AST SpaceMobile full investment research

2 November 2026 | Nasdaq ASTS | USD | Framework 8.0

Analytical Base: 39/60, or 65. Rating: Watchlist. The company is a competitive satellite platform with scarce engineering, spectrum and carrier-integration capabilities. Its strongest deployment advantage faces competing broadband roadmaps during 2027-2028.

The selected model values forward-four-quarter recurring operating profit at 20 times, with recurring share compensation and depreciation included. Every probability-weighted pricing window from Q4 2026 through Q1 2030 has negative operating earnings. This method therefore supplies no positive earnings-based price ceiling for those quarters. The signed arithmetic is retained in the valuation tables for transparency.

The model produces USD 1.757 billion of probability-weighted 2030 revenue and a USD 104.6 million annual core operating loss. Individual weighted quarters turn profitable in Q3 and Q4 2030. Faster deployment can produce profitable rolling windows from Q2 2028; the combined distribution remains loss-making across the published valuation windows.

Owner-requested covered Watchlist. Initial protected Excel Base: 65. The automatic outsized-upside screen remains unmet. The current earnings ceiling and allocation rank based on expected velocity are unavailable.

Snapshot	Value
Regular close, 2 November 2026	USD 36.33
Economic units, 6 August 2026	389.167494 million
Economic equity capitalization using that dated count	USD 14.138 billion
June shares plus July conversion reserve and June probable awards	441.545840 million
Current valuation window	Q4 2027 through Q3 2028
Earnings-based price ceiling at that window	Unavailable: negative operating earnings

The share count combines Class A shares and the paired redeemable LLC economic units once. Class B and C voting shares do not add a second economic interest. The latest source count is dated August; a November capitalization count is unavailable. The closing quote is a dated pricing snapshot used separately from the operating forecasts.

The investment case

AST SpaceMobile uses large low-Earth-orbit phased arrays, signal processing and mobile-operator spectrum to connect ordinary phones beyond terrestrial coverage. A workable network requires spacecraft, manufacturing, gateways, spectrum permissions, carrier integration and accepted service in each market. These requirements create long lead times and high capital needs.

The central opportunity is wholesale connectivity distributed through existing mobile operators, supplemented by government work, gateways and sovereign networks. Partner distribution can reduce customer-acquisition friction. Revenue depends on paid activation, regional permissions, useful coverage and wholesale economics. The more than three billion subscribers reached by partner operators describe potential distribution.

ASTS has demonstrated phone-to-space links and carrier handoffs. The November 2 AT&T announcement described an October 21 terrestrial-network-to-satellite handoff with Ericsson and Nokia. Real-world beta is the next stage. October readiness announcements still describe intermittent initial service, which requires a measured adoption ramp.

Competition makes time important. Starlink-powered services already offer messaging and selected applications. New broadband roadmaps target late 2027 and early 2028. These alternatives can reduce ASTS adoption, wholesale revenue and renewal leverage. The model includes regional capacity limits, paid take-up limits and pricing compression from 2028.

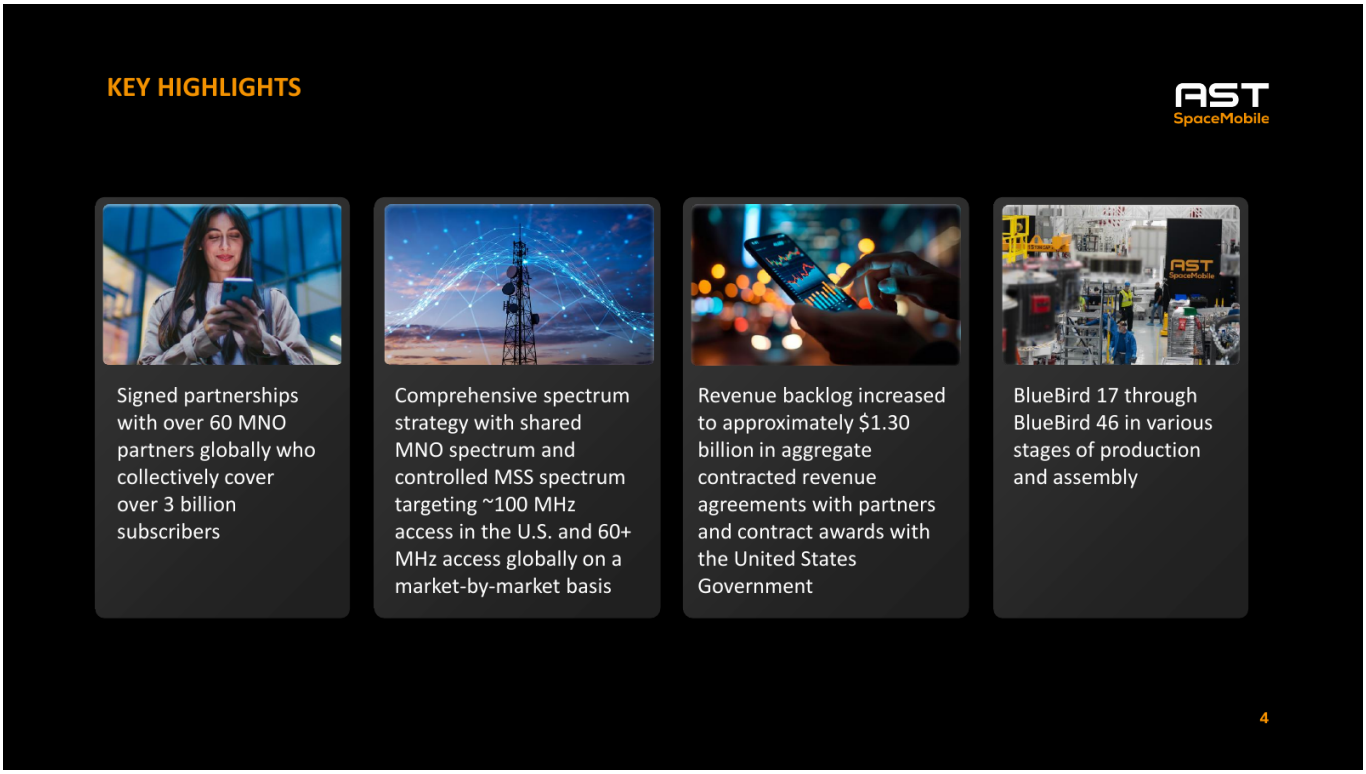

Figure S1. AST SpaceMobile, second-quarter business update, 10 August 2026, page 4. Reported partner reach, financing and business progress share one source. Figures are company statements at that date; subscriber reach and contracted backlog require separate conversion into accepted revenue.

Score and risk accounting

Category	Points	Evidence
Core Thesis	13/20	Large arrays, ASIC processing, spectrum access, IP and carrier integration create difficult engineering and execution barriers. Existing Starlink service and funded alternative systems limit ecosystem indispensability and enduring pricing power.
Cycle Stage	9/10	Consumer service is entering an early commercial ramp, with launches, beta availability and carrier activation still ahead. Government awards and gateway deliveries provide an initial revenue base. Present fleet size and the moved constellation schedule leave execution-dependent upside.
TAM Expansion	8/10	The aperture, processing and communications platform supports consumer access, government communications and sensing, sovereign networks, emergency resilience and IoT. Awards and Japanese program selection provide specific adjacent-market evidence. Space-based AI compute remains early and shared payload capacity limits aggregate capture.
Catalysts	4/5	The next 6-18 months contain constellation shipments and commissioning, real-world carrier beta, initial paid activation, gateway acceptance and funded government milestones. Launch schedules and country authorizations can move several events together.
Macro	9/10	Demand for coverage beyond tower economics, communications resilience, national sovereignty and distributed defense capabilities provides a long-lived structural demand base. Public carrier and government commitments support the direction. Consumer affordability and procurement timing constrain conversion.
Alpha	1/5	The company and D2D theme have accessible English investor materials and visible carrier announcements. Cross-checking Japanese program documents and competing carrier plans improves evidence quality, while a strong proprietary information advantage remains unestablished.

Risk class	Deduction	Transmission
Operational delivery	(1.0)	Manufacturing completion, launch reliability, commissioning, ASIC rollout and usable availability are serial dependencies. BB7 was lost and the 45-satellite milestone moved.
Competitive pricing and substitution	(1.0)	Live low-priced D2D alternatives and 2027-2028 broadband roadmaps can reduce share, wholesale pricing and renewal leverage.
Commercial counterparty and acceptance concentration	(1.0)	Consumer access depends on MNO activation and undisclosed current wholesale terms; government revenue and gateway acceptance are lumpy and concentrated.
Funding and dilution	(1.0)	Constellation completion and replacement consume substantial cash. Financing, convertibles, share issuance, SBC and economic share conventions affect shareholder capture.
Regulatory and spectrum permissions	(1.0)	FCC approval carries conditions and geographic limits; foreign spectrum, interference coordination and gateway approvals determine usable paid coverage.

Positive points total 44. Five separate risk deductions produce 39/60=65. The score sits at the Watchlist threshold. Reducing Core from 13 to 12 would produce 38/60, rounded 63. The score assesses thesis quality; the individual operating probabilities belong in the model.

DB3 LEO infrastructure and communications resilience support the demand backdrop. Government and gateway business already exists, while broad consumer service is entering its early ramp. The thesis depends on commercially useful capacity becoming available before competing systems narrow the opportunity.

Current operating and financial anchor

Period	Revenue	Reported OP	BB7 loss	Core OP excluding BB7
2025 actual	70.9	(287.7)		(287.7)
Q1 2026 actual	14.7	(149.4)	0.0	(149.4)
Q2 2026 actual	31.5	(297.6)	125.9	(171.7)

Amounts are USD million. The newest completed earnings release and financial filing cover June 30, 2026. The latest two full management calls are May 11 and August 10. Third-quarter results are scheduled for November 9. Q3 values in the cash and asset bridge are current reconstructions; no earlier published ASTS forecast is created.

The second-quarter BB7 gross loss was approximately USD 158.4 million, reconstructed from the precise USD 125.911 million net charge plus the rounded USD 32.5 million insurance recovery. Recurring stock compensation of USD 63.467 million and depreciation and amortization of USD 20.664 million remain costs. The separate USD 10.9 million June insurance receivable is collected once in modeled investing cash, with no second income recognition.

