Planet Labs PBC | PL

Review date: 2 November 2026, America/Toronto (calendar Q426). Financial-law revision: 25 October 2026, R14. Selected valuation start: Q427. Latest reported quarter: 31 July 2026; results released 3 September 2026. Holding status: unrecorded. Classification: Watchlist; temporal Earth-observation data and sovereign-space capability. The financial tables retain the October25 law; this review adds evidence and source-specific interpretation.

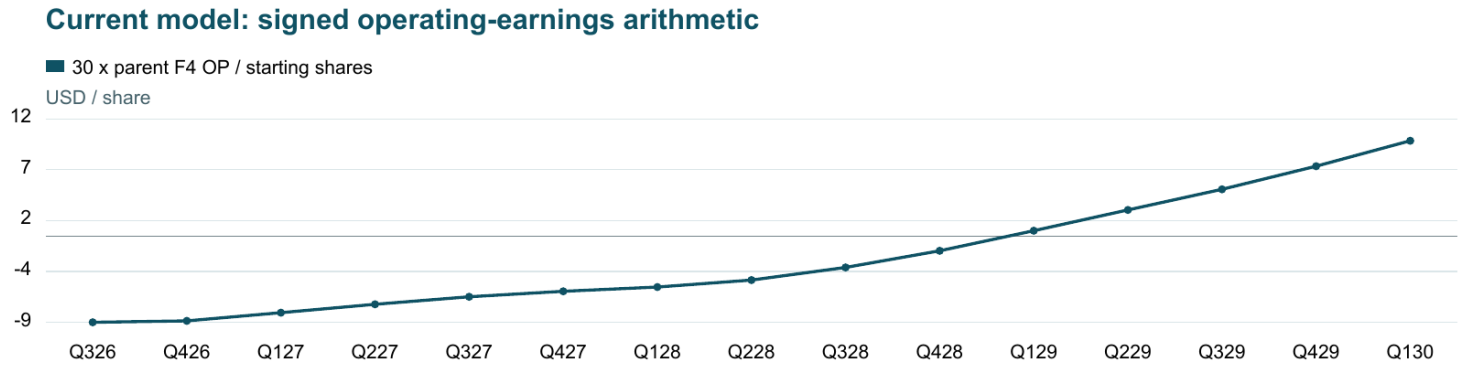

The collection archive, distribution software and sovereign relationships support a growing business. Full manufacturing, service, cloud, D&A and stock compensation costs leave the active four-quarter operating-earnings window negative. The sanctioned method therefore supplies no positive earnings-supported ceiling.

Opening reference	Selected interpretation
Saved quote	USD 23.93; retained historical quote with an unverified date.
Active window	Q427-Q328
Parent core operating earnings	-79.339 million USD
Method	30 x rolling four-quarter parent core operating earnings / starting-quarter shares
Starting-quarter shares	416.823529 million
Signed arithmetic	-5.710275 USD/share
Meaning	The active loss window has an unavailable earnings-supported ceiling. Its signed formula output is retained as a diagnostic; price upside remains unavailable.
Analytical score	43/60 = 72%, Watchlist; price independent. Protected Excel Base remains 72.

FINANCING CONDITION: The zero-principal-cash baseline is conditional on holder conversion and the resulting settlement. The issuer can choose cash or shares upon conversion; it has no disclosed right to pay an unconverted maturity in shares. Unconverted notes require USD 460 million cash at 15 October 2030. The full-cash diagnostic invalidates both slow operating paths; even 25% principal cash invalidates the slow-delayed path. There is no assumed ATM, refinancing or capped-call rescue.

Financial amounts are USD millions unless stated. I reconstruct six fully costed conditional paths using the operating assumptions and financing limits presented below.

All fifteen complete four-quarter derivations

F01. Signed operating-earnings diagnostic under the retained method. Loss windows have an unavailable earnings-supported ceiling; their signed formula outputs remain visible.

Start	Quarter 0 OP	Quarter 1 OP	Quarter 2 OP	Quarter 3 OP	F4 parent OP	Start shares (million)	Signed screen (USD/share)
Q326	-26.2410	-32.9897	-31.4010	-29.3576	-119.9894	403.0000	-8.932215
Q426	-32.9897	-31.4010	-29.3576	-25.0717	-118.8201	405.7647	-8.784898
Q127	-31.4010	-29.3576	-25.0717	-22.2005	-108.0308	408.5294	-7.933147
Q227	-29.3576	-25.0717	-22.2005	-20.1752	-96.8049	411.2941	-7.061000

Q427	-22.2005	-20.1752	-19.2271	-17.7365	-79.3392	416.8235	-5.710275
Q128	-20.1752	-19.2271	-17.7365	-16.5429	-73.6817	419.5882	-5.268140
Q228	-19.2271	-17.7365	-16.5429	-10.4545	-63.9610	422.3529	-4.543188
Q328	-17.7365	-16.5429	-10.4545	-1.0449	-45.7787	425.1176	-3.230546
Q428	-16.5429	-10.4545	-1.0449	6.6576	-21.3846	427.8824	-1.499333
Q129	-10.4545	-1.0449	6.6576	13.2777	8.4360	430.6471	0.587671
Q229	-1.0449	6.6576	13.2777	20.7851	39.6756	433.4118	2.746272
Q329	6.6576	13.2777	20.7851	30.3949	71.1153	436.1765	4.891275
Q429	13.2777	20.7851	30.3949	42.2532	106.7109	438.9412	7.293291
Q130	20.7851	30.3949	42.2532	52.8844	146.3176	441.7059	9.937671

Each quarter: parent OP=(operating OP+parent cost Q) x ownership P - Q - outside claim R. The native P/Q/R paths are 1/0/0; unit factor 1 and multiple 30 remain unchanged. Each row sums the four quarterly parent OP values, then applies the starting-quarter denominator. Q326 is a current reconstruction; the immutable historical as-then display retains its own vintage. The last three of 18 financial rows have incomplete F4 windows and no ceiling; no tail earnings are invented.

