Dell: converting infrastructure demand into profit

Dell's procurement scale, system integration and enterprise support can turn scarce components into working AI infrastructure faster. The durable profit opportunity also includes proprietary storage and software, where Dell captures more value than it earns on purchased accelerator content. Execution, product mix and customer cash quality determine whether that opportunity reaches shareholders.

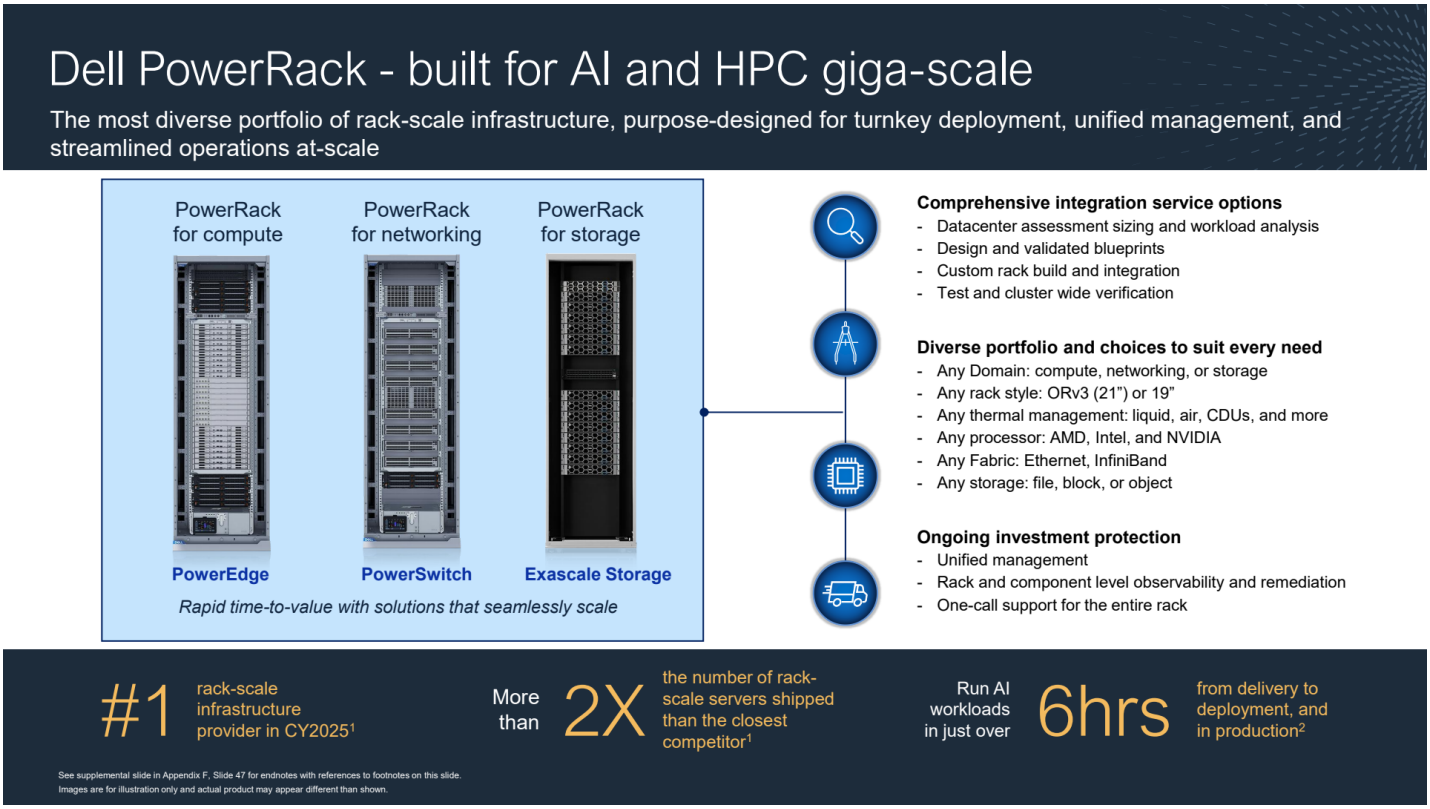

The active Q4 2027 operating ceiling is about $884 per share under the existing 20x segment-based operating-profit method. The operating case requires strong AI-system conversion, continued traditional-server and storage demand, cost control and funded share retirement. Later forecasts remain LOW-confidence assumptions.

Research snapshot	Current state
Date / latest actual	21 October 2026. Latest results: fiscal Q2 2027 ended 31 July 2026, released 1 September.
Status / classification	Covered; holding status not asserted. Systems-platform beneficiary: procurement, integration and services.
Analytical score / band	45 /60 =75%; High Conviction
Protected Excel Base	75; current workbook authority retained separately from the analytical score
Historical price snapshot	USD 462; 20 October 2026 regular close. No live-price claim.
Latest actual weighted diluted shares	652 million, all economic classes included
Actual outstanding share snapshot	635,812,750 shares at 1 September 2026 across Classes A, B and C; a different measure and date from weighted diluted shares
Market capitalization	Not independently verified. The forecast share denominator is not used to label a model-implied capitalization as actual.
Active ceiling	Q4 2027: USD 884
Exact valued window	Q4 2027-Q3 2028; forward OP USD 27,906 million
Method / denominator	20x ISG + CSG segment-based OP proxy / 631 million starting-quarter diluted-equivalent shares
Accounting qualification	Segment OP excludes specified group corporate items and SBC; the separate actual GAAP reconciliation is shown below.

Financial tables use USD millions, shares in millions and ceilings in USD per share. Reader-facing displays are rounded to whole values and may not add exactly; the frozen model and linked calculations retain full precision. Body discussion excludes price-dependent return, EV and ranking. The original filename is preserved for continuity; current analysis uses fiscal Q2 2027 actuals.

Products, customers and competitive position

Infrastructure Solutions Group combines AI-optimized servers, traditional servers/networking and storage. Client Solutions Group supplies commercial and consumer PCs. The product model keeps those four economic lines and other activity separate. AI hardware can generate enormous receipts while much of its purchase price belongs to GPU, memory and networking suppliers.