2

Figure S2. AST SpaceMobile June 2026 Form 10-Q, statement of operations, source PDF page 4. The actual loss and its non-controlling-interest allocation have different scopes from a forecast of consolidated network operating earnings. Source figures are USD thousand.

Physical capacity and useful service

The August update reports 13 in-orbit spacecraft, including BlueWalker 3. Twelve surviving BlueBirds are numbered 1-6 and 8-13. BB7 was lost after its April launch. Launch, array deployment, commissioning and revenue acceptance are separate milestones. The source review found no later completed issuer launch announcement after August 5 by November 2; a complete current orbital-status reconciliation remains unavailable.

The filing describes 25 BlueBirds as five Block 1 and twenty Block 2 craft for noncontinuous service. Management described roughly half-day coverage at 25 and continuous coverage in key markets at 45-60. About 90 are planned for all targeted markets. The latest dated 45-satellite goal is early 2027; the model evaluates later commissioning as well.

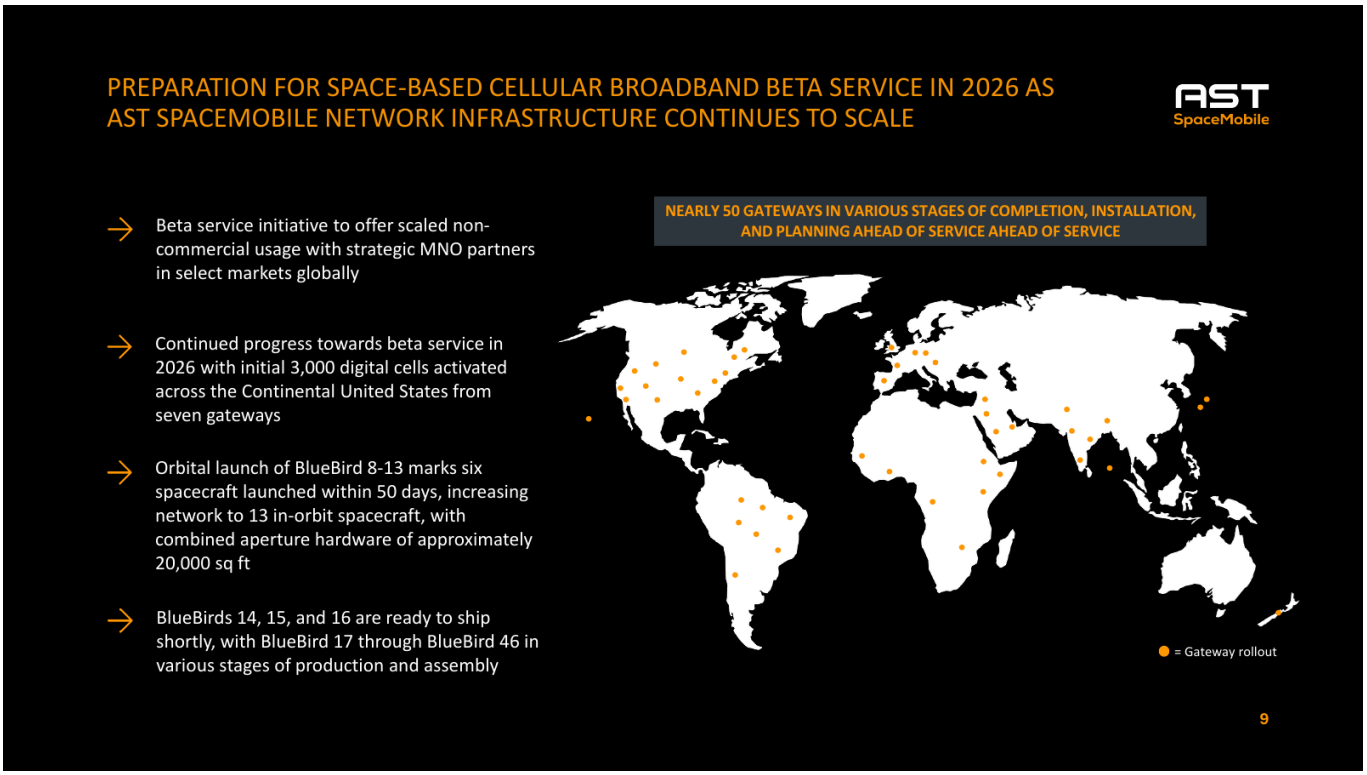

Figure S3. Second-quarter presentation page 9, 10 August 2026. Fleet, digital cells and gateways have different readiness denominators. October gateway counts exceed 60 across deployed, installed and planned stages; that combined figure does not measure sixty accepted new gateway sales.

Quantity	Source scope	Selected model use
25 BlueBirds	Noncontinuous coverage, including five Block 1	Coverage willingness rises with the operational fleet
45-60 BlueBirds	Continuous key-market service goal	Joint timing and country readiness constrain paid adoption
90 BlueBirds	All targeted-market coverage goal	Fleet and cash paths govern capacity recognition
Over 60 gateways	Mixed deployed, installed and planning stages	Recognition requires shipment and acceptance

Processing capacity and consumer load

The AST5000 design provides 10 GHz of aggregate processing bandwidth and up to 40 MHz per beam. FPGA and ASIC manufacturing continue in parallel. The model gives FPGA-era craft 0.1 ASIC-equivalent capacity. Current fleet composition and sustained commercial throughput remain uncertain.

Peak device rates establish a link capability. The measured Block 1 peak of 98.9 Mbps and the approaching 200 Mbps Block 2 design target do not measure sustained average traffic across paying users. The model converts processing bandwidth into aggregate payload traffic using explicit engineering assumptions.

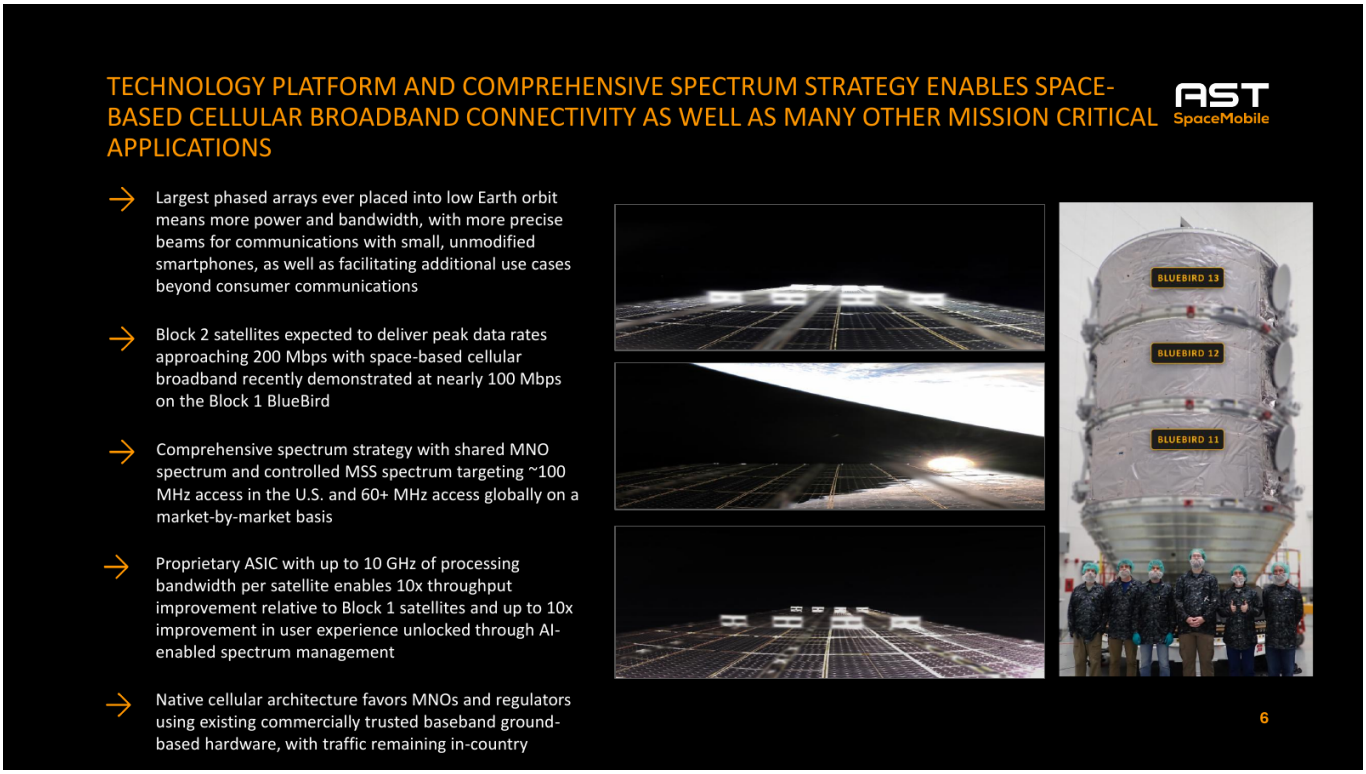

Figure S4. Second-quarter presentation page 6, 10 August 2026. Device peak rate and aggregate ASIC processing describe different constraints. The model uses their stated scope and applies separate spectral-efficiency, geography, payload and busy-load assumptions.

Conversion	Selected assumption
ASIC processing bandwidth	10 GHz per equivalent
Spectral efficiency	1 bit/s/Hz; sensitivity 0.5-2
Payload efficiency	70%
Consumer share of capacity	65%, with 35% reserved for other uses
Monthly days / months per quarter	30 /3
Regional allocation	70% developed,30% emerging
Average paid-user usage	0.5 GB fast/central;0.75 GB delayed
Capacity revenue equation	Paid users=min(eligible paid demand, usable monthly GB/user usage)

Monthly consumer GB equals ASIC-equivalent craft times 10 GHz times spectral efficiency, eligible geography, payload efficiency, consumer allocation, busy load and month seconds, divided by 8. Commercial demand is calculated separately. These engineering and pricing assumptions are low-confidence proxies until sustained load

and wholesale terms are reported.