Opening calculation controls

These two captured controls verify the denominator and quarterly parent-claim transport. They are diagnostics only; the selected native paths remain unchanged. Neither changes the current company operating-profit path.

Control	Diagnostic inputs	Raw F4 OP	Parent F4 OP	Signed 30 x arithmetic (USD/share)	Definition
starting shares plus 10 pct	shares 5=458.505882	-79.339	-79.339	-5.191159	Available
nonneutral parent control Q427	ownership 5=0.800000; parent cost 5=2.000000; outside claim 5=3.000000	-79.339	-78.299	-5.635416	Available

All fifteen complete F4 derivations appear on the preceding page. The protected 18-quarter denominator path is 403 to 450 million shares; each complete window uses its own starting-quarter value. No incomplete final-window ceiling is extrapolated, and no current reconstruction replaces a historical published vintage.

The business and the financial hurdle

Planet sells repeat observation, requested high-resolution collections, hyperspectral measurements, software access, and customer spacecraft programmes. Its differentiated archive and integrated delivery architecture support switching friction, but demand must become usable paid service after manufacturing, launch and acceptance. I model the conversion from demonstrations to paid capacity through explicit operating scenarios.

Latest actual: Q2 FY2027	USD million / ratio
Revenue	116.052
Gross profit	65.632
Operating expense	79.141
Operating profit	-13.509
D&A	10.788
Reported P&L SBC, net of capitalization	17.060
Adjusted EBITDA	13.928
Gross margin	56.55%

The latest quarter combines positive adjusted EBITDA with a GAAP operating loss. Substantial D&A and stock compensation remain full costs in the model. Sources: Q2 FY2027 Form 10-Q and issuer results, financial statements and non-GAAP reconciliation [q2_10q, q2_results].

The reported 109% net-dollar-retention metric compares recurring ACV over the six months ended July 31. I use annual 1.09 continuation as an explicit LOW planning assumption. Recurring ACV includes dedicated image-tasking capacity and excludes satellite-services contracts; contract performance obligations determine the classification. [q2_10q, PDF39-40]

Reported guidance and the selected current-year bridge

Source guidance was published 3 September 2026. I select planning points within those disclosed ranges and derive the corresponding full-cost financial path. H1 is reported actual; Q3 and the derived Q4 are fiscal periods.

Measure	H1 actual	Q3 issuer range	Q3 selected	FY issuer range	FY selected	Q4 residual
Revenue	210.202	101 to 105	103.000	430 to 441	435.500	122.298
Non-GAAP gross margin	57.70%	56 to 58%	57.00%	55 to 57%	56.50%	54.02%
Adjusted EBITDA	12.895	-6 to -1	-3.500	3 to 10	6.500	-2.895
Issuer-defined cash capex	47.091	30 to 37	33.500	100 to 115	107.500	26.909

Q4 revenue =selected full year -reported H1 -selected Q3. Q4 non-GAAP gross profit =selected FY revenue x selected FY margin -reported H1 non-GAAP GP -selected Q3 revenue x selected Q3 margin. Q4 adjusted EBITDA and capex are the same full-year less H1 less Q3 residual. The model subsequently derives full GAAP cost, D&A, SBC and operating profit; operating earnings retain the full GAAP cost basis.

Source: Q2 FY2027 issuer results, PDF4-5. The Swedish handover accelerated into reported Q2 and was already in the unchanged annual outlook; the model counts that handover once across the results and later contract disclosure. Capex includes Berlin/SF and Pelican/Owl long-lead procurement; ownership changes can reclassify existing basis into customer delivery while preserving the original cash outlay. [q2_results, calls]

Source non-GAAP gross-profit proofs: H1 FY2027:116.033+3.673+1.635-0.057=121.284; Q2 FY2027:65.632+1.869+0.815=68.316. These bridges remove the stated SBC/acquired-amortization and signed source adjustments; fleet D&A remains in gross profit. [q2_results, PDF17]

Framework assessment: operating quality and risk

Category	Points	Range	Reason
Core	16	20	Daily wide-area archive, calibration, distribution and tasking integration create switching friction and an increasingly scarce longitudinal dataset. Sovereign services deepen integration. Rival high-resolution/rapid-tasking constellations and customer insourcing constrain the moat; the moat remains exposed to competing capabilities.
Cycle	8	10	Defense demand, funded constellation programmes and a larger contracted book support commercial scaling. Hardware acceptance, launch/calibration and advance-funded cash remain lumpy; D&A and SBC keep full-cost operating profitability under pressure.
TAM	9	10	Defense, civil monitoring, agriculture, insurance, mapping and AI applications offer multiple revenue paths. Adoption is constrained by usable resolution, latency, rights, integration and customer budgets. Orbital compute enters through the bounded research option; scaled commercial MW sales require an identified contract.
Catalysts	4	5	Berlin first completion/early 2027 launch, Owl paid acceptance, customer handovers and distinct NASA/ESA evaluations provide dated tests. Facility maximums and demonstrations supply milestones whose conversion to accepted output and paid utilization is tested separately.
Macro	8	10	Sovereign intelligence resilience and European procurement are supportive, while public budgets, export restrictions and launch economics remain constraints. The assessment counts the specific US/EU exposure once.
Alpha	3	5	Separating lifetime bundles, shared capacity, GAAP costs, customer advances and demonstration announcements improves the analytical edge. Widely public defense/AI enthusiasm and incomplete contract economics limit confidence.
Risk deduction	-5	5	Maximum penalty for simultaneous manufacturing/launch/acceptance, competition, SBC, advance cash timing and conditional convertible financing exposure. Full unconverted 460 M principal is a genuine legal cash risk; weak operating regimes cannot fund it without additional action.