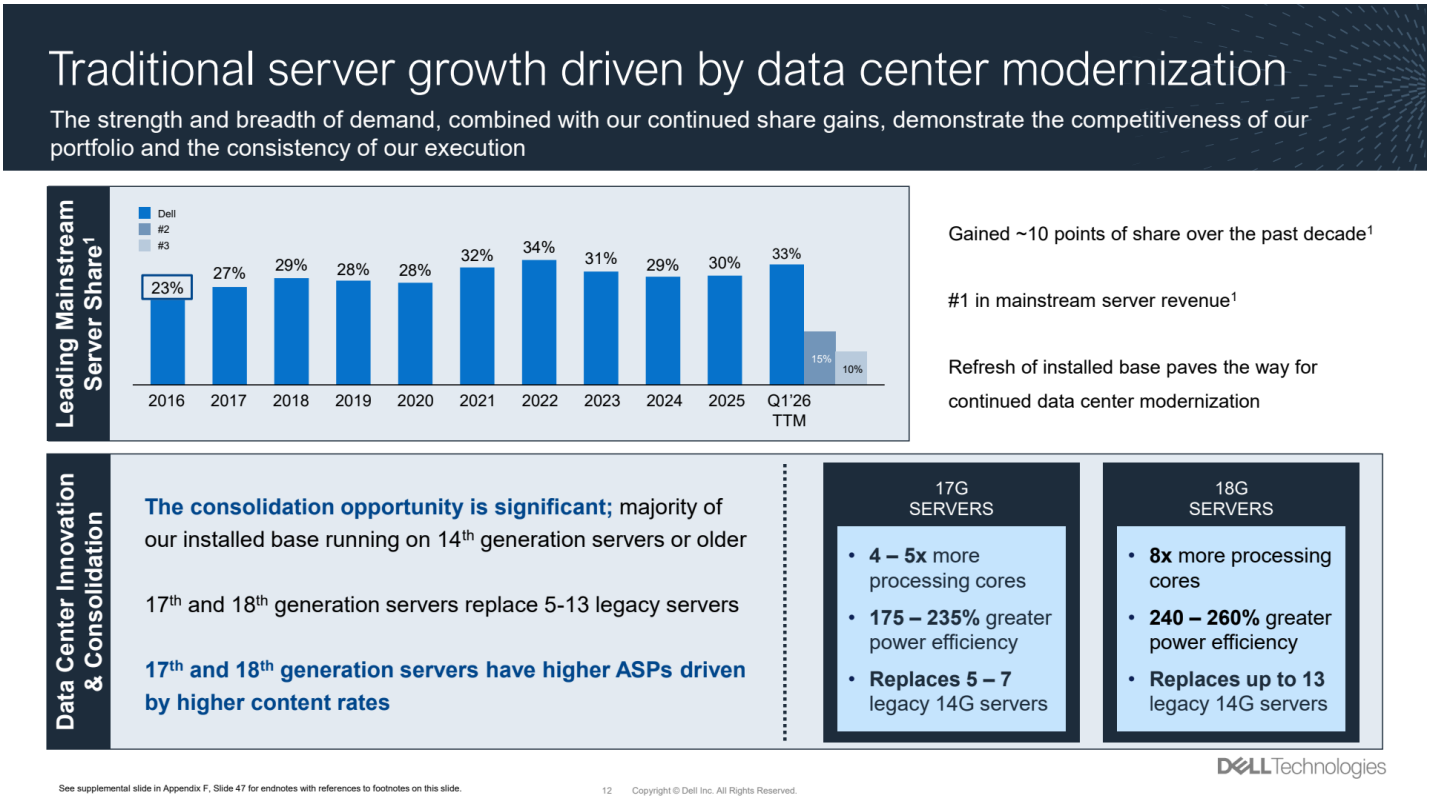

Dell fiscal Q2 2027 performance review, 1 September 2026, original page 11. PowerRack integration spans compute, networking and storage. Market leadership and deployment performance are issuer claims with the source footnotes; the schematic is illustrative, not a disclosed customer order.

Enterprise relationships, financing, global service and validated rack integration can lower customer deployment risk. Large cloud buyers can also buy directly from ODMs or integrate systems internally. HPE, Supermicro, Lenovo, generic vendors and customer-designed systems constrain hardware pricing. Dell's advantage is operational and commercial rather than a sole-source semiconductor process.

The company can earn more when customers need a complete deployment and ongoing support. Customers supplying their own GPUs, using a different storage architecture or purchasing directly change the captured wallet. Counting total AI capex as Dell sales would miss those boundaries.

Supercycle, replacement curve and expanded TAM

The near-term cycle combines AI deployment with traditional-server modernization. New generations pack more cores and memory into fewer boxes, so dollar revenue, units and customer compute capacity can move differently. Component inflation can raise system ASP while compressing the integrator's profit; a larger invoice alone does not prove greater value capture.

Dell fiscal Q2 2027 performance review, original page 12. Issuer server-share and consolidation comparisons retain their benchmark scope. Slide generation comparisons differ from some call examples; they are not a universal unit-conversion ratio or a Dell revenue forecast.

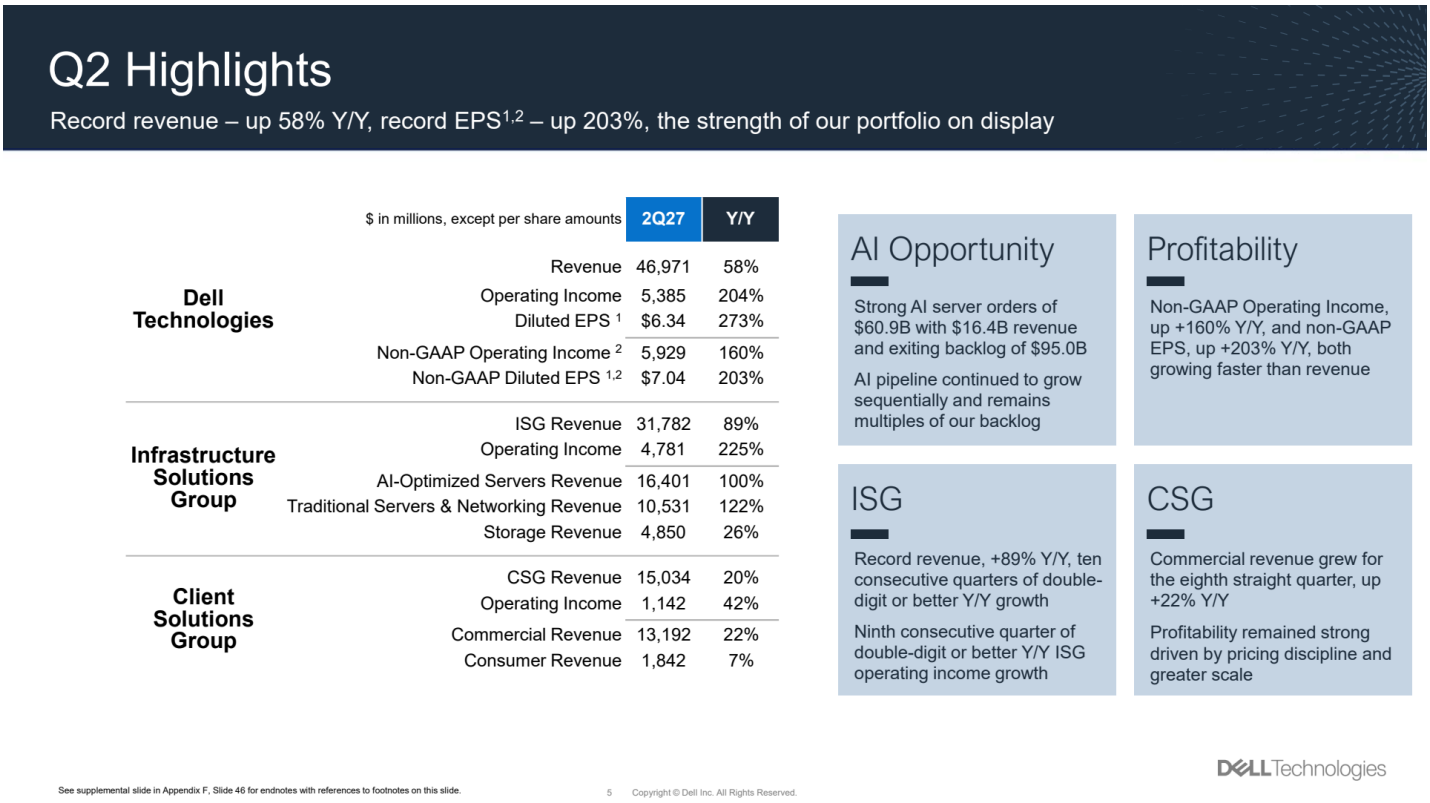

TAM phase	Company capture mechanism	Treatment
Current AI infrastructure	Systems, integration, enterprise storage and support for deployed workloads	Current demand is already central to the forecast. Purchased component and complete-system wallets overlap.
Physical AI / enterprise agents	More inference, retained context, industrial and edge deployments can require storage and management	Framework planning weight 50% for adjacent 2026-2030 applications; it is not an extra multiplier on already modeled demand.
New longer-term applications	Distributed AI and future workloads may create infrastructure and data-management needs	Framework planning weight 20% for distant optional applications. No separate revenue inferred without a dated, qualified wallet.

Management's very large agentic-compute market forecasts are industry hypotheses, not Dell sales guidance. The model uses company receipts and bounded storage/premium cohorts instead of multiplying a power or token forecast into Dell revenue.

DELL / 21 OCTOBER 2026 / FRAMEWORK 8.0

Demand quality and the physical conversion gate

Dell reported quarterly AI orders of about $61 billion, AI sales of about $16 billion and ending backlog of $95 billion. Orders, backlog and pipeline describe overlapping stages of the same contracts. Backlog is a stock; recognized sales are a flow. Adding them creates duplicate demand.

