Protected Base / analytical score	82 /49 of 60 rounded to 82

1. Supercycle, position and economic capture

AMD is scaling an integrated compute portfolio across server CPUs, AI accelerators, networking and software. Agentic workloads create CPU demand for orchestration, tool execution and enterprise services alongside accelerator demand for training and inference. Helios and MI455X began generating revenue in the reported quarter, while EPYC adoption broadened across cloud and enterprise customers.

July 23, 2026

AAI 2026: AMD Delivers Full-Stack Compute for the Agentic AI Era

AMD launches broad high-performance computing and physical AI portfolios, including its first rack-scale AI solution and the world's most powerful AI rack, AMD Helios.

News Highlights

- At Advancing AI 2026, AMD launches 6th Gen AMD EPYC™ CPUs, AMD Instinct™ MI400 Series GPUs, AMD Helios™ AI rackscale solutions, AMD Ryzen™ AI Embedded X100 processors and the AMD Kria™ AI SOM and Robotics Developer Platform.
- AMD Helios delivers up to 30% more inference tokens per dollar than the competition, maximizing output from every rack deployed.
- AI is accelerating demand for the full range of AMD silicon spanning data center, PCs, edge and embedded processors, driving AMD's TAM to ~$2 trillion in 2030.
- Anthropic, OpenAI, Meta, Cerebras, AT&T and Cisco detailed how they are collaborating with AMD to advance AI infrastructure, enterprise capabilities and edge AI.

SAN FRANCISCO, July 23, 2026 (GLOBE NEWSWIRE) -- AMD (NASDAQ: AMD) today launched its next-generation AI infrastructure and physical AI portfolio at Advancing AI 2026, led by AMD Helios rackscale solutions, now in production to be deployed by leading AI companies at gigawatt scale.

As AI expands from training to inference and agentic workloads, compute demand is accelerating rapidly. AMD delivers an open, full-stack AI platform that gives customers the flexibility to deploy the right compute for every workload.

"The next phase of AI will span frontier models, agents and physical AI, creating new opportunities to bring intelligence everywhere," said Dr. Lisa Su, chair and CEO, AMD. "Realizing that potential will take the entire industry working together. AMD is partnering across the ecosystem to deliver leadership compute and open platforms that give customers the performance, flexibility and choice to scale AI from the data center to the edge."

AMD Helios: The Highest Performance Rack-Scale AI Solution
Delivering frontier AI requires a fully integrated rack architecture, with every part of the stack pushing the boundaries of performance. AMD Helios rackscale solutions are built for this, with co-optimized silicon spanning 72 high-performance AMD Instinct™ MI455X GPUs and 18 powerful 6th Gen AMD EPYC™ "Venice" CPUs, connected by AMD Pensando™ front-end, scale-up and scale-out networking, and accelerated by AMD ROCm™ open software. AMD Helios combines leadership compute performance, memory capacity and networking

AMD Advancing AI issuer material, July 23, 2026. Helios product and system composition; third-party manufacturing and system content retain separate ownership. Source I02.

The relevant framework databases are DB10 server and agentic compute, DB6 memory and DB5 packaging. AMD occupies the system and silicon layer. Its competitive advantages include per-core and per-socket performance, a broad EPYC portfolio, chiplet integration, customer co-design and an expanding ROCm ecosystem. Nvidia, Intel, Arm-based CPUs and customer-designed accelerators provide substantive alternatives. Qualified foundry, packaging, substrate and memory capacity remains outside AMD ownership.

The classification is SYSTEM-LAYER BENEFICIARY with differentiated compute platforms and qualified programs. EPYC combines established share gains with an agentic demand inflection; Instinct and Helios are in an early deployment ramp. Client and Gaming remain mature, cyclical markets. Embedded combines recovery with multiyear design conversion. These curve descriptions convey research stage; measured fractions of ultimate market adoption are unavailable.

AMD captures its own silicon, networking, software and system-design economics. OEM and ODM manufacturing, cooling, switching, cloud service and financing wallets retain their own owners. CPU content inside Helios belongs in the EPYC pool, while associated non-CPU content belongs in the accelerator pool. The consolidated model reconciles those product pools once.

Source: P03, P08, P14, I02

2. Forward market expansion and the three-phase lens

The current management opportunity estimates are approximately USD 220B for server CPUs and USD 1.4T for data-center AI accelerators by 2030. The broader high-performance and AI-compute opportunity approaches USD 2T. These scopes overlap; the model allocates company capture within them. The 2030 revenue path remains an explicitly estimated company trajectory.