Selected engineering and demand inputs

Input	Faster funded	Central funded	Delayed stress
Geography and gateway eligibility	20.0%	20.0%	15.0%
Busy-load and congestion factor	55.0%	50.0%	40.0%
GB per paid user per month	0.50	0.50	0.75
Developed net ARPU, USD/month	3.50	3.00	2.50
Emerging net ARPU, USD/month	1.50	1.25	1.00
Annual ARPU compression from 2028	2.0%	5.0%	10.0%
Annual cash fixed-opex growth	10.0%	8.0%	4.0%
Government cash gross margin	85.0%	80.0%	70.0%
Gateway gross margin	17.5%	11.5%	8.3%
Repeat unit capital cost, USD m	22.00	22.00	27.50
New annual award grants, million shares	2.00	1.50	0.75

The consumer capacity conversion uses 1 bit/s/Hz,70% payload efficiency,65% consumer allocation and a 70%/30% regional split. Eligible geography and busy load affect usable physical capacity. Paid willingness is a separate demand assumption: max(0,min(1,(average fleet-5)/40)). It reduces demand for intermittent availability before capacity is applied. Consumer cash variable cost is 15% of revenue.

Demand pools are analyst assumptions below the reported three-billion partner reach. For 2027 onward, n=max(0,year-2027). Developed and emerging accounts in millions are 500+133.333 n and 1,000+166.667 n faster;400+133.333 n and 800+200 n centrally;300+116.667 n and 500+166.667 n delayed. They represent commercially eligible accounts under each conditional path.

With q=calendar quarter, faster developed take-up is min(8%, 2%+1%(q-1)+1% n); emerging is min(3%, 0.5%+0.3%(q-1)+0.5% n). Central developed is min(6%, 1%+1%(q-1)+0.5% n); emerging is min(2.5%, 0.25%+0.25%(q-1)+0.4% n). Delayed developed is min(4%, 0.5%+0.3%(q-1)+0.3% n); emerging is min(2%, 0.2%+0.1%(q-1)+0.2% n). The willingness and capacity tests apply after these take-up endpoints.

Q3 reconstruction has no consumer billing. In every pre-2027 path, developed and emerging eligible pools are 100 million and 150 million, with take-up 0.5% and 0.2%. Q4 2026 applies a 2% paid-beta factor; later quarters use the derived commercial demand and capacity. Government annual recognition weights are 20%, 23%, 27%, 30%; gateway weights are 24%, 25%, 25%, 26%. These timing and load assumptions carry low confidence and respond to actual activation and collections.

Aperture and modular manufacturing

The company describes a Block 2 array of approximately 2,400 square feet, compared with roughly 700 square feet for Block 1. More than 200 microns form one Block 2 array. Modular construction supports manufacturing scale while a large aperture helps the phone-to-space link budget. Processing capacity, payload power, spectrum and commercial load determine the useful traffic produced by that hardware.

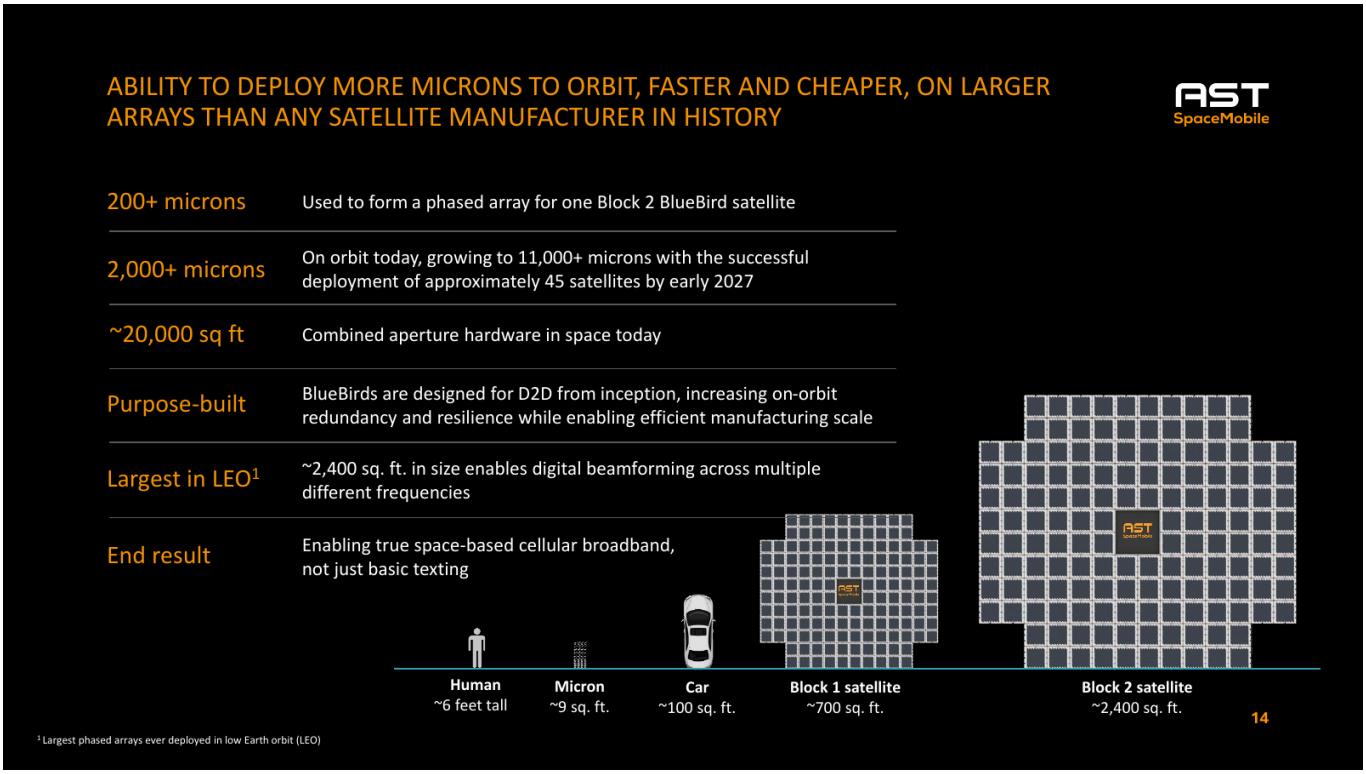

Figure S10. AST SpaceMobile second-quarter presentation page 14,10 August 2026. Company aperture and micron counts describe physical architecture. The forecast of more than 11,000 microns depends on successful deployment of approximately 45 satellites by early 2027. The source exhibit preserves that condition.

Source quantity	Reported or planned scope
Over 200 microns	One Block 2 array
About 700 square feet	Block 1 array
About 2,400 square feet	Block 2 array
Over 11,000 microns	Conditional 45-satellite deployment plan

The model converts complete, commissioned satellite capacity into service. It gives no additional revenue for the micron count or array surface area. Manufacturing work in progress, shipping, launch and service acceptance each have their own timing constraints.

Manufacturing and launch timing

Component output, complete satellites and available launches are distinct constraints. The micron facility can support more than ten satellite-equivalent arrays per month. Full assembly, integration and testing targets six complete satellites per month. The model caps new good units at eighteen per quarter. October production through BB50 describes work in progress.

The Q1 call described a 45-day commissioning target and a later two-week ambition. Launcher stacking maxima of three on Falcon 9, five on Vulcan and eight on New Glenn require qualified configurations and provider availability. Ten booked launches and a one-to-two-month cadence remain planning evidence. The BB7 loss and moved 45-satellite timing support a wider joint timing distribution.

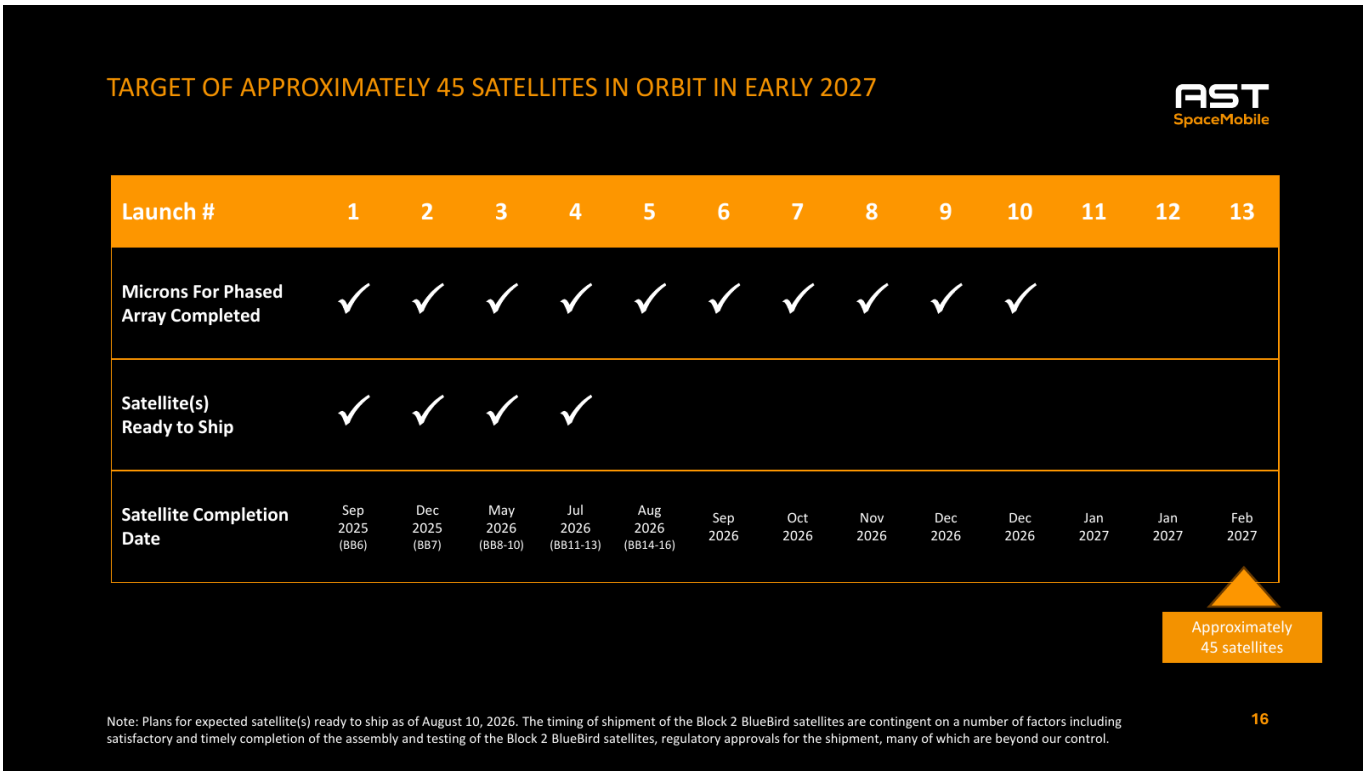

Figure S5. Second-quarter presentation page 16, 10 August 2026. Ready-to-ship and completion dates are production plans. The headline 45-in-orbit goal moved to early 2027. The model recognizes usable capacity by conditional commissioning and cash paths.