Category points total 48. Five distinct risk classes deduct 5, leaving 43/60, or 71.67%, rounded to 72%. The analytical Watchlist assessment is independent of the saved quote. Protected Excel Base 72 is unchanged. Manufacturing/acceptance, competition, stock compensation, customer-advance timing and conditional convertible financing are separate risk channels; the maximum risk deduction is already applied.

What Planet supplies

Issuer rendering of a Pelican spacecraft intended for Berlin production. Rendering published by Planet Labs PBC; attribution: Planet Labs PBC. [berlin]

Planet combines Earth-observation data, delivery software and services with spacecraft programmes for customers seeking dedicated or sovereign access. The collection layer spans broad-area PlanetScope monitoring, high-resolution SkySat and Pelican tasking, and Tanager hyperspectral observations. These products answer different questions: repeat imagery shows change across an area, tasking requests a closer look, and hyperspectral measurements help identify materials and emissions.

Sources: [sweden], [tasking], [nasa].

The customer contract can include a physical satellite, its operation, data access and additional image rights. Other arrangements reserve collection capacity on spacecraft that also serve more customers. The resulting business includes manufacturing, mission operations, cloud processing and professional services as well as repeat data delivery. Standalone gross margins for every product and for satellite services remain undisclosed within the published customer-group figures.

Sources: [q2_10q], [jsat], [germany240], [di7].

The January 2026 issuer announcement also described Owl as a forthcoming constellation designed for near-daily one-metre imagery. The design description sets the intended capability; operating availability, timing and paid adoption require separate customer evidence.

Sources: [sweden].

From collection to a customer workflow

A usable observation passes through spacecraft construction, launch, commissioning and calibration before routine collection and delivery. Ground stations, processing systems and APIs then turn collections into imagery products and analytical workflows. The Berlin operation also houses mission control and processing functions; the issuer says its stations in Germany, the UK, Norway and Iceland downlink nearly half of Planet's worldwide satellite data.

Sources: [berlin], [tanager_light], [p12].

SkySat and Pelican tasking share a delivery channel: official documentation allows an order to be fulfilled by either constellation when the customer account and available capacity permit. Collection remains constrained by illumination, clouds and scheduling. Flexible orders specify a collection window; actual delivery depends on the stated collection constraints. Tanager sensitivity settings also trade greater exposure against area coverage.

Sources: [tasking], [tasking_rules], [credits].

Software can connect several data providers and distribute their collections within one workflow. The Slovenian resilience prototype combines open Copernicus inputs with PlanetScope monitoring, then directs requests to commercial high-resolution providers, including Planet. Its role is to find a relevant event and obtain a suitable follow-up image; Planet revenue depends on the selected provider and paid contractual scope.

Sources: [slovenia], [slovenia_tech].

Different contracts can use the same spacecraft

The JSAT programme illustrates the combination of ownership and shared commercial capacity. Planet's January 2025 announcement describes USD 230 million of build, delivery and operating services over an estimated seven-year recognition period. The customer later specified ten Pelicans, with launches and services introduced in stages. JSAT owns the constellation, while Planet retains the ability to serve its own customers using the expanded fleet. The package total covers the combined spacecraft and service obligations; a bare-satellite price remains undisclosed.

Sources: [jsat], [jsat_customer], [jsat10].

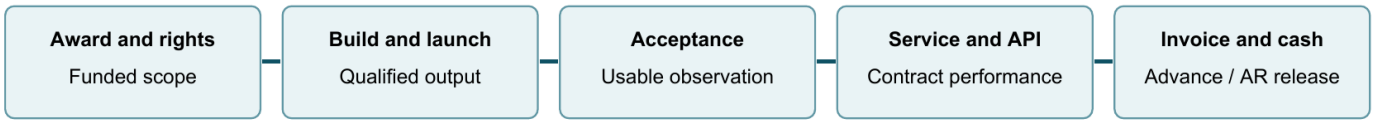

The German EUR 240 million security agreement is a separate customer commitment, but its physical infrastructure overlaps prior programmes. The July 2025 release explicitly refers to satellites already under development, including those for an earlier satellite-services agreement. Dedicated capacity and direct downlink can therefore produce a different stream of customer payments without requiring an independently purchased second fleet.

Sources: [germany240].

Sweden's low-nine-figure programme includes customer ownership, data and awareness services. Government material refers to roughly ten Swedish satellites across Planet and ICEYE together; the number allocated to each provider remains unspecified. The first Planet-built Swedish spacecraft launched in May 2026. Management subsequently described an earlier-than-planned handover in the quarter ended 31 July 2026, a timing change already reflected in the September results.

Sources: [sweden], [sweden_gov], [sweden_launch], [calls].

How one observation becomes paid performance

D01. Original schematic of the contract-to-cash chain. Each stage has its own quality, rights, cost and timing test.

Collection request -> available spacecraft and rights -> launch/commissioning if new capacity is needed -> calibrated usable imagery -> contract acceptance or eligible over-time performance -> processing/API delivery -> service-period revenue -> customer invoice/advance release -> cash collection.

Stage	Economic test	Model treatment
Award	Binding scope and terms establish the booking; prospective pipeline remains separate	Conditional awards are drawn from nonoverlapping prospective pools.
Build / launch	Qualified physical output and prior commitments	Existing delivery, replacement, Owl, research and current procurement reserve factory slots before new awards.
Acceptance	Quality, rights and customer delivery	Hardware revenue follows accepted units; spacecraft identifiers serve as operational references.
Service	Accepted units remain usable over contracted term	Per-vintage partial first and final quarter; full lifetime value conserved.
Cash	Advance, noncash consideration and receivable timing	Deposits create performance obligations; noncash rights create assets with their disclosed accounting treatment.

