CoreWeave: The Cluster Is the Product

Full investment research | Model assumptions and source evidence

Full deep dive | CRWV, Nasdaq | Reviewed 26 October 2026 | Framework 8.0

Q4 2027 model price target: $144.64 per share. Analytical Base: 45/60 = 75, High Conviction. Classification: TEMPORAL - scarce energized GPU capacity with a software and deployment advantage. Covered research company; actual ownership has not been established from the research workbook.

CoreWeave sells a working AI computer at industrial scale: GPUs, networking, storage, scheduling and the ability to keep a large training job running. That has real value when customers cannot obtain a comparable cluster on time. The question for shareholders is how much of that value survives the bill for building it.

The model reaches about $26.5 billion of 2027 revenue and $3.4 billion of operating profit. It also requires substantial additional financing and models roughly 869 million potential diluted shares at the start of Q4 2027. The last retrieved actual common-share count was 551.5 million on July 31, 2026.

The target uses 20 times forward-four-quarter operating profit, not net earnings. Depreciation and stock compensation stay in operating costs. Debt and interest are not subtracted in this framework's operating-profit multiple; the funding and after-interest tables show why that distinction is material. This is an aggressive expansion case conditional on financing access, rather than a claim that signed megawatts are already earning or fully funded.

Evidence review through October 26, 2026; active financial assumptions retained from the October 6 model after full reassessment. Latest reported financials: Q2 2026, released August 11; Q3 and later quarters below are models. Currency USD; financial tables USD millions unless stated. No analyst price target is imported. The full editable source embeds the same images as the PDF.

October 26 review: funding risk, with unchanged active forecasts

The full 21-page owner-supplied UBS report, dated October 23, and the CoreWeave passages of Austin Lyons's October 24 published Patel/Rasgon panel transcript have been reviewed against the complete existing model and scorecard. The original supplied files are preserved. The published edited panel transcript is complete; its original audio/video was not replayed. Broker estimates and speaker commentary remain distinct from issuer actuals and guidance. [U1, U2]

Decision: retain the Q4 2027 model ceiling of $144.64400130327667 and analytical Base of 75. The protected Excel Base remains 75. Every current and future forecast was reassessed; no active numerical assumption changes. Historical Q3 2026 and earlier forecasts and their then-published rolling ceilings remain unchanged. The 20x forward-four-quarter GAAP-style operating-profit method, case-first funding and potential-share convention remain in force.

This is a financing-conditional valuation. An OP-based ceiling is not a measure of cash solvency. The model calculates capital that would be required; its residual borrowing and $3 billion cash balance do not establish that lenders have committed that capital. If funding becomes unavailable, the capacity and revenue paths must change together. A small interest-only ceiling sensitivity is not evidence that credit risk is small.

What the new credit report changes in our understanding

UBS's illustrative 2027 base case combines $46.9 billion capex, $23.2 billion operating cash flow including customer prepayments, and equity equal to 5% of capex to obtain roughly $21.4 billion new debt need. Its discussion expressly excludes repayments of existing delayed-draw loans. This is not an incremental $21.4 billion shortfall to add to our model. Nor should customer prepayments be subtracted again from UBS's cash-flow figure. [U1, pp.3-4]

Our existing 2027 build already includes $44.87 billion asset-funding uses, $12.70 billion principal repayments, $8.39 billion new common-equity cash and $33.57 billion required gross new debt. Asset-funding uses include changes in construction in progress; they are not a newly reconciled GAAP cash-capex figure. The differing equity and prepayment assumptions, capital definitions and repayment scope explain why the two debt requirements cannot be compared as like-for-like forecasts.

UBS raises its own 2028 interest-expense forecast from $6.43 billion to $8.30 billion. Our existing 11% aggregate funding-rate diagnostic produces $8.40 billion of 2028 interest, close in magnitude but with different debt and capacity assumptions. UBS's 2027 average diluted-share forecast is not a substitute for our 868.72 million beginning-Q4-2027 potential shares. Its revenue-multiple target is not imported into the protected operating-profit method. [U1, pp.5-8]

The September $3.7 billion convert headline is already represented by the full $4.2 billion principal including the option and $3.5708 billion net cash after capped calls in our model. No proceeds are added again. The 35-million-share ATM is an authorization; UBS's assumption that it has not been used does not establish actual issuance or non-use. Our existing 70% probability and 24.5-million expected-share schedule remain explicit estimates.

Why a 15% unsecured market yield is a warning, not a new coupon

Rasgon explicitly distinguishes the roughly 15% secondary-market yield he cites from CoreWeave's current interest payments. This is a credible signal for possible marginal unsecured financing costs. It is not a 15% coupon on the whole debt stock. The transcript provides no identified bond, maturity or instrument-level quote. The latest available drawn-debt composition includes secured borrowing and lower-rate converts; future secured/unsecured borrowing and refinancing mix remain unknown. [U2, P007-P009]

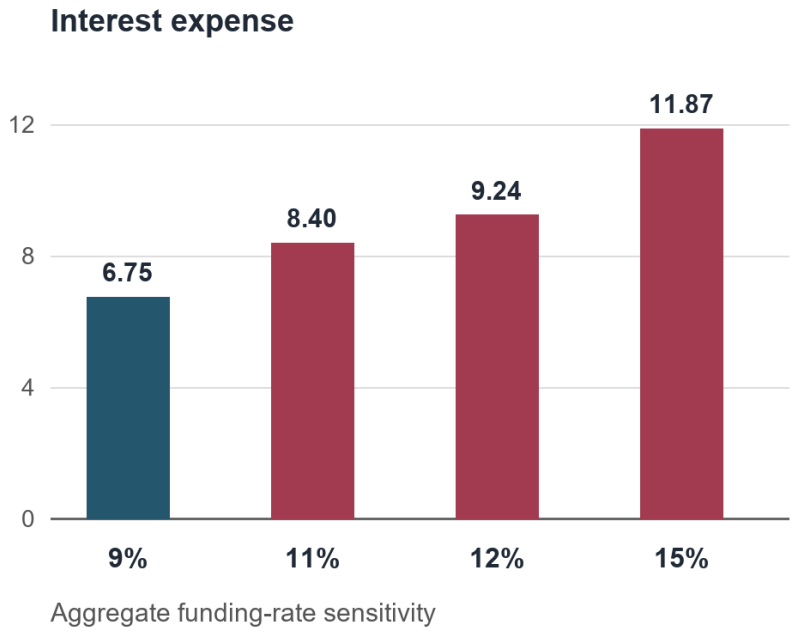

A bounded mix calculation illustrates the issue without guessing that mix: 25% fresh unsecured borrowing at 15% plus 75% secured borrowing at 7% averages 9%. At 9% secured pricing, any positive 15% unsecured share raises the marginal blend unless cheaper funding offsets it. These are arithmetic examples, not selected funding allocations. Since required 2027 gross borrowing is about as large as the June 2026 debt stock, future mix matters materially. Retaining 9% therefore explicitly retains the model's conditional secured-access funding proxy; it does not assert that new unsecured money is available at 9%.

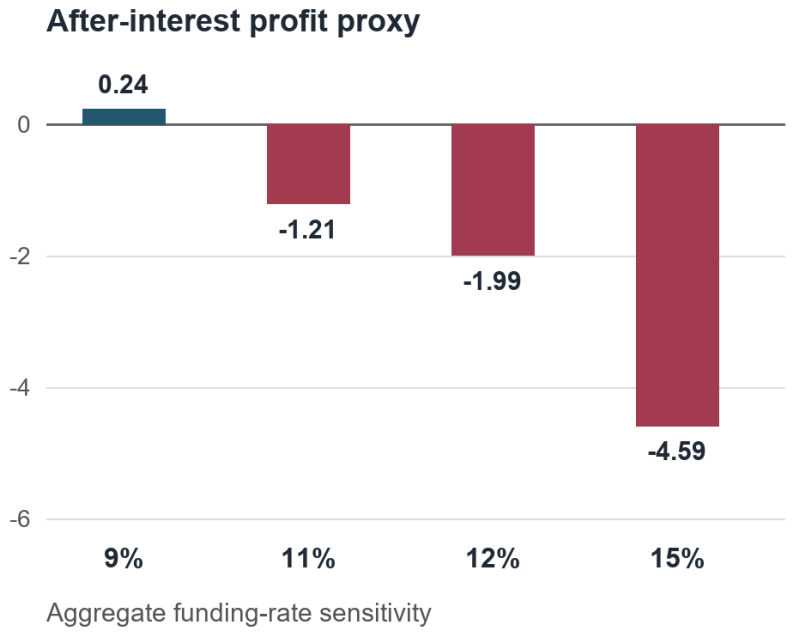

The following reruns apply each stated aggregate rate to opening modeled debt from 2027, including the debt/equity feedback. They are unweighted diagnostics, not new probability-weighted forecasts and not estimated default probabilities. The 15% case deliberately applies an unsecured-market signal more broadly than the source establishes. All other operating assumptions stay unchanged, and funding is still assumed obtainable. No unavailable credit is manufactured into a successful financing commitment.

Aggregate rate	2028 interest, $B	2028 after-interest profit proxy, $B	2028 new equity cash, $B	Q4 2027 OP ceiling, $
9%	6.75	0.24	8.43	144.64
11%	8.40	-1.21	8.80	144.28
12%	9.24	-1.99	9.00	144.09
15%	11.87	-4.59	9.64	143.54

Credit costs matter even when the OP-based target barely changes

2028 model diagnostics | USD billions | financing assumed available in every test

Unweighted sensitivities; not company guidance or an estimated default probability.

Fresh rerun of the preserved CoreWeave engine. Credit-rate scenarios are unweighted diagnostics; they do not replace the active forecast or model an outright loss of financing access.

The 15% diagnostic requires $38.54 billion of 2028 gross new debt, $9.64 billion of new common-equity cash and roughly $90.71 billion ending debt. Its Q4 2027 potential-share denominator rises to 875.42 million. The OP ceiling falls only to $143.54 because the sanctioned method does not directly subtract interest. The substantially worse after-interest result is the more useful warning. A failed borrowing base, materially lower equity issue price or inability to fund equipment would require a further operating/capacity revision, not merely this interest test.

Capacity, pricing and platform evidence after the prior review

CoreWeave's India release describes 240 MW across three 80 MW buildings, with the first phase expected in mid-2028 and a further 240 MW expansion opportunity. The investor-relations version is dated October 7; the corporate version displays October 6. Those dates are preserved rather than silently harmonized. Planned capacity is not energized, accepted or earning capacity. The release repeats approximately 4.2 GW contracted power as of August 11; it does not establish an updated aggregate contracted total. [U3]

The planned campus is allocated within the existing global build path. No additional 240 MW, equipment purchase or revenue is added on top. For scale, 240 MW at the existing $26 billion/GW equipment assumption would require $6.24 billion before maintenance, pipeline and funding costs; a six-year equipment life would imply $1.04 billion annual depreciation at full deployment. Actual IT/gross-MW scope, commissioning and site-specific economics remain unverified. The existing one-month billing lag, capex, depreciation, central costs and financing remain fully charged in the global model.

The October 21 Zero Trust AI Framework and Physical AI Launchables releases broaden security and packaged-workload capabilities. Neither disclosed a distinct fee schedule or incremental contracted revenue. They support the existing compute-demand and ancillary-attachment cases. Applying a separate software multiple or a full duplicate revenue stream would count the same customers and infrastructure twice. Rubin availability and engineering work do not eliminate support costs, depreciation or commissioning risk. [U4, U5]

Explicit probability and score review

Capacity conversion remains 65%, with the reference/conditional paths ending 2027 at 2.9/3.5 GW and 2030 at 5.8/8.5 GW. The 35% reference branch is a slower-growth outcome, not a default-probability estimate. Newly named sites are 100% allocated within those global paths until evidence supports a non-overlapping increment. Contracted power alone does not warrant raising delivery confidence, while the new credit commentary does not establish a realized cancellation or financing breach.

The joint commercial probability remains 60%. Premium pricing remains limited to eligible new cohorts, with a 50% overlap haircut, 20% incremental service cost, 3% central revenue cost and forecast SBC. Ancillary reference attachment remains 3.5%, versus 4.5%/5%/5.5%/6% in the conditional 2027-2030 path. The new platform releases are fully allocated within these hypotheses; they are not additional independent probability cases. Financing costs still flow through cash, debt and potential shares, with no second Base weighting.

The complete scorecard remains 45/60: core thesis 16, cycle 9, TAM 9, catalysts 5, macro 8 and alpha 3, less one point each for competition, delivery, customer credit, capital/dilution and governance/ecosystem risk. The credit review reinforces the existing capital and concentration deductions. It does not demonstrate a new separate risk category or a delivery failure that justifies an additional deduction. This unchanged conclusion follows the full review; no numerical change was forced for reporting purposes.

Next changes require instrument-level financing terms and availability, executed equity quantities, accepted/billable power, eligible-contract realized pricing, or customer deterioration. A credible new signal can change probabilities before official confirmation; the missing funding mix here remains an explicitly bounded uncertainty, not an automatic reason to assign it zero economic relevance.

New source register and completeness

- U1: Owner-provided UBS Global Research, CoreWeave Inc: Credit Risks and Playing AI Defense, October 23, 2026. All 21 supplied pages and figures reviewed visually; the raster PDF has no native text. Complete supplied document, with broker forecasts attributed. SHA256 9809081bc8d8a94e72a6654ca72651fecdea778989b1128986a5b87c488a4c1f.
- U2: Austin Lyons, published edited Patel/Rasgon transcript, October 24, 2026. Complete saved article and 220 assets preserved; full edited transcript read. Original video/audio not replayed; linked text-to-speech is not the original panel. Claims about other issuers retain separate review obligations.

- U5: CoreWeave Physical AI Launchables, October 21, 2026.

Latest official results located remain Q2 2026. The prior complete Q2 and Q1 earnings transcripts and the Q2 filing remain the earnings foundation; current IR listing checks are distinct from a fresh replay. September conference/webcast coverage is not promoted to a complete transcript. Original issuer news HTML was captured from the corporate site; direct IR retrieval restrictions and derived IR-list captures remain identified in the source record. No new executed ATM sale or later actual share count was established by these sources.

The following unchanged full source page is retained privately so the broker funding assumptions and their boundaries can be inspected in context. It is not a public website exhibit.

Our point is that even if credit markets tighten, there are potential levers for CoreWeave to reduce its need for external debt and to access alternative capital sources, including private credit, vendor financing and potentially selling larger equity stakes (as CoreWeave did recently with Jane Street). Just this morning, rival Nebius announced a $3.5 billion credit facility from Citi. We recently met with executives at providers of private credit and with data center builders in search of capital and did NOT come away with a view that capital will be scarce in 2027. Put simply, in our view, this does NOT have to be a "debt spiral" story as some have suggested.

Figure 2: Funding Gap Scenarios

$ bn unless noted	Scenario 1 Debt Heavy	Scenario 2 Base Case	Scenario 3 Debt Light	Scenario 4 Slow Down
MW Added	1,300	1,300	1,300	800
Capex	$46.9	$46.9	$46.9	$28.9
Revenues	$28.4	$28.4	$28.4	$26.6
Prepay % Capex	15%	20%	35%	35%
OCF	$21.0	$23.2	$30.4	$21.2
Equity % Capex	0%	5%	20%	20%
Debt Needs	$25.9	$21.4	$7.1	$1.9

Source: UBS estimates

Would CoreWeave Slow the Business Down?