Q2 Highlights

Record revenue – up 58% Y/Y, record EPS[1,2] – up 203%, the strength of our portfolio on display

	$ in millions, except per share amounts	2Q27	Y/Y
Dell Technologies	Revenue	46,971	58%
	Operating Income	5,385	204%
	Diluted EPS [1]	$6.34	273%
	Non-GAAP Operating Income [2]	5,929	160%
	Non-GAAP Diluted EPS [1,2]	$7.04	203%
Infrastructure Solutions Group	ISG Revenue	31,782	89%
	Operating Income	4,781	225%
	AI-Optimized Servers Revenue	16,401	100%
	Traditional Servers & Networking Revenue	10,531	122%
	Storage Revenue	4,850	26%
Client Solutions Group	CSG Revenue	15,034	20%
	Operating Income	1,142	42%
	Commercial Revenue	13,192	22%
	Consumer Revenue	1,842	7%

AI Opportunity

Strong AI server orders of $60.9B with $16.4B revenue and exiting backlog of $95.0B

AI pipeline continued to grow sequentially and remains multiples of our backlog

Profitability

Non-GAAP Operating Income, up +160% Y/Y, and non-GAAP EPS, up +203% Y/Y, both growing faster than revenue

ISG

Record revenue, +89% Y/Y, ten consecutive quarters of double-digit or better Y/Y growth

Ninth consecutive quarter of double-digit or better Y/Y ISG operating income growth

CSG

Commercial revenue grew for the eighth straight quarter, up +22% Y/Y

Profitability remained strong driven by pricing discipline and greater scale

See supplemental slide in Appendix F, Slide 46 for endnotes with references to footnotes on this slide.

DELL Technologies

Dell fiscal Q2 2027 performance review, original page 5. The original issuer exhibit shows AI orders, sales and backlog together with financial results. These measures are not independent revenue pools.

At the September Citi conference, the CFO described backlog as noncancelable after customer-credit, financing, design and approximate data-center-readiness review. Design work and component planning improve its conversion quality, while timing can still slip. More than six thousand customer relationships do not eliminate concentration: the filing says most AI revenue comes from relatively few large customers and cloud providers.

Dell identifies matched components as the main constraint rather than final assembly capacity. DRAM and NAND are the largest bottlenecks, with CPUs, disks, optics, substrates, power components and cooling equipment also relevant. A rack cannot be accepted merely because most of its parts are available. Revenue recognition and cash collection need complete delivery and customer readiness.

Latest actuals and the segment accounting bridge

Fiscal Q2 2027 actual	USD million	Source meaning
AI servers	16,401	ISG product revenue
Traditional servers / networking	10,531	ISG product revenue
Storage	4,850	ISG product revenue
ISG total	31,782	Sum of three product lines
CSG	15,034	Commercial 13,192; consumer 1,842
Other revenue	155	Reconciles segment receipts to company total
Company revenue	46,971	Exact reported actual
ISG gross profit	7,513	Revenue 31,782 less cost of revenue 24,269

DELL Technologies

Dell fiscal Q2 2027 performance review, original page 26. Actual business-unit revenue and profit are shown separately from company GAAP/non-GAAP results. Product revenue is disclosed, but AI/traditional/storage product gross margins are not.

The valued segment proxy excludes the group corporate reconciliation. It must not be called GAAP operating profit or net income. Company revenue includes other activities, while the valued earnings proxy uses ISG and CSG; other profit is separately reconciled and set to zero in the forward proxy.

What the valuation basis includes

Supplemental non-GAAP measures

Operating income

$ in millions	2Q26	3Q26	4Q26	1Q27	2Q27
GAAP operating income	**1,773**	**2,119**	**3,092**	**3,656**	**5,385**
Non-GAAP adjustments:					
Amortization of intangibles [1]	125	121	125	97	96
Stock-based compensation	179	165	189	189	184
Other corporate expenses [2]	207	98	132	293	264
Total adjustments to operating income	**511**	**384**	**446**	**579**	**544**
Non-GAAP operating income	**2,284**	**2,503**	**3,538**	**4,235**	**5,929**
Non-GAAP operating income as a % of revenue	*7.7%*	*9.3%*	*10.6%*	*9.7%*	*12.6%*

[1] This amount includes non-cash purchase accounting adjustments primarily related to the EMC merger transaction in 3Q17.

[2] Consists primarily of severance expenses, payroll taxes associated with stock-based compensation, transaction-related expenses, impairment charges, and incentive charges related to equity investments.

DELL Technologies

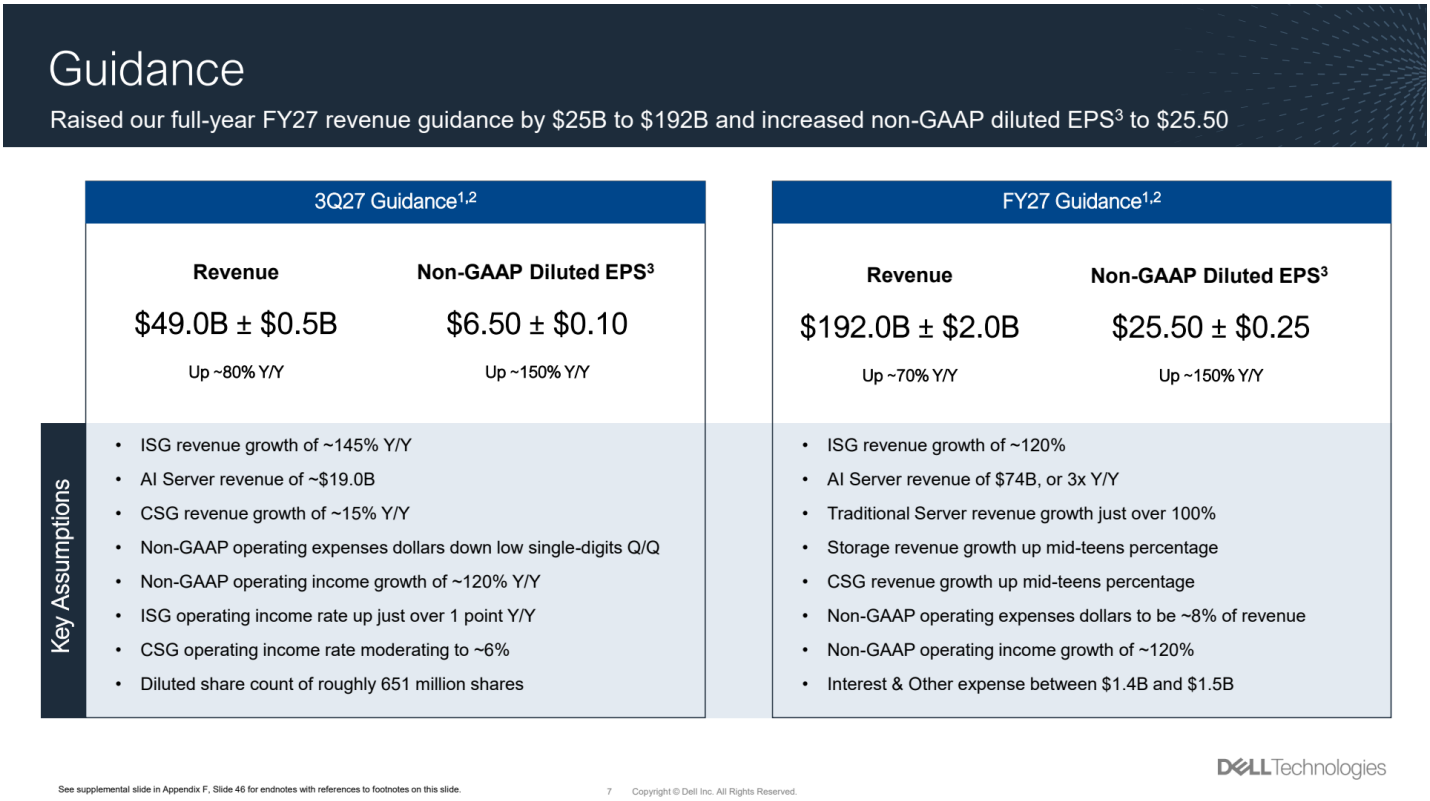

Dell fiscal Q2 2027 performance review, original page 33. Original GAAP-to-non-GAAP operating-income reconciliation. The fiscal Q2 adjustment is 544 million dollars, including 184 million of stock compensation. Figures are actuals, not a projected recurring deduction schedule.

The sanctioned method remains 20x forward-four-quarter segment-based OP divided by starting-quarter all-class diluted-equivalent shares. This research retains that method. It does not switch to EPS, EBITDA, enterprise value or a GAAP multiple, and it does not claim that the omitted group adjustments vanish economically.

