise valued OP.

Gross receivables = quarterly revenue x 4 x DSO/365. Gross inventory = quarterly COGS x 4 x inventory days/365. Prepayments = quarterly COGS x 4 x 9%. AP = quarterly COGS x 4 x AP days/365. NWC = AR + inventory + prepay - AP; current provisions are added back once.

CFO = economic OP + explicit D&A + embedded fixed-cost SBC + impairment provisions - cash tax - change in gross NWC - interest - lease cash - once-only opening accrual settlement. Closing cash = opening cash + CFO - capex - dividends - repurchases - debt repayment - acquisition reserve. Cash tax = max(OP,0) x 12.5%; projected dividend = max(OP-tax,0) x 30%.

Forward ceiling = sum(named quarter OP plus next three OP) x 20 x 1000 / starting-quarter gross diluted shares(M). The last three modeled quarters remain without a complete forward window. Conditional marginal bridge depends on vector order and is not independently additive optionality.

No full Q3 financial statements/cashflow or family sales split yet; full results subject to Oct 29 board.

Latest H1/September activity records retrieved as full issuer-authored PDFs via mirrors; separate formal-event verbatim transcript/audio unavailable.
No company-specific MR-set, CKD or MXC ASPs or quantities; forecasts use explicitly labeled diagnostic proxies.
No reported quantitative wafer/assembly/test allocation, yields or company-specific hyperscaler/SpaceX award.
F&S July 2025 commissioned forecasts are dated background; normalization/capture/demand revisions are subjective.
D&A residual cost attribution, SBC pro-rata allocation, future tax and liquidity laws are LOW model assumptions.
Source public-date/printed-date ambiguity for completion confirmation retained; no duplicate cash effect.