In Figure 2 above we show a Scenario 4 – CoreWeave electing to deliberately slow the business down in order to manage leverage and balance sheet risk. In 2Q26, CoreWeave's backlog or RPO hit $104 billion, up $5 billion sequentially and $74 billion year-over-year. This growth in demand and hence customer commitments is what drives capex and hence leverage. If the availability and cost of capital becomes the new bottleneck to scale an AI infrastructure company, then unless you have the balance sheets of Amazon, Microsoft and Google, one viable option – heretofore considered an extremely unlikely and unnecessary scenario – is to hit the brakes on any new backlog

U1 page 4, UBS October 23, 2026: illustrative funding scenarios and interest discussion. Broker assumptions; not guidance or a matched comparison to the operating model. The preceding page states that existing DDTL repayments are excluded. Original exhibit, panel 1 of 2; read from top to bottom.

growth and capacity adds (beyond the minimum required to service the existing committed backlog), to slow the pace at which you scale.

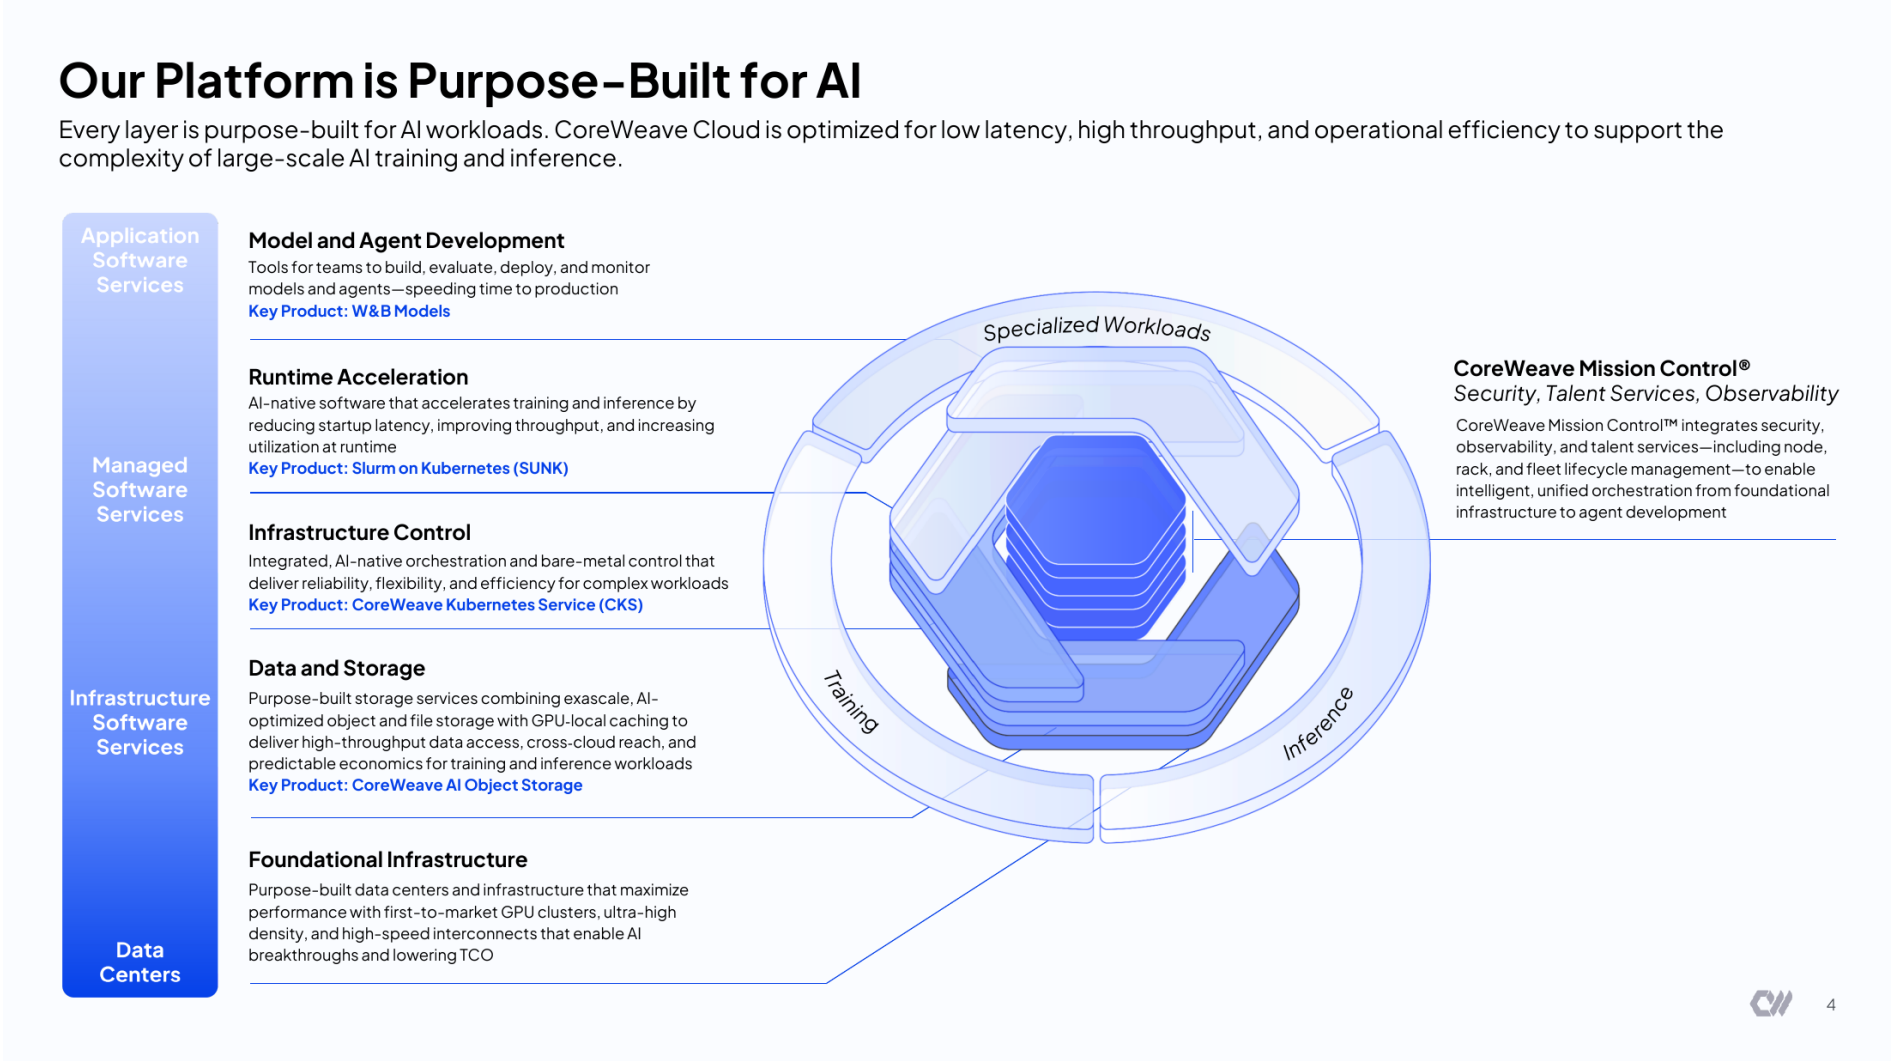

Investors have expressed to us a desire to have Oracle limit any incremental backlog/ contract growth and instead focus on executing against the (large) commitments it already has and thereby (at least temporarily) cap the stress on the balance sheet, even if this meant walking away from deals with solid medium-term economics. Would CoreWeave do this? In our view, likely not, given the strong current demand and medium-term economics on standing up new AI data center capacity. But if CoreWeave were forced under extreme circumstances to prioritize the health of its near-term balance sheet, it obviously could. We show this outcome as Scenario 4, which would impact revenues but increase bottom-line profitability and materially reduce the need for external debt financing.

Interest Expense Sensitivity

CoreWeave's interest expenses were $640 million ($2.6 billion annualized) in 2Q26, weighing heavily on earnings, as CoreWeave posted a GAAP net loss of $626 million on a revenue base of $2.58 billion. For 3Q26, the company has guided to a considerable ramp in interest expense to $900 million at the mid-point of the guidance. On an expected revenue base of $3.6 billion in 3Q26, this implies CoreWeave will spend 25% of total revenues on interest expense alone. The high credit quality of the customers committing to CoreWeave, the long-dated take-or-pay nature of these contracts as well as CoreWeave's track record in standing up powered capacity to service these commitments have enabled CoreWeave to drive its cost of capital lower over time. As per the latest 10-Q, the bulk of CoreWeave's debt offerings carry an effective interest rate of 9-11%, down from almost 15% as recently as 2023. Last quarter, CoreWeave stated that every 100bps increase/decrease in interest rates impacts quarterly interest expense by ~$30 million (so $120 million annually), based on its total floating-rate debt balance of $11.6 billion at the end of 2Q26.

U1 page 4, UBS October 23, 2026: illustrative funding scenarios and interest discussion. Broker assumptions; not guidance or a matched comparison to the operating model. The preceding page states that existing DDTL repayments are excluded. Original exhibit, panel 2 of 2; read from top to bottom.

1. What customers are paying for

E01. CoreWeave platform stack and software layers. Issuer presentation, August 11, 2026, page 4.

A GPU is only one part of a useful training system. Network topology, storage throughput, scheduling, failure recovery and support determine how much expensive hardware stays productive. CoreWeave Cloud runs infrastructure; Mission Control manages cluster operations; its development and inference tools extend the workflow around that infrastructure. These layers can reduce idle time and shorten deployment. They do not eliminate the customer's ability to move future workloads to another cloud. [S1, S2, S3]

The scarce product is therefore usable, powered and interconnected capacity at the promised date. This is a temporal delivery bottleneck, not a physics monopoly over AI. NVIDIA controls the core GPU ecosystem; hyperscalers can build their own infrastructure; Nebius and other specialists also compete. A large installed fleet gives CoreWeave operating experience, but replacement capital and customer bargaining power continue after the initial shortage.

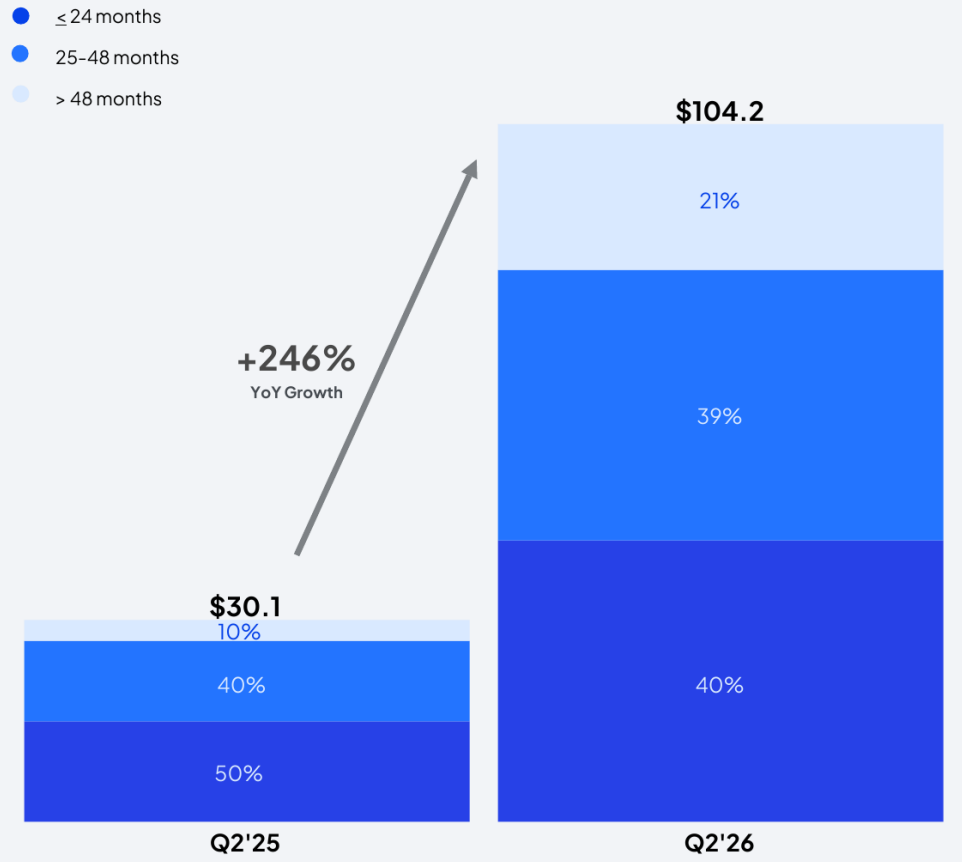

The first S-curve is large-scale training. The second is inference, where traffic mix, latency and cost per useful task matter more than a single peak-throughput benchmark. CoreWeave has evidence of customer demand in both, but the report keeps managed inference inside GPU-service revenue unless a separate incremental fee can be identified. The same customer contract cannot appear in infrastructure, software and inference revenue three times.

2. Evidence hierarchy: a large backlog, with delivery conditions

Revenue Backlog [1]

Revenue Backlog:
$104.2 billion, up 246% YoY, driven by continued diversification from enterprise and AI-natives customers

Does not include more than $25 billion of net new customer commitments added in early Q3

Note: $ in billions
1. Revenue backlog includes remaining performance obligations, plus other amounts we estimate will be recognized as revenue in future periods under committed customer contracts, in each case, subject to the satisfaction of delivery and availability of service requirements. Revenue backlog is expected to fluctuate from period to period, given the nature of our committed contract business and the size of committed contracts. The percentages shown in the bar charts represent the percentage of revenue backlog we expect to recognize in the months following the end of the quarterly reporting period

E03. Revenue backlog and recognition timing at June 30, 2026. Issuer presentation, August 11, 2026, page 13. The June balance excludes the separately cited early-Q3 commitments.