Joint path	Probability	45 commissioned	90 commissioned
Faster funded	25%	Q2 2027	Q1 2028
Central funded	50%	Q3 2027	Q2 2028
Delayed funding stress	25%	Q1 2028	Cash-constrained path

The probabilities are model judgments. They combine launch, ASIC, permitting, commercial acceptance and financing dependencies. Multiple milestones attached to the same fleet contribute one joint outcome. Whole physical unit additions are kept within manufacturing capacity; fractional displayed fleets represent expectations across outcomes.

Competition and pricing

Provider or partner	Verified stage	Economic significance
T-Mobile / Starlink	Public USD 10/month add-on, also included in certain plans; selected apps and capacity conditions	A retail benchmark; AST net wholesale receipts are a separate input
Virgin Media O2	Live Starlink-powered messaging and selected-app data,26 February 2026,GBP 3/month	Shows live low-price alternatives and regional packaging
KDDI / Starlink	September 15 primary roadmap targets V2 broadband/native voice by end 2027	Creates a competing deployment window
Deutsche Telekom / Starlink	March 2 agreement targets ten European markets in early 2028, with compatible devices and MSS spectrum	Partner relationships can span competing platforms
Amazon / Globalstar	April 14 acquisition agreement; expected closing 2027 and advanced D2D rollout beginning 2028	Capital, spectrum and distribution support another route

ASTS can differentiate through large arrays, ordinary-phone connectivity and mobile-network integration. Wholesale retention and paid adoption still require evidence. The model uses developed-market net ARPU of USD 3.50/3.00/2.50 and emerging-market USD 1.50/1.25/1.00 across the three paths, with selected price compression from 2028. These values are analytical assumptions; uniform current global revenue-share terms are undisclosed.

The historical 2019 Vodafone agreement describes 50/50 revenue sharing in specified markets. A 50/50 reference in the current filing describes SatCo ownership. The selected net ARPU already represents AST receipts. Applying another 50% ownership deduction to the same wholesale revenue would reduce the same economics twice.

Current spectrum and carrier permissions

Dated evidence	Granted or announced scope	Model implication
FCC order,21 April 2026	Conditional 248-satellite authorization and supplemental coverage. Interference, earth-station coordination, debris, reporting and foreign certification conditions remain.	Half-constellation milestone 2 August 2030; remaining milestone 2 August 2033. Authorization supports feasibility; operational acceptance and local rights determine revenue.
Brazil issuer update,26 October 2026	Anatel 30 MHz S-band authorization and secondary use of up to 20 MHz 700 MHz spectrum within four regional operators licensed areas; four planned gateways.	Issuer-reported permissions inform country access. The more-than 200 million handset-line market requires activation, compatible service and paid adoption. Underlying Portuguese orders were not obtained.
TELUS partner test,5 October 2026	First satellite-network integration test; customer availability expected within the following year.	The test supports integration probability and a dated commercial window. It supplies no measured paid-user or revenue amount.
European LOI,18 October 2026	Deutsche Telekom, Orange, Telefonica and Vodafone explore a potential joint MSS spectrum bid and European-operated infrastructure.	Spectrum allocation, financing and final agreements remain conditional. Partner subscribers and geographic reach are separate from accepted AST revenue.

October 20 service-readiness language names the United States, Canada, Japan, United Kingdom and Saudi Arabia for initial intermittent coverage. The approximately 1,150 MHz global tunable range is a hardware capability; the approximately 100 MHz U.S. access target combines partner and controlled spectrum. North American 45 MHz MSS and market-by-market 60 MHz S-band priority rights have different legal and geographic scopes. These quantities cannot be added into simultaneous worldwide bandwidth.

Revenue markets and expansion

The model separates consumer wholesale service, government work and gateway infrastructure. About USD 1.30 billion of backlog combines partner contracts and government awards. The June filing reports about USD 1.20 billion of remaining performance obligations, with 6.6% expected in the next twelve months. Variable mobile-operator revenue sharing is excluded from that RPO. The two backlog measures and the operating vectors overlap.

Management described a goal approaching USD 1 billion in the first full commercial year, including government possibly contributing half and gateway revenue above USD 100 million. Calendar 2027 depends on when service begins. The faster path derives approximately USD 993.8 million in 2027; the central path reaches about USD 1.12 billion in 2028. This convergence tests the build against the conditional management envelope.

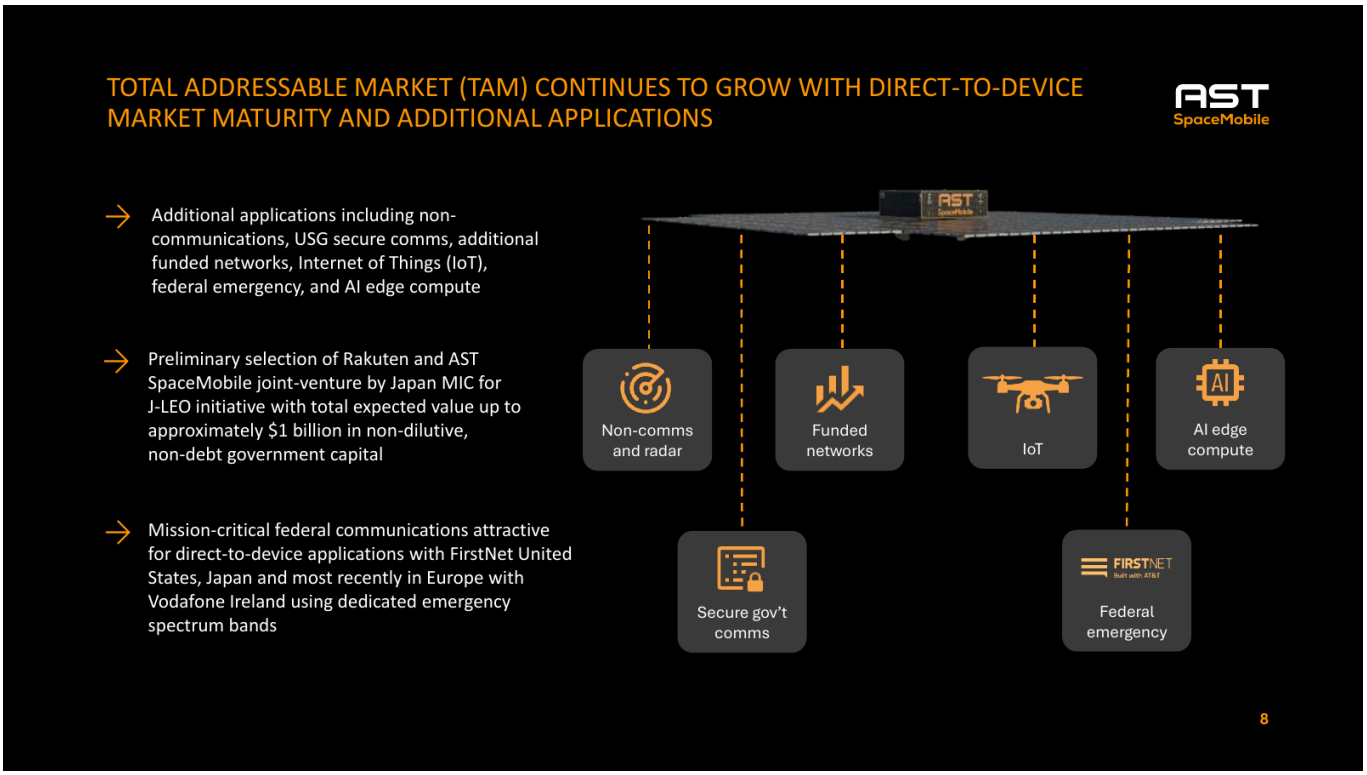

Figure S6. Second-quarter presentation page 8, 10 August 2026. Sovereign networks, sensing, secure communications and other applications expand the opportunity. Shared payload, spectrum, funding and ownership constrain company capture.

Market	Company capture mechanism	Model treatment
Consumer backup access	Wholesale service through activated MNOs	Capacity-limited paid users times net ARPU
Government communications and sensing	Funded milestones, secure service and later programs	Path-specific annual government revenue and margins
Sovereign networks	Satellite infrastructure, access rights and funded construction	Japan capital support is separate from sales and capacity
Emergency resilience and IoT	Usage and bundles using existing fleet resources	Within shared service capacity and existing vectors
Space-based AI compute	Early payload integration; BB47/48 cited as a target	No separate additive sales; amount and customer capture remain unresolved within shared platform programs

Japan capital support and ownership

Japan MIC budget material specifies JPY 150 billion for satellites, launches and ground facilities. CIAJ selected RAST as applicant and Rakuten Mobile as co-proposer on June 30, subject to required examination and approval. Management described up to approximately USD 1 billion of capital support for the planned joint venture and roughly half the investment in its Japanese-flagged subset.

The selected conditional bridge reimburses 50% of eligible commissioned cost. Eligible assets are 50% of new cost in the faster path,25% centrally and zero in the delayed path. Receipts follow one quarter later and each branch has a USD 1 billion cap. The underlying satellites, their costs, their capacity and their operating revenue are unchanged.

Weighted modeled receipts through Q4 2030 total USD 464.75 million. This forecast assumes that AST retains the modeled global wholesale economic access and that the support relieves its construction cash burden. Final cash recipient, asset control, profit allocation and tax treatment remain unresolved. Additional co-investment or diverted economics would require a new bridge.

Gross depreciation remains in selected operating profit. Capital-support receipts receive no assumed operating-income amortization. A separate asset-net or deferred-grant-income sensitivity quantifies an alternative accounting outcome. Cash taxes include a prudential taxable-support proxy; jurisdiction and final grant treatment require reassessment.