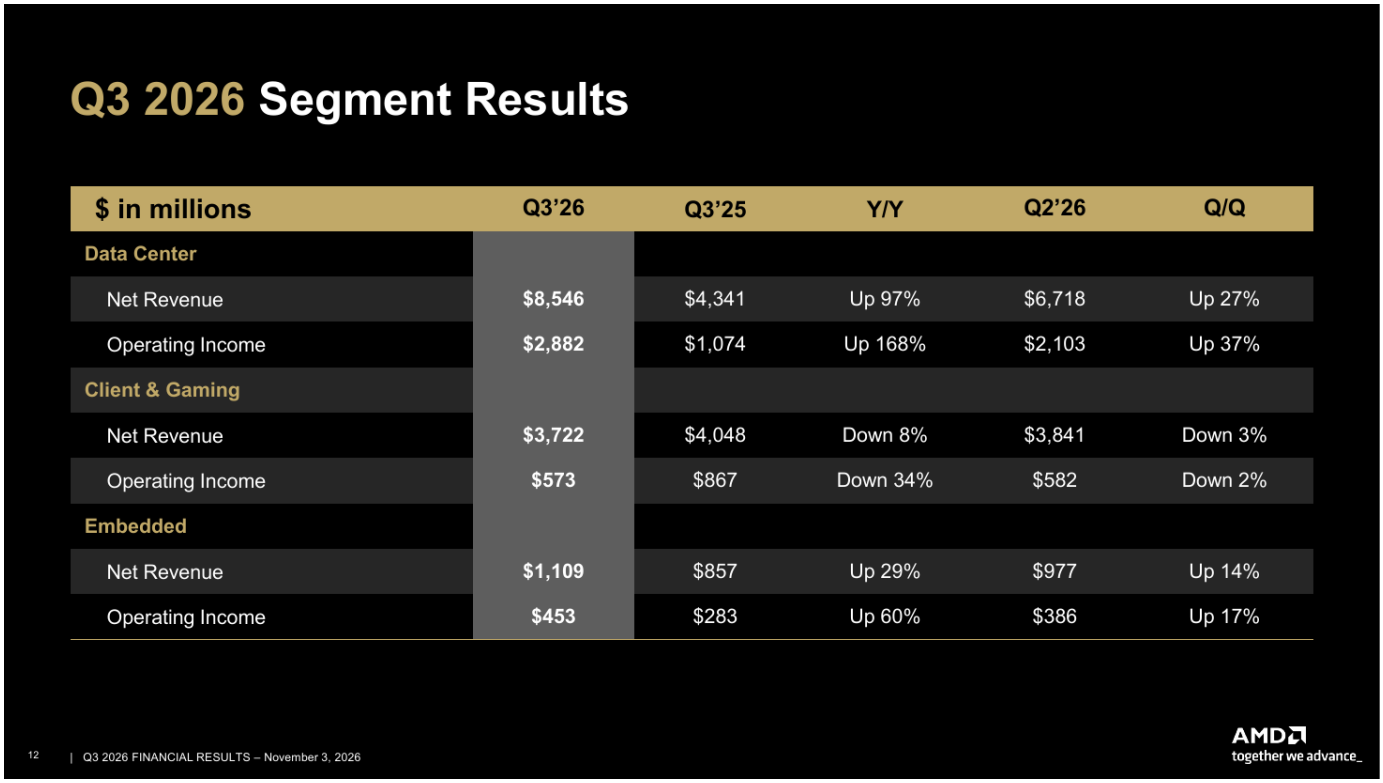

Phase 1 comprises current cloud, enterprise, training, inference, PC and embedded workloads. Phase 2 includes persistent agents, physical AI and specialized inference, supported by qualified products, customer engineering and commercial deployment programs. Phase 3 comprises wider robotics, space, industrial and other compute-intensive applications. The framework thematic confidence weights of 100%, 50% and 20% describe the thesis lens. The operating forecast uses the individual probabilities and overlap decisions in its ledger.

Helion extends EPYC into configurable rack-scale agent infrastructure. Embedded adaptive products serve control planes, optical networking, aerospace and defense, industrial systems and automotive applications. Design wins represent multiyear product opportunities. The forecast recognizes their revenue over the selected delivery path.

Source: P08, P14, I02

3. Current reported earnings and the two newest calls

The reported fiscal quarter ended September 26, 2026; the release and earnings 8-K are dated November 3. Consolidated revenue was USD 13.377B. Data Center revenue was USD 8.546B, Client USD 2.949B, Gaming USD 0.773B and Embedded USD 1.109B. The statement reconciles GAAP and non-GAAP gross profit, operating expenses, operating income and earnings separately.

AMD issuer slide 12, November 3, 2026. Segment revenue and operating income, USD millions. Unallocated costs reconcile segment profit. Source P12.

The August 4 and November 3 earnings calls were read through their closing Q&A. The earlier call established the larger CPU and accelerator TAM, strong Helios demand, improving supply and 2027 growth substantially above the former long-range model. The newest call raises the near-term operating markers: total 2027 revenue growth above 80%, Data Center above 80% of group sales, server revenue approximately doubling and AI revenue significantly more than doubling.

Management describes CPU growth as predominantly units and core counts, with an additional mix contribution. It expects continued supply expansion and says demand remains higher than available supply. The forecast treats supply, customer power and facility readiness, installed systems and revenue acceptance as linked realization steps. The analyst question using a precise revenue-per-GW range remains a question; management retained a broad double-digit-billions description in the earlier call.

The official Q2 transcript is preserved. The current Q3 transcript is the complete StockAnalysis/Quartr rendition, with opening and closing operator passages and all Q&A; the issuer event supplies a replay link. At the source cut, the issuer had supplied no Q3 transcript link and SEC submissions showed the Q2 10-Q as the latest quarterly filing. Transcription and filing-completeness limitations remain explicit.

Source: P02, P03, P08, P12, P14, P16

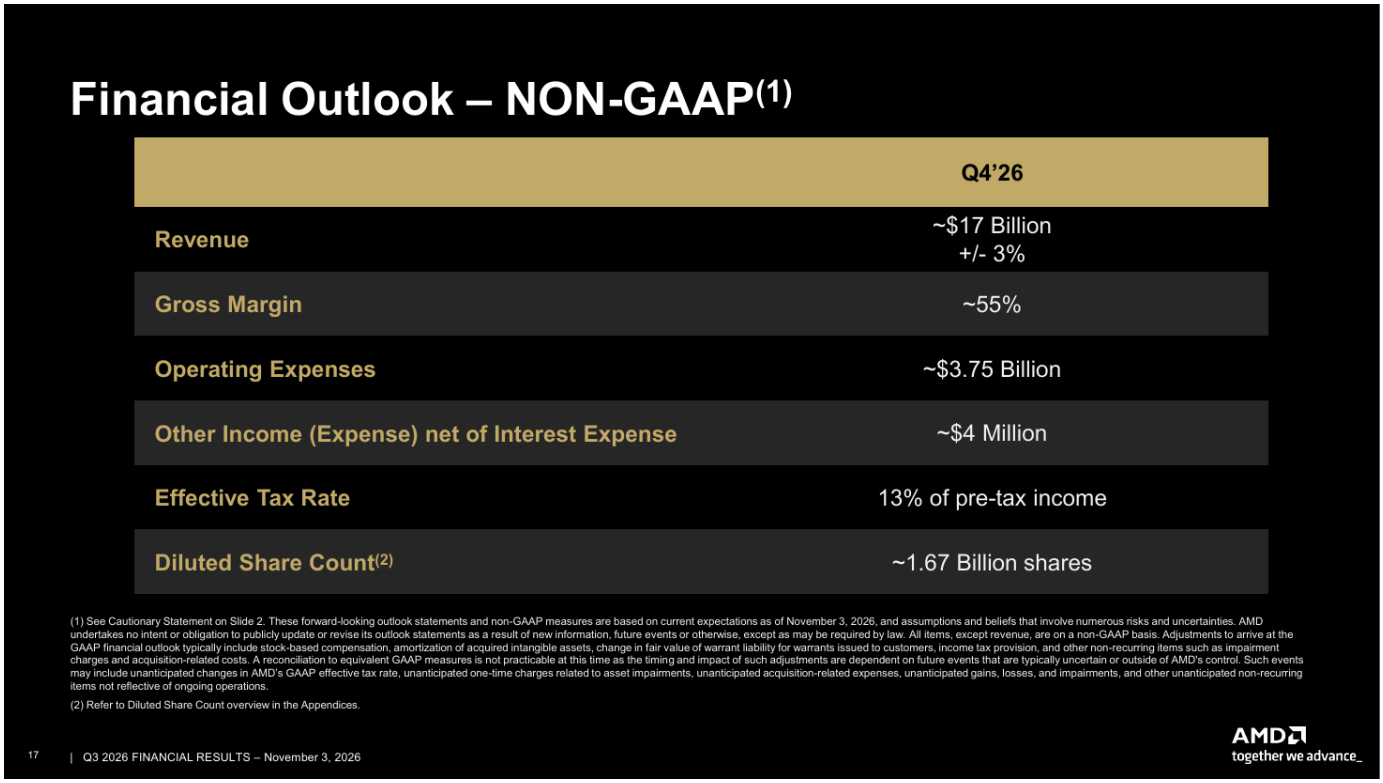

Q3 reported statement	USD M
Net revenue	13,377.00
Non-GAAP GP	7,483.00
Non-GAAP opex	3,560.00
GAAP GP	7,210.00
GAAP opex	4,378.00