A shared spacecraft can support more than one contract only within reserved capacity, geography and service priority. The JSAT ownership arrangement and German access agreement are distinct revenue rights on overlapping infrastructure; their announced totals refer to separate payment rights on overlapping infrastructure. [jsat, germany240, q2_10q]

Capacity is a chain of distinct milestones

Pelican view of the Berlin site,26 June 2026. The image shows the location; manufacturing output requires separate production evidence. Image Copyright 2026 Planet Labs PBC. All rights reserved. Source: source link

Berlin's scalable annual rate describes the facility target. Current production requires a separate output and qualification record. On 22 September, Planet said the new 5,700-square-metre site had completed handover and cleanroom fit-out, with manufacturing due to start that autumn and its first satellite expected by year-end. The stated ceiling of sixty satellites a year belongs to Berlin alone. Current output, utilization, yield and the net addition to worldwide qualified production remain undisclosed.

Sources: [berlin].

Satellite identifiers also differ from delivered commercial capacity. The 14 May release reported nine Pelicans on orbit while calibration continued. The July release described Pelican-11 as an engineering pathfinder that had a stated engineering mission with commercial data provision excluded. The 20 October announcement said Pelican-12 had entered commissioning and orbit lowering, with further validation payloads aboard. A fleet-wide count of accepted billable assets and their paid utilization remains undisclosed in these dated releases.

Sources: [pelican9], [p11], [p12].

The 20 October issuer and partner disclosures reported Tanager-2 first-light observations from early October, with commissioning and calibration continuing at that disclosure date. Carbon Mapper expected regular public data after that process. More collection capability can increase revisit opportunities; new customer acceptance, annual paid capture volume and realized pricing require subsequent contract and operating evidence.

Sources: [tanager_light], [carbonmapper].

October awards and demonstrations have different economic scope

Tanager-2 observes the Torrevieja salt-lake area in Spain on 7 October 2026, during its early commissioning period. Image: Planet Labs PBC, published in its 20 October 2026 first-light article. Source: source link

Planet reported a NASA Tanager evaluation task order covering more than 250,000 square kilometres of archive and newly tasked data. Its purpose is to assess product quality and usefulness for Earth-science work before decisions about wider research access. The consideration and the size of any recurring operational follow-on remain undisclosed.

Sources: [nasa].

The ESA selection covers a twelve-month Slovenian resilience prototype, initially addressing wildfire monitoring. It is an awarded pilot with a defined national use case, while its financial consideration and Planet's share of data-provider spending remain undisclosed. Open architecture and multi-provider tasking support the workflow's reach; contracted deployments in other countries require separately identified awards.

Sources: [slovenia], [slovenia_tech].

Suncatcher is a Google-related orbital-compute demonstration within an R&D effort already discussed before October. The launch tests the demonstration payload; a scalable paid compute service requires its own customer contract. The filings treat dedicated Google and NASA Communications Services Project research funding as offsets to research expense, separately from ordinary revenue and hosting charges. That pre-existing NASA research arrangement is distinct from the October Tanager data-evaluation order. Amazon.ia is another arrangement: the announced philanthropic grant went to external nonprofit partners, with no Planet contract consideration disclosed.

Sources: [launch], [q2_10q], [nasa], [amazonia].

The contract and asset classification determine timing

A spacecraft contract may recognize revenue when the customer accepts delivery or, when the specified control and payment conditions are met, over time using progress toward completion. Dedicated collection capacity is recognized across the service period. Multiple obligations are allocated consideration using relative standalone selling prices, which the company often estimates using cost plus a margin. Image rights can also be noncash consideration. Quarterly revenue, cash collection and gross profit follow the allocated obligations, recognition milestones and cash terms.

Sources: [q2_10q].

The intended use of satellite material determines whether it sits in company-owned property or customer inventory. If that use changes, the accounting policy transfers it at carrying value. This reclassification preserves the original cash outlay; the transferred cost can later enter the cost of a customer delivery. Newly paid construction, an existing carrying basis and the later accounting charge must remain distinct.

Sources: [annual], [q2_10q].

Customer deposits record obligations to deliver the contracted goods and services. Reported restricted cash is also separate from unrestricted cash and investments. These distinctions matter when the company funds construction and supports customer operations before, during and after handover. The complete customer-by-customer allocation of opening construction assets, deposits and future operating costs remains undisclosed.

Sources: [q2_10q].

Competitive capabilities need comparable definitions

Planet's integrated manufacturing, operations, repeat imagery and delivery software form a useful operating architecture to examine. Whether that architecture produces pricing power or lower full costs is a separate question. A product-by-product cost comparison and an independently verified ranking of every rival's coverage remain unavailable in the retrieved documents.

Sources: [berlin], [tasking], [q2_10q].

BlackSky's March 2026 release describes its fourth Gen-3 spacecraft commissioned in less than a week and 35-centimetre daily tasking with analytical services. That establishes a relevant high-resolution competitor, while selected-location tasking is a different scope from mapping the landmass repeatedly. Satellogic's first Merlin launched in October and targets daily global one-metre observations; its October release moved full operational capacity to the second half of 2027. The orbiting first unit supports a competing roadmap whose full daily-global milestone remains scheduled for the stated future period.