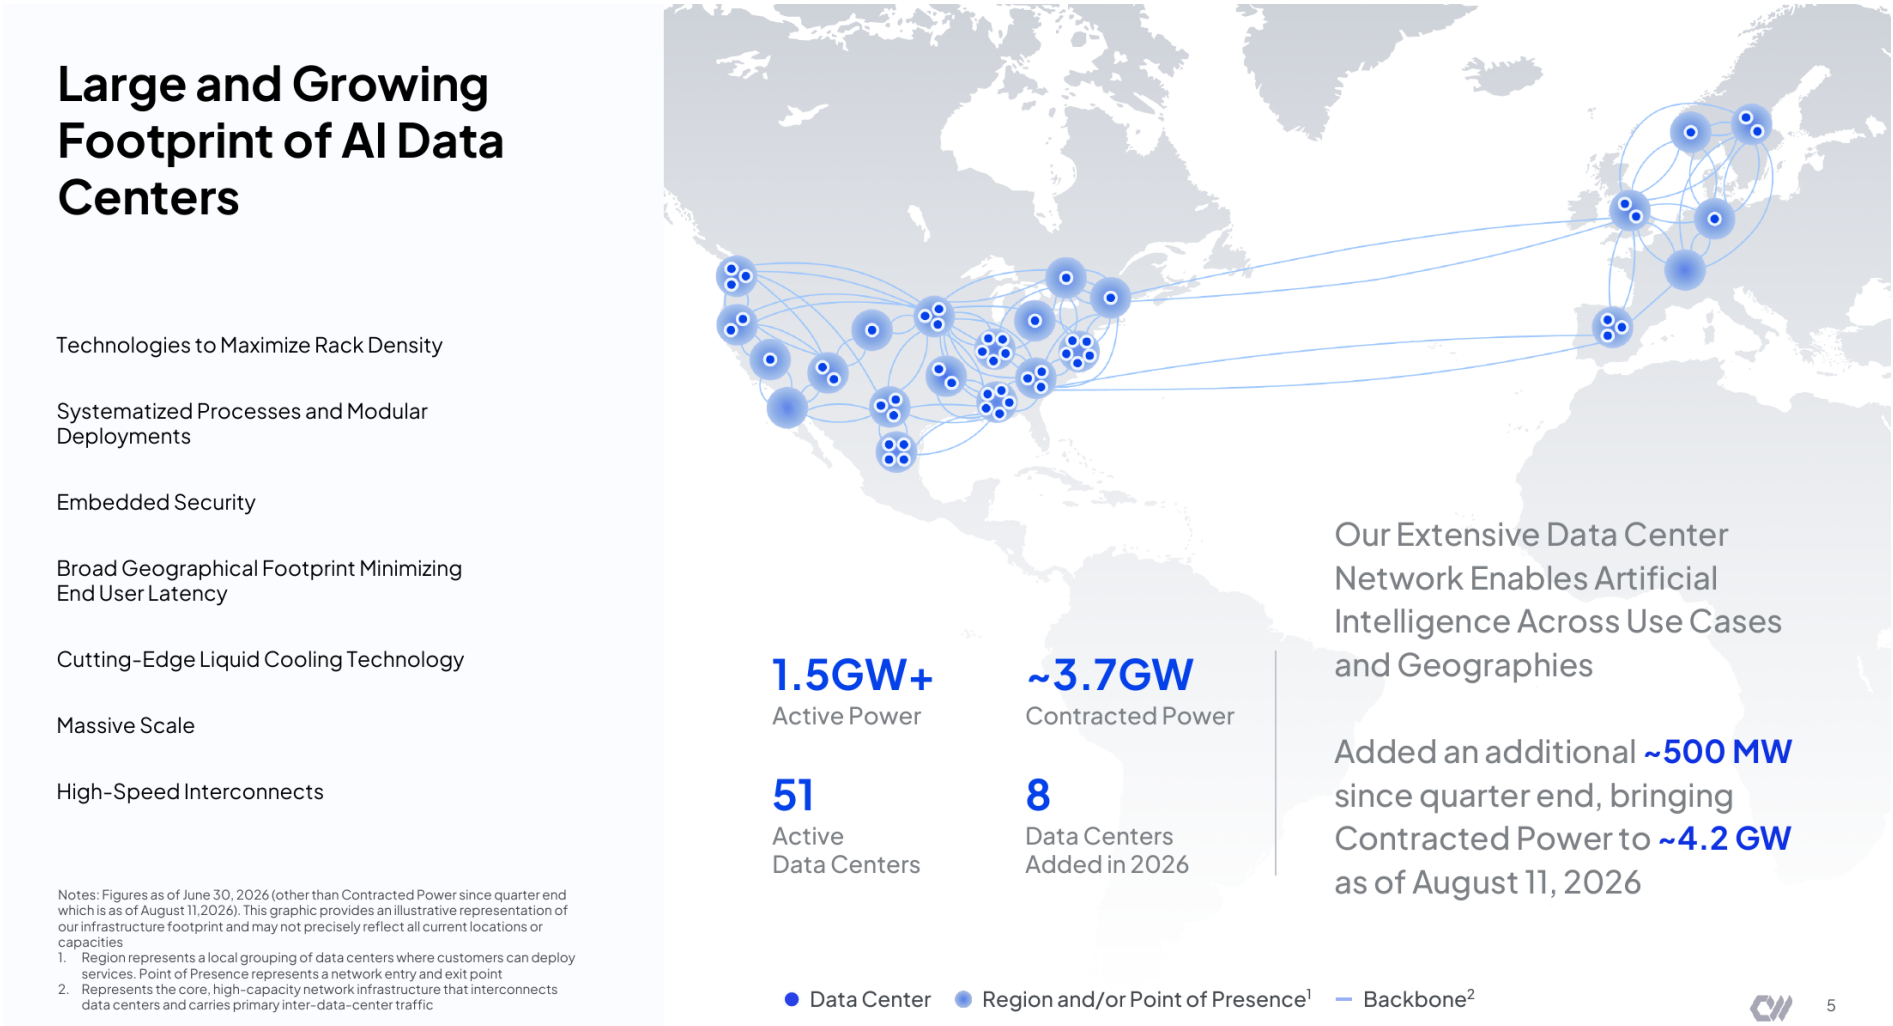

Primary evidence	Scope and investment implication
Q2 revenue $2,575M; revenue backlog $104.2B	Revenue is recognized service; backlog is future contracted activity subject to delivery and contract definitions.

Primary evidence	Scope and investment implication
RPO $103.7B, versus backlog $104.2B	Different measures. RPO timing: 41% over the next 24 months, 39% over the following 24 months and 20% afterward. Backlog timing is 40% / 39% / 21%; never add them together.
More than $25B early-Q3 commitments	Separately disclosed after June 30. Incremental to that dated backlog snapshot, but neither immediate cash nor a full-year revenue addition.
Three largest Q2 customers: 36%, 26%, 10%	About 72% of revenue. Strong demand and substantial customer concentration coexist.
98% of Q2 revenue from committed contracts	Limits the amount of existing revenue immediately exposed to higher spot rates.
About 70% of Q2 signed deals included prepayment	A deal-count statistic, not 70% of revenue or a 70% cash deposit. Customer funding is real; its amount is contract-specific.

Meta's expanded agreement for approximately $21B, including an exercised option, extends through December 2032. OpenAI's disclosed aggregate commitment is about $22.4B; earlier expansions are components of that total. Jane Street combines a $6B infrastructure commitment with a separate equity investment. Anthropic's phased multi-year agreement expects initial compute later in 2026. These customers support the demand bridge; they are not separate add-ons to backlog or the capacity model. AWS compatibility is not evidence that AWS is a disclosed CoreWeave buyer. [S1, S2; source register]

The top-down demand check uses disclosed customer commitments and recognition windows, instead of assigning an invented fraction of hyperscaler capital spending to CoreWeave. Customer capex includes equipment, buildings, networking and internal cloud investment; it is not automatically CoreWeave revenue. Confidential contract allocations and overlapping end users prevent a reliable customer-by-customer annual revenue model. The physical model below therefore caps capture at delivered, billable capacity.

3. Contracted power is not billable power

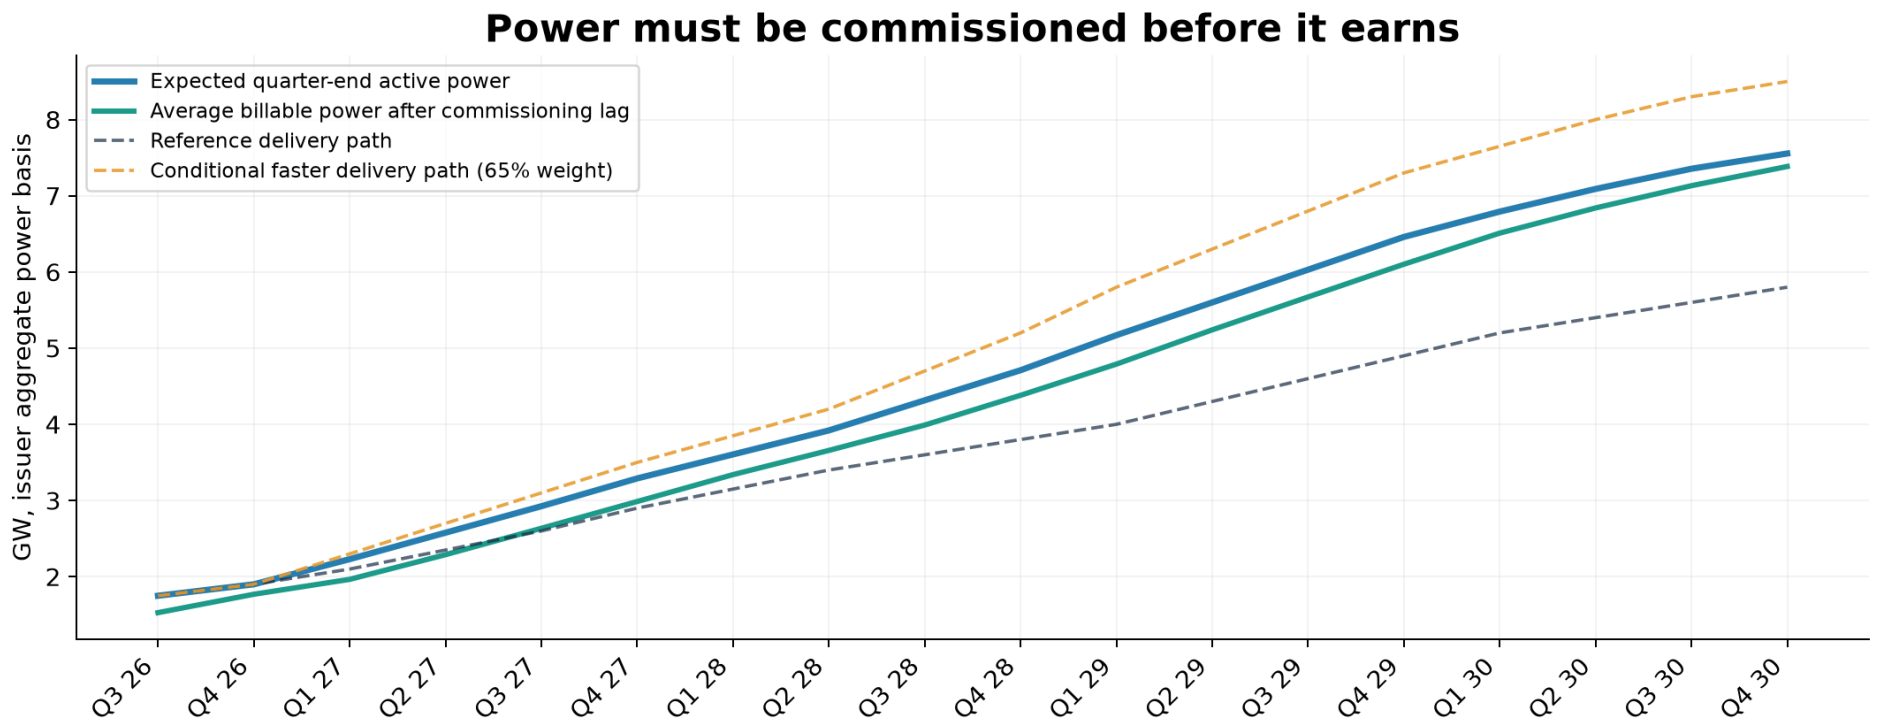

E02. CoreWeave data-center footprint: 1.5 GW active and 3.7 GW contracted at June 30, 2026; approximately 4.2 GW contracted at August 11. Issuer presentation, page 5. Preserve the original date footnotes.

At June 30, CoreWeave reported 1.5 GW active and 3.7 GW contracted power across 51 data centers. Contracted power reached approximately 4.2 GW by August 11. A further greater-than-1.5-GW opportunity set included options, letters of intent and land control; it is not another 1.5 GW of active capacity. Management's 2030 plan is at least 8 GW active, including its NVIDIA-supported expansion rather than adding that partnership on top. [S1-S3]

The issuer's consolidated power disclosures do not provide a complete reconciliation from facility electrical input to customer IT load. This report keeps that aggregate basis internally consistent. For named supplier projects, critical IT MW and gross power MW are labeled separately; they are not interchangeable. For example, Galaxy's 133 MW of delivered critical IT capacity was described as roughly 200 MW gross. Indonesia's announced 360 MW is specifically IT power and begins in 2028.

Commissioning matters. Management describes one to two months of installation/testing and cost before a deployment fully earns. The active model uses a one-month billing lag with a two-month sensitivity. New capacity arrives evenly during a quarter for modeling purposes; the source does not disclose a precise monthly deployment schedule. Average billable power is therefore lower than average active power. Existing signed power, permits, equipment, utility service, testing and customer acceptance must all line up.

M1. One active probability-weighted capacity path. Dashed paths are conditional inputs, not separate recommendations. Consolidated power basis is not proven identical to project IT MW.

Quarter	Reference end GW	Conditional end GW	Expected end GW	Average billable GW
Q3 2026	1.75	1.75	1.75	1.528
Q4 2026	1.90	1.90	1.90	1.769
Q1 2027	2.10	2.30	2.23	1.965

Quarter	Reference end GW	Conditional end GW	Expected end GW	Average billable GW
Q2 2027	2.35	2.70	2.58	2.289
Q3 2027	2.60	3.10	2.93	2.635
Q4 2027	2.90	3.50	3.29	2.987
Q1 2028	3.15	3.85	3.60	3.340
Q2 2028	3.40	4.20	3.92	3.658
Q3 2028	3.60	4.70	4.32	3.990
Q4 2028	3.80	5.20	4.71	4.381
Q1 2029	4.00	5.80	5.17	4.790
Q2 2029	4.30	6.30	5.60	5.240
Q3 2029	4.60	6.80	6.03	5.672
Q4 2029	4.90	7.30	6.46	6.102
Q1 2030	5.20	7.65	6.79	6.510
Q2 2030	5.40	8.00	7.09	6.840
Q3 2030	5.60	8.30	7.36	7.132
Q4 2030	5.80	8.50	7.55	7.385

Capacity probability: 65%. The defined outcome is delivery of the conditional faster path above, including the financing and commissioning needed to make it productive. The reference path still assumes significant execution: 2.9 GW at end-2027 and 5.8 GW at end-2030. The conditional path reaches 3.5 GW and 8.5 GW, respectively. Customer commitments and management's delivery plans support a meaningful weight; construction, grid and capital requirements prevent treating the full plan as certain. Source confidence is HIGH for the dated issuer disclosures and LOW for the precise quarterly paths. This is a delivery assumption, not a statistical estimate.