Capital bridge through Q4 2030	Faster	Central	Delayed	Weighted
Capital-support cash	973.5	442.8	0.0	464.8
Selected probability	25%	50%	25%	100%
Operating revenue added by support	0.0	0.0	0.0	0.0

Probability-weighted revenue

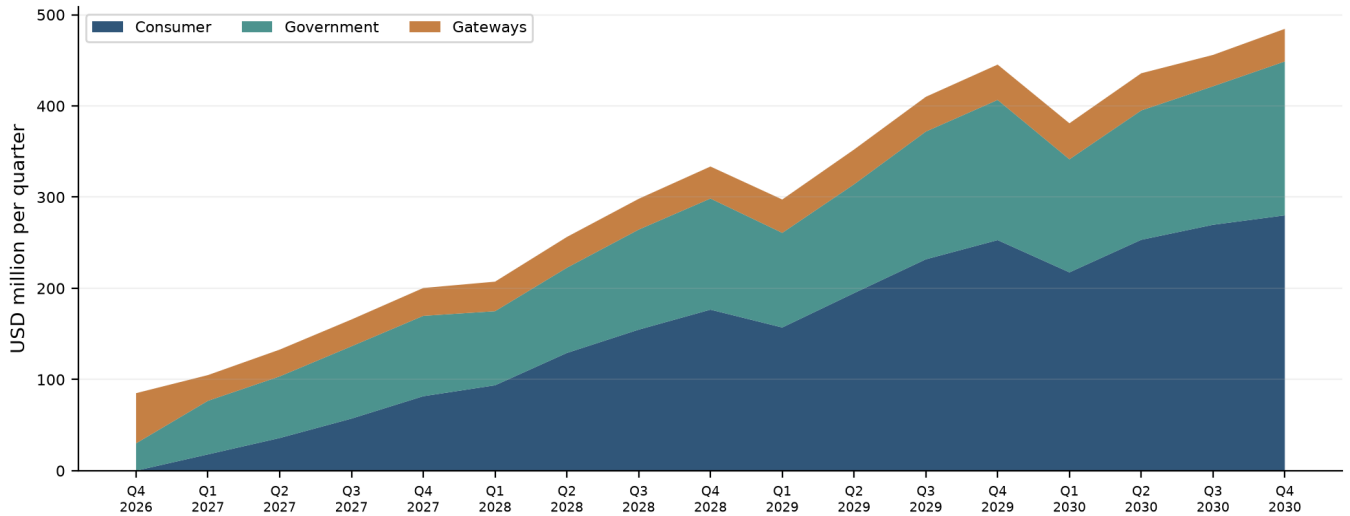

Figure F1. Selected probability-weighted revenue. Q3 2026 is held in the separate reconstruction. Service capacity, paid adoption, recognition and cash are calculated within each joint path before weighting.

F1 values / Quarter	Consumer	Government	Gateways	Total
Q4 2026	0.028017	30.0	55.0	85.0
Q1 2027	17.9	58.8	28.2	104.8

F1 values / Quarter	Consumer	Government	Gateways	Total
Q2 2027	35.8	67.6	29.4	132.8
Q3 2027	57.1	79.3	29.4	165.8
Q4 2027	81.7	88.1	30.6	200.3
Q1 2028	93.6	81.2	32.4	207.3
Q2 2028	129.1	93.4	33.8	256.3
Q3 2028	154.6	109.7	33.8	298.1
Q4 2028	176.6	121.9	35.1	333.5
Q1 2029	157.0	103.8	36.6	297.4
Q2 2029	194.7	119.3	38.1	352.1
Q3 2029	231.8	140.1	38.1	410.0
Q4 2029	252.8	153.7	38.8	445.3
Q1 2030	217.5	124.0	39.5	380.9
Q2 2030	253.2	141.8	40.8	435.8
Q3 2030	269.6	151.9	34.4	455.9
Q4 2030	280.0	168.8	35.8	484.5

Consumer revenues use regional eligible-account pools, paid take-up and the lower of demand and physical capacity. Government and gateways use acceptance profiles and the realized fleet completion fraction. Each vector has separate gross-profit assumptions.

Operating costs and earnings

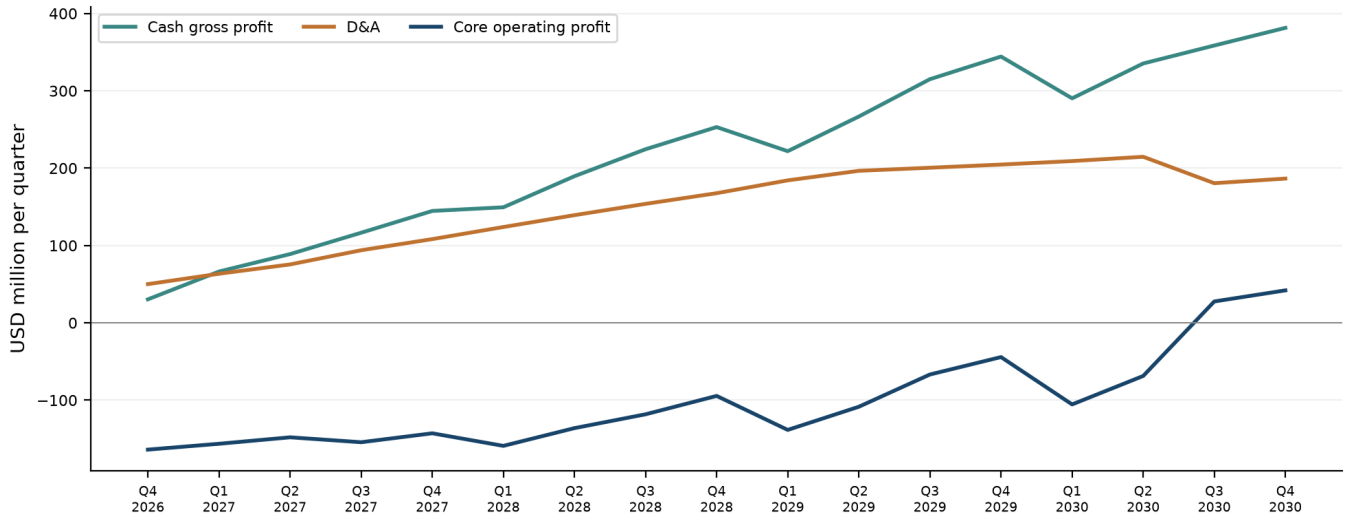

Figure F2. Core operating profit includes recurring cash overhead, share compensation, gross depreciation and spectrum cost. It excludes hypothetical capital-grant income. Weighted margin equals weighted operating profit divided by weighted revenue.

F2 values / Quarter	Cash GP	Cash fixed opex	SBC	D&A	Core OP	OP margin %
Q4 2026	30.4	114.3	29.9	50.1	(163.9)	(192.8)
Q1 2027	66.3	118.5	34.0	63.5	(156.4)	(149.2)
Q2 2027	88.9	120.7	34.0	75.5	(148.0)	(111.5)
Q3 2027	116.5	122.9	34.0	93.9	(154.4)	(93.1)
Q4 2027	144.7	125.1	34.0	108.2	(142.8)	(71.3)
Q1 2028	149.4	127.4	37.0	123.9	(159.1)	(76.7)
Q2 2028	189.6	129.8	36.6	139.2	(136.1)	(53.1)
Q3 2028	224.4	132.2	36.6	153.8	(118.3)	(39.7)
Q4 2028	253.1	134.6	25.2	167.6	(94.5)	(28.3)
Q1 2029	221.9	137.1	12.3	184.2	(138.4)	(46.6)
Q2 2029	266.7	139.6	12.3	196.6	(108.5)	(30.8)
Q3 2029	315.0	142.2	12.3	200.5	(66.8)	(16.3)
Q4 2029	344.3	144.8	12.3	204.6	(44.3)	(9.9)
Q1 2030	290.3	147.5	12.3	209.2	(105.5)	(27.7)
Q2 2030	335.3	150.3	12.3	214.7	(68.7)	(15.8)
Q3 2030	358.6	119.6	10.7	180.6	27.6	6.1
Q4 2030	381.4	122.1	10.7	186.5	42.0	8.7

A cash-positive period can still have an operating loss because depreciation and stock compensation are real economic costs. Initial satellite construction has already consumed cash before the assets enter service. The model

keeps capitalization, depreciation, operating cash and new financing separate.

Annual operating crosscheck

Year	Total revenue	Consumer	Government	Gateways	Core OP
2026	176.3	0.028017	53.4	122.8	(642.3)
2027	603.7	192.5	293.8	117.5	(601.6)
2028	1,095.2	553.9	406.2	135.0	(508.0)
2029	1,504.8	836.3	516.8	151.6	(358.0)
2030	1,757.1	1,020.3	586.4	150.4	(104.6)

USD million. The 2026 full-year total combines reported first-half revenue with reconstructed Q3 and modeled Q4. The 2026 core-profit comparison removes the BB7 net charge while retaining recurring SBC and D&A. Annual totals summarize the quarterly build; the ceiling calculation uses its exact forward-four-quarter window.

Year	Faster revenue	Central revenue	Delayed revenue	Faster OP	Central OP	Delayed OP
2027	993.8	583.1	254.9	(387.3)	(624.5)	(770.1)
2028	1,774.7	1,119.6	366.8	(58.2)	(551.6)	(870.4)
2029	2,455.7	1,551.8	459.8	330.0	(365.9)	(1,030.3)
2030	3,021.4	1,898.9	209.0	602.9	(248.6)	(523.9)

The 25% delayed tail first fails in Q2 2030. Subsequent service and operating cash cease in that outcome. Its value is not supported by the cash generated in the two funded paths. The model records unpaid obligations and an asset writeoff at the failure event.