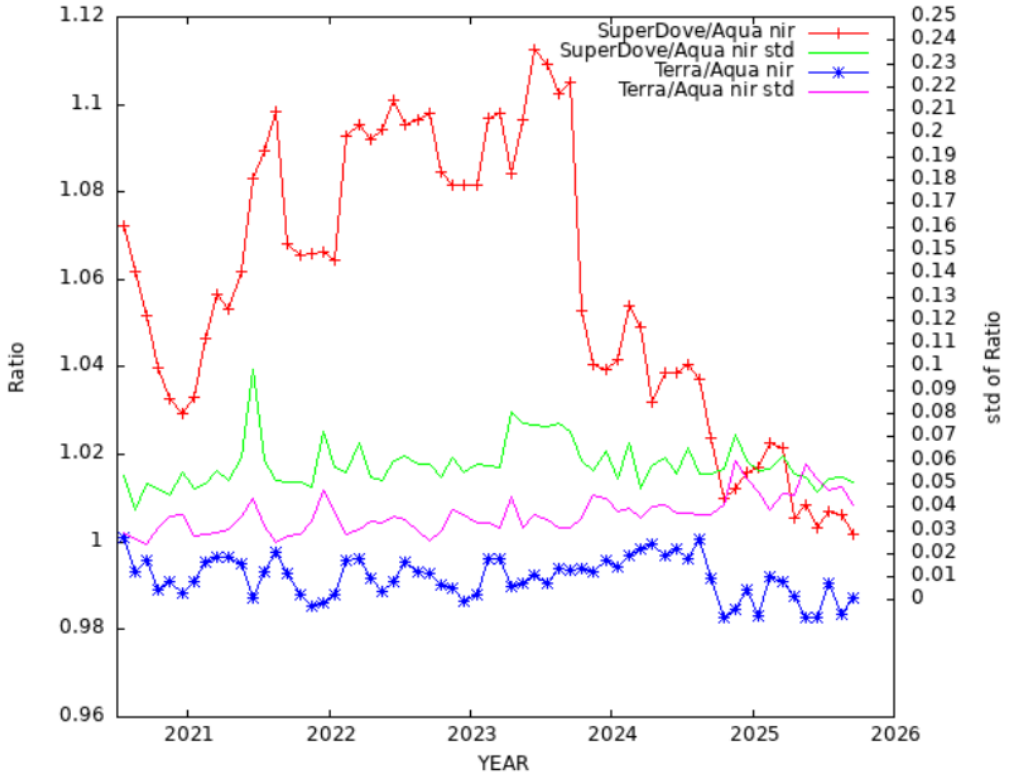

Sources: [blacksky], [merlin], [merlin_march].

Tanager's technical validation is more specific. The USGS independently characterized Tanager-1 image quality, with system tables describing an eighteen-kilometre swath and approximately weekly temporal resolution. That assessment supports the stated sensor-performance measurements. Coverage cadence, procurement and realized demand each require their own evidence.

Sources: [usgs].

Radiometric quality: the exact measured scope

NASA published a PlanetScope radiometric assessment on 19 June 2026. The exact report was newly identified in this review; its date precedes the October 25 research vintage. Searches of the prior source inventory, contract ledger and business handoff found no matching NASA record, title, author or radiometric reference. [nasa_qa]

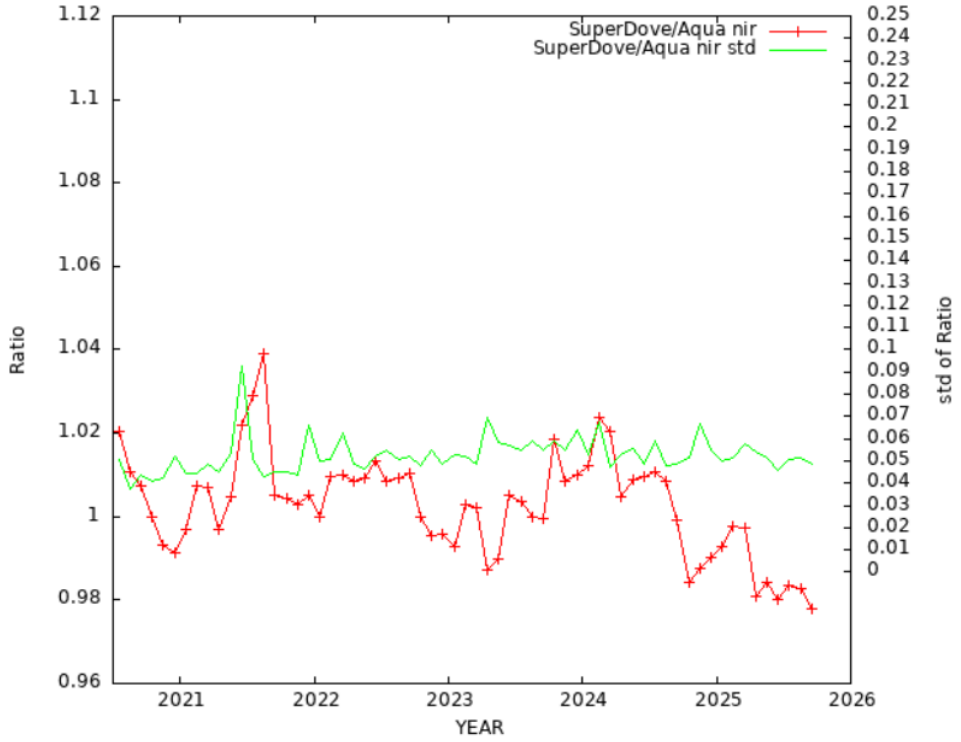

NASA assessment, PDF15: raw SuperDove near-infrared monthly ratios across the displayed history. The historical range and the late improvement must be read together. Original government figure, unaltered; NASA NTRS20260005298, public use permitted. Numerical figure crop; complete source page preserved. [nasa_qa]

The study compares Dove Classic, Dove-R and SuperDove with MODIS and Sentinel-2 references. It reports typical temporal variability around 4-5% for red/NIR and 6-12% for other bands/types against an approximately 1% scientific stability objective. Its table includes 281 SuperDoves and 41,046 observations through September 2025; Classic and Dove-R were decommissioned in April 2022. These findings apply to the tested products and periods.