4. Pricing power belongs to eligible new contracts

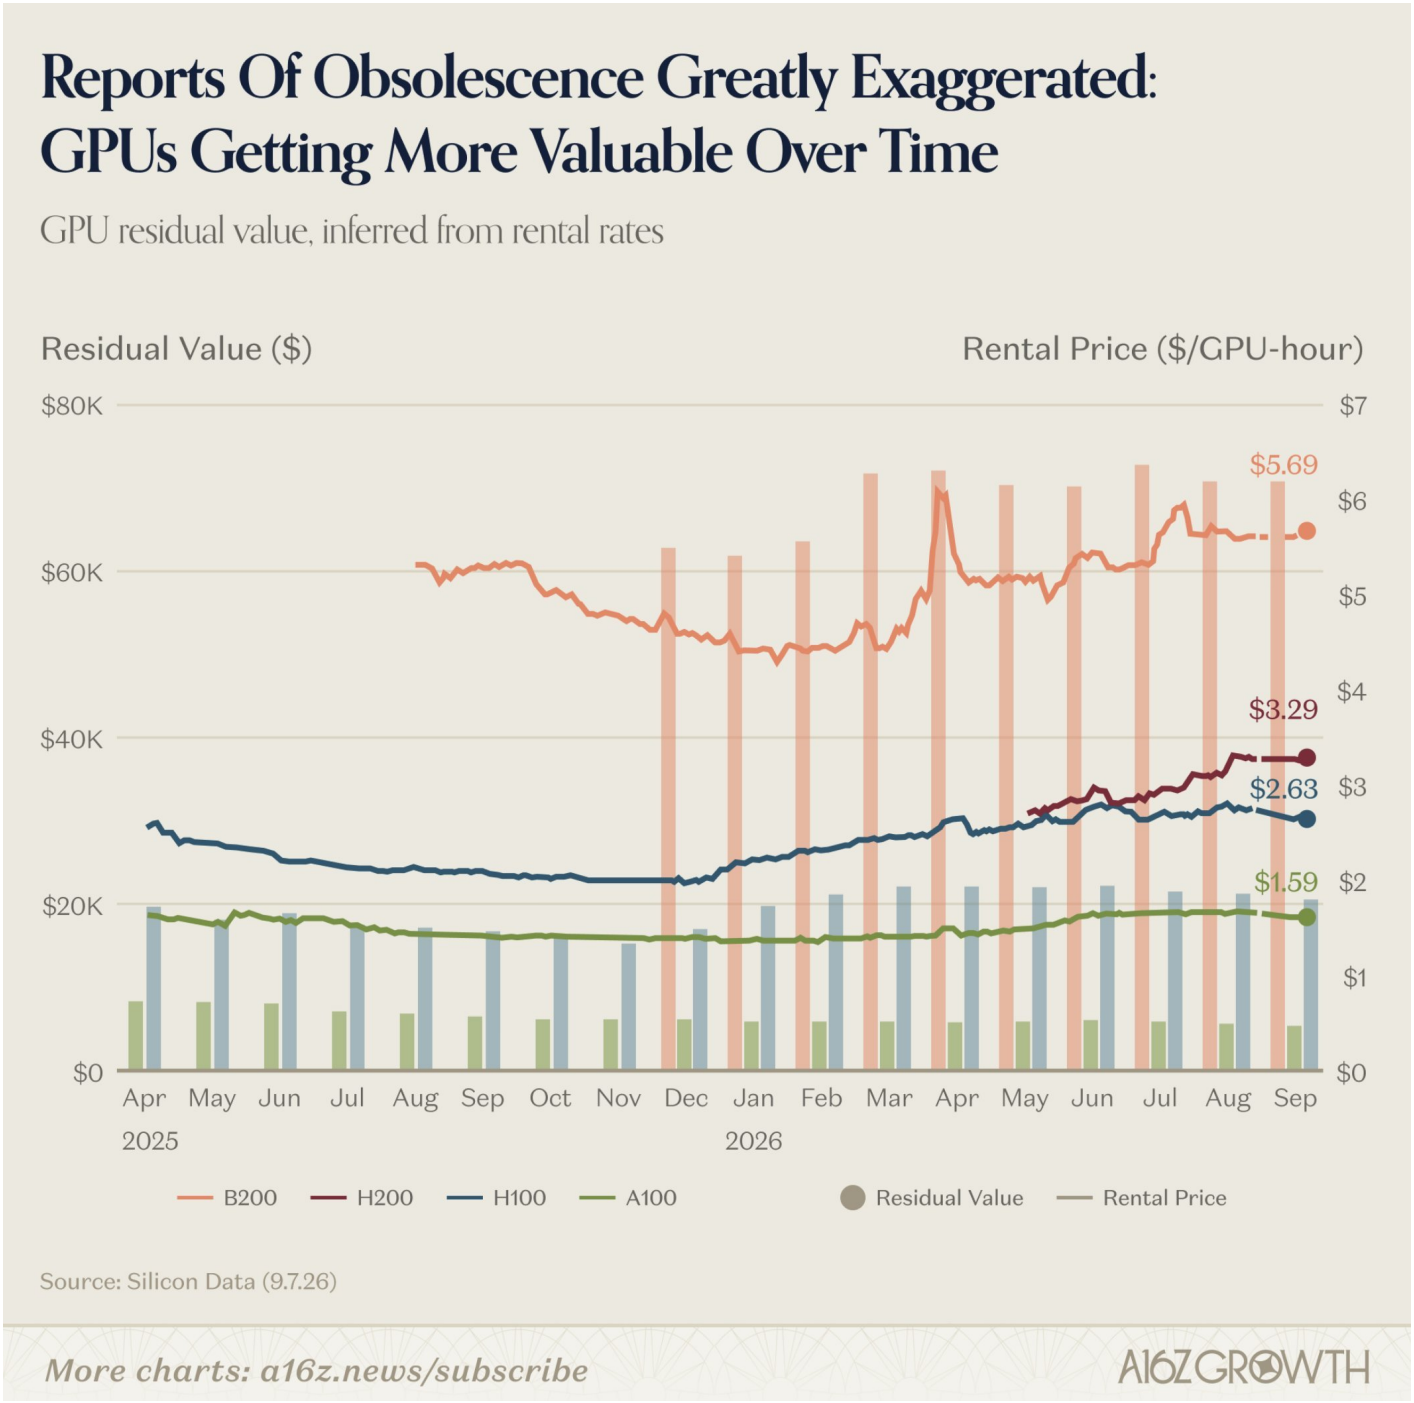

CoreWeave said July price increases averaged about 25% across SKUs. August guidance already incorporates that commercial environment. There is no second 25% uplift to 2026 revenue in this model. The September 17 issuer update described roughly $40M annualized revenue per MW for particular clusters on three-to-six-month contracts. It did not establish a $40M yield for the entire fleet or for a multi-year agreement. [S2, S4]

The model uses **$10M of annual core revenue per average billable MW** in 2027, easing to $9.4M/MW by 2030. This is equivalently $10B per GW per year in 2027; the spreadsheet carries USD millions per GW. Those are utilization- and commercial-realization proxies, not quoted rate cards. At the $40M/MW conditional short-contract endpoint, only 2-5% of billable capacity is eligible during 2027, rising to 6-8% in 2028 and fading later. A 50% overlap deduction removes economics that

could already be captured by the reference rates, mix and guidance.

Commercial upside receives a **60% probability**. This branch combines restricted-cohort pricing and stronger ancillary attachment, because both depend on successful commercial execution on the same platform. It does not award two independent probabilities to the same sales effort. Each dollar of retained pricing increment incurs 20 cents of incremental service/component cost plus central costs and stock compensation. Management's five-to-ten-point better contribution on new contracts is supporting evidence, not another margin uplift stacked on this one.

The critical arithmetic is: eligible billable GW × [40,000 minus reference annual yield in USD millions/GW] ÷ 4 × 50% retained after overlap. That is the conditional quarterly revenue increment; probability is applied through the coherent state weights, once. Renewals at attractive rates support the reference curve, but management says the near-term renewable older fleet is very limited. No blanket repricing of the fixed-price backlog is assumed.

E11. User-provided GPU rental-rate and inferred residual-value illustration, with a16z Growth / SiliconData attribution. The illustration is not CoreWeave realized resale data.

The supplied Silicon Data / a16z image supports investigating older-GPU rental durability. Its residual values are inferred from rental economics; they are not observed transaction prices for used GPUs. An A100 or H100 may remain cost-effective when memory capacity, availability and deployment granularity matter more than maximum compute. That does not mean every inference workload is memory-bound or that Blackwell cannot serve small jobs. Hardware partitioning and independent serving processes can support multiple workloads. The model keeps six-year technology depreciation and does not book an asset revaluation gain.

5. The customer checks support the moat - and put limits on it

Differentiation - What Customers Told Us

We typically heavily discount statements from technology suppliers about their competitive advantages, as in most cases they are far less differentiated than they convey. As such, we'd rather ground our views about CoreWeave's competitive differentiation in what customers and other independent industry checks say, not in what CoreWeave management says. Below we offer the raw feedback that we heard from a handful of checks over the last few weeks. A few things stood out from these conversations:

- **Performance Matters:** Vendor choice doesn't simply come down to price, as if AI infra services were a commodity. They were choosing CoreWeave despite its (higher) pricing, and because of uptime reliability, utilization, and GPU deployment speeds, which are driven by CoreWeave's software stack. In other words, performance materially influences ROI, TCO and vendor choice and CoreWeave appears to rank very well on these attributes.
- **Training-Focused:** Most customers that we spoke to were using CoreWeave for training runs. While others may be executing inference workloads on CoreWeave, this feedback added to our view that CoreWeave would be well-served to move up the stack into the burgeoning cloud inference layer via its Managed Inference platform.
- **Availability:** Customers clearly turned to CoreWeave (and other neo-clouds) partly because of GPU availability, especially for next-gen Nvidia chips. This advantage could of course disappear once the larger hyperscalers stand up enough 1P capacity. That said, it was clear from these checks that a) supply constraints are likely to persist and b) CoreWeave has real performance advantages over the hyperscalers that could even widen over time.

E09. User-provided summary of customer differentiation checks. Anonymous source and sample; preserve separately from issuer disclosures.

Customer 1

- *We have a mid-8-figure (so ~$50 million) for annual AI compute spend, and of this, we spend about 1/3 on the neo-clouds, of which CoreWeave has the largest share. The other 2/3 is spent on the hyperscalers and the inference clouds such as Fireworks, Baseten and Modal. I'd guess that the portion spent with the neo-clouds might be closer to 50% in 12-18 months. We used to only use the hyperscalers but they have proven to be too slow and too expensive, the neo-clouds can stand up capacity much faster and they're also 30-45% less expensive on the same Nvidia GPUs. Some training runs might need up to 200,000 GPUs and that price gap makes a huge difference. It also seems like the neo-clouds get preferential access to the latest generation of Nvidia chips such as Vera Rubins.*
- *For training workloads, for which speed between hops and syncing is critical, we use CoreWeave, Nebius, Lambda and Crusoe among others. Here, it's all about reliable and fast connectivity to say a 50,000 GPU cluster. Some training runs need as much as a 200,000-GPU cluster, and for this you can't beat CoreWeave. They have the highest price points for training runs, maybe 10-15% higher than peers, but they've offered 50-60% discounts off list, as we signed a 3-year commitment. But price isn't the whole discussion, it's also about utilization and uptime reliability. No one is faster than CoreWeave in getting idle GPUs back up, that is key. If you have an idle GPU, you're losing money because you're paying full price regardless, so you need to consider the price of idles and the speed to get back up. When you have a large training run, no one beats CoreWeave, this is their invisible advantage, reliability on high-volume jobs. They have the least amount of idle GPUs and the deepest software stack.*
- *Inference workloads might make up 90% of our spend over time, from 60-70% today. For the inference layer, we use 6-7 different firms and the key issues are access to extra compute and getting your utilization up from 60-70% to as close as you can to 100%. Here, CoreWeave is moving up the stack but their Managed Inference platform is playing catch-up to the Token Factory service of Nebius. It's more difficult for the pure-play inference players like Fireworks and Baseten to move down the stack because they don't own GPUs, they just package GPU access*

E10. User-provided anonymous customer interview, printed September 22, 2026. One customer account; spending mix is not CoreWeave revenue mix. Original exhibit, panel 1 of 2; read from top to bottom.

CoreWeave Inc 22 September 2026

[redacted]

from others. CoreWeave may have a 1-2 year headstart with their hardware and software layer, it would be hard for the inference players to move down into the compute layer and compete. We use Fireworks and Baseten for spot-based workloads, experiments, and if CoreWeave were to match their inference service levels, we'd prefer to just use CoreWeave. But the 4 inference platforms we use are very good, better than CoreWeave, at inference cost optimization. I'd estimate that CoreWeave and Nebius are about 1-2 quarters behind the pure-play inference players.

- *We use the hyperscalers more on inference, when we need lots of storage, data management and compliance and other features, we trust them on these parts of the stack. The issue is that the hyperscalers don't have available capacity, that's why even they are using the neo-clouds as subcontractors. If the GPU supply shortage didn't exist and the 30-50% price difference was closed, we'd probably just use the hyperscalers. But realistically, the compute supply crunch will last for several years. We turn to Nebius and Lambda when we need extra training compute. Nebius covers Europe better than CoreWeave and in certain European regions, you can't even work with CoreWeave. If we need extra on-demand compute for say a short 2-week period, Nebius is better and cheaper. Also, there is a node architecture difference, as you have to buy a minimum 8-GPU rack from CoreWeave, while others like Nebius will allow you to literally buy access to a single chip.*

E10. User-provided anonymous customer interview, printed September 22, 2026. One customer account; spending mix is not CoreWeave revenue mix. Original exhibit, panel 2 of 2; read from top to bottom.

The anonymous customer describes CoreWeave as strong in large training runs, recovery from failures, low idle capacity and software integration. That is a credible mechanism for paying more than the cheapest advertised GPU rate. The same interview describes competition: Nebius can suit European and small on-demand requirements; specialized inference services remain attractive; hyperscalers could win more business if their capacity and price gap closed. The interview is one customer's experience, dated September 22 in the screenshot, not an audited market survey or proof of universal technical leadership.

These checks support the commercial branch's 60% weight and the temporal classification. They do not raise the published customer count, add a new contract, change depreciation or justify another price uplift. CoreWeave's limited early Rubin deployment with Cognition demonstrates real access and workload progress. Its reported throughput multiples relate to a specific workload and comparison; they are not multipliers on company revenue. Counter-evidence from inference specialists and hyperscalers remains part of the competition risk.

6. The accounting anchor and near-term guide

Q2'26 Financial Summary

(in millions, except percentages and per share amounts)

	Three Months Ended June 30,	
	2026	**2025**
Revenue	$2,575	$1,212
Operating expenses	$2,624	$1,193
Operating income (loss)	$(49)	$19
Operating income (loss) margin	*(2)%*	*2 %*
Interest expense, net	$(640)	$(267)
Net loss	$(626)	$(290)
Net loss margin	*(24)%*	*(24)%*
Basic net loss per share	$(1.14)	$(0.60)
Diluted net loss per share	$(1.14)	$(0.60)

Non-GAAP Metrics[1]

(in millions, except percentages)

	Three Months Ended June 30,	
	2026	**2025**
Adjusted EBITDA	$1,510	$753
Adjusted EBITDA margin	*59 %*	*62 %*
Adjusted operating income	$128	$200
Adjusted operating income margin	*5 %*	*16 %*
Adjusted net loss	$(567)	$(130)
Adjusted net loss margin	*(22)%*	*(11)%*

Note:
1. Adjusted EBITDA, Adjusted EBITDA Margin, Adjusted Operating Income, Adjusted Operating Income Margin, Adjusted Net Loss and Adjusted Net Loss Margin are non-GAAP financial measures. Please see the reconciliation from GAAP to non-GAAP measures contained in the Appendix

17

E05. Q2 2026 quarterly financial summary, with GAAP and adjusted measures shown side by side. Issuer presentation, August 11, 2026, page 17.

Reconciliation from GAAP to Non-GAAP Measures

Adjusted Operating Income (Loss) and Adjusted Operating Income (Loss) Margin

The following table presents a reconciliation of operating income (loss) and operating income (loss) margin, the most directly comparable financial measures stated in accordance with GAAP, to adjusted operating income and adjusted operating income margin, respectively, for each of the periods presented:

(in millions, except percentages)

	Q2 2025	Q3 2025	Q4 2025	Q1 2026	Q2 2026
Operating income (loss)	$19	$52	$(89)	$(144)	$(49)
Stock-based compensation	145	144	157	153	165
Acquisition related costs	30	11	9	1	1
Amortization of acquired intangibles	6	10	11	11	11
Adjusted operating income	$200	$217	$88	$21	$128
Revenue	$1,212	$1,365	$1,572	$2,078	$2,575
Operating income (loss) margin	*2 %*	*4 %*	*(6)%*	*(7)%*	*(2)%*
Adjusted operating income margin	*16 %*	*16 %*	*6 %*	*1 %*	*5 %*

Note: The components of Adjusted Operating Income may not add up to 100% due to rounding

20

E06. Reconciliation of GAAP operating loss to adjusted operating income. Issuer presentation, August 11, 2026, page 20.

USD millions	FY2025 actual	Q1 2026 actual	Q2 2026 actual
Revenue	5,131	2,078	2,575
Cost of revenue	1,453	716	879
Technology / infrastructure	2,929	1,273	1,507

USD millions	FY2025 actual	Q1 2026 actual	Q2 2026 actual
Sales / marketing	144	69	60
General / administrative	651	164	178
GAAP operating profit	-46	-144	-49
D&A	2,454	1,147	1,393
Stock compensation expense	630	153	165
Net interest expense	1,229	536	640
Net income	-1,167	-740	-626
Adjusted operating profit	666	21	128
Adjusted EBITDA	3,093	1,157	1,510

Technology and infrastructure expense includes server/network depreciation, internal software and R&D. Q1 R&D of $104M and Q2 R&D of $117M are subsets of that category, not additional expenses. D&A also appears in cost of revenue. This report reconstructs forecast operating profit from cash contribution, central cash expense, D&A and stock compensation; it never subtracts D&A twice from reported GAAP profit.