Q3 reported statement	USD M
GAAP OP	2,832.00
Total SBC	523.00
Acquired-intangible amortization	534.00
Below-OP warrant remeasurement	1,097.00
Continuing CFO	1,202.00
Capex	648.00
FCF	554.00

Q3 CFO reconciliation	USD M
Net income	2,428.00
D&A excluding PPA	239.00
Acquired-intangible amortization	534.00
SBC	523.00
Investment gains	-67.00
Noncash customer warrants	1,179.00
Deferred taxes	-321.00
Other adjustments	44.00
AR change	-1,928.00
Inventory change	-2,995.00
Prepaid/other asset change	-1,070.00
AP change	2,313.00
Accrued/other liability change	323.00

4. Guidance, product calibration and confidence

Q4 net-revenue guidance is USD 17B plus or minus 3%. Non-GAAP gross margin is 55% and operating expenses are USD 3.75B. The USD 4M other-income gain already includes existing interest expense. The detailed share table estimates 1,668M diluted shares, comprising 1,647M basic shares and 21M employee-award dilution, with expected acquisition effects included and zero expected customer-warrant share impact.

AMD issuer slide 17, November 3, 2026. Q4 revenue and non-GAAP financial guidance; other income is already net of existing interest. Source P12.

The selected five-product allocation exactly reconciles the reported Q3 segment totals and the Q4 guidance midpoint. Within reported Data Center revenue, the CPU and accelerator split is an analytical allocation. Individual product margins are also proxies. A common calibration offset reconciles their summed non-GAAP GP to the reported Q3 aggregate and independently to the Q4 guidance aggregate.

Product GP is calculated separately for accelerators, CPUs, Client, Gaming and Embedded. SBC, purchase-accounting amortization and ordinary other operating expenses are then restored visibly. The source aggregate anchors are HIGH confidence. Product allocation, future capture, yield improvement and costs remain LOW confidence wherever the company supplies no matching quantitative disclosure.

The FY2026 non-GAAP opex anchor is actual plus guidance: Q1 actual 3,145M, Q2 actual 3,394M and Q3 actual 3,560M plus Q4 guided 3,750M. The selected future group budgets carry paid engineering, software and support. Customer or acquired-team announcements receive incremental costs only after an overlap reconciliation.

Source: P03, P08, P12, P29

Calibration	Q3 actual / estimate	Q4 guide / estimate
Net revenue	13,377.00	17,000.00
Non-GAAP GP	7,483.00	9,350.00
Non-GAAP opex	3,560.00	3,750.00
Common GM offset	-0.7917%	-0.4122%
Diluted shares M	1,661	1,668.000

Product allocation	Q3 source-calibrated estimate	Q4 guide-calibrated estimate
Instinct/non-CPU	3,846.00	7,569.00
EPYC	4,700.00	5,250.00
Client	2,949.00	2,150.00
Gaming	773.00	753.16
Embedded	1,109.00	1,277.84

5. Summing analytical score and protected portfolio Base

The analytical score is 49/60, or 81.666667% rounded to 82. Core Thesis 16, Cycle 10, TAM 10, Catalysts 5, Macro 9 and Alpha 4 total 54 before the five scored risk deductions. The protected portfolio Base remains 82.

The strongest evidence is the combination of actual Helios revenue, broad EPYC demand and expanded customer deployment plans. Competitive alternatives and external supply dependencies constrain the moat score. Dated product ramps and agent adoption support the cycle and catalyst scores. The research edge depends on correctly translating CPU demand, economic costs, ownership dilution and financing into company capture.

Source: P03, P08, P14

Category	Points	Evidence
Core Thesis	16	Differentiated platform; alternatives and external supply
Cycle Stage	10	Helios revenue and broader EPYC deployments
TAM Expansion	10	CPU, accelerator and physical-AI scope
Catalysts	5	Dated product/customer/acquisition milestones
Macro	9	Compute investment and component pressures
Alpha	4	Company capture, costs and ownership reconciliation
Risks	-5	Five separately scored risk classes
Total / rounded	49/60	81.666667% rounded to 82%

6. Product revenue, margin and cost transmission

The accelerator pool includes Instinct and associated non-CPU Data Center content. The annual reference path is supported by named customer programs, a broader inference opportunity and an annual roadmap, with LOW-confidence revenue capture and quarterly phasing. Helios deployments are already inside this pool. The HPE/Vultr order includes HPE system content and services; adding its full value to AMD sales would repeat wallets and existing customer demand.

The EPYC path separates a reference CPU forecast from the probability-weighted gap to the attributed Aletheia endpoint. The source excerpt contains detailed sales, unit and supplier claims, but its report masthead, original date and calendar-versus-fiscal basis are missing. The selected calendar-year mapping and later fade remain analytical assumptions. Source-reported CPU revenue already combines unit and mix effects; supplier-capacity growth and implied ASP are cross-checks.