The exact historical reconciliation makes comparability transparent. Forward product costs include modeled procurement, manufacturing, R&D, engineering, support and selling activity on the segment basis. A change to the valuation basis or an additional corporate deduction would be a separate methodology decision.

Basis	Fiscal Q2 2027 OP, USD million	Use
ISG + CSG segment proxy	5,923	Active valuation basis
Company non-GAAP	5,929	Guide and accounting consistency check
Company GAAP	5,385	Reported financial reconciliation

Fiscal guidance and exact allocation

Dell fiscal Q2 2027 performance review, original page 7. Original fiscal Q3 and full-year fiscal 2027 guidance. Fiscal 2027 ends in January 2027; fiscal Q3 ends in October 2026 and maps to calendar Q4 under the existing company convention.

Guide / calibration field	Fiscal Q3 2027	Fiscal FY2027
Revenue midpoint, USD million	49,000	192,000
Revenue range	48,500-49,500	190,000-194,000
AI receipts, USD million	19,000	74,000
Non-GAAP EPS midpoint, US cents	650	2,550
Non-GAAP EPS range, US cents	640-660	2,525-2,575
Diluted shares	Approximately 651 million	Model fiscal average 651 million used only for consistency calibration
CSG OP margin	Approximately 6%	Management reiterated roughly 6% into the next fiscal quarter
Operating costs	Down low-single digits sequentially	Approximately 8% of revenue

Guide / calibration field	Fiscal Q3 2027	Fiscal FY2027
Interest/other and tax	Not the valuation metric	1,400-1,500 expense;18% tax used in EPS consistency check

EPS is shown in whole US cents:100 cents equals one dollar. Source images retain the original dollar display.

The model aligns the fiscal totals exactly. Storage must exceed the prior year by more than $2,500 million. Within the company total, the product allocation gives storage about $19 billion. That is a product mix allocation, not another addition to total guided sales.

FY2027 fiscal quarter	Revenue, USD m	AI, USD m	Storage, USD m
Q1 actual ended May 2026	43,842	16,132	4,334
FQ2 FY2027 (ended 2026-07-31)	46,971	16,401	4,850
FQ3 FY2027	49,000	19,000	4,650
FQ4 FY2027	52,187	22,467	5,350
Full fiscal year	192,000	74,000	19,184

FY2026 storage was 16,631 million; adding more than 2,500 requires a fiscal 2027 total above 19,131 million. The 19,184 allocation meets that boundary. The near-term figures in this table precede the later storage-attach and deployment-premium contributions.

Product profitability: constrained estimates

The filing discloses ISG and CSG revenue, gross costs, SG&A and R&D. It does not disclose separate AI, traditional-server and storage gross margins. The model therefore starts with explicit AI and traditional assumptions, then allocates the remaining reported ISG costs to storage. The resulting storage margin is a residual estimate, not a measured product result.

Product calibration	GP per $1,000 sales	Opex per $1,000 sales	OP per $1,000 sales	Evidence status
AI	85	30	55	LOW estimated split; OP aligns with management mid-single digits
Traditional servers	340	130	210	LOW estimated split
Storage residual	523	180	344	LOW residual needed to tie to reported ISG totals
CSG	160	84	76	HIGH reported segment cost and profit totals

Cost calibration is expressed as dollars for each $1,000 of product sales. Values are independently rounded. The storage allocation is a LOW-confidence residual, so rounded GP less rounded opex may differ from rounded OP. Exact calculations remain in the model.

Storage's proprietary software and platform mix can support higher profit capture than purchased accelerator content. The exact magnitude remains uncertain. Applying the same blended ISG margin to every AI dollar would obscure the product economics.

AI margin and traditional-server margin sensitivities reallocate the storage residual to keep the reported actual ISG profit fixed. They are coherent alternative calibrations. Consequently, their results are not simple partial derivatives of one margin with every other margin held constant.

Near-term costs and post-guidance normalization

The model constrains the next fiscal quarter to guidance rather than extending the best actual margin indefinitely. It uses about $4 billion of operating expense, ISG margin of about 14% and CSG margin of 6%. The exact calculation is in the table. CSG keeps its own cost rates while ISG absorbs the residual cost allocation.

Calibration term	Calendar Q4 2026 / fiscal Q3	Calendar Q1 2027 / fiscal Q4
Receipts, USD million	49,000	52,187
Total proxy opex	3,920	3,728
CSG OP per $1,000 sales	60	60
ISG OP per $1,000 sales	135	136
Segment-proxy OP	5,525	6,013
ISG manufacturing normalization per $1,000 sales	18	17
ISG opex weight retained, rounded percent	88%	78%

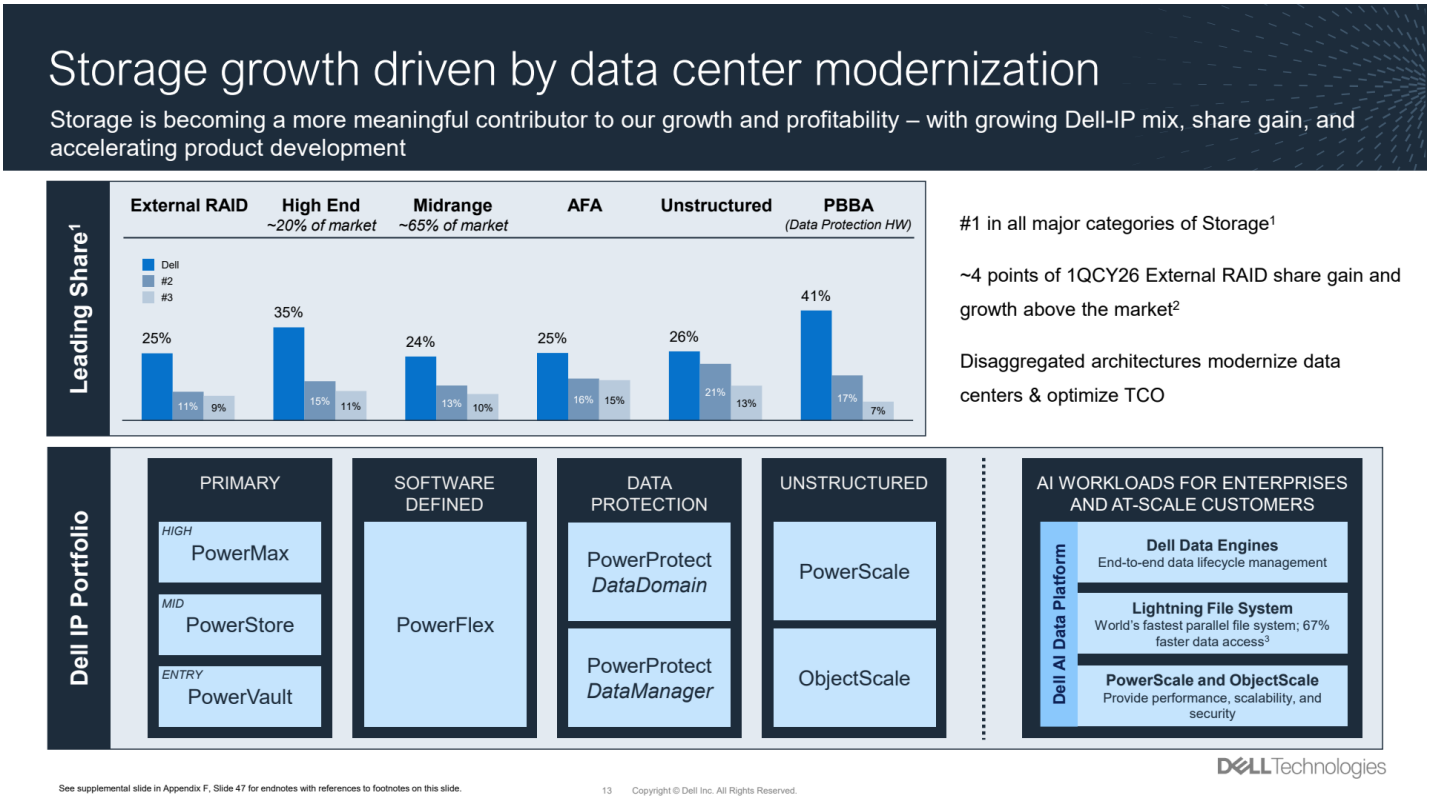

January profit is a labeled consistency calibration from annual non-GAAP EPS, interest and tax, after the actual first-half and next-quarter bridge. Approximately 8% annual opex also constrains the January expense allocation. Neither calculation is a newly disclosed product margin or a change to the sanctioned valuation basis.