Fleet and saleable capacity

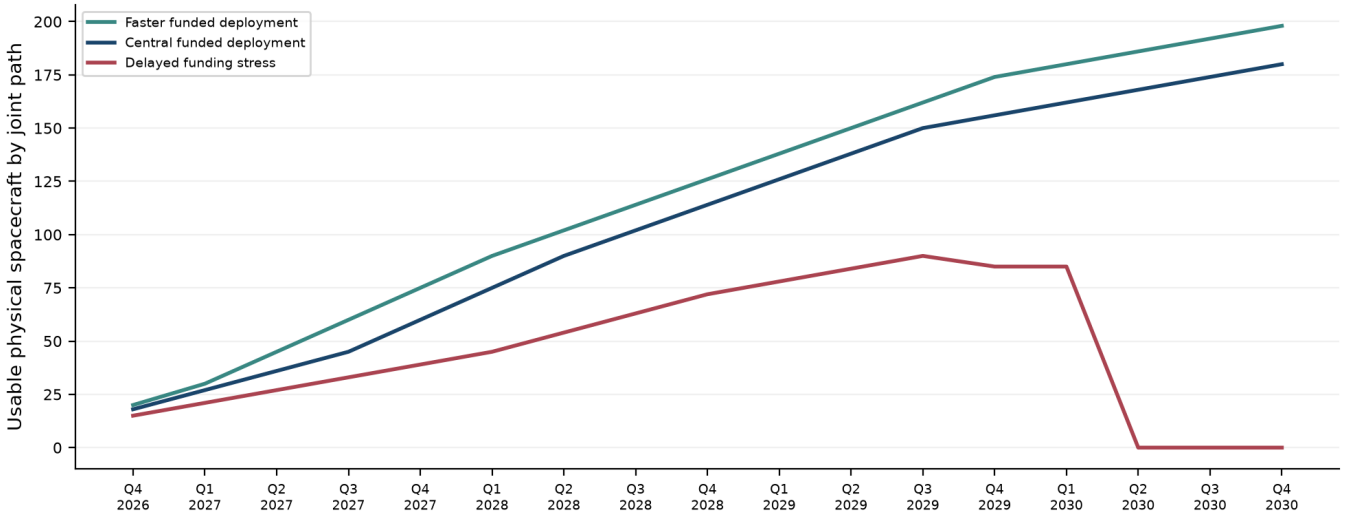

Figure F3. Operating fleets follow each joint path. The delayed path ceases service after default; physical assets can remain subject to creditor claims. Expected fleet statistics can be fractional because they weight mutually exclusive outcomes.

F3 values / Quarter	Expected usable fleet	ASIC equivalents avg	Consumer Gbps	Developed paid users m	Emerging paid users m
Q4 2026	17.8	2.9	1.3	0.002469	0.001461
Q1 2027	26.2	7.9	3.6	1.6	0.7
Q2 2027	36.0	15.9	7.2	3.2	1.4
Q3 2027	45.8	25.4	11.4	5.0	2.2
Q4 2027	58.5	36.3	16.3	7.2	3.1

Q1 2030	147.2	130.6	58.7	20.7	11.1
Q2 2030	130.5	135.1	60.8	25.1	11.6
Q3 2030	135.0	125.0	58.9	26.7	11.5
Q4 2030	139.5	129.8	61.2	27.8	11.9

Construction cash and depreciation

June satellite, materials, launch and prepayment CIP of USD 1,724.085 million has already consumed cash. Commissioning transfers an asset from CIP into the ready-for-use depreciation base. Charging its entire cost again as current cash would overstate funding needs.

The June filing reports satellite-in-orbit gross cost of USD 235.387 million at both December and June. The opening five-craft depreciating fleet and Q3 transfer of seven Block 2 craft are accounting-timing assumptions consistent with that category evidence. The physical BB6 array deployed earlier, and its exact intended-use date remains unavailable.

CFO guidance of USD 21-23 million includes launch and direct labor. Repeat-unit capital cost is USD 22 million in the funded paths; the delayed tail includes a 25% execution contingency. An initial seven-unit allocation uses the geometric midpoint of USD 22 million and the approximately USD 158.4 million reconstructed BB7 gross charge, or USD 59.034 million. This is a low-confidence allocation of existing CIP. Individual unit ledgers would improve it.

New satellite cohorts depreciate over twenty quarters with a half-quarter first and final convention. The source general satellite-life range is two to seven years; a Block 2-specific life has not been disclosed. A continuing two-quarter construction buffer includes Q1 and Q2 2031 inputs, so terminal cash does not rise by silently ending the production pipeline.

Quarter	Commissioned asset cost	Satellite cash	Factory cash	Ending sat CIP	D&A
Q4 2026	130.6	0.0	32.0	1,539.6	50.1
Q1 2027	195.2	0.0	32.0	1,346.5	63.5

Q4 2030	115.5	98.3	12.0	198.5	186.5

Liquidity and capital structure

June / July bridge	USD million
June unrestricted cash	2,288.3
June restricted cash	434.6
July notes gross	1,150.0
July net proceeds before capped calls	1,131.2
Capped-call premium	(111.4)
July usable financing addition	1,019.8
July pro forma unrestricted cash before later spending	3,308.1
Gross debt after July issue	4,172.2
Convertible principal	3,703.5
Annual cash coupons on five converts	73.7

The USD 428.4 million UBS cash collateral is restricted. Releasing that collateral and repaying the USD 420 million bridge are paired movements. The former USD 800 million ATM program is effectively exhausted and terminated. SoundPoint availability after its original October 5 window, extension and funding conditions remains unresolved.

Q3 2030	2,921.8	594.5	0.0	1,027.7
Q4 2030	3,212.9	666.3	0.0	1,136.4

A USD 500 million planning reserve approximates one quarter of first-half operating and investing uses. The general funding rule remains editable: when available funding is assumed and pre-financing cash falls below reserve, equity restores twice the buffer after fees. The dated financing reference is USD 36.33, with a 15% discount and 3% fee.

The selected funded paths need no additional equity; that result changes under adverse assumptions.

Economic shares and convertible notes

Instrument	Principal USD m	Approx strike USD	Potential shares m	Maturity
2032 4.25%	3.5	27.0	0.1	2032-03-01
2032 2.375%	325.0	72.1	4.5	2032-10-15
2036 2.00%	1,150.0	96.3	11.9	2036-01-15
2036 2.25%	1,075.0	116.3	9.2	2036-04-15
2034 1.625% July 2026	1,150.0	79.6	14.5	2034-02-01

The valuation reserve includes all economic units, probable awards and 40.2771 million gross potential convertible shares. It is a conservative denominator for the defined earnings arithmetic. The cash forecast retains contractual liabilities and coupons. It makes no assertion that holders convert early. The 2034 issue and 2.25% 2036 issue have no issuer early-redemption right.

The same-date June economic count plus July conversion reserve and June probable awards totals 441.545840 million. Using August Class A shares with June awards creates a bounded 58,232-share timing overlap. The model starts from the same-date count, separately rolls vesting, withholding and new awards, and keeps future financing share assumptions editable.

exchanges of AST LLC Common Units acquired by the Company, (C) tax deductions in respect of portions of certain payments made under the TRA, and (D) certain tax attributes that are acquired directly or indirectly by the Company pursuant to a reorganization transaction. All such payments to the TRA holders (as defined in the TRA) are the obligations of the Company, and not those of AST LLC. As of June 30, 2026, there have been no TRA liabilities recorded.

12. Net Loss per Share

Basic and diluted net loss per share attributable to the holders of Class A Common Stock is computed by dividing net loss attributable to common stockholders by the weighted-average number of shares outstanding during the period.

The following table sets forth reconciliations of the numerators and denominators used to compute basic and diluted net loss per share of Class A Common Stock (in thousands, except share and per share data):

	For the Three Months ended June 30, 2026	For the Six Months ended June 30, 2026
Numerator		
Net loss before allocation to noncontrolling interest	$ (299,919)	$ (549,500)
Net loss attributable to noncontrolling interest	(69,010)	(127,579)
Net loss attributable to common stockholders - basic and diluted	$ (230,909)	$ (421,921)
Denominator		
Weighted-average number of shares - basic and diluted	299,061,662	294,898,761
Net loss per share attributable to holders of Class A Common Stock - basic and diluted	$ (0.77)	$ (1.43)

	For the Three Months ended June 30, 2025	For the Six Months ended June 30, 2025
Numerator		
Net loss before allocation to noncontrolling interest	$ (135,903)	$ (199,531)
Net loss attributable to noncontrolling interest	(36,509)	(54,431)
Net loss attributable to common stockholders - basic and diluted	$ (99,394)	$ (145,100)
Denominator		
Weighted-average number of shares of Class A Common Stock outstanding - basic and diluted	241,571,070	232,892,845
Weighted-average number of penny warrants - basic and diluted	414,437	208,364
Weighted-average number of shares - basic and diluted	241,985,507	233,101,209
Net loss per share attributable to holders of Class A Common Stock - basic and diluted	$ (0.41)	$ (0.62)

As of June 30, 2026, the Company excluded from the calculation of diluted earnings per share 11,215,111 shares of Class B Common Stock, 78,163,078 shares of Class C Common Stock, and 12,159,478 shares of Class A Common Stock that may be issued pursuant to awards outstanding under the AST LLC Incentive Plan, the 2020 Plan and the 2024 Plan that are service-based and performance-based for which the underlying performance conditions are probable, and 25,824,820 shares of Class A Common Stock issuable upon conversion of the 2032 4.25% Convertible Notes, the 2032 2.375% Convertible Notes, the 2036 2.00% Convertible Notes, and the 2036 2.25% Convertible Notes (on an as-converted basis) as their effect would have been to reduce the net loss per share. Therefore, the weighted-average number of shares of Class A Common Stock outstanding used to calculate both basic and diluted net loss per share of Class A Common Stock is the same.

Shares of the Class B Common Stock and Class C Common Stock do not participate in the earnings or losses of the Company and are therefore not participating securities. As such, separate presentation of basic and diluted earnings per share of Class B Common Stock and Class C Common Stock under the two-class method has not been presented.

13. Spectrum Usage Rights and Related Financing

On January 5, 2025, AST LLC entered into a binding agreement (the “Strategic Collaboration Term Sheet”) with Ligado LLC under which the Company will receive long-term access to up to 45 MHz of lower mid-band spectrum in the United States and Canada for direct-to-device satellite applications. The Strategic Collaboration Term Sheet was entered into as part of the restructuring of Ligado LLC, which together with certain of its direct and indirect subsidiaries (together with Ligado LLC, “Ligado”) filed voluntary petitions for relief under Chapter 11 of the United States Bankruptcy Code in the United States Bankruptcy Court for the District of Delaware (“Bankruptcy Court”).

Figure S8. June 2026 Form 10-Q, source PDF page 25. Loss-quarter GAAP diluted EPS excludes antidilutive securities and uses the Class A weighted average. Consolidated forward network economics require the broader economic-unit bridge. Source share units follow the table labels.