2027E upside is supply constrained, 2028E to be seen

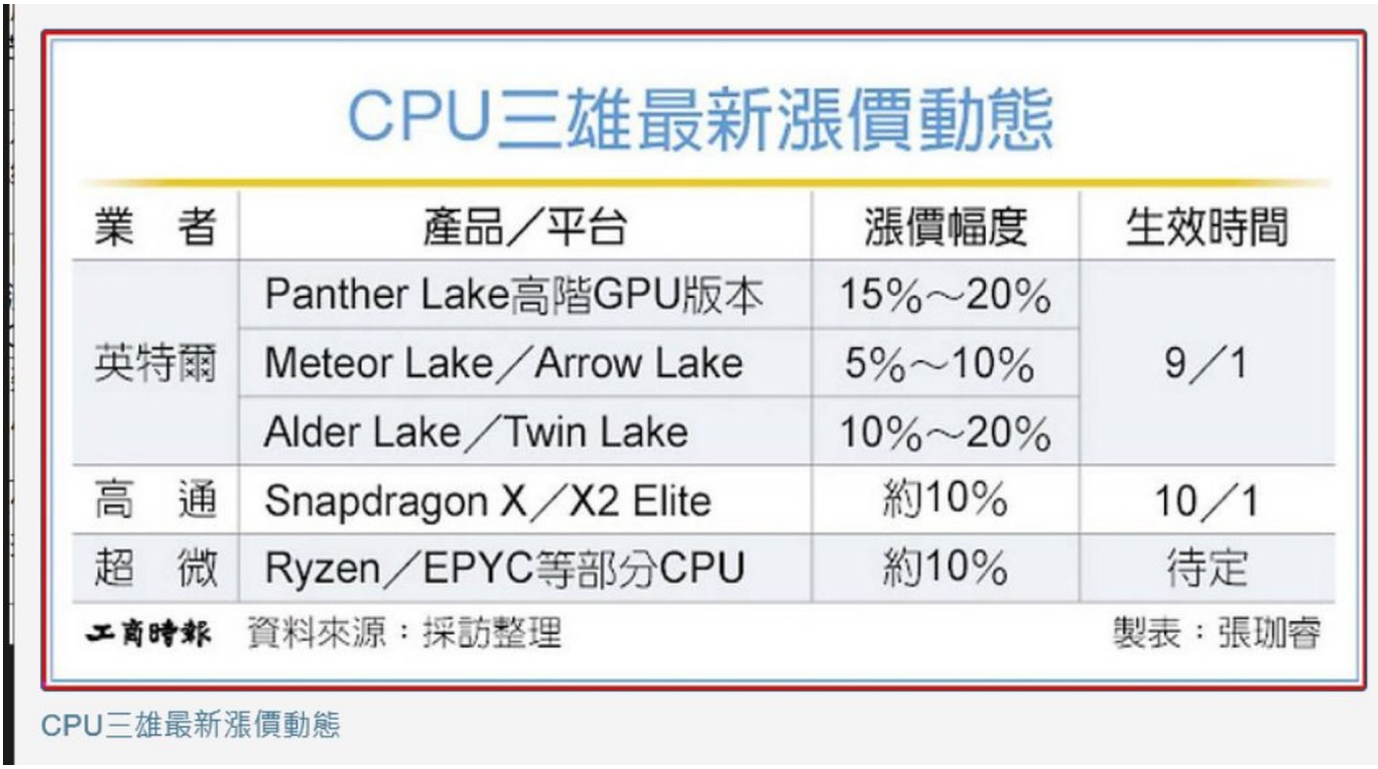

We expect limited upside to our 2027E for server CPU revenue/shipments of $40b/13.5m for AMD as it is supply constrained. The following year, 2028E, should be better as we expect TSMC's N2 and ASE's FOCoS-Bridge output to grow by 50%/100%+ YoY, respectively. As such, we are modelling AMD's server CPU revenue and shipments to still grow by 70%/30% YoY in 2028E, above the 60%-70% CAGR in 2025-2030E. AMD remains as the major beneficiary of agentic AI growth, especially for consumer-facing agents, which is mostly run on x86 CPUs.

Original attributed Aletheia excerpt relayed October 4, 2026. Report masthead/date and period convention are unavailable. Units, ASP/mix and supplier claims remain conditional. Source S12; original bytes preserved.

Client and Gaming use distinct product margins and quarterly patterns. The Client stress hypothesis applies a 12% market-unit decline and a 5% AMD share/mix offset to the eligible Client pool, with 80% probability and a partial fade in 2028. Gaming retains its own cycle. Embedded receives an 80% probability on the gap between its reference recovery path and the stronger conditional conversion path.

CPU, Client and Embedded margin improvements reflect selected yield and mix assumptions. A 55% probability residual accelerator input-cost hypothesis reduces GPU margin through 2027 and fades through 2028 after customer cost sharing. The PC and GPU-cost outcomes use a joint distribution because memory and component inflation affect both. Fixed group engineering budgets remain paid across the outcomes.

The inherited 20%-probability CPU pricing branch remains restricted to a narrow eligible pool: 10% of reference EPYC and 6% of Client/Gaming after the Client stress. It removes 50% overlap, retains 99% units, assigns 30% GP retention to added price revenue and deducts 5% support. The reference CPU excludes the conditional Aletheia wedge. Recognition phases, unit loss and input costs remain model assumptions.

Original Commercial Times Chinese pricing table, October 12, 2026. Select AMD Ryzen/EPYC quotation increases around 10% with timing undetermined. Reposts belong to one source family. Source CPU-20261012.

Q3 2030	23,400.00	36,450.00
Q4 2030	25,200.00	41,850.00

PC / GPU-cost state	Probability	PC stress	GPU miss
both	45.0%	1	1
pc only	35.0%	1	0
gpu only	10.0%	0	1
neither	10.0%	0	0

7. Quarterly operating model and recurring accounting

Consolidated net revenue is the sum of the five product pools plus the separately identified scoped price/volume overlay. Non-GAAP GP is the sum of independently modeled product GP and scoped overlay GP and scoped overlay GP. Cost-of-sales SBC and PPA reduce GP; group non-GAAP opex, opex SBC, opex PPA and ordinary other costs determine parent economic operating profit.

The selected method retains the existing parent economic OP basis. Reported Q3 provides a direct accounting tie. The model restores recurring stock compensation and purchase accounting visibly, and keeps the legal contingency and acquisition-related other costs separately identified. Product mix and paid operating leverage govern the forward OP path.

Appendices

Reconciliation of GAAP Operating Income to Non-GAAP Operating Income

$ in millions, except % (Unaudited)	Q3'26	Q2'26	Q3'25
GAAP operating income	$ 2,832	$ 1,990	$ 1,270
GAAP operating margin	*21%*	*17%*	*14%*
Stock-based compensation	523	503	419
Amortization of acquisition-related intangibles	534	544	562
Recovery of inventory loss at contract manufacturer (1)	–	–	(67)
Acquisition-related and other costs (2)	27	40	42
Loss contingency on legal matters	7	17	12
Non-GAAP operating income	$ 3,923	$ 3,094	$ 2,238
Non-GAAP operating margin	*29%*	*27%*	*24%*

(1) Recovery of inventory loss at contract manufacturer was related to the recovery of losses incurred as a result of an incident at a third-party contract manufacturing facility that occurred in Q1'24.
(2) Acquisition-related and other costs primarily included transaction costs, purchase price fair value adjustments for inventory, certain compensation charges, and workforce rebalancing charges.