After the guided fiscal year, the model uses AI, traditional, storage and client product GP/opex rates rather than a common ISG OP margin. It then subtracts an additional 50 basis points of ISG revenue as manufacturing/procurement cost. This is a LOW-confidence input-cost allowance with zero and double-cost sensitivities. It is a real cost in the model, not a renamed corporate deduction.

Post-guidance product	Model cost rule: dollars per $1,000 sales
AI	85 gross profit less30 recurring opex, before5 additional procurement/manufacturing cost
Traditional	340 gross profit less130 recurring opex, before5 additional procurement/manufacturing cost

Post-guidance product	Model cost rule: dollars per $1,000 sales
Storage	About523 gross profit less180 recurring opex, before5 additional procurement/manufacturing cost; LOW residual estimate
CSG	160 gross profit less100 opex =60 operating profit
Other	Forward receipts retained; zero valued OP

Storage and proprietary data-platform capture

Dell fiscal Q2 2027 performance review, original page 13. Issuer storage-share and IP portfolio exhibit. Platform and selected performance claims retain the source benchmark limitations; they do not establish an absolute attach-revenue amount.

Enterprise agents require usable context, data preparation, retained work and access control. Dell's storage/software portfolio can serve those needs alongside compute. Management reported six quarters of above-market Dell-IP demand. Lightning remained in beta or competitive trials rather than a material current-revenue contributor.

The October data-platform announcement supplies a named availability catalyst. Data processing enhancements are planned for December 2026; semantic, knowledge-graph and agent features for the first half of 2027. Internal benchmark speedups do not equal a measured increase in customer spending.

The active storage hypothesis gives a 60% subjective probability to a bounded attach opportunity. Only 20% of reference storage is eligible, with 20% additional attach and 50% removed for overlap with the already-growing storage/IP case. The conditional full-ramp increment is 2% of reference storage; the weighted increment is $12 per $1,000 of reference storage receipts. It begins after product availability and ramps over several quarters.

Storage bridge	Frozen input
Probability	60%
Conditional eligible cohort	20% of reference storage receipts
Conditional extra attach	20%
Overlap removed	50%
Ramp	Q3 2027:25%; Q4 2027:50%; Q1 2028:75%; Q2 2028 onward:100% within the modeled horizon
Incremental costs	55% GP, less 20% receipts for engineering, R&D, support and selling;35% OP contribution
Active four-quarter contribution	Receipts 247; OP 86 million

Deployment speed and a finite price premium

Management describes an advantage of four to six weeks in major deployments and customer willingness to pay for earlier operation. The economic reason is the cost of idle, expensive compute. The claim is company-attributed, with no independently measured premium percentage. The model uses a small explicit commercial proxy on new contracts.

Deployment premium bridge	Frozen input
Subjective probability	50%
Eligible receipts	25% of newly priced/repriceable AI sales; fixed backlog is excluded
Conditional price premium	1% on the eligible cohort
Recognition ramp	Half ramp in Q2 2027; full ramp from Q3 2027
Incremental cost	25% of premium receipts for procurement/expediting plus 15% for engineering/support;60% net OP contribution
Fade	Q1 2030:75%; Q2:50%; Q3:25%; Q4:zero
Active four-quarter contribution	Receipts 155; OP 93 million

The premium is separate from ordinary component pass-through and efficient delivery already represented in reference margins. It is neither a margin increase on all AI revenue nor a promise that a faster deployment always earns more. Extra expediting and support costs reduce it, and the benefit fades as rivals respond.

Raise the weight if comparable new contracts demonstrate higher realized pricing for matched scope and earlier acceptance. Reduce it if delivery advantage narrows, customers resist premiums or extra costs consume the value.

DELL / 21 OCTOBER 2026 / FRAMEWORK 8.0

Cash conversion, customer credit and financing

Supplemental non-GAAP measures

Adjusted free cash flow

$ in millions	2Q26	3Q26	4Q26	1Q27	2Q27
Cash flow from operations	**2,543**	**1,172**	**4,674**	**4,081**	**2,225**
Adjustments:					
Capital expenditures and capitalized software development costs, net [1]	(675)	(666)	(721)	(963)	(1,239)
Free cash flow	**1,868**	**506**	**3,953**	**3,118**	**986**
Adjustments:					
Financing receivables [2]	592	1,135	1,036	(263)	6,667
Equipment under operating leases [3]	58	29	99	310	496
Adjusted free cash flow	**2,518**	**1,670**	**5,088**	**3,165**	**8,149**

[1] Capital expenditures and capitalized software development costs, net includes proceeds from sales of facilities, land, and other assets.
[2] Financing receivables represent the operating cash flow impact from the change in DFS financing receivables.
[3] Equipment under operating leases represents the net change of capital expenditures and depreciation expense for DFS leases and contractually embedded leases identified within flexible consumption arrangements.

37 Copyright © Dell Inc. All Rights Reserved.

DELL Technologies

Dell fiscal Q2 2027 performance review, original page 37. Conventional free cash flow is 986 million dollars; adjusted free cash flow adds financing-receivable and leased-equipment adjustments. The adjusted measure is not all unencumbered buyback cash.

Fiscal Q2 cash measure	USD million
Operating cash flow	2,225
Capex / capitalized software, net	-1,239
Conventional free cash flow	986
Financing-receivables addback	6,667
Lease-equipment adjustment	496

Fiscal Q2 cash measure	USD million
Adjusted free cash flow	8,149
Cash plus long-term investments	14,248
Total debt principal, approximate	34,700
Core debt, approximate	14,000
DFS-related debt, approximate	20,700
DFS financing receivables, approximate	20,400

AI deployments can consume inventory and financing cash before collection. Financing receivables increased sharply, and revenue is concentrated among large customers. A noncancelable contract supports order quality but does not remove credit and funding risk. Comparing core debt alone with all company cash would omit the financing operation.

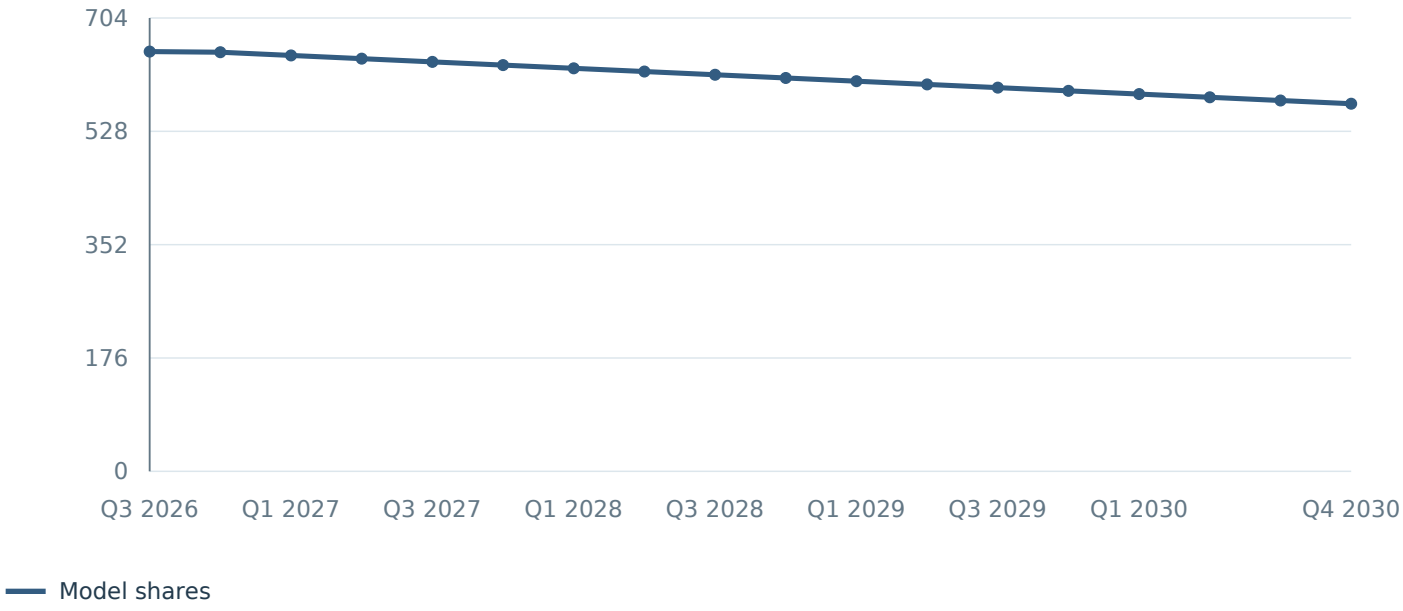

The analysis keeps conventional cash generation, financing-receivable funding and adjusted cash metrics separate. Inventory and accounts payable timing can help or hurt cash conversion. Revenue and operating-profit growth do not automatically fund the modeled share retirement.