The Q2 adjusted-to-GAAP bridge is explicit: adjusted operating profit $128M less $165M stock compensation, $1M acquisition costs and $11M acquired-intangible amortization equals a $49M GAAP operating loss. Adjusted EBITDA of $1.51B is further from cash distributable to shareholders because equipment investment, interest and principal repayment still follow. [S1, S2]

Guidance

Q3'26 Guidance

Revenue
$3.45 – 3.60 billion

Adjusted Operating Income
$200 – 260 million

Interest Expense
$860 – 940 million

Capital Expenditures
$11.5 – 13.5 billion

FY'26 Guidance

Revenue
$12.4 – 13.2 billion

Adjusted Operating Income
$960 – 1,150 million

Capital Expenditures
$35 – 39 billion

Exiting 2026 ARR[1]
$18.5 – 19.5 billion

Note:
1. Annualized run-rate revenue (ARR) is calculated by taking revenue from the last month of the quarter multiplied by 12

3

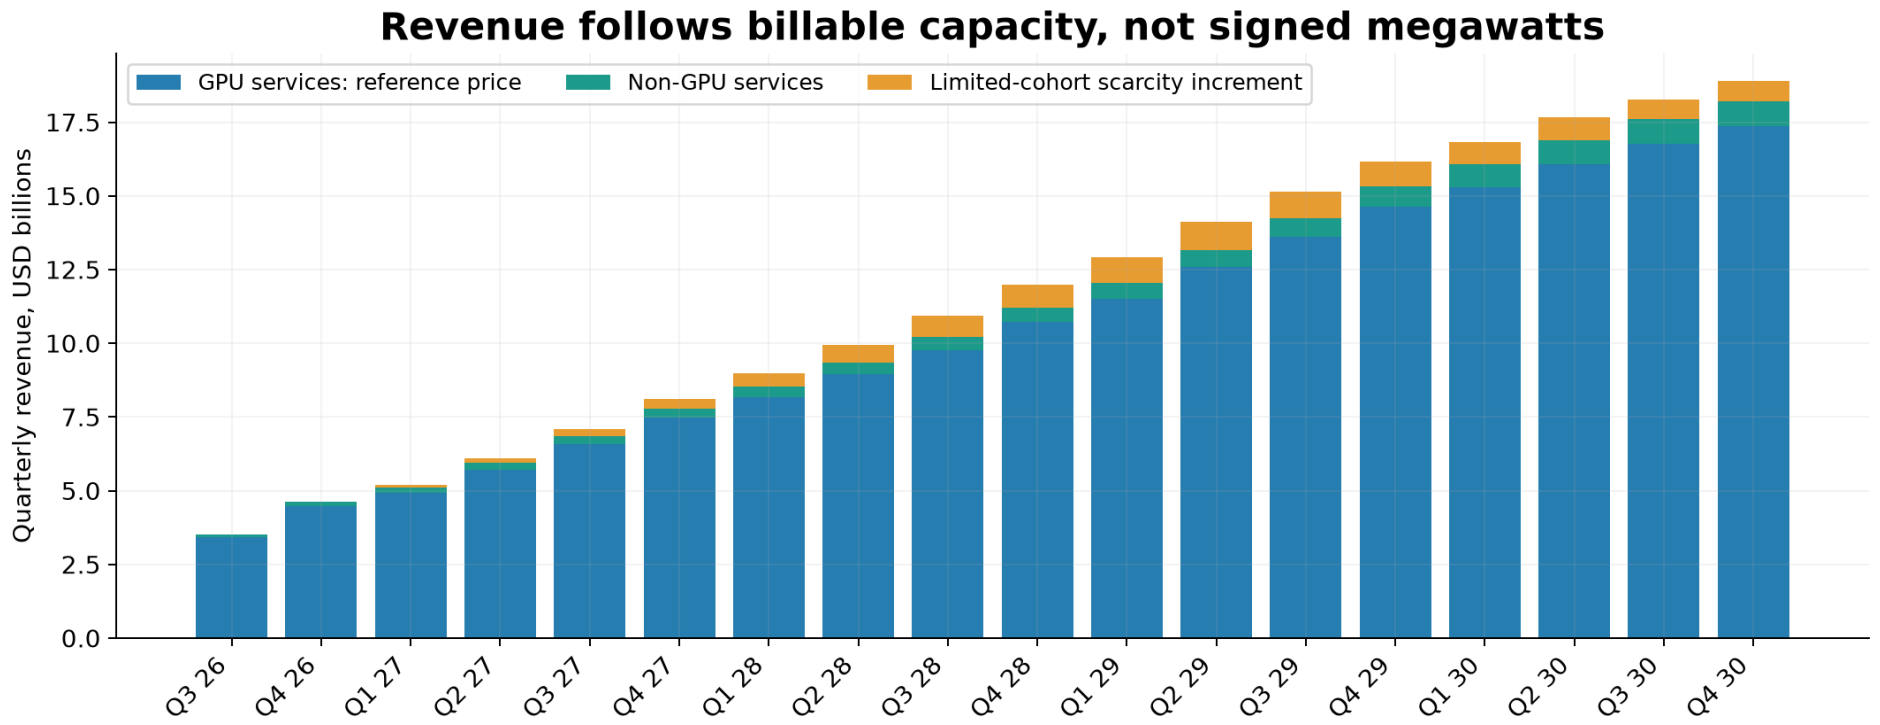

E08. Q3 and full-year 2026 outlook issued August 11, 2026, page 3. Guidance is forward-looking; retain the original ARR definition and units.

Period / status	Revenue	Adjusted OP	Company capex	Other guide
Q3 2026 issuer guide	3,450-3,600	200-260	11,500-13,500	Net interest 860-940
FY2026 issuer guide	12,400-13,200	960-1,150	35,000-39,000	Exit ARR 18,500-19,500; active power >1.85 GW

Period / status	Revenue	Adjusted OP	Company capex	Other guide
Q3 2026 active model	3,525	230	12,500	GAAP-style OP 38; interest 900
Q4 2026 active model	4,622	676	8,361	GAAP-style OP 474; interest 1,050
FY2026 model / actual H1	12,800	1,055	37,000	GAAP-style OP 319

The 2026 model sits within the latest guide. Its Q4 adjusted operating margin is roughly 15%, near the upper edge of management's broad low-teens description; this is not an additional company forecast. Exit ARR is the final month's revenue annualized, not recognized full-year revenue. Likewise, management's more-than-$30B end-2027 ARR ambition does not mean $30B will necessarily be recognized during 2027. Company capex equals gross PPE increase less the change in construction in progress. It is not the cash-flow statement's cash equipment purchase line.

7. Revenue model: the units and the company capture

M2. Expected revenue by modeled vector; all quarters are forecasts. Ancillary categories are modeling proxies because the issuer does not report these as audited segments.

Quarter	GPU reference	Ancillary	Scarcity increment	Total revenue	Confidence
Q3 2026	3,415.0	110.0	0.0	3,525.0	MEDIUM
Q4 2026	4,482.0	140.0	0.0	4,622.0	MEDIUM
Q1 2027	4,912.5	201.4	88.4	5,202.3	LOW
Q2 2027	5,722.2	234.6	154.5	6,111.3	LOW
Q3 2027	6,588.5	270.1	237.2	7,095.9	LOW
Q4 2027	7,467.0	306.1	336.0	8,109.2	LOW
Q1 2028	8,182.3	360.0	453.9	8,996.2	LOW
Q2 2028	8,960.9	394.3	579.9	9,935.1	LOW
Q3 2028	9,776.2	430.2	723.0	10,929.4	LOW
Q4 2028	10,733.0	472.3	793.8	11,999.1	LOW
Q1 2029	11,496.7	540.3	873.7	12,910.8	LOW
Q2 2029	12,576.0	591.1	955.8	14,122.8	LOW
Q3 2029	13,612.0	639.8	905.2	15,157.0	LOW
Q4 2029	14,644.0	688.3	834.7	16,167.0	LOW
Q1 2030	15,298.5	764.9	747.0	16,810.4	LOW
Q2 2030	16,074.3	803.7	784.9	17,662.9	LOW
Q3 2030	16,761.0	838.1	654.8	18,253.9	LOW
Q4 2030	17,354.1	867.7	677.9	18,899.7	LOW

GPU reference: average billable GW × annual realized yield ÷ 4. Quarterly end capacity is not multiplied by a full quarter of earnings. The one-month lag assumes a uniform deployment rate; billable average = active average minus (L - L²/2) × current capacity addition minus (L²/2) × prior capacity addition, with L = 1/3 of a quarter. H2 2026 revenue is anchored to guidance, so its effective realized yield calibrates to that total rather than overriding the guide.

Ancillary: the Q2 issuer reported more than $400M non-GPU ARR across storage, CPU, networking and software. That is broader than pure software. A 3.5% attachment to core GPU revenue is the reference proxy, near the scale suggested by the $400M ARR against Q2 annualized total revenue. The commercial branch raises attachment to 4.5% in 2027, 5% in 2028, 5.5% in 2029 and 6% in 2030. At 60% weight, this remains a bounded attach-rate hypothesis rather than an independent software TAM. Omni, storage and Forge-related monetization belong inside this row. Managed inference's booked ARR is already part of underlying infrastructure demand; adding it again would double-count.

Demand check: June backlog alone implies about $41.68B of recognition in its next two years under the issuer's 40% timing split. The model's next-eight-quarter revenue is shown below. The portion above that amount must come from later contracts or changing recognition timing; the disclosed greater-than-$25B early-Q3 commitments provide an available pool, not automatic recognition. The model remains delivery-constrained and does not convert a broad AI infrastructure TAM directly into revenue.

Demand cross-check	USD billions / scope	
June backlog next 24 months		41.68
Model Q3 2026 to Q2 2028		53.60
Revenue beyond June timing snapshot		11.92
Early-Q3 new commitment pool	>25.0, timing and allocations not fully disclosed	
Recognition conclusion	Plausible available demand does not prove the modeled delivery schedule	

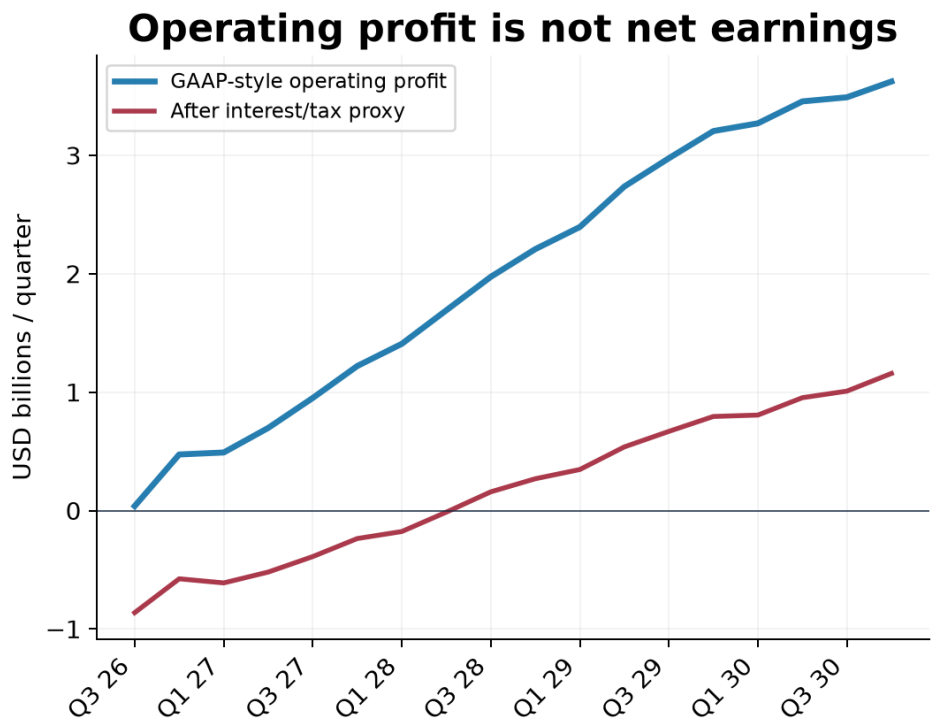

8. Unit economics: match capital intensity to a mature cohort

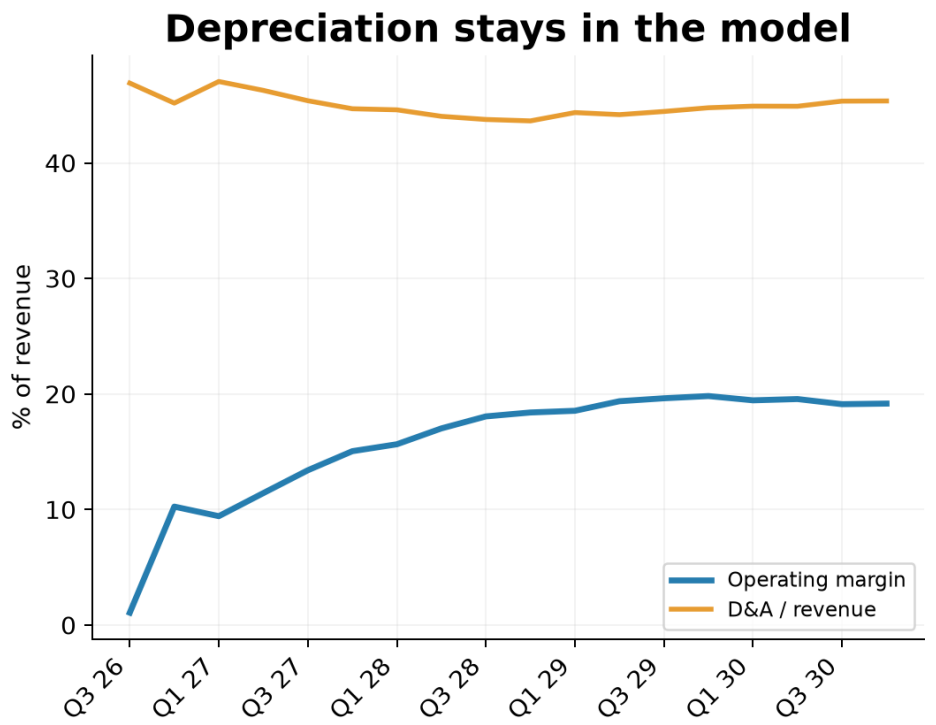

A source-calibrated pair matters more than choosing each input independently. At $10M annual revenue/MW and 68% cash contribution, $26M of installed equipment per MW depreciated over six years leaves about $2.47M per MW, or roughly 25% contribution, before central costs and stock compensation. That broadly matches management's mature-deployment commentary. Its contribution definition is not fully reconciled to this proxy; the match is a calibration check, not an audited equivalence. [S3]

The $26M/MW future capital-intensity assumption is LOW confidence, bounded at $20M-$35M in sensitivities. Q2's $9.352B company capex alongside roughly 0.5 GW of added active power provides a rough $18.7M/MW cross-check. FY2026's $37B model capex against approximately 1.05 GW of year-end active-power growth implies about $35M/MW, but includes catch-up, existing projects and differing payment/in-service timing. Neither division isolates a clean homogeneous equipment cohort. The model retains the entire 2026 capex guide before using the mature-cohort calibration from 2027.

Quarterly maintenance/replacement investment equals 0.5% of opening deployed gross PPE, in addition to the new capacity investment. The existing quarterly D&A anchor is $1.393B; new in-service cohorts depreciate over 24 quarters, with half a quarter on placement. The opening D&A anchor declines by 10% in 2030 as a rough old-cohort retirement proxy. Asset-specific retirement dates are unavailable. A five-year depreciation sensitivity is shown; the older-GPU rental thesis never authorizes extending the issuer's six-year technology life.