8. Acquisitions, ownership and finite acquired assets

The World Labs agreement provides approximately USD 8.2B of stock consideration and a share count determined from a future ten-trading-day VWAP window. Taalas consideration and acquired shares are undisclosed. Q4 share guidance includes the estimated combined closing effect. The selected common half-quarter closing proxy reconciles that weighted allowance with a full issuance block from Q1 2027.

The ordinary diluted component is separated from the Q4 weighted acquisition allowance before the full World Labs and Taalas blocks enter. The retained annual ordinary net-dilution rate is 0.5%. Customer warrants occupy their own named-quarter schedule, with zero in Q4 under current guidance and a maximum 320M across OpenAI and Meta. Legal vesting and exercise depend on purchases, stock performance and additional commercial/technical conditions.

Appendices

Share Count Overview

Shares (millions) (Unaudited) [1]	Q3'26 Actual	Q4'26 Estimate
Basic shares	1,636	1,647
Dilutive impact from employee equity grants [2]	25	21
Diluted shares	1,661	1,668

The table above provides actual share count for Q3'26 and an estimate of share count to use when calculating GAAP and non-GAAP diluted earnings per share for Q4'26.
(1) Share counts are weighted average shares.
(2) The dilutive impact of employee equity grants is based on the Treasury Stock method and is dependent on the average stock price during the period. Q3'26 average stock price was $511. The estimated dilutive impact of employee equity grants in Q4'26 is based on the average stock price of $587 between September 28, 2026 and October 23, 2026. Q4'26 share count estimate also includes potential shares to be issued for the acquisitions of Taalas Inc. and World Labs Technologies, Inc., which are expected to close by the end of 2026, subject to regulatory approvals and customary closing conditions. Q4'26 share count is not expected to be impacted by customer warrants.

AMD issuer slide 24, November 3, 2026. Q3 actual and Q4 estimated weighted-average shares, including employee and acquisition assumptions. Millions of shares. Source P12.

The selected acquisition path includes a LOW-confidence Taalas stock-consideration proxy inferred from common closing timing. A 40% identifiable-intangible allocation and 32-quarter life supply a finite PPA sensitivity. Full acquired assets enter at closing; Q4 amortization receives the same half-quarter time weight as the closing assumption. Existing PPA runs down against its finite acquired-asset book.

The group non-GAAP engineering and support budget includes acquired-team activity after expected closing. A finite additional acquired-cost diagnostic exposes the missing cost composition. Standalone acquired revenue receives zero incremental contribution after the existing compute and specialized-inference overlap review. The model carries transaction dilution and PPA while preserving that unresolved commercial scope.

The original Taalas engineering exhibit is retained beside its interpretation. Its design-time and tapeout comparisons are the author's estimates. AMD's definitive agreement describes system-level integration with Instinct, and the Cerebras collaboration supplies an additional specialized-inference route. The existing accelerator pool already contains this opportunity; qualification, paid utilization and program-level content are the next tests.

	Normal Way	Taalas Way	Note
Time to Design and Verify	3-12 months	1 week	Credible claim by Taalas.
Fab Time (Normal)	6 months	1.5-2 months	My estimates.
Fab Time (Hot Lot // Rush Order)	3 months	< 1 month	
Bringup and Post Silicon Validation	3-6 Months	None lol	
Tapeout Cost	$15-$50M	$200K-$500K	

Original author engineering comparison, August 9, 2026, Irrational Analysis exhibit 31. Design/tapeout timing and cost are author estimates. AMD transaction PPA and recurring costs remain undisclosed. Original bytes preserved.

9. Rolling four-quarter valuation and complete derivations

Each current ceiling uses parent economic OP in the named quarter and the next three calendar quarters, multiplied by 25 and divided by that starting quarter's diluted-share proxy. The model retains unit factor 1. Quarterly revenue, product GP, operating costs and shares feed the same calculation used by the workbook and every report exhibit.

The active horizon is Q4 2027, matching the existing Master H1 selection. The Toronto calendar rule establishes the current-quarter update and historical-preservation cutoff. The final three modeled operating quarters have no complete four-quarter window and retain a missing ceiling. The historical Q3 2026 publication retains its original information vintage, forward window and share basis in the protected historical table.

Probability weights enter the coherent operating and cash paths. The final ceiling receives the resulting operating profit once. Acquisition, tax, depreciation and funding effects retain their declared accounting treatment. Price-dependent ranking belongs to the live portfolio workbook.

Q4 2027: (9,971.318761 + 9,833.949086 + 11,962.281542 + 13,959.713418) x 25 /1,805.254029 = USD 633.252468. Window: Q4 2027 through Q3 2028.

Q1 2028: (9,833.949086 + 11,962.281542 + 13,959.713418 + 15,882.615151) x 25 /1,832.334303 = USD 704.546096. Window: Q1 2028 through Q4 2028.

Q2 2028: (11,962.281542 + 13,959.713418 + 15,882.615151 + 13,748.042289) x 25 /1,859.417173 = USD 746.909478. Window: Q2 2028 through Q1 2029.

Q3 2028: (13,959.713418 + 15,882.615151 + 13,748.042289 + 16,674.499235) x 25 /1,886.502641 = USD 798.632199. Window: Q3 2028 through Q2 2029.

Q4 2028: (15,882.615151 + 13,748.042289 + 16,674.499235 + 19,419.550052) x 25 /1,913.590711 = USD 858.656796. Window: Q4 2028 through Q3 2029.

Q1 2029: (13,748.042289 + 16,674.499235 + 19,419.550052 + 22,097.076506) x 25 /1,930.681386 = USD 931.525634. Window: Q1 2029 through Q4 2029.

Q2 2029: (16,674.499235 + 19,419.550052 + 22,097.076506 + 19,941.789961) x 25 /1,947.774670 = USD 1,002.848494. Window: Q2 2029 through Q1 2030.

Q3 2029: (19,419.550052 + 22,097.076506 + 19,941.789961 + 23,965.371767) x 25 /1,964.870566 = USD 1,086.888238. Window: Q3 2029 through Q2 2030.

Q4 2029: (22,097.076506 + 19,941.789961 + 23,965.371767 + 27,765.890430) x 25 /1,981.969076 = USD 1,182.790006. Window: Q4 2029 through Q3 2030.

Q1 2030: (19,941.789961 + 23,965.371767 + 27,765.890430 + 31,521.788072) x 25 /1,994.070205 = USD 1,293.771402. Window: Q1 2030 through Q4 2030.