All-class shares and capital-return discipline

Actual weighted diluted shares were 652 million; next-quarter guidance is approximately 651 million. Actual outstanding economic shares include Classes A, B and C. Using only Class C float would understate the denominator. One-for-one class conversions do not add economic shares.

Forecast all-class diluted-equivalent share path

Millions of diluted-equivalent shares

Q3 2026 is actual weighted diluted shares; Q4 is guidance-anchored. Later five-million quarterly net retirement is a LOW-confidence, cash-dependent assumption, not a company guarantee.

Quarter	Shares, million	Status
Q3 2026	652	Actual
Q4 2026	651	Guide proxy
Q1 2027	646	Net-retirement assumption
Q2 2027	641	Net-retirement assumption
Q3 2027	636	Net-retirement assumption
Q4 2027	631	Net-retirement assumption
Q1 2028	626	Net-retirement assumption
Q2 2028	621	Net-retirement assumption
Q3 2028	616	Net-retirement assumption
Q4 2028	611	Net-retirement assumption
Q1 2029	606	Net-retirement assumption
Q2 2029	601	Net-retirement assumption
Q3 2029	596	Net-retirement assumption
Q4 2029	591	Net-retirement assumption
Q1 2030	586	Net-retirement assumption

Quarter	Shares, million	Status
Q2 2030	581	Net-retirement assumption
Q3 2030	576	Net-retirement assumption
Q4 2030	571	Net-retirement assumption

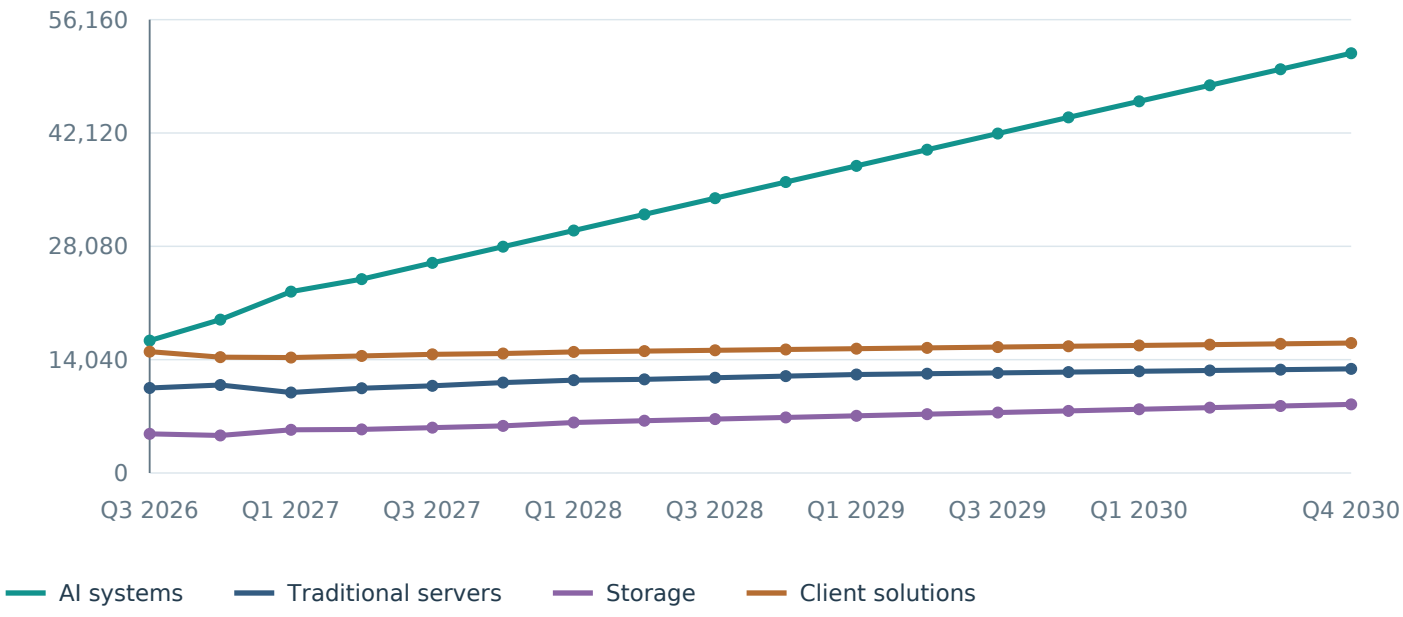

An illustrative repurchase price of $500 would require $2,500 million per quarter to retire five million net shares, before dividends and employee-equity offsets. This is a capital-budget illustration, not a forecast share price. The path depends on cash, financing needs, buyback execution and dilution.

The active ceiling uses 631 million starting-quarter shares. A flat 651 million forward denominator produces the separate sensitivity shown later. Share retirement is not used to mask an operating shortfall.

Quarterly revenue by product: 18 operating quarters

Recognized receipts by product

USD millions

First quarter is reported actual product receipts. Remaining quarters are LOW-confidence forecasts; near-term fiscal totals reconcile to guidance. Other revenue appears in the table and is outside plotted product series.

Quarter	AI	Traditional	Storage	Client	Other	Total
Q3 2026	16,401	10,531	4,850	15,034	155	46,971
Q4 2026	19,000	10,900	4,650	14,350	100	49,000

Quarter	AI	Traditional	Storage	Client	Other	Total
Q1 2027	22,467	9,970	5,350	14,300	100	52,187
Q2 2027	24,015	10,500	5,400	14,500	100	54,515

Q4 2030	52,000	12,900	8,501	16,100	100	89,601

Beyond fiscal 2027 guidance, the model retains a large system-wallet capture case. AI receipts around $200 billion by calendar 2030 are a LOW-confidence company forecast rather than management guidance. Dollar growth can reflect delivered units, richer configurations or purchased-content inflation; no unsupported unit or ASP series is fabricated.

AI systems: full quarterly cost and profit detail

The first row is constrained to reported segment totals, with estimated product allocation where Dell does not disclose it. All subsequent product gross and operating margins are explicit model estimates. Revenue includes only the relevant storage or premium contribution, with manufacturing and incremental operating costs retained.

Q4 2030	52,000	4,160	1,560	2,600	5%

Actual source precision constrains aggregate segment values, not the unreported AI/traditional/storage split. Later rates and product capture remain LOW confidence. The model's source and calibration register identifies the numerical assumptions.

Consolidated proxy: gross profit less operating costs

Segment-basis gross profit, opex and OP

USD millions, segment-based model

First period ties to ISG+CSG actual costs; future periods are modeled. GP less opex equals valued OP. Actual other OP and corporate adjustments are reconciled separately, not silently included.

Quarter	Gross profit	Opex	OP
Q3 2026	9,921	3,998	5,923
Q4 2026	9,445	3,920	5,525

Q3 2030	15,165	6,259	8,906
Q4 2030	15,467	6,376	9,092

Product GP is the revenue left after manufacturing/procurement costs; operating costs include modeled engineering, R&D, field support and selling. Additional component pressure is subtracted through the post-guidance manufacturing allowance. The finite premium and storage attach also carry explicit extra costs.

Margins, mix and the quarterly operating table

Segment-model gross and operating margins

Percent of company receipts

These are segment-model ratios using company revenue including other receipts. They are not labeled consolidated GAAP margins. AI mix can grow revenue faster than GP and dilute the aggregate ratio.