Cash contribution margins are distinct for reference GPU services and ancillary services. Reference GPU margins rise from 68% to 73% over 2027-2030; ancillary margins move from 60% to 65%. Pricing increments retain 80% before central expense and stock compensation. Central cash costs are a $200M quarterly reference increasing 15% each calendar year, plus 3% of revenue. Stock compensation is 4% of revenue in 2027-2028 and 3.5% thereafter. These rates include the modeled central R&D/support/administration burden; no duplicate R&D line is added. Margin expansion beyond calibrated guide quarters is a LOW-confidence scale assumption.

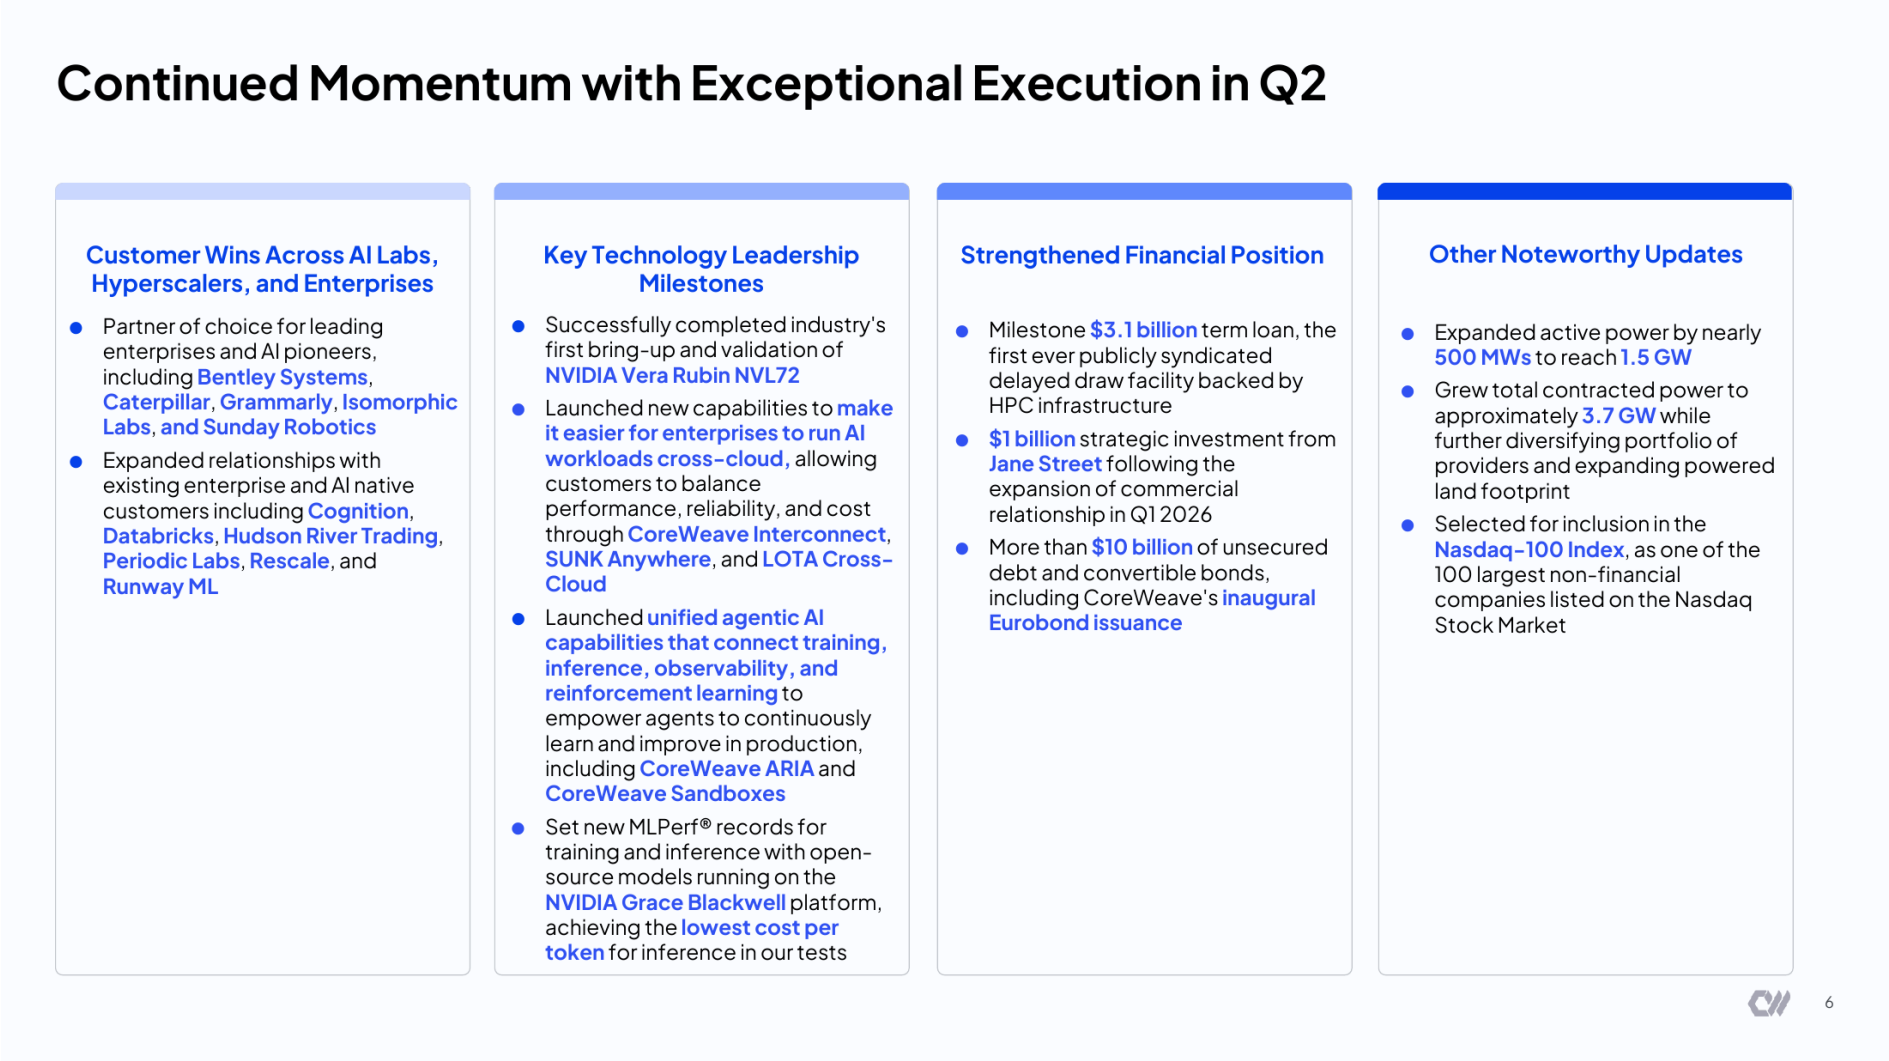

M3. GAAP-style operating profit includes modeled D&A and stock compensation. The after-interest/tax series is a financing diagnostic, not issuer guidance or a separate valuation method.

Quarter	Cash contribution	Central cash costs	D&A	SBC	OP	OP margin	After-interest / tax
Q3 2026	2,177.2	305.8	1,653.4	180.0	38.0	1.1%	-862.0
Q4 2026	3,090.7	338.7	2,088.0	190.0	474.0	10.3%	-576.0
Q1 2027	3,532.1	386.1	2,447.4	208.1	490.6	9.4%	-610.8
Q2 2027	4,184.1	413.3	2,828.1	244.5	698.2	11.4%	-519.2
Q3 2027	4,897.9	442.9	3,220.2	283.8	951.0	13.4%	-388.4
Q4 2027	5,642.1	473.3	3,623.8	324.4	1,220.7	15.1%	-236.2
Q1 2028	6,313.9	534.4	4,011.7	359.8	1,408.0	15.7%	-176.9
Q2 2028	7,025.8	562.6	4,374.6	397.4	1,691.3	17.0%	-13.3

Quarter	Cash contribution	Central cash costs	D&A	SBC	OP	OP margin	After-interest / tax
Q3 2028	7,786.2	592.4	4,782.5	437.2	1,974.1	18.1%	158.4
Q4 2028	8,548.3	624.5	5,235.9	480.0	2,208.0	18.4%	268.9
Q1 2029	9,264.9	691.5	5,726.7	451.9	2,394.9	18.5%	346.8
Q2 2029	10,197.6	727.9	6,238.9	494.3	2,736.5	19.4%	537.9
Q3 2029	11,002.3	758.9	6,737.5	530.5	2,975.5	19.6%	668.8

Q4 2030	13,774.8	916.8	8,573.2	661.5	3,623.4	19.2%	1,158.0

9. Funding is a condition of the operating forecast

E04. Quarterly business and financing highlights. Issuer presentation, August 11, 2026, page 6.

June 30, 2026 actual	USD millions	Scope
Unrestricted cash	5,524	Restricted cash 1,380 is excluded from funding reserve.
Debt principal	35,551	Net carrying value35,068 differs through unamortized items.

June 30, 2026 actual	USD millions	Scope
Gross / net PPE	52,622 / 46,736	Gross includes construction in progress11,918.
Deferred revenue	9,692	Customer liability, not fresh cash available twice.
Operating-lease liability PV	16,319	Operating rent is already in modeled service costs.
Finance-lease liability PV	221	Separate from debt principal; modeled principal schedule included.
Uncommenced operating leases	35,500	Undiscounted contractual payments, not current debt to add again to lease PV.

Cash accounting exposes the burden. H1 operating cash flow was $3.663B, versus $14.117B of cash PPE purchases, a simple deficit of $10.454B before other investing and financing uses. Q2 alone generated $679M of operating cash flow against $6.422B cash PPE. Working-capital changes helped H1 cash flow, but reversed to a drag in Q2. The difference between company capex, asset additions and cash paid cannot be fully allocated from the retrieved disclosures. It must not be relabeled as an accounts-payable change. [S1]

The September convertible closed at $4.2B principal, including the exercised option, with a 2.875% coupon. Net proceeds of $4.137B less $566.2M capped-call cost leave $3.5708B before issuer expenses. The 35-million-share ATM is an authorization; no completed sale was established in the retrieved materials. Its direct and forward components share one cap. The model assumes 70% of that capacity, 24.5M shares, is ultimately issued across Q4 2026-Q2 2027 at $80 per share less 2% fees. This is a funding assumption, not an actual transaction report. [S5-S7]

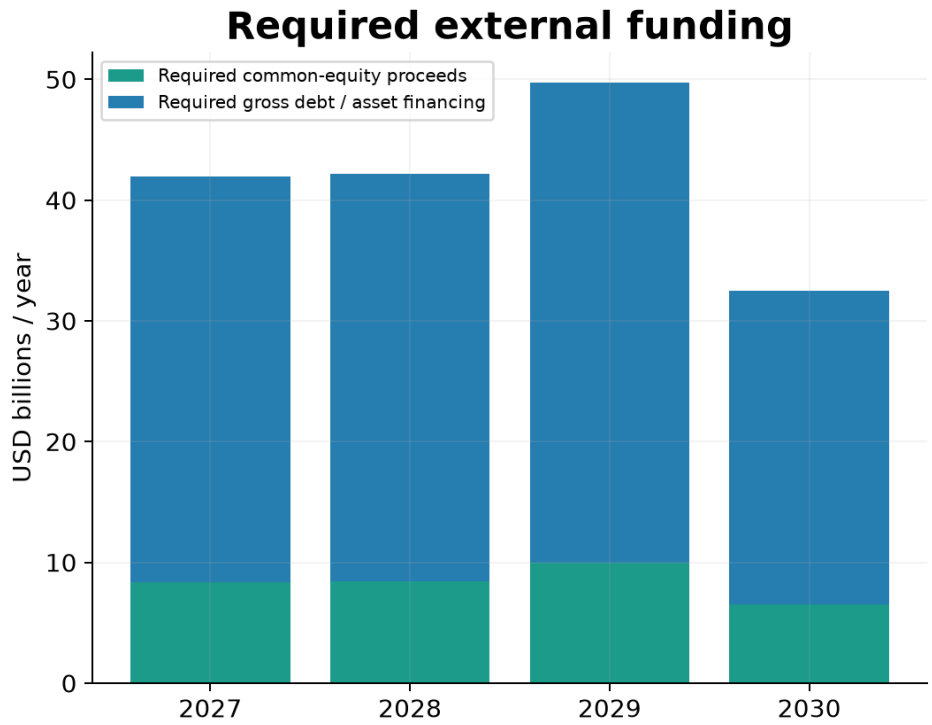

After operations, customer advances, the September convert, the assumed ATM and a $3B liquidity reserve, the residual external financing need is split 20% common equity and 80% debt/asset financing. All new common equity uses the fixed $80 issue-price assumption, with $60 and $100 sensitivities; issuance is never priced off the model target. Interest is 9% of beginning-quarter debt from 2027, with 7% and 11% sensitivities. Intra-quarter draw interest, fees and customer-financing components are not individually forecast; this is an aggregate expense proxy.

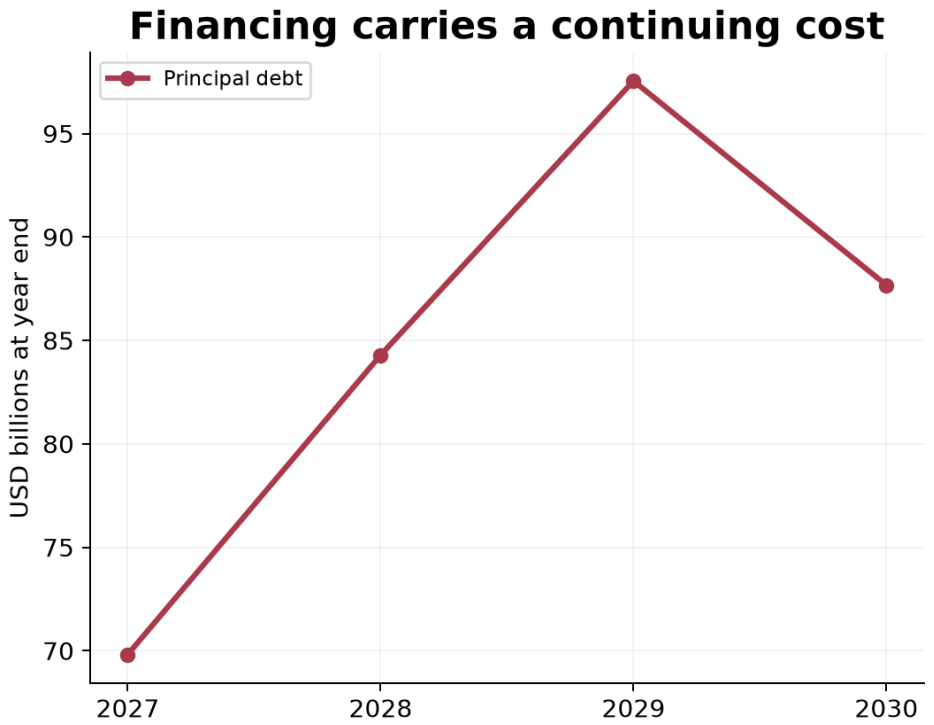

Debt is not allowed to accumulate without amortization. Known June principal maturities are $4.413B for the remainder of 2026, $6.184B in 2027, $4.416B in 2028, $2.421B in 2029 and $3.221B in 2030. Within-year timing is allocated evenly because a precise quarterly schedule was not disclosed. New modeled borrowing amortizes over 16 quarters starting in the next quarter. Required gross financing includes repayments as well as investment, and the debt rollforward subtracts the principal paid. The separate $221M finance-lease PV is allocated to H2 2026 and 2027 proportionally to its disclosed remaining $12M/$223M payment schedule; that is an explicit timing proxy, not an exact contractual principal schedule.