NTRS records acquisition on 11 June 2026 and publication on 19 June 2026. The PDF separately displays the literal preparation date 07/01/2025 and differing observation windows. Those fields remain independently preserved. The report supplies technical measurements and a scope-specific test for current product acceptance. [nasa_qa]

Calibration mitigants and the applications they support

NASA assessment, PDF19: prototype epoch recalibration improves the displayed ratio and temporal consistency. This technical mitigation example belongs to the original assessment. Numerical figure crop from the original government page; complete source page preserved. [nasa_qa]

Planet explains software mitigation in its 22 October article and September 2026 ARPS v1.2 specification. Four-band ARPS combines PlanetScope detail with MODIS/VIIRS and Landsat/Sentinel radiometric references. Five-band ARPS starts from PlanetScope surface reflectance and retains greater sensitivity to calibration, geometry and atmosphere. The specification also documents clear-reference gaps, cloud/shadow errors, snowy/open-water limitations and occasional tile/seam artifacts. Product, band set, scene and acceptance threshold determine the residual risk. [dense20261022, arps12]

The 27 October crop article has supporting primary university publication metadata. Its 2019-2023 Yuma County study uses daily 3 m Planet Fusion imagery, ten crop classes and field-ID cross-validation. Reported test accuracy is 92.7%; training accuracy is 98.2%. Planet-affiliated coauthors participated. This specific classification result supports the usefulness of harmonized time series for that task; scientific-reflectance stability remains a distinct metric. Price, paid area and a new operational customer order are undisclosed. [crop20261027, crop_paper]

NASA continues authorized PlanetScope access and lists several quality studies; its access page was updated 24 August 2026. PlanetScope science products, current ARPS/Fusion, Tanager hyperspectral data and Pelican tasking each require product-specific validation and economics. [nasa_vendor]

A finite NASA proxy and the selected evidence disposition

The customer endpoint examined here is NASA/CSDA PlanetScope land-surface reflectance work requiring precise cross-sensor radiometry. The government origin of the measured report is verified. Future economic realization depends on the paid product, service period, remaining consideration and contractual remedy.

Auditable reference	Scope and limit
USD13.5 M historical task	Issuer release dated 10 December 2025, for fiscal Q3 ended 31 October 2025. This is the face value of one PlanetScope scientific-data order. Remaining current value, term and radiometry-sensitive paid scope are undisclosed.
Separate USD0.9 M order	The release also describes a November 2025 high-resolution tasked-imagery order with a separate purpose.
Finite bound	13.5 x remaining fraction x precision-exposed share x lost fraction x quarter weight. Each factor is 0 to 1; quarter weights sum to at most 1. Gross total bound isUSD0-13.5 M. The unselected 10% diagnostic has aUSD1.35 M total upper bound. Annual entitlement and current-quarter allocation remain unasserted.
Cost bridge	Reported Q2/H1 R&D isUSD35.156 M/USD68.576 M. Its employee, spacecraft, SBC, hosting and funded-research components are disclosed. A calibration-specific incremental budget remains undisclosed.

I assign zero admission weight to the specific inference that these historical raw-instrument measurements establish a new impairment of current harmonized-product revenue or above-plan remediation expense. The current ARPS architecture, the NASA recalibration example and the narrower Fusion application result provide product-specific counter-evidence. The historical technical limitation and current ARPS residual caveats remain explicit. [nasa_qa, arps12, crop_paper, nasa_legacy]

The financial law, all quarterly numbers, the 43/60 analytical score, protected Excel Base 72 and 30 x method remain unchanged. The provisional 65/25/10 research tree is unselected. The 2 November 2026 evidence review retains the source-specific zero admission described above.

Generic 30% execution delay and general R&D spending supply no proof that an adverse radiometry event is already charged. The distinct Tanager option retains its own scope. New credible evidence matching a current paid product, attributable renewal/acceptance change or incremental spending above plan will receive explicit probability, LOW economic bounds and timing before official confirmation when appropriate.

Risks follow the delivery obligations

Manufacturing scale must be matched by qualified parts, launch availability, calibration and customer acceptance. A higher factory ceiling cannot by itself resolve launch schedules or create paid demand. The large programmes also reserve rights on shared infrastructure, so an asset's apparent spare capacity depends on the time, geography and service priority already promised to other customers.

Sources: [berlin], [isar], [p12], [jsat], [germany240].

Government business can bundle durable data access with hardware and operational support, but the funding and options must be read contract by contract. The German civil award includes options inside its maximum value; the NASA award is an evaluation; and the Slovenian project is a pilot. These categories differ from one another and from management's broader sales funnel. The model distinguishes each funding status, obligation and service period.

Sources: [germany25], [nasa], [slovenia], [calls].

Delivery is supported by cloud infrastructure, third-party data and professional staff. Customer credit tariffs show that processing and data movement consume resources. Internal hosting costs require the separate company cost disclosures and assumptions. Product margin can also change with the mix of satellite construction and ongoing data services. Complete standalone margins and marginal support-cost schedules by product remain undisclosed.

Sources: [processing], [di7], [q2_10q].

Technical progress and customer monetization can separate. Faster onboard inference, a successful relay test, first light or an emissions detection validates a capability without proving an additional paid service. Commercial value depends on the contracted obligation, actual delivery quality, complete support costs and repeat customer use. Cash can arrive before or after the relevant performance, depending on the contract.