Capped calls and debt optionality

January 2025 capped calls were sold in November 2025. The July 2025 hedge on the original USD 575 million notional remains outstanding after the related note principal fell to USD 325 million. Its approximate strike and cap are USD 72.07 and USD 120.12. The July 2026 hedge covers USD 1.15 billion, with an approximate USD 79.57 strike and USD 149.20 cap.

The selected valuation reserve receives no capped-call credit. The contractual sensitivity calculates the payoff per covered share as the positive difference between the lower of terminal price and cap, and the strike. Settlement elections, maturity and counterparty performance determine actual benefit. These protections are separate from current available cash.

The optional USD 550 million SoundPoint facility would yield about USD 533.5 million after a 3% draw fee. At an assumed 3% SOFR plus 8% spread, annual interest is USD 60.5 million. Idle cash at 3% yields USD 16.5 million, leaving USD 44 million of annual incremental carry before a possible USD 5.5 million extension fee. The model assigns 25% eligibility/early-draw probability as a counterfactual, and selects no draw when the modeled timing provides no need within the facility window.

6. Debt

Long-term debt consists of the following (in thousands):

	As of	
	June 30, 2026	December 31, 2025
2032 4.25% Convertible Notes	$ 3,514	$ 50,000
2032 2.375% Convertible Notes	325,000	575,000
2036 2.00% Convertible Notes	1,150,000	1,150,000
2036 2.25% Convertible Notes	1,075,000	-
Prosperity Capital Equipment Loan	-	12,552
Prosperity Term Loan	-	4,242
Trinity Capital Equipment Loan[(1)]	48,638	52,641
UBS Bridge Financing Loan	420,000	420,000
Total debt	$ 3,022,152	$ 2,264,435
Less: current portion of long-term debt	(8,494)	(11,999)
Less: unamortized debt issuance costs[(1)]	(50,236)	(44,853)
Long-term debt, net of issuance costs	$ 2,963,422	$ 2,207,583

(1) Includes unamortized end of term payments of $3.4 million and $4.0 million as of June 30, 2026 and December 31, 2025, respectively.

As of June 30, 2026, the aggregate fair value of the Company's debt was $3.5 billion, which included the fair value of the 2032 4.25% Convertible Notes of $12.6 million, the 2032 2.375% Convertible Notes of $512.8 million, the 2036 2.00% Convertible Notes of $1,338.7 million and the 2036 2.25% Convertible Notes of $1,154.6 million. As of December 31, 2025, the aggregate fair value of the Company's debt was approximately $2.5 billion, which included the fair value of the 2032 4.25% Convertible Notes of $147.2 million, the 2032 2.375% Convertible Notes of $760.8 million, and the 2036 2.00% Convertible Notes of $1,156.7 million. The fair value of the 2032 4.25% Convertible Notes was determined based on recent observable market quote in an active market and rolled forward to the balance sheet date using significant inputs derived from, or corroborated by, observable market data (Level 2 inputs). The fair value of the 2032 2.375% Convertible Notes, the 2036 2.00% Convertible Notes, and the 2036 2.25% Convertible Notes were determined based on observable market quotes in an active market around period-end (Level 1 inputs). The fair value of remaining debt has been determined under the discounted cash flow method using significant inputs derived from, or corroborated by, observable market data (Level 2 inputs).

Debt discount and issuance costs are comprised of costs incurred in connection with debt issuance and are presented in the unaudited condensed consolidated balance sheets as a deduction to the carrying amount of the debt and amortized using the effective interest method to interest expense over the term of the debt. During the three and six months ended June 30, 2026, the Company recognized $23.6 million and $45.3 million of interest expense related to the debt noted above, respectively. The interest expense included amortization of debt issuance costs of $2.1 million and $4.2 million for the three and six months ended June 30, 2026, respectively. During the three and six months ended June 30, 2025, the Company recognized $5.7 million and $10.4 million of interest expense, respectively. The interest expense included amortization of debt issuance costs of $0.4 million and $0.7 million for the three and six months ended June 30, 2025, respectively.

As of June 30, 2026, the Company was in compliance with all debt covenants requirements.

2032 4.25% Convertible Notes

On January 27, 2025, the Company issued $460.0 million aggregate principal amount of convertible senior notes due 2032 (the "2032 4.25% Convertible Notes"), including the exercise in full of the option granted to the initial purchasers to purchase up to $60.0 million aggregate principal amount of notes. The 2032 4.25% Convertible Notes are senior, unsecured obligations of the Company and bear interest at a fixed rate of 4.25% per year, payable semiannually in arrears on March 1 and September 1 of each year, beginning on September 1, 2025. The 2032 4.25% Convertible Notes will mature on March 1, 2032, unless earlier repurchased, redeemed, or converted.

Holders may convert their notes at their option at any time prior to the close of business on the business day immediately preceding December 1, 2031 only under the following conditions: (1) during any calendar quarter commencing after the calendar quarter ending on June 30, 2025 (and only during such calendar quarter), if the last reported sale price of the Company's Class A Common Stock for at least 20 trading days (whether or not consecutive) during a period of 30 consecutive trading days ending on, and including, the last trading day of the immediately preceding calendar quarter is greater than or equal to 130% of the conversion price on each applicable trading day; (2) during the five business day period after any ten consecutive trading day period (the "measurement period") in which the trading price per $1,000 principal amount of notes for each trading day of the measurement period was less than 98% of the product of the last reported sale price of the Company's Class A Common Stock and the conversion rate on each such trading day; (3) if the Company issues a notice of redemption, at any time prior to the close of business on the scheduled trading day immediately preceding the redemption date; or (4) upon the occurrence of specified corporate events. On or after December 1, 2031 until the close of business on the second scheduled trading day immediately preceding the maturity date, holders may convert all or any portion of their notes at any time, at the option of the holder regardless of the foregoing conditions. Upon conversion, the Company will pay or deliver, as the case may be, cash, shares of the

Figure S9. June 2026 Form 10-Q debt note, source PDF page 14. Principal, coupons, cash obligations and conversion or call conditions require tranche-specific treatment. The five-tranche table includes the separate July financing disclosed later in the same filing.

Quarterly earnings valuation

Each branch calculates its four-quarter operating earnings and divides 20 times that amount by its own economic dilution reserve. The active diagnostic weights those branch per-share results. It does not divide average earnings by average shares after nonlinear funding events.

I select 20 times within the framework 15-30 times reference range. Constellation replacement capital, launch dependency, competing D2D capacity, unproven wholesale ARPU and dilution support this selection below the upper end. Recurring stock compensation and gross depreciation remain expenses. The multiple was selected before computing the price arithmetic.

The active Q4 2027 window is Q4 2027-Q3 2028. Its signed arithmetic is USD(25.28) per reserve unit. All fourteen active windows are negative, so their earnings-based price-ceiling display is neg. These calculations expose the amount of operating improvement needed for this method to support a positive value.

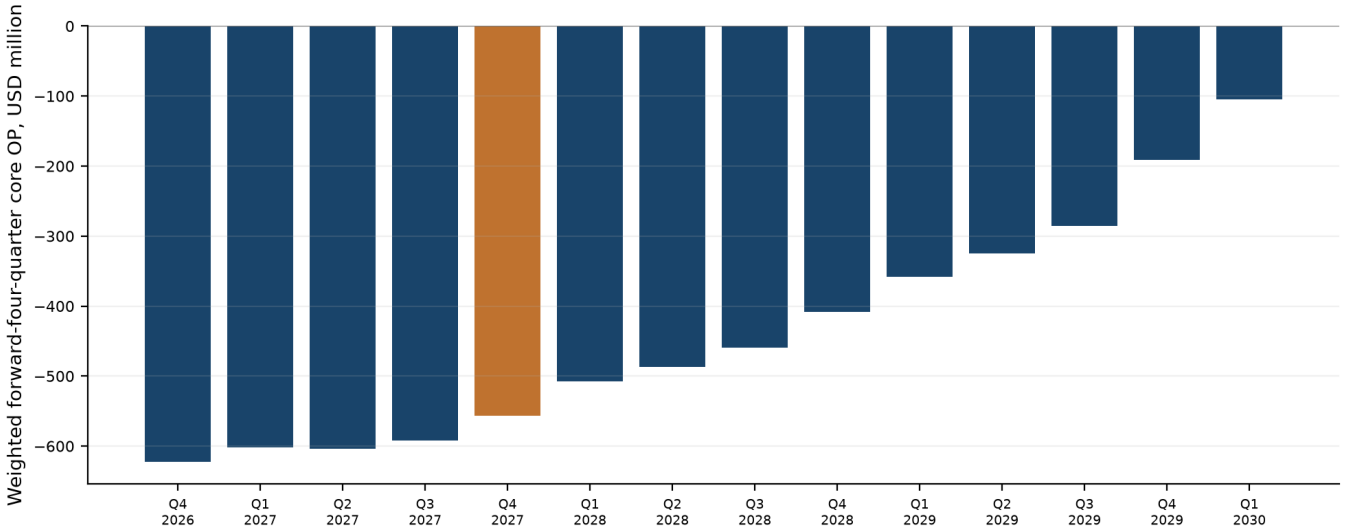

Figure F5. Forward earnings behind the quarterly valuation path. The highlighted Q4 2027 selection prices Q4 2027-Q3 2028. Signed diagnostics are shown separately from unavailable positive equity-price ceilings.

F5 values / Quarter	Exact window	Weighted F4Q OP	Multiple	Ceiling	Signed diagnostic

Q1 2030	Q1 2030 to Q4 2030	(523.9)	20.0	440.0	(23.8)

These are conditional branch calculations. The single active distribution retains all three paths at 25%, 50% and 25%. Negative operating windows provide no positive earnings-based ceiling. The dilution reserve includes potential securities; actual conversion timing remains separate from the contractual cash test.