Q3 of year Y	Fiscal Q2 of FY Y+1
Q4 of year Y	Fiscal Q3 of FY Y+1

Active probability ledger and quarterly contributions

Hypothesis	Probability / source	Company bridge / overlap / cost
AI data-platform attach	60%; October 6 product availability, September storage/IP commentary	20% eligible storage x 20% extra attach x 50% non-overlap, then probability and staged recognition.55% GP less 20% extra opex.
Deployment premium	50%; September 9/10 management discussion	25% newly priced AI receipts x 1% premium, then probability and timing/fade.40% total incremental costs; fixed backlog excluded.
Backlog conversion	85%; September 1/10 company evidence	Zero separate receipts: existing fiscal AI forecast already requires conversion. Backlog/pipeline cannot be added as another sales pool.
SpaceX read-through	50%; relationship already named in May	Zero separate increment after attempted eligible systems x wallet x share x acceptance bridge. No new cohort or Dell allocation established beyond reference.
IREN supply agreement	90%; May customer filing	Zero new increment: prior equipment contract already within order/reference context. Customer cloud revenue is a separate economic layer.
Supply readiness	75%; September company evidence group	No second volume shock. Current receipts, manufacturing cost allowance and bounded premium jointly address matched-parts/timing evidence.

Probabilities are subjective economic judgments, not measured frequencies. Company statements across its own events are correlated evidence rather than independent confirmation. Existing receipt growth and costs remain active; probabilities apply only to the defined increments, not to the whole company or the final ceiling.

Quarter	Storage receipts increment	Storage OP increment	Premium receipts increment	Premium OP increment
Q3 2026	0	0	0	0
Q4 2026	0	0	0	0
Q1 2027	0	0	0	0
Q2 2027	0	0	15	9
Q3 2027	17	6	33	20
Q4 2027	35	12	35	21
Q1 2028	56	20	38	23
Q2 2028	77	27	40	24
Q3 2028	79	28	43	26
Q4 2028	82	29	45	27

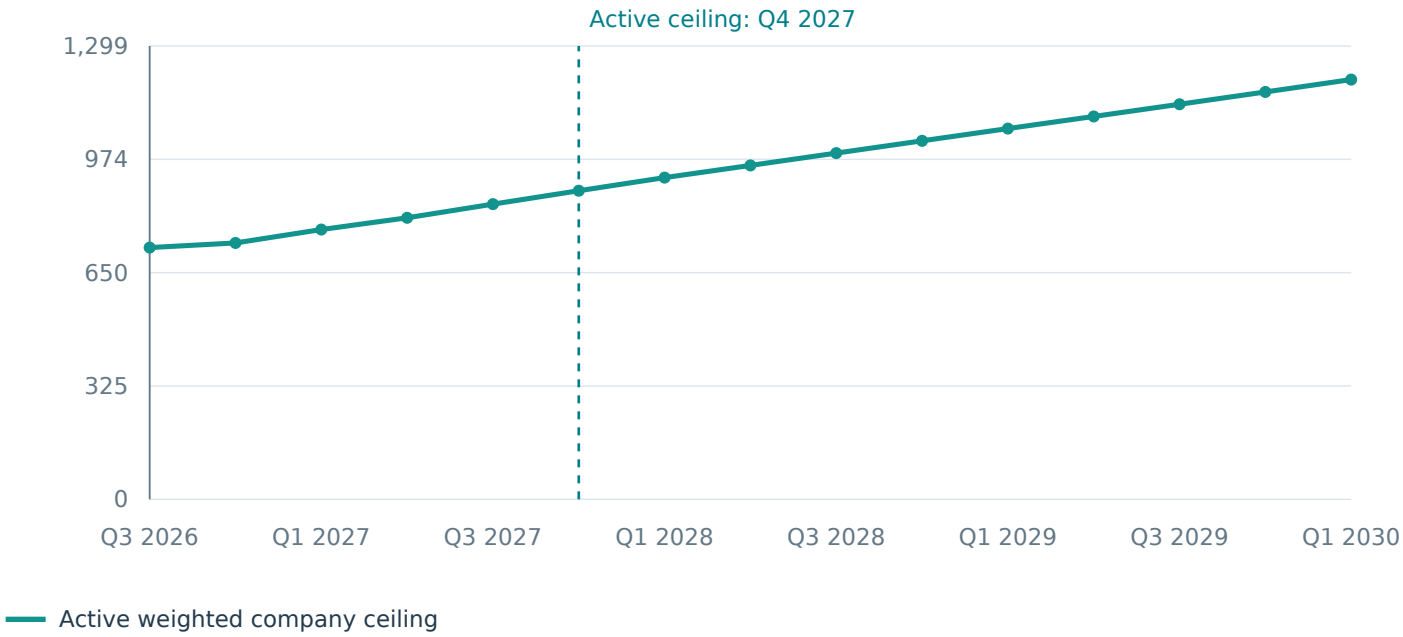

Quarter	Storage receipts increment	Storage OP increment	Premium receipts increment	Premium OP increment
Q1 2029	84	29	48	29
Q2 2029	86	30	50	30
Q3 2029	89	31	53	32
Q4 2029	91	32	55	33
Q1 2030	94	33	43	26
Q2 2030	96	34	30	18
Q3 2030	98	34	16	9
Q4 2030	101	35	0	0

Storage attach remains bounded by its eligible cohort through the modeled horizon; no perpetual extrapolation beyond 2030 is claimed. The separate deployment premium explicitly fades to zero by the last modeled quarter.

Quarterly ceiling path and method

Rolling forward-four-quarter operating ceiling

USD per share

One probability-weighted operating case under 20x segment-based OP. Each ceiling uses its exact four-quarter window and starting-quarter all-class diluted-equivalent shares. No price or analyst-target overlay.

Ceiling quarter	Forward OP, USD m	Multiple	Shares, million	Ceiling, USD
Q3 2026	23,522	20	652	722
Q4 2026	23,918	20	651	735
Q1 2027	24,975	20	646	773
Q2 2027	25,862	20	641	807
Q3 2027	26,904	20	636	846
Q4 2027	27,906	20	631	884
Q1 2028	28,861	20	626	922
Q2 2028	29,715	20	621	957
Q3 2028	30,563	20	616	992
Q4 2028	31,391	20	611	1,028
Q1 2029	32,198	20	606	1,063
Q2 2029	32,975	20	601	1,097

Ceiling quarter	Forward OP, USD m	Multiple	Shares, million	Ceiling, USD
Q3 2029	33,744	20	596	1,132
Q4 2029	34,502	20	591	1,168
Q1 2030	35,249	20	586	1,203

The active Q4 2027 window prices Q4 2027 through Q3 2028. A calendar horizon roll changes which existing ceiling is selected, independently of operating revisions. The company's fiscal/calendar mapping and starting-quarter diluted-share convention remain fixed.

All 15 exact valuation windows and chains

Ceiling quarter	Exact four-quarter window	Forward OP, USD m	Multiple	Shares, m	Ceiling, USD

Q1 2029	7,755 + 7,951 + 8,148 + 8,344	32,198 x 20 / 606 = 1,063
Q2 2029	7,951 + 8,148 + 8,344 + 8,532	32,975 x 20 / 601 = 1,097
Q3 2029	8,148 + 8,344 + 8,532 + 8,720	33,744 x 20 / 596 = 1,132
Q4 2029	8,344 + 8,532 + 8,720 + 8,906	34,502 x 20 / 591 = 1,168
Q1 2030	8,532 + 8,720 + 8,906 + 9,092	35,249 x 20 / 586 = 1,203

Annual cross-check and material sensitivities

Calendar year	Revenue	Gross profit	Opex	OP
2027	223,921	42,708	17,733	24,975
2028	266,358	49,730	20,869	28,861
2029	305,755	55,104	22,906	32,198
2030	344,078	60,049	24,799	35,249

Calendar year	OP margin	Storage extra receipts	Premium extra receipts
2027	11%	52	83
2028	11%	293	165
2029	11%	350	205
2030	10%	389	89

Calendar annual totals are cross-checks, not fiscal-year guidance. Calendar 2027 includes a guided-year final quarter and three later fiscal quarters; it must not be compared directly to the fiscal 2027 revenue midpoint.