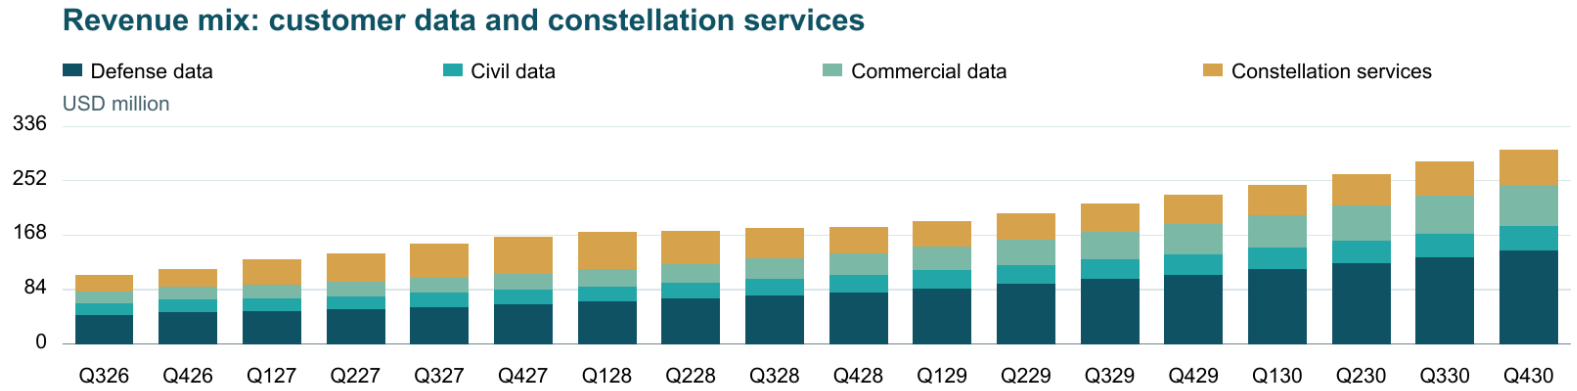

Sources: [p11], [p12], [launch], [tanager_light], [q2_10q].

Dated tests of commercial execution

Date / milestone	Established scope	Economic uncertainty
September 22,2026 | Berlin	Handover and cleanroom fit-out; up to 60/year is future Berlin capability	Actual output, yield, utilization and net global qualified addition undisclosed.
Autumn / end 2026 | Berlin	Manufacturing intended to start; first complete satellite expected year-end	Completion, launch and paid acceptance have separate milestones.
Early 2027 | Isar	One firm Pelican launch mission; further missions planned	Launch date/cost and later slots remain uncertain.
October 20 | Pelican 12	Commissioning, orbit lowering and validation payloads	The demonstration validates the stated capability; accepted billable units require customer evidence.
October 20 | Tanager 2	First light from earlyOctober; calibration still continuing	Regular data follows qualification; fee and paid-acceptance date remain undisclosed.
October 21 | NASA evaluation	Archive and new Tanager data over 250,000 km 2	Price and follow-on undisclosed; four-quarter recognition fromNovember is LOW.
October 13 | Slovenia	Twelve-month prototype with multiple data providers	Planet fee/share and wider adoption unreported.
2028 earliest | future Tanager	Announced larger-swath roadmap	Development, launch, collection quality and paid adoption remain separate gates.

Sources: [berlin, isar, p12, tanager_light, nasa, slovenia]. These dated issuer/customer facts and plans supply the milestones tested by the conditional model.

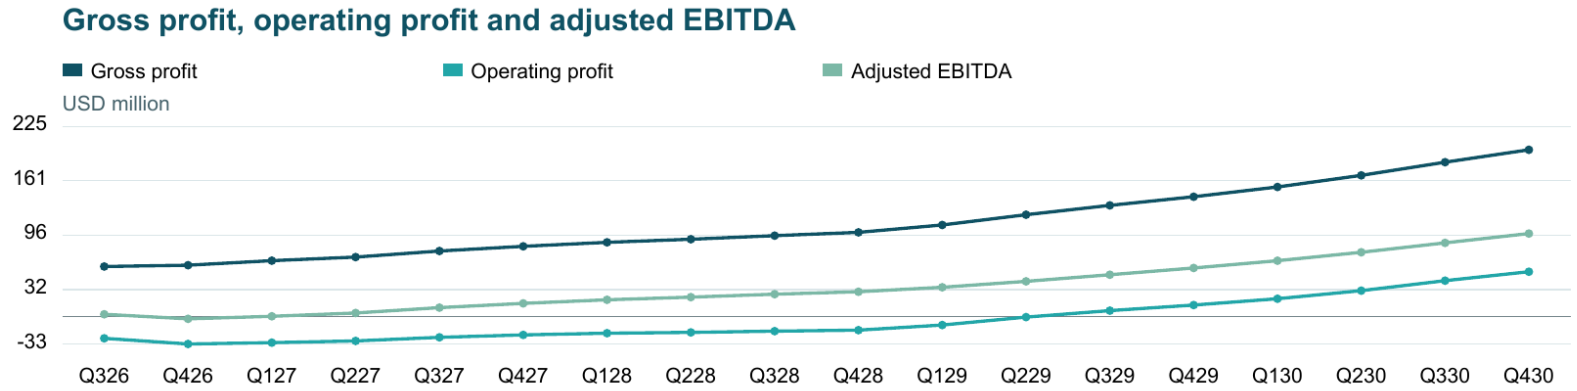

Revenue mix and its numerical bridge

F02. Probability-weighted current calendar reconstruction. I reconstruct customer-data splits and CSS allocation for the model; issuer product-segment disclosure remains limited.

The main physical driver: qualified acceptance

F04. Base on-time conditional path. F00=Aug-Oct 2026; F17=Nov 2030-Jan 2031. Remaining units include all forecast awards through F17, including future awards. They represent the modeled award pipeline and delivery queue. SF24/year is LOW; Berlin 60/year is a future Berlin-only ceiling, with no inferred 30+30 split.

Fiscal	Factory output	Prior / replacement	New awards used	Owned accepted	Retained accepted	Projected units remaining
F00	6.000	3.938	0.000	0.000	0.000	40.848
F01	6.000	4.458	0.000	0.000	0.000	40.848

The six operating regimes and probability law

Demand probabilities are slow 25%, base 55% and fast 20%. On-time execution carries 70% and delayed 30%, yielding six joint paths. Each path runs its full revenue, manufacturing, service, cost, capital and cash mechanics before probability weighting. Minor pilots/research use conditional expected values within the paths; smaller pilots and research events enter as conditional expected values within those six paths.

Case	Joint probability	Active F4 OP	Minimum cash after replacement reserve	Stub cash after awarded-performance reserve
slow on time	0.175	-151.907	245.933	245.933
slow delayed	0.075	-153.240	122.546	122.546
base on time	0.385	-65.001	608.494	1,715.377
base delayed	0.165	-78.221	513.693	1,463.923
fast on time	0.140	-8.206	723.300	2,829.840
fast delayed	0.060	-36.364	621.365	2,473.361

Probability-weighted OP is the sum of complete conditional OP x joint probability. A positive-probability path that fails an input definition, physical constraint or funding gate makes the aggregate target unavailable. Raw operating profit remains an operating diagnostic in failed scenarios. The funding gate leaves their supported valuation result unavailable. The baseline is conditional on conversion of the notes before unconverted cash maturity.