The funding-use proxy is placed-in-service investment plus the change in construction inventory. It represents assets that must ultimately be paid for or financed, including vendor-financed additions; it is not a forecast of the reported cash-PPE line. CIP transfers into service and replenishes as projects progress, with incremental pipeline inventory equal to 20% of new capacity equipment spending. Net customer advances are assumed at 8% of asset funding uses, with 0%/16% sensitivities. A supporting liability rollforward credits 12% of revenue against prior advances and assumes gross new advances replace those credits plus the net funding increment. The 12% service-credit ratio is illustrative; its cancellation does not independently validate the 8% net-cash assumption.

The residual funding sources are required, not committed. Facility borrowing bases, collateral eligibility, customer credit and market access can restrict borrowing even when backlog is large. A funding miss delays capacity and revenue; it is not repaired by calling uncommitted debt available cash. These model paths do not prove covenant headroom or eliminate refinancing/default risk. The capacity probability and explicit funding sensitivities reflect that uncertainty, while the remaining

facility-level gap stays visible.

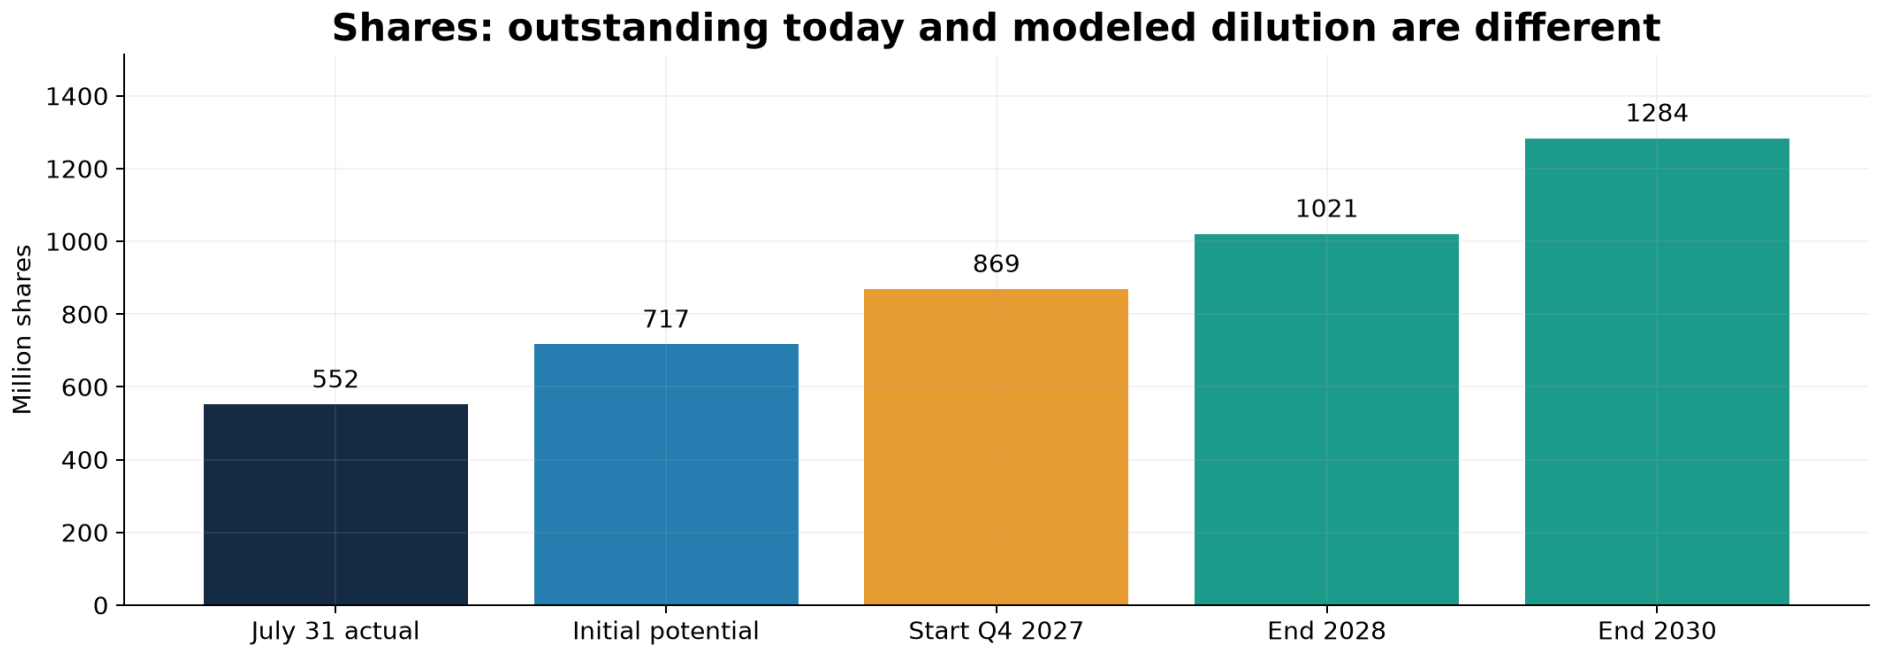

M4. Full-year model financing from 2027. Gross debt/asset financing includes refinancing of amortizing principal; it is not the same as the increase in debt balance.

Year	Asset funding uses	Debt principal repayments	Residual financing need	Common equity cash	Gross debt required	Debt at year end
2027	44.87	12.70	41.96	8.39	33.57	69.82
2028	46.56	19.26	42.17	8.43	33.74	84.29
2029	57.74	26.56	49.76	9.95	39.81	97.54
2030	38.17	35.85	32.48	6.50	25.98	87.68

Table M4 units are USD billions. Equity amounts exclude the separately modeled ATM proceeds. 2026 funding forecasts cover H2 only and are not shown as a full-year funding table. Operating-lease rent stays in operating costs; neither total undiscounted leases nor lease PV is added again as an asset purchase. Existing OEM/software debt of $5.102B is already inside June debt principal.

10. The share count is an economic input

M5. Actual common shares versus a conservative gross potential-share convention. Future counts are modeled; none is presented as an exact October 6 issued-share count.

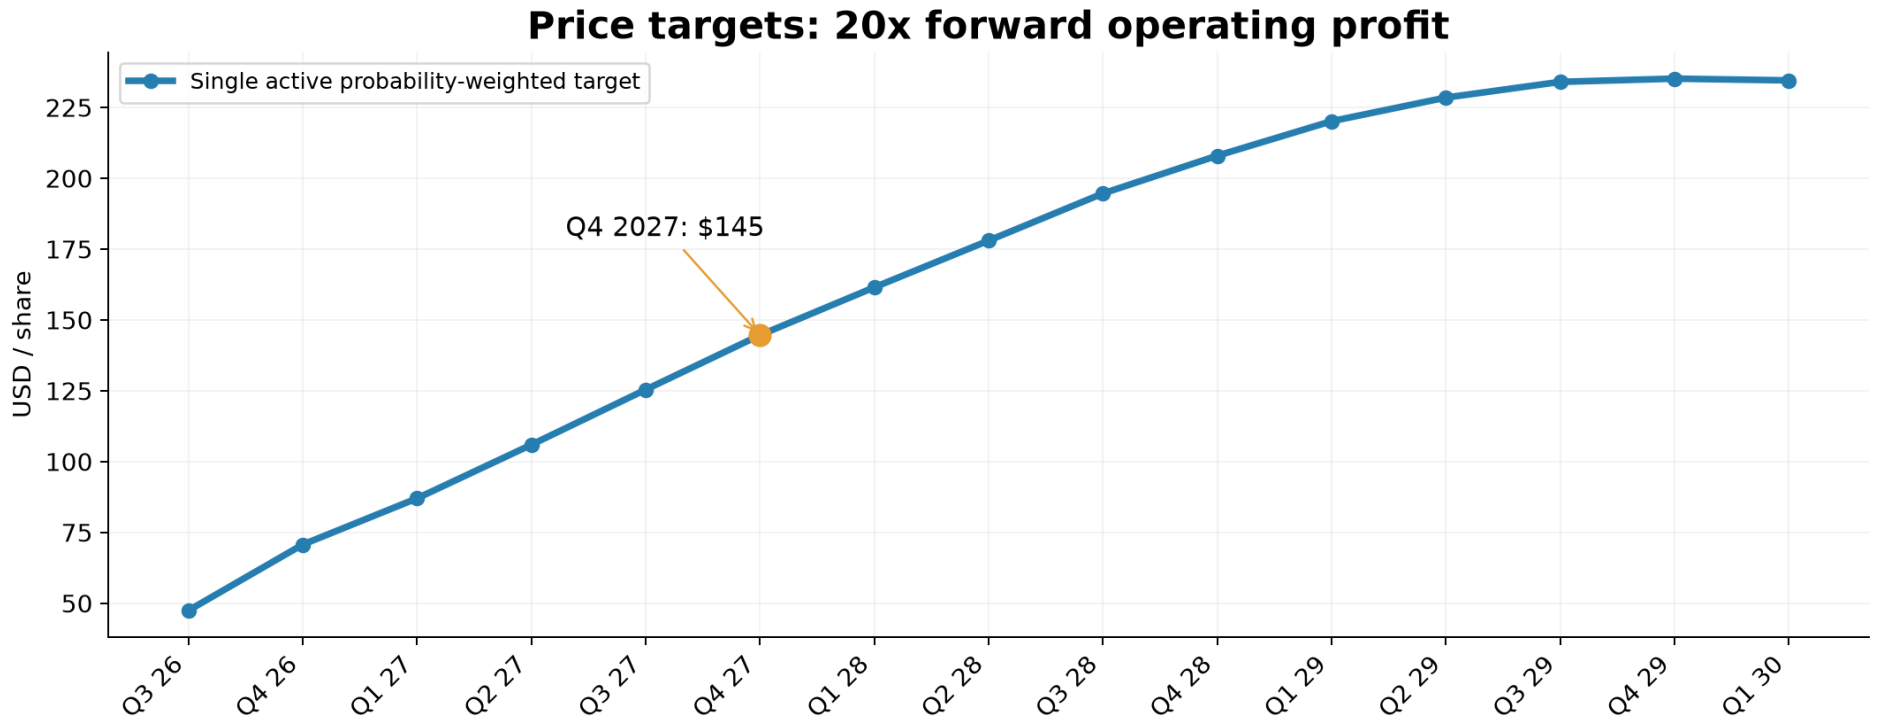

Share bridge	Million shares	Treatment
July31 actual common shares	551.536602	ClassA458.871690 + ClassB92.664912
Options	23.641274	Potential; no option exercise proceeds credited
RSUs	29.328373	Potential shares; already-issued RSAs are not added again
Warrants	11.864667	July prospectus count used once; June EPS table difference unresolved
Three convertible issues	100.368965	Initial gross if-converted shares; includes September issue
Opening potential valuation shares	716.739881	Not GAAP weighted EPS shares and not actual outstanding
Modeled Q4 2027 beginning potential shares	868.720410	Includes later funding shares and incremental awards
Modeled 2030 year-end potential shares	1,283.612201	Required financing and new awards materially enlarge the denominator

The 2031, 2032 and 2033 convertible issues carry initial if-converted shares of 24.002685M, 33.444800M and 42.921480M. Conversion prices are approximately $107.80, $119.60 and $97.85; capped-call caps are $215.60, $230 and $199.70. Cash, shares or mixed settlement may be chosen under the terms. Gross potential shares are reserved in the valuation denominator without assuming the instruments have already converted or extinguishing their principal from the funding schedule. No capped-call dilution benefit is credited. This is conservative, and differs from treasury-stock or settlement-specific dilution. [S5-S9]

Q2's 551M GAAP diluted weighted-average shares excluded anti-dilutive instruments during a loss. That does not make them disappear from a forward valuation. July's reported warrant count differs from June's approximately 4M anti-dilutive EPS count; the instrument-level bridge is unresolved. The model uses the higher July count once, never both, and does not apply one exercise price to every warrant. Unvested restricted stock awards are already legally outstanding. Reserved but ungranted plan/ESPP shares are not added as if issued.

Existing award vesting is already represented in opening potential shares. For new grants, the model subtracts a $150M quarterly legacy stock-compensation amortization proxy from total modeled SBC through Q2 2029, floors the remainder at zero and divides it by the assumed $80 grant/issue-price proxy. After that, new modeled SBC is fully reflected in new potential awards. This is an expense-linked future-grant proxy, not a disclosed vesting schedule. The quarter-start denominator convention does not pre-reserve every share issued in the following three quarters; the later share trajectory and sensitivity make that limitation explicit.

11. One active valuation, with coherent financing states

M6. The active target weights each fully calculated operating-and-funding outcome once. It is not computed by dividing average profit by average shares when state dilution differs.

Target quarter	Exact F4Q window	Expected F4Q OP	Expected start shares	Multiple	Active USD target
Q3 2026	Q3 2026 to Q2 2027	1,700.7	716.740	20x	47.46
Q4 2026	Q4 2026 to Q3 2027	2,613.7	739.197	20x	70.72
Q1 2027	Q1 2027 to Q4 2027	3,360.4	772.192	20x	87.04
Q2 2027	Q2 2027 to Q1 2028	4,277.8	806.894	20x	105.96
Q3 2027	Q3 2027 to Q2 2028	5,270.9	839.510	20x	125.41
Q4 2027	Q4 2027 to Q3 2028	6,294.0	868.720	20x	144.64
Q1 2028	Q1 2028 to Q4 2028	7,281.3	899.693	20x	161.51
Q2 2028	Q2 2028 to Q1 2029	8,268.3	926.479	20x	178.01
Q3 2028	Q3 2028 to Q2 2029	9,313.5	953.618	20x	194.66
Q4 2028	Q4 2028 to Q3 2029	10,314.9	986.852	20x	207.98
Q1 2029	Q1 2029 to Q4 2029	11,311.7	1,020.702	20x	220.16
Q2 2029	Q2 2029 to Q1 2030	12,187.2	1,057.882	20x	228.50
Q3 2029	Q3 2029 to Q2 2030	12,906.2	1,093.390	20x	234.05
Q4 2029	Q4 2029 to Q3 2030	13,420.8	1,131.181	20x	235.20
Q1 2030	Q1 2030 to Q4 2030	13,839.3	1,169.418	20x	234.57

Financial amounts above are USD millions and shares are millions. For each state s and starting quarter Q: revenue vectors less cash costs, D&A and SBC produce OP(s,Q). Sum OP over Q through Q+3, multiply positive forward OP by 20, and divide by that state's beginning-Q potential shares. The active price target equals the sum of state target × state weight. No Base score or probability is applied a second time. A non-positive forward OP receives a zero target in this multiple-based framework rather than an invented positive value.

Capacity and commercial execution are represented by four mutually exclusive joint outcomes. The probability of commercial upside is assumed 60% under either capacity outcome; this is a tractable dependence assumption, not measured independence. Within the commercial branch, pricing and ancillary attach improvements move together. Financing, taxes and shares are calculated separately in every state before weighting, preserving nonlinear effects. The following table provides the complete active-quarter chain; the appendix does the same for every target quarter.

Q4 2027 state	Weight	F4Q OP, USD M	Start shares M	20x OP / shares	Weighted contribution
C0P0 reference capacity	14%	3,850.072	844.930281	91.133487	12.758688
C0P1 reference capacity + commercial	21%	6,299.486	843.712991	149.327693	31.358815

Q4 2027 state	Weight	F4Q OP, USD M	Start shares M	20x OP / shares	Weighted contribution
C1P0 faster capacity	26%	5,018.066	882.730232	113.694206	29.560494
C1P1 faster capacity + commercial	39%	8,019.032	881.386109	181.964113	70.966004
Single active result	100%	State OP calculation above	State shares above	Probability applied once	144.644001

12. The probability ledger and pre-committed tests

B1. Capacity conversion / commissioning

Ledger field	Current treatment
Source / date	Issuer calls, customer contracts and power disclosures; May7/Aug11/Sep17,2026
Probability / reference	65% subjective judgment; 2.9 GW at year-end 2027; 5.8 GW at year-end 2030
Conditional endpoint	3.5 GW at year-end 2027; 8.5 GW at year-end 2030
Overlap and cost bridge	Existing supplier sites and NVIDIA partnership are inside aggregate power. No extra MW add-ons. $26B/GW equipment plus maintenance, CIP, D&A, central costs, funding and dilution; one-month billing lag.
Active contribution	Q4'27 price target versus capacity-p=0 control: 18.593991 USD. Interaction with commercial branch retained.
Update / counter trigger	Raise only on energized and accepted capacity matching timeline with funding; reduce on utility/collateral/acceptance delays.