Diagnostic	Q4 2027 ceiling, USD	Interpretation
No new attach or premium	879	Removes only the two newly modeled increments; full company reference remains.
AI5pctOP	878	Alternative product calibration also adjusts storage residual to preserve actual ISG costs; not a one-variable derivative.
AI6pctOP	891	Alternative product calibration also adjusts storage residual to preserve actual ISG costs; not a one-variable derivative.
Traditional 18pctOP	892	Alternative product calibration also adjusts storage residual to preserve actual ISG costs; not a one-variable derivative.
Traditional 24pctOP	877	Alternative product calibration also adjusts storage residual to preserve actual ISG costs; not a one-variable derivative.
Zero procurement allowance	915	Manufacturing-cost allowance sensitivity; other product rates retained.
Double procurement allowance	854	Manufacturing-cost allowance sensitivity; other product rates retained.
Flat 651M future shares	857	Active operating case with a flat 651 million future denominator.

The most important uncertainty is product profitability and future capture, not the small added attach or premium alone. The share path also needs funding. These diagnostics do not represent the full downside from a weaker AI order cycle, customer default or lost competitive position.

Scorecard and four scored risks

Category	Points / maximum	Evidence and constraint
Core thesis	15 / 20	Procurement, integration and enterprise service advantages; customer bypass and direct competitors limit capture.
Cycle stage	10 / 10	Actual conversion and credit-vetted backlog support the current expansion, with matched-parts and acceptance constraints.
TAM expansion	8 / 10	AI systems, enterprise storage and agentic workloads expand the eligible wallet; component and system pools overlap.
Catalysts	5 / 5	Next fiscal earnings, parts/acceptance conversion and named data-platform releases.
Macro	9 / 10	High AI infrastructure investment supports demand; customer financing and grid readiness remain required.
Alpha	2 / 5	Separating product profitability, working capital and complete-system pass-through is more informative than headline orders.
Risks	-4	Four separately scored classes: financing/counterparty, execution/supply, competition/capture and accounting/model uncertainty.
Total	45 /60 =75%	Analytical score. Protected Excel Base 75 remains separate.

The strong cycle score reflects actual sales and substantial reviewed backlog. Core quality reflects procurement, integration and service capability, with customer bypass and direct competitors limiting exclusivity. TAM includes enterprise data and workloads, while avoiding double counting complete systems and components. The modest alpha score reflects a widely followed company with difficult product-margin identification.

Risk class	Deduction	Transmission to shareholder economics
Financing / counterparty	-1	Customer concentration, receivables funding and credit loss can impair collection and buyback capacity.
Execution / supply	-1	Missing matched parts, acceptance slips and expediting costs constrain shipments and margins.
Competition / capture	-1	ODMs, branded rivals or customer integration can reduce eligible system wallet and price realization.
Accounting / model uncertainty	-1	Unreported product split, corporate exclusions and cash-dependent shares can overstate comparable earnings if mislabeled.

The score measures thesis quality. It is not the probability of a backlog contract, product launch or price premium and is not applied again to operating profit or the ceiling.

Dated tests, counters and re-rate triggers

Observation / timing	Evidence that raises confidence	Counter or reduction trigger
Next fiscal results and guide	Matched system conversion, storage mix and company cost guidance support the forecast.	Backlog aging, delayed acceptance, lower guide or margin pressure.
November-December 2026 releases	Announced storage/data-processing features ship with customer adoption and a priced wallet.	Launch slips or selected internal benchmarks fail to translate into useful customer demand.
First-half 2027 platform availability	Semantic/data-agent functionality becomes available; eligible attach is visible beyond the existing growth path.	Unpriced trials persist; adoption remains inside baseline hardware purchases or support costs exceed the assumed economics.
2027 supply and deployment	Four-to-six-week advantage persists on comparable systems and newly priced contracts show a premium.	Customers refuse pricing, rivals close the gap or overtime/expediting absorbs the premium.
Each quarter: cash and credit	Conventional cash collection and funded financing support net retirement without stressing the balance sheet.	Adjusted cash remains strong only through receivable addbacks; customer defaults or funding pressure.
Each quarter: shares	All-class diluted-equivalent denominator follows the funded schedule.	Buybacks slow or compensation issuance offsets retirements.
2030 premium fade	The model removes the short-lived benefit as competition catches up.	A durable premium needs new incremental evidence; do not extend the current assumption automatically.

Update both favorable and unfavorable evidence. Repeated management commentary about the same contracts is not another order pool. New evidence should change only the affected receipts, cost, timing, financing or share assumptions while retaining the sanctioned valuation method.

Cross-book relationships and watch pairs

Names / relationship	Economic connection	Company-specific watch
NVDA / AMD / Intel	Accelerators and CPUs are purchased content inside systems.	Dell shipment value includes supplier content; processor share changes alter mix and wallet rather than creating two full system pools.
MU / Samsung / SK hynix / storage suppliers	DRAM, NAND and disks can raise configuration value and input cost.	Track matched supply, price pass-through, customer de-specification and segment margin. Supplier pricing power can pressure the integrator.
IREN / SpaceX / neocloud customers	Deployments may buy systems, financing and services.	Credit-vetted accepted sales and captured hardware content matter; cloud-services contract value belongs to another layer.
HPE / Supermicro / Lenovo / ODMs	Alternative systems, direct procurement and enterprise routes.	Time-to-operation, total cost, service scope and priced product mix test Dell differentiation.
Networking / power / cooling suppliers	Complete AI racks require matched components and facility readiness.	One missing part can defer a full system. Do not infer deliveries from generic capex alone.
Enterprise storage competitors	Data preparation, context and management compete across architectures.	Dell-IP attach and customer adoption, rather than internal benchmark headlines, test incremental profit capture.

The paired cross-watch is component scarcity versus Dell pass-through and acceptance: strong memory/networking demand can help system revenue while hurting delivery timing or margin. Customer and supplier revenues are linked stages, not additive definitions of the same market.

Sources, limits and reproducible model identity

Original source	Date	Coverage / scope
Q2_FY27_Transcript.pdf	2026-09-01	Latest issuer call,26 pages. Research packet includes prepared remarks and Q&A.
Q2_FY27_Performance_Review.pdf	2026-09-01	Current results, guide and original exhibits embedded beside analysis.
Q2_FY27_Financial_Tables.pdf	2026-09-01	Reported financial and non-GAAP reconciliation tables.
Q2_FY27_10Q.html	2026-09-08	Latest filing: exact segment costs, share classes, financing and credit risk.
Q1_FY27_Transcript.pdf	2026-05-28	Previous issuer call,14 pages. Research packet includes prepared remarks and Q&A.
FY26_10K.html	2026-03-16	Fiscal annual product baseline, accounting and competition.
Citi_Conference_Transcript.pdf	2026-09-10	10 September CFO remarks: margin, supply terms, backlog quality and deployment.
Goldman_Sachs_Conference_Transcript.pdf	2026-09-09	9 September CEO remarks: deployment, supply and customer economics.
Dell_AI_Data_Platform_20261006.html	2026-10-06	6 October product announcement and forward availability; internal tests are limited benchmarks.
IREN_Dell_Purchase_Agreement_20260526_8K.html	2026-05-26	Customer filing on the earlier Dell equipment purchase; not a new October award.

The research packet contains both latest issuer earnings transcripts and the two September conferences. No independent full-audio review is claimed. Exact financial and cost tables anchor the calculations. Original PDFs, HTML, figures, dates and hashes are retained; source content is evidence rather than an instruction to the modeler.

Unresolved inputs include product-level GP/opex, customer-specific complete-system wallet, priced attach, actual deployment premium, later component terms and funded share retirement. These are LOW-confidence assumptions with explicit costs, overlap, timing and counters. An optional later IREN release original-download gap does not support any new Dell forecast.

Model identity: Dell Technologies Inc.,21 October2026, active ceilingQ4 2027. This report and its editable source use the same operating and ceiling values. Exact integrity bindings are retained in the model and report manifest. Recoverable history remains outside this clean-state report.

Display convention: whole-number reader tables and valuation-chain components are rounded. Exact quarter values, probabilities, shares and valuation arithmetic remain unchanged in the bound structured model and linked workbook. Rounded constituents may not sum to a rounded total.