Engineering and cost sensitivity

Unselected control	2030 revenue	2030 core OP	Q4 2027 signed diagnostic	Positive active windows
Spectral efficiency 0.5 bit/s/Hz	1,274.5	(514.7)	(33.9)	0.0
Spectral efficiency 2.0 bit/s/Hz	2,215.3	108.3	(17.7)	2.0
Usage 0.25 GB per paid-user month	2,232.9	123.3	(17.6)	2.0
Usage 1.0 GB per paid-user month	1,278.4	(511.4)	(33.7)	0.0

Each control changes one engineering assumption while preserving the remaining financial law. Actual traffic load, spectral efficiency, usage, geography and paid attach need measurement. Low usage can support more paying access subscribers on the same capacity, while high usage consumes that capacity faster. A new positive distant window in a sensitivity leaves the selected probabilities and published horizon unchanged.

Satellite life, initial unit cost, equity issue price, grants, withholding and wholesale retention also affect cash and per-share results. Their controls and complete quarterly states are retained in the linked financial model. Forecast cash receipts and financing availability remain conditional.

Rule 16b numerical probability ledger

The central funded path is the no-increment comparison control. The single active law is 25% faster funded,50% central funded and 25% delayed funding stress. Each path carries its own physical capacity, revenue, costs, cash, shares and failure behavior. Scenario probabilities are subjective judgments about joint outcomes. Source authenticity is assessed separately.

Year	Known-award comparison	Faster government	Central government	Delayed government	Active government	Increment above control
2027	125.0	500.0	275.0	125.0	293.8	168.8
2028	125.0	650.0	400.0	175.0	406.2	281.2
2029	125.0	800.0	525.0	217.3	516.8	391.8
2030	125.0	950.0	650.0	95.6	586.4	461.4

The USD 125 million known-award scale is a comparison amount with uncertain remaining recognition timing. Modeled government revenue consumes those existing awards and later conditional programs. Government, gateway and consumer receipts share the same satellite and contract ledger.

Launch and ASIC realization

The joint timing paths reach 45 commissioned satellites in Q2 2027, Q3 2027 and Q1 2028. The initial seven Block 2 accounting transfers use FPGA capacity. New manufacturing is capped at 18 good units per quarter. The capacity bridge determines the revenue increments shown below. Verified launch manifests, commissioning, ASIC throughput and country permissions are the update tests.

Signal reference: ASTS-LAUNCH-ASIC-2026Q2-OCTNOV. Sources: August 10 presentation and call; October 20 readiness update; November 2 AT&T handoff announcement.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Consumer monetization

Paid users are the lower of regional eligible paid demand and capacity at the selected usage. Central net ARPU is USD 3.00 developed and USD 1.25 emerging per month. All take-up, usage, geography and wholesale terms are low-confidence proxies. The consumer allocation reserves 35% of capacity for other applications. Actual price, attach, retention and usage measurements would change these inputs.

Signal reference: ASTS-CONSUMER-MONETIZATION. Sources: Issuer MNO-reach disclosures and the current T-Mobile and O2 retail offers.

Faster probability	Central probability	Delayed probability
25%	50%	25%

First full commercial year

The first-full-year management goal approaching USD 1 billion is conditional on service start. The faster 2027 build derives USD 993.8 million; the central path reaches about USD 1.12 billion in 2028. Government, gateways and consumer capacity create that total. The goal, backlog and RPO provide overlapping evidence for the same revenue.

Signal reference: ASTS-FIRST-FULL-COMMERCIAL-YEAR-REVENUE. Sources: August 10 management Q&A on the first full commercial year.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Government programs

Government 2027 conditional annual outcomes are USD 500 million, USD 275 million and USD 125 million. At 25/50/25 weighting, active government revenue is USD 293.75 million. Cash gross margins are 85%, 80% and 70% before separately modeled SBC, corporate expenses and gross D&A. Task awards, milestone acceptance, collections and procurement recompetitions are the key tests.

Signal reference: ASTS-GOVERNMENT-PROGRAMS. Sources: Second-quarter awards, funded government work and the August 10 call.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Gateway infrastructure

Gateway 2027 annual paths are USD 130 million, USD 120 million and USD 100 million. The current fleet completion and acceptance schedule constrain recognition. A rough shipment check divides sales by the Q2 product-revenue/thirteen-gateway proxy; product and software mix remain uncertain. Current mixed-stage gateway counts add no separate sales multiplier.

Signal reference: ASTS-GATEWAY-INFRASTRUCTURE. Sources: Second-quarter product results, gateway deliveries and management Q&A.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Capital cost and life

The funded paths use USD 22 million per repeat unit, within the CFO 21-23 million range that includes labor and launch. The delayed tail uses USD 27.5 million with a 25% contingency. Initial seven-unit costs use a USD 59.034 million existing-CIP allocation proxy. Twenty-quarter depreciation and the continuing two-quarter pipeline determine costs and cash. Reported unit ledgers and useful lives would replace these proxies.

Signal reference: ASTS-COST-CAPITALIZATION-AND-LIFE. Sources: June 30 Form 10-Q property note and CFO call guidance on cost including labor and launch.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Funding and dilution

Starting June unrestricted cash is USD 2,288.253 million and the known July usable addition is USD 1,019.8 million. Contractual liabilities remain in cash. The selected funded paths require no additional equity. The delayed outcome cuts capex, first defaults in Q2 2030 and ceases later service. No cash transfers between paths support that outcome.

Signal reference: ASTS-CASH-CREDIT-AND-DILUTION. Sources: June 30 cash, debt, compensation and share notes; July 20 financing; dated November 2 closing quote.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Capped calls

Source-contract authenticity is 100%. Economic benefit depends on settlement conditions and terminal prices. The selected gross 40.2771 million convertible-share reserve receives no hedge credit. Contract sensitivities quantify the payoff separately. Actual exercise, settlement, unwind, maturity and counterparty performance are update tests.

Signal reference: ASTS-CAPPED-CALLS. Sources: 2025 Form 10-K capped-call disclosures and the June 2026 filing.

Optional SoundPoint facility

The eligibility and early-draw counterfactual has 25% probability. USD 550 million gross yields USD 533.5 million before a possible extension fee. Assumed annual interest is USD 60.5 million and idle-cash income USD 16.5 million. The selected path has no need within the modeled availability window, so active proceeds are zero. Closing, verified extension and a timely funding need would change that disposition.

Signal reference: ASTS-SOUNDPOINT-OPTIONAL-FACILITY. Sources: June 2026 Form 10-Q SoundPoint terms and liquidity discussion.

Japan capital support

The same-fleet capital-support bridge applies 50% support to 50% eligible cost faster and 25% centrally, with a one-quarter lag and USD 1 billion branch cap. Delayed support is zero. Weighted receipts are USD 464.75 million through Q4 2030. Current operating revenue and gross D&A remain identical to the zero-support control. Final recipient, control, profit rights and tax treatment can change this endpoint.

Signal reference: ASTS-JLEO-CONDITIONAL-CAPITAL-SUPPORT. Sources: Japan MIC budget, CIAJ June 30 selection and the August 10 management discussion.

Faster probability	Central probability	Delayed probability
25%	50%	25%

Existing BB7 insurance receivable

Authenticity of the recognized USD 10.9 million receivable is 100%. Cash timing follows the 25/50/25 joint paths: Q4 2026 in funded paths and Q1 2027 in the delayed path. Cash clears the existing receivable with no new earnings. Receipt disclosure, dispute or a longer settlement delay would change timing.

Signal reference: ASTS-BB7-EXISTING-INSURANCE-RECEIVABLE. Sources: June 30 Form 10-Q Note 4 insurance receivable.

What would change the assessment

Test	Evidence that supports a stronger case	Evidence that weakens it
Fleet and reliability	Launch manifests and commissioned units meeting the conditional path	Further launch losses, long commissioning delays or assembly bottlenecks
Commercial load	Paid users, sustained throughput and repeat usage with measured net receipts	Low attach, unavailable gateways, congestion or weak wholesale retention
Economics	Observed satellite costs, product mix and service margins consistent with scale	Higher renewal capex, short useful lives, repeated operating-cost increases
Government and sovereignty	Accepted funded task work and clear Japan capital terms	Delayed awards, diverted JV rights or contingent cash that fails to arrive
Competition	Commercial differentiation and retained carrier economics	Low-price broadband substitutes or partners selecting competing capacity
Capital	Cash and contractual liabilities reconciling to the path	New financing discounts, higher debt cost or insufficient unrestricted liquidity

Near-term dated tests include the November 9 results, completed launch and commissioning disclosures, paid-service activation, gateway acceptance and government milestones. Any change enters its company-specific operating and funding bridge. A moved calendar quarter is evaluated separately from a forecast revision.

Cross-company context

ASTS overlaps the LEO and defense themes through resilient communications and sovereign infrastructure. Its demand is driven by connectivity, government procurement and mobile-network distribution. Broad AI infrastructure spending alone supplies no direct revenue input. AI-compute optionality needs a paid customer, a power and thermal budget, downlink economics and an allocated payload before a distinct operating vector is added.

Launch providers affect delivery timing and launch prices. The current model uses total satellite cost and launch constraints; it creates no automatic revenue revision for another covered stock. Mobile-operator distribution can span several satellite providers. Source mentions of suppliers and competing platforms remain research context until their own company capture is assessed.

Source scope and remaining unknowns

Both newest calls are preserved in full, including Q&A, from Quartr through StockAnalysis. An official issuer-authored full transcript was not located. The Q2 replay presents registration and the Q1 current webcast field is blank. Official audio was not downloaded or independently listened to. Filing and presentation quantities resolve transcription discrepancies such as nine versus ninety satellites.

The latest financial filing is June 2026, filed August 10. Current November cash, Class A share count and facility extension status remain unavailable until updated disclosures. Earlier-quarter cash and asset inputs are current reconstructions. Their purpose is to connect the known balance sheet to future forecasts.

Key operating gaps are current flight-generation mix, commissioning status, sustained throughput, regional paid take-up, average usage, current wholesale terms and net ARPU. Country permissions and gateways retain their stated readiness categories. The Brazil permission is issuer-reported; underlying Portuguese orders were not obtained.

Japan cash recipient, asset control, global capacity access, profit allocation, co-investment and tax or grant accounting remain material conditions. The selected cash-support outcome can fail if those rights differ. Capped-call value and note settlement follow their contractual terms; potential diluted reserve shares are separate from assumed actual conversions.

Several new issuer and partner releases are preserved as exact rendered primary-source captures because raw HTML routes were unavailable. The launch search is bounded to reviewed issuer and partner materials. It does not establish a complete global orbital catalog. These limits narrow the claims and identify the next numerical inputs to test.