B2. Commercial bundle: eligible pricing

Ledger field	Current treatment
Source / date	Issuer pricing release/calls; customer-check screenshots supportive; July/Aug11/Sep17,2026
Probability / reference	60% subjective judgment; 2026 guidance includes July hikes; 2027 core yield $10M/MW/year
Conditional endpoint	$40M/MW/year only on 2-5% of the billable cohort in 2027; 6-8% in 2028, then fading
Overlap and cost bridge	50% haircut to excess over reference; fixed-price existing contracts excluded; no extra5-10pp margin addition. 20% incremental service cost plus 3% central expense and forecast SBC; taxes and funding calculated per state.
Active contribution	FY2027 expected incremental pricing revenue 816.128125 USD M.
Update / counter trigger	New-deal cohort rates, tenors and commissioning determine weight; lower realized yield or competitor availability reduces it.

B3. Commercial bundle: non-GPU attachment

Ledger field	Current treatment
Source / date	Issuer: more than $400M non-GPU ARR, Omni launch and first contract; Aug11,2026
Probability / reference	60% subjective judgment; 3.5% attachment to core revenue
Conditional endpoint	4.5% / 5% / 5.5% / 6% attachment in 2027 / 2028 / 2029 / 2030
Overlap and cost bridge	Same commercial state as B2, not an independent probability. Storage, CPU, networking, software and Omni are one vector; managed inference is already in cloud services. Ancillary cash contribution margin 60% in 2027 to 65% in 2030; central cost, SBC and D&A are deducted at company level.
Active contribution	FY2027 expected ancillary increment over3.5%reference 148.141667 USD M.
Update / counter trigger	Disclosed non-GPU recurring revenue and paid attachment raise confidence; cannibalization or bundled pricing reduces it.

B4. Older GPU renewal durability

Ledger field	Current treatment
Source / date	Issuer renewal examples, anonymous customer and Silicon Data / a16z chart; Aug11/Sep17/Sep22,2026
Probability / reference	65% subjective judgment; Preserved multi-year commercial yield curve and six-year depreciation
Conditional endpoint	Useful paid workloads persist through renewals; small renewable cohort
Overlap and cost bridge	100% of this limited signal is already expressed in referenceyield and commercialconfidence; no separateincrement. No asset revaluation, D&A extension or cash gain from inferred residual value.
Active contribution	0 additional USD; reference retention supported, not a secondpriceincrease.
Update / counter trigger	Repeated renewal-price and utilization evidence supports retention; idle capacity or falling rates reduces yield.

B5. Managed inference / adjacent AI adoption

Ledger field	Current treatment
Source / date	Issuer inference ARR and limited Rubin workload deployment; Aug11/Sep30,2026
Probability / reference	50% subjective judgment; Core billable capacity and reference customer demand already include inference
Conditional endpoint	Broader inference and physical-AI workloads fill shared capacity; no exclusive additional customer award
Overlap and cost bridge	100% of quantifiable current inference ARR overlaps cloud-service demand. Robotics and space optionality has no separate signed-capacity amount. Maintain GPU, network and storage expenses; do not apply software-only margins to full inference ARR.
Active contribution	No additional dollars beyond GPU capture. Adding the ARR was rejected for double-counting; a separate fee or capacity allocation is the next test.
Update / counter trigger	A distinct software fee, net new capacity and acceptance date permit a future increment.

B6. ATM funding availability

Ledger field	Current treatment
Source / date	ATM prospectus; no completed sale established; Sep17,2026
Probability / reference	70% subjective judgment; No executed ATM shares or cash confirmed
Conditional endpoint	35M maximum shares at an assumed $80/share, less 2% fees
Overlap and cost bridge	Direct and forward issuance share one cap. Expected 24.5M issuance is already in the share schedule; proceeds are counted once. $1,920.8M funding cash and 24.5M shares across Q4 2026 / Q1 2027 / Q2 2027.
Active contribution	Share and cash schedule only; not customer revenue.
Update / counter trigger	Executed issuance or forward-settlement disclosures replace modeled amounts with actuals.

B2 and B3 share one commercial state. Together they change the active Q4 2027 target by $38.85 versus the commercial-p=0 control. Capacity and commercial control differences are interaction-dependent and must not be added as independent target uplifts. The source-authenticity judgment is distinct from the probability of the modeled economic outcome. No official-confirmation requirement is used to force a credible breadcrumb to zero.

13. Sensitivities and the funding breakpoints

Assumption changed alone	Value	Q4 2027 target USD	Start potential shares M
capacity probability	0.000	126.05	844.20
capacity probability	0.350	136.06	857.40
capacity probability	0.650	144.64	868.72
capacity probability	1.000	154.66	881.92
pricing probability	0.000	105.80	869.50
pricing probability	0.300	125.22	869.11
pricing probability	0.600	144.64	868.72
pricing probability	1.000	170.54	868.20
capital intensity per GW	20,000.000	188.36	850.17
capital intensity per GW	26,000.000	144.64	868.72
capital intensity per GW	35,000.000	82.58	896.58
interest rate	0.070	145.01	866.54
interest rate	0.090	144.64	868.72
interest rate	0.110	144.28	870.94
issue price	60.000	137.57	913.10
issue price	80.000	144.64	868.72
issue price	100.000	149.26	842.09
technology life quarters	20.000	93.17	868.12
technology life quarters	24.000	144.64	868.72
net customer advance fraction	0.000	142.45	882.03
net customer advance fraction	0.080	144.64	868.72
net customer advance fraction	0.160	146.91	855.42
billing lag quarters	0.000	163.06	867.68

Assumption changed alone	Value	Q4 2027 target USD	Start potential shares M
billing lag quarters	0.333	144.64	868.72
billing lag quarters	0.667	126.50	869.68

These are diagnostics, not additional active cases or a price-target spread. In particular, capital intensity changes both D&A and funding shares. A longer commissioning lag reduces billable revenue while costs still begin. A lower assumed equity issue price requires more shares for the same net cash. Changes in customer advances alter timing and financing; they do not turn backlog into a second revenue stream. Interest changes after-interest profitability and cash needs even though the sanctioned multiple values operating profit.

The strongest disconfirming evidence would be delivery missing guide while fixed costs arrive, materially worse mature-cohort returns than management describes, insufficient borrowing-base capacity, persistent issuance at much lower prices, or customers reducing contracted requirements. The active model should then reduce or delay capacity and reflow costs/funding together. A covenant breach or funding gap that cannot be closed is a thesis break, not a reason to silently increase debt assumptions.

14. TAM expansion and cross-book consequences

The addressable market is useful AI work delivered on infrastructure. Phase 1 is training and commercial inference now; the demand mechanism is established, but CoreWeave's capture depends on billable capacity, pricing and customer retention. Phase 2 is physical AI: robotics, autonomous systems and simulation expand model development and recurring inference. The framework gives this adjacency a 50% exploratory weight, yet its quantified near-term economics are already inside shared compute demand. Phase 3 includes defense, space and other ubiquitous-compute workloads, with 20% exploratory confidence and no separate booked-revenue increment. Government accreditation, deployment locations and customer procurement remain barriers. Broad TAM is not counted on top of the same fleet.

CoreWeave is linked to NVIDIA through equipment, software support, investment and customer-adoption timing. It competes with covered Nebius for workloads and funding, while the user-provided interview points to different strengths across training, inference, regions and deployment size. Faster CRWV/NBIS deployment can support covered optics suppliers Lumentum, Coherent, AAOI and Sivers, semiconductor infrastructure and memory demand; it does not prove any supplier's specific share or ASP. Power and cooling constraints can help equipment suppliers while simultaneously delaying cloud revenue. A dollar of supplier backlog is not the same dollar of CoreWeave recognized revenue.

A critical counter is efficiency. Better utilization, smaller models and architecture changes can reduce resources per task. They may also lower price per useful result and increase aggregate adoption. The model does not assume a fixed one-agent/one-GPU relationship or turn every efficiency improvement into an automatic demand collapse or uplift. Net capacity utilization, retained revenue and customer ROI decide the outcome.

15. Score, risks and catalysts

Category	Points	Reason
Core thesis	16 /20	15 for scarce working clusters, delivery and software; +1 for verified customer prepayments. Alternatives prevent a monopoly score.
Cycle stage	9 /10	Rapid deployment and new-generation adoption, with meaningful operational evidence.
TAM expansion	9 /10	Training, inference and shared compute can expand across industries; capture remains capital-intensive.
Catalysts	5 /5	Q3 results, >1.85GW end2026 delivery, 2027 contracted conversion and priced new contracts.
Macro	8 /10	Strong AI demand; financing and energy conditions can constrain realization.
Alpha	3 /5	Engineering/financing reconciliation adds insight, but substantial public coverage limits information scarcity.
Competition risk	-1	Hyperscaler internal capacity, specialist clouds, inference services and cheaper substitutes.
Delivery risk	-1	Grid, construction, GPU/network supply and commissioning delays.
Customer concentration / credit	-1	Top three account for72% of Q2 revenue; contracted commitments still depend on counterparties.
Capital / dilution risk	-1	Heavy capex, amortizing debt, conditional refinancings and future equity.
Governance / ecosystem risk	-1	Founder voting control and reliance on NVIDIA ecosystem/customer relationships.
Total	45 /60 =75	High Conviction thesis classification; not an outcome probability or assurance of equity returns.

Each of the five scored risk classes subtracts one point. The category score was built from these components, not selected to make the stock rank near a desired position. CoreWeave's new Excel Base is 75; existing-company Excel Bases remain protected. Holdings and allocation are not inferred from inclusion in the research universe.

Next observable tests are Q3 revenue and guide delivery, active versus billable power by year-end, repeated realized pricing on eligible contracts, funding draws and actual ATM issuance. The most important 2027 test is not a larger signed-power headline; it is whether energized clusters become accepted, earning services without returns being consumed by capital cost and dilution. Reassess commercial probability when equivalent competitor capacity becomes readily available, and capacity probability when the delivery/funding sequence changes.

16. Outside-universe research candidates

Targeted lookup in the 137-company pre-addition research workbook found CORZ, GLXY and APLD absent. Workbook coverage does not establish actual holdings. The following are research candidates only; no new rows, scores or price targets are created for them.

Candidate / exchange	Specific scarcity exposure and priority	Next test and counter
Core Scientific - CORZ, Nasdaq	High research priority: conversion of powered sites into high-density hosting for CoreWeave. June 30 figures showed 590 MW leased and 395 MW billable; the July 28 release updated billable capacity to 437 MW by mid-July. The remaining conversion gap is measurable.	Customer acceptance, funding responsibilities and rent/margin commencement. Concentration, retrofit costs and lease-versus-IT MW definitions matter.
Galaxy Digital - GLXY, Nasdaq	High research priority: July 6 release confirmed 133 MW critical IT at Helios delivered and rent commenced in Q2; Phase II 260 MW IT delivery expected from Q2 2027.	New rent/cash returns and tenant concentration; diversified crypto business can dominate consolidated valuation. Roughly 200 MW gross for 133 MW IT is a boundary warning, not extra capacity.
Applied Digital - APLD, Nasdaq	Research priority: 400 MW CoreWeave leases; October 2 disclosure put 250 MW operational critical IT at Polaris Forge 1. Named equipment suppliers connect the remaining buildout to phased hosting revenue.	October 7 earnings, financing, ready-for-service milestones, construction cost and cash rent. Contracted MW is not yet all billable and cannot be added outside CRWV aggregate power.
ABB; AAON / BASX; Caterpillar	Monitor named electrical, cooling and backup-power procurement relationships. Qualified equipment lead times can create commercial leverage.	Verify actual constrained product, delivery slot, capacity and margin before a full model. Relationship alone is not proof of pricing power. ABB Ltd Swiss SIX:ABBN / OTC ADR:ABBNY; AAON Nasdaq:AAON owns BASX; Caterpillar NYSE:CAT.

This is a property-and-infrastructure research queue, not a recommendation to duplicate exposure automatically. The near-term scarcity is energized, commissioned capacity, with recognition tied to ready-for-service dates and acceptance. Electrical interconnects, cooling validation, construction financing and customer specifications create qualification and timing barriers. Competitor campuses and hyperscaler self-builds are the capacity response. Detailed source IDs, dates and unresolved supplier questions are retained in the discovery record.

17. Annual trajectory: a check, not the valuation window

USD billions except GW / shares	2026	2027	2028	2029	2030
Revenue	12.80	26.52	41.86	58.36	71.63
Operating profit	0.32	3.36	7.28	11.31	13.84
D&A	6.28	12.12	18.40	25.94	32.33
Interest expense	3.13	5.11	6.75	8.13	8.60
After-interest / tax proxy	-2.80	-1.75	0.24	2.35	3.93
Company capex / proxy	37.00	37.65	39.18	48.64	32.48
Year-end active power GW	1.90	3.29	4.71	6.46	7.55
Year-end potential shares M	772.2	899.7	1,020.7	1,169.4	1,283.6

2026 financial totals combine actual H1 with model H2. H1 revenue is $4.653B unallocated to the forecast vectors because comparable audited segment data do not exist. The revenue decomposition therefore does not retrospectively invent H1 core-versus-ancillary mix. Longer-range annual tables test capital intensity, financing and economics; the price target always uses the exact four-quarter window beginning in its labeled quarter.

18. Full quarterly state derivations

This appendix supplies every state-specific operating and valuation chain used in the active path. P0 is reference commercial execution; P1 includes the limited-cohort pricing and ancillary-attach bundle. C0 is the reference delivery path; C1 is faster delivery. Revenue, OP and shares are USD millions / million shares. For every row: OP = revenue × OP margin. The forward target then uses the sum of four quarterly OP figures, 20x and beginning-quarter shares shown. Weighted contributions sum to the single target in M6.

State C0P0 - weight 14%

Quarter	Revenue	OP margin	Quarter OP	F4Q OP	Start shares	State target	Weighted target
Q3 2026	3,525.00	1.08%	38.00	1,479.83	716.740	41.2933	5.7811
Q4 2026	4,622.00	10.26%	474.00	2,110.20	739.197	57.0944	7.9932

Both latest complete earnings transcripts, including Q&A, were reviewed. Reported facts, management guidance, attributed customer/channel evidence and model judgments retain their distinct status. Company statements establish their own claims; they are not independent tests of technical superiority. User screenshots have preserved originals and captions, with anonymous/unresolved provenance labeled. No research mailbox was accessed.

Material open items: exact post-July31 issued shares; warrant-count reconciliation; executed ATM sales/forward settlements; facility-level borrowing-base capacity; exact cash-capex/AP/OEM timing; customer-advance cash/service-credit schedules; consolidated gross-versus-IT MW mapping; per-generation billable yield, capital intensity and useful-life cohorts; and realized ancillary monetization. These gaps inform explicit proxies and sensitivities rather than fabricated precision.

Current source-of-truth destinations: G:/My Drive/1amInvesting/Artifacts/CRWV_CoreWeave_DeepDive.md and .pdf; linked sheet CRWV_Q_Model in v3_2_master_portfolio.xlsx. Model inputs, source originals, evidence images and validation records are retained in the dated local research workspace. This artifact contains one active research case; prior versions belong in the external archive.