Protected historical Q3 2026 publication

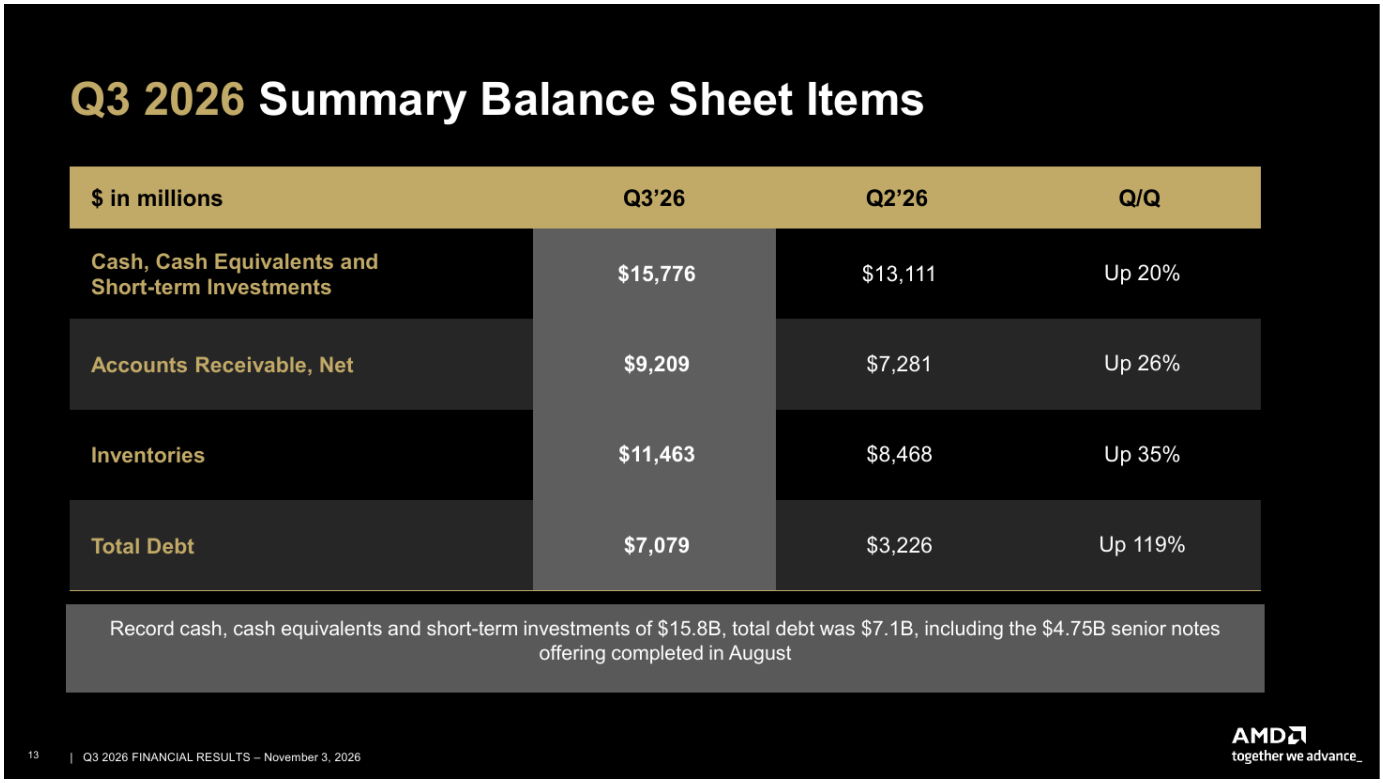

The historical publication retains its original information vintage. Current Q3 actual accounting appears separately. Historical forecast inputs, the as-then forward window and original denominator remain recoverable.

Historical Q3 forecast	Original value
Revenue M	13,000.000000
GP M	6,994.000000
Opex M	4,480.000000
OP M	2,514.000000
Shares M	1,660.000000
Forward OP M	18,863.829960
Ceiling USD	284.093824702

Original chain: (2,514.000000 + 4,209.353846 + 5,571.807003 + 6,568.669111) x 25 /1,660 = USD 284.093824702. Window: Q3 2026 through Q2 2027. All inputs belong to that original publication vintage.

10. Cash conversion, capital, taxes and debt

Opening September 26 liquid funds are USD 15.776B and book debt is USD 7.079B. Source Q3 cash conversion is reconciled from reported net income through ordinary depreciation, acquired-intangible amortization, SBC, customer warrants, deferred taxes and working capital. The source 239M D&A excludes the separate 534M acquired-intangible adjustment.

AMD issuer slide 13, November 3, 2026. Latest liquid funds, receivables, inventory and debt. USD millions. Source P12.

The forecast maintains explicit receivables, inventory, prepayments, payables, accrued liabilities and other current liabilities. Their source-scaled balances drive working-capital cash. New capex creates finite PPE cohorts with a twenty-quarter life and half-quarter initial depreciation. Existing PPE depreciation is capped by its remaining book. Capex cash, depreciation expense and noncash addback have separate roles.

Ordinary owned-PPE depreciation is already included in non-GAAP product margins and group operating expenses. The finite asset tracker receives zero additional P&L deduction. Its matched depreciation is added back in the cash reconciliation; capex remains a separate cash outflow.

Recurring book tax uses the selected 13% source-guided rate as a forecast proxy, with a corresponding cash-tax calculation after available recurring losses. The exceptional Q3 GAAP benefit and volatile investment/warrant marks retain separate source labels. A 21% tax diagnostic and working-capital day stresses show the consequences of weaker conversion.

Future principal payments include 625M in Q1 2028, 1,250M in Q3 2029 and 750M in Q2 2030. The 875M September 2026 maturity is already reflected in opening debt. The model distinguishes carrying value from face principal and retains later maturities. Q4 guided net other income already includes existing interest; later interest is calculated from explicit debt balances.

Strategic investment cash includes the full announced Meta commitment and the selected unallocated five billion commitment budget through 2028. These purchases create investment assets. Supplier purchase commitments flow through COGS and working capital; lease and support obligations retain their operating-cost/capex overlap. The source provides no current program-level remaining balance for the older conditional investment commitment.

- AMD EPYC processors support the dedicated computing environments behind Meta's Muse personal AI agent. Meta has deployed millions of EPYC processors across multiple generations and is a lead customer for 6th Gen EPYC™ CPUs. The companies are also collaborating on future generations, including "Verano."
- AMD Instinct GPUs are currently used in production in Meta's infrastructure for training, ranking and recommendation engines. Meta was also an early definition customer for the AMD Instinct™ MI450 architecture, and it will deploy a custom AMD Instinct GPU that is optimized for its workloads. The collaboration is also informing future AMD platforms, including AMD Instinct™ MI500 series GPUs and next-generation rack-scale systems.
- AMD and Meta have worked together to advance ROCm through PyTorch to ensure that developers can leverage AMD GPUs right out of the box. As well, AMD delivered Day-0 support for Meta's Muse Spark Open models on AMD Instinct GPUs and for Muse Glimmer on AMD Ryzen™ AI PCs and AMD Radeon™ GPUs.
- AMD and Meta have expanded their software collaboration to large-scale AI training, optimizing recommendation models on AMD Instinct MI350X GPUs and contributing improvements to PyTorch, Triton and ROCm for other developers to use.

As Meta grows its AI capabilities, the companies are working together across silicon, software and systems to address the demands of operating AI infrastructure for billions of people. The companies have aligned product roadmaps and engineering decisions around current and future Meta workloads, evolving years of collaboration into building and deploying integrated AI systems at gigawatt scale.

In addition, AMD will invest $1 billion in Meta's equity offering.

About AMD
AMD (NASDAQ: AMD) drives innovation in high-performance and AI computing to solve the world's most important challenges. Today, AMD technology powers billions of experiences across cloud and AI infrastructure, embedded systems, AI PCs and gaming. With a broad portfolio of AI-optimized CPUs, GPUs, networking and software, AMD delivers full-stack AI solutions that provide the performance and scalability needed for a new era of intelligent computing. Learn more at www.amd.com.

Cautionary Statement
This press release contains forward-looking statements concerning Advanced Micro Devices, Inc. (AMD) such as the collaboration, expectations and anticipated benefits of the strategic partnership with Meta including the expected broader deployment of AMD Helios rack-scale systems in the near future; the companies collaborating on future generations of AMD EPYC™ processors including "Verano"; the collaboration informing future AMD platforms including AMD Instinct MI500™ series GPUs and next-generation rack-scale systems; and the companies aligning product roadmaps and engineering decisions around

AMD/Meta issuer release, October 27, 2026, page 2. EPYC agent infrastructure and the announced AMD equity commitment have separate operating and capital economics. Source I01.

Employee award settlement cash is modeled separately from SBC expense and its noncash addback. The selected recurring cash ratio is 1x SBC, bounded at 0.5-3x. Discretionary repurchases are zero. Each of the 16 joint operating paths pays its own costs and capex before funding is calculated. Supplemental debt maintains the selected liquidity floor and accrues future interest; the report shows funding outcomes and minimum cash across paths.

Source: P03, P15, P22, P27, P30, I01

11. Annual trajectory and sensitivity controls

The annual tables sum the quarterly model. They test whether the 2027 revenue, Data Center mix, CPU and accelerator growth, and opex leverage align with management's current directional statements. The 2030 company-capture path is compared with the separately scoped CPU and accelerator opportunity estimates.

Sensitivities change one declared input or coherent coupled outcome and recompute the affected economics. The engine retains CPU, PC and GPU-cost endpoints; acquisition timing, consideration and PPA; customer warrants; strategic investment timing; working capital; tax; settlement cash and financing. Lower cash investment does not create additional revenue or manufacturing capacity without a separate operating bridge.

12. Programme, probability and overlap ledger

Each ledger probability is a subjective research judgment about a defined commercial outcome. Named customer announcements and source reposts are grouped by original event. The ledger states the reference already modeled, the conditional amount, active increment, cost bridge, timing, overlap and revision trigger.

OpenAI and Meta strategic deployments, Anthropic, HUMAIN and the wider cloud ecosystem reside inside the existing CPU/accelerator pools. Installed or testing racks demonstrate a deployment milestone. Their GW capacities retain multiyear scopes. The programs receive zero additional revenue after overlap, while the selected capital, operating and ownership costs remain explicit.

AMD and Meta Advance Strategic Partnership to Power Meta’s Superintelligence Infrastructure

News Highlights

- AMD and Meta collaborate across CPUs, GPUs, networking, systems and software to power Meta services and AI infrastructure
- AMD Helios rackscale solutions will power Meta’s leading frontier models and services
- AMD technology is the compute engine of choice for Muse and AMD technologies provide Day-0 support for leading Meta models

SANTA CLARA, Calif., Oct. 27, 2026 (GLOBE NEWSWIRE) -- AMD (NASDAQ: AMD) today highlighted its deep strategic partnership with Meta, announcing AMD Helios™ rackscale solutions are running at Meta, AMD EPYC™ processors power Meta’s Muse AI agent, and AMD technologies provide Day-0 support for Meta models including Muse Spark Open and Muse Glimmer.

This builds on years of co-design and collaboration between the two companies across AMD EPYC™ processors, AMD Instinct™ GPUs, AMD Pensando™ networking and AMD ROCm™ AI infrastructure.

“Meta is a strategic partner for AMD, and we have built this partnership through years of deep technical collaboration – from EPYC processors powering Meta’s infrastructure to Instinct GPUs and open software supporting its AI workloads,” said Lisa Su, Chair and CEO, AMD. “With Helios now running at Meta, we are taking that partnership to a new scale in the superintelligence era. Together, we are building and deploying infrastructure at gigawatt scale and shaping future generations of silicon, software and systems to enable Meta’s most ambitious superintelligence models and services.”

“AMD has been a key partner in building out the compute that's running our frontier models,” said Mark Zuckerberg, founder and CEO, Meta, “We're making big investments in the computing power that will enable us to bring personal superintelligence to everyone, and AMD plays an important role in that.”

AMD Powering Meta Infrastructure, Today
AMD technology powers Meta’s infrastructure across compute, networking, systems and software.

- Initial AMD Helios rackscale solutions are installed and being tested by Meta on the path to a broader deployment in the near future.

AMD/Meta issuer release, October 27, 2026, page 1. Initial installed/tested racks establish a deployment milestone within the existing company revenue pools. Source I01.

The four PC/GPU-cost joint probabilities sum to 100%; CPU and Embedded outcomes create 16 coherent operating states. Cash and funding are evaluated within each state before averaging. The inherited Aletheia and pricing hypotheses keep their source identity and quantitative incremental bridges. Acquisition closing and customer-warrant timing retain separate diagnostics.

The model records zero increments for specialized inference, overlapping Oracle cloud CPU adoption and the HPE/Vultr system-order headline after an attempted wallet and program reconciliation. A future distinct

accepted AMD content award, acquired revenue disclosure or capacity allocation can change that disposition.

Finite customer overlap diagnostics

These source-specific checks are diagnostic subsets within the retained USD 42B 2027 accelerator pool. A LOW assumed accelerator/non-CPU-only allocation of USD 10B per GW gives a finite first-GW check. Management company-wide per-GW discussion has broader and undisclosed content; the issuer supplies no accelerator-only amount. The allocation is an analytical diagnostic. Company program dollar attribution and exact annual delivery allocations remain undisclosed. Each diagnostic applies 100% overlap, giving zero additional revenue or OP. Support is already inside paid group costs.

Diagnostic subset	GW	p	Conditional R M	Weighted R M	Production cost M	Support subset M
OpenAI initial 1GW	1.00	80.0%	10,000.00	8,000.00	5,165.01	500.00
Meta initial 1GW	1.00	90.0%	10,000.00	9,000.00	5,165.01	500.00
Anthropic initial 1GW	1.00	80.0%	10,000.00	8,000.00	5,165.01	500.00
HUMAIN next 0.25GW	0.25	70.0%	2,500.00	1,750.00	1,291.25	125.00

Weighted diagnostic subsets total USD 26.75B, leaving USD 15.25B of the existing USD 42B pool for other workloads. Calibrated 2027 GPU GM supplies the conditional production-cost check;5% support is a subset of group cost. These amounts add zero to the engine and establish no dated program award. Announced 6GW and 2GW potentials retain multiyear scopes.

Existing programme / source	Probability and timing	Active economic disposition
OpenAI / Meta strategic programmes	80% inherited multiyear conversion; up to 6GW each	Existing CPU/GPU pools; zero added R/OP. Meta initial-rack check uses 90% within diagnostic subset. Warrants and capital are separate.
Anthropic / July 22 issuer	80% initial timing; firstGW beginsH1 2027	Up to 2GW total. Revenue is inside existing pools. Selected full conditional investment budget is paid separately.
HUMAIN / August 31 issuer	70% expansion; next 250MW within 1GW by 2030	Zero extra after overlap. Test H2 2027 readiness and acceptance.
Meta equity / October 27 issuer	95% timing research confidence	Full USD 1B capital use; next-quarter cash diagnostic. Zero added sales, OP or AMD shares.
EPYC TAM / management calls	70% inherited capture judgment	USD 220B opportunity; reference CPU and conditional gap already include capture.
World Labs / Taalas / issuer	90% closing timing; selected full-close accounting	Shares and finite PPA enter once. Delay, allocation and extra ordinary-cost diagnostics retain uncertainty.
Customer warrants / filed terms	Maximum 320M; named-quarter economic proxy	Q4zero guided. Dilution separate from embedded net-revenue credit. Future below-OP remeasurement unknown.
Specialized inference / Taalas / Cerebras	60% inherited commercial-use judgment	Attempted 1-2% allocation of 42B=420-840M revenue and 48% illustrative GP=201.6-403.2M before group costs; full overlap yields zero extra.
Oracle cloud and HPE/Vultr	Adoption milestones within current pools	Zero extra after cloud/agent and system-wallet checks. HPE order includes cooling, switching and services.

13. Five scored risk classes

Platform and software competition costs one point: Nvidia, custom silicon, Arm and Intel can change wallet share, customer choice and realized prices. Supply and ramp execution costs one point: wafer, packaging, HBM, DDR5, yield and rack qualification determine shippable systems.

Customer concentration and infrastructure timing costs one point: major customers must finance, build and energize deployment sites. Economic dilution and investment exposure costs one point: customer warrants, SBC, acquired shares, strategic investments and funding affect cash and per-share outcomes. Trade restrictions and cyclical end markets costs one point: export/import conditions, inspection tariffs and weaker PC/Gaming demand affect accessible revenue and margins.

Source: P15, P08

Scored risk class	Points
Platform/software competition	-1
Supply and ramp execution	-1
Customer/infrastructure timing	-1
Dilution and investment exposure	-1
Trade and cyclical end markets	-1
Total	-5

14. Dated tests and cross-book monitoring

Q4 2026 tests are the Helios deployment step-up, the GPU/CPU crossover, actual Client sell-through, Embedded conversion, acquisition closings and full financing/accounting disclosure. H1 2027 adds the start of Anthropic's first-GW deployment. H2 2027 adds HUMAIN's next-phase readiness. These commencement milestones retain their project-specific acceptance schedules.

Every earnings release should reconcile CPU and GPU capture, product mix, paid costs, net warrant revenue, legal vesting, investment cash, tax and inventory conversion. Independent customer allocations and realized units/ASP can raise the CPU probability. Qualification delays, shrinking price retention or missed infrastructure schedules can reduce it. The residual GPU-cost and PC hypotheses should change when realized memory costs, customer cost sharing and sell-through improve or worsen.

AMD demand informs memory, foundry, packaging, substrates, optics and power research. Each supplier has a different content, allocation, qualification and revenue-recognition bridge. Intel and Arm provide the CPU cross-watch; custom accelerators and Nvidia provide the platform cross-watch. Direct economic evidence is required before updating another company or admitting a new name.

Source: P08, P14, I01, I02

15. Source quality, remaining gaps and model limits

Issuer releases, filings, financial tables and presentations anchor reported values and guidance. The two newest earnings transcripts supply management explanations through Q&A. The Q2 transcript is issuer hosted; the Q3 source is a complete secondary transcription with issuer replay available. Source files, retrieved dates and hashes are preserved in the research manifest.

The Q3 10-Q and official transcript remain pending at the source cut. Detailed current commitments, exact customer-warrant accounting, acquired shares and PPA, recurring acquired costs, product-level margins, CPU units/ASP and contractual revenue per GW remain unresolved. The forecast labels each selected proxy and exposes finite alternatives.

The Aletheia excerpt has incomplete report metadata and period basis. The Commercial Times table is attributed supply-chain reporting within one source family. The Taalas comparison is an author engineering estimate. Their original images are preserved at the point of use, alongside the arithmetic and specific confidence limits.

Historical published forecasts are retained with their original vintage. Current calculations begin at the authorized current quarter. Source updates, the protected score, operating probabilities, valuation method, share basis and library/publication checks remain individually auditable.

Source: SOURCE-MANIFEST, SOURCE-READ-PROOF, ROOT

Final bounded source cut: November 3, 2026 at 20:43 America/Toronto (November 4 at 01:43 UTC). SEC submissions still identify the August 5 Q2 10-Q as the latest. The issuer event still has no official Q3 transcript link; material release, slide, table and replay links are unchanged.