Revenue equations and opening obligations

Opening firm RPO 753.117 is part of backlog 814.863. Nominal cancelable obligations are 61.746; the LOW timing split 94%/2%/4% keeps every cohort nonnegative. An 85% expected acceptance applies to the unfirm cohort, without changing the disclosed gross stocks. Firm RPO data is inside the retained customer book, never an additional revenue line.

Constellation-services allocation is 40% of global opening RPO, or 301.2468, with the current/future profile conserved. This allocation is an explicit analyst classification. The unrecognized RPO tail after F17 is 48.199488; CSS tail is 15.9488. These tails are kept in the additional six-quarter fiscal stub.

Existing continuing data reference =91 - fixed 0.225 pilot allocation =90.775. Future retained data =90.775 x selected NDR^((j-1)/4) - rejected share of cancelable data. New data =sum over unique annual customer contracts of annual value/4 x active-quarter service weight. Each cohort renews once per year, with renewal NDR; new-customer counts cover distinct additional contracts.

Total data =retained like-for-like data + unique new-customer cohorts + finite NASA/ESA pilots + named NASA new-hyperspectral-SKU follow-on + Owl premium. Owl premium is applied once inside eligible accepted data economics. Total company revenue =data + opening CSS + newly accepted hardware + customer operations + dedicated capacity service.

New annual customer assumptions separate defense, civil and commercial customers. The historic customer-category margin proxies 66%/54%/55% are LOW; total actual cost and CSS residual calibrate them. Standalone satellite-services margins remain undisclosed within the published customer categories. [q2_10q]

Award, asset and service cohort equations

Prospective awards are drawn from the management 1,000 near-qualified funnel and a separate 3,000 wider funnel. Both are prospective funnels; booked obligations are tracked separately. Owned programme equivalents =award x owned fraction / lifetime bundle value. Dedicated required equivalents =dedicated lifetime value / (term/4) / annual revenue per capacity equivalent. The 23 lifetime bundle proxy derives from 230/10 JSAT, including operations and retained rights; it measures the combined lifetime bundle.

Shared allocation =minimum of required nonincremental capacity and a prospective 44-quarter free-capacity trough. That trough deducts existing-service peak reservations, existing-data rights and all prior shared commitments; it includes opening retirement, qualified old CIP and qualified maintenance replacement. No service-expiry recycling is credited to new awards. The model reserves current growth/Owl fleet for data and excludes that reserved capacity from shared sales.

Remaining new retained equivalents =required dedicated equivalents - shared allocation. One physical queue reserves slots for legacy hardware, maintenance, old CIP commissioning, Owl, current spacecraft procurement and bounded orbital research before newly awarded owned/retained units. Eligible awards wait 2+execution-delay quarters, then consume the actual remaining slots.

Owned hardware revenue =accepted owned units x lifetime bundle x hardware allocation. Operations revenue =sum accepted owned vintages x active-service weight x bundle x service allocation / operations term. Dedicated revenue follows newly accepted retained fractions; an entirely shared contract earns service over its own eligible interval even when required new units are zero.

For qualification fraction f, the service interval starts at vintage quarter +1-f. A quarter earns only its overlap with the finite term: max(0,min(quarter end,service end)-max(quarter start,service start)). This recognizes f in the first quarter and the complementary tail, conserving the lifetime consideration for integer and fractional terms. Physical life must cover dedicated term and accounting life; customer-owned mission life must cover sold operations.

Cost equations: full expense before operating profit

COGS =data non-D&A/non-SBC expense basis + legacy/new service support + full customer-hardware carrying cost + guide absorption residual + allocated D&A +direct-period SBC allocated to COGS +immediately expensed ineligible inventory SBC +released inventory SBC. Data cost includes customer-type hosting, variable support and fixed fleet expense. Hosting minimum residual =max(0,contractual minimum - modeled COGS hosting - hosting already in R&D), preventing a second charge for the same contracted hosting.

Current guide calibrates non-GAAP gross profit and adjusted EBITDA first. Required non-D&A/non-SBC COGS =revenue - non-GAAP GP + acquired-intangible addback - COGS D&A. Functional R&D, selling and administration then share the normalized expense base. Future expense retains fixed inflation and the selected activity elasticities; the residual manufacturing/absorption cost decays only at the explicit selected rate.

R&D includes gross funded research less recognized reimbursement plus functional D&A and stock compensation. Google and NASA Communications Services Project funding reduces R&D expense under the disclosed accounting policies. The remaining NASA funding budget of USD 9 million includes the first two quarters of the modeled research budget; the finite 9 budget prevents a second uncapped current stream. Future Google continuation and orbital pilot are finite LOW opportunities.

Gross profit =revenue - COGS. Operating profit =gross profit - R&D - sales/marketing - administration. Forward adjusted EBITDA =operating profit +D&A +total P&L SBC. Reported and blended historical rows also retain the issuer signed adjustments: Q2 FY2027 is -13.509+10.788+17.060-0.411=13.928; the Q326 reconstruction retains one-third of that negative 0.411 adjustment. Forward quarters contain no such litigation adjustment. Litigation-liability cash payment is a separate balance-sheet use. The stock-compensation budget is a real full-cost deduction from operating profit. Source actual net P&L SBC 17.060 is distinct from 17.957 before capitalization and 0.897 capitalized. [q2_results, PDF17-18; q2_10q, PDF21,23-24,30,41-43]

Capital, useful lives and stock-compensation conservation

Opening net PPE176.090 contains 94.913 of construction in progress; only the 81.177 balance is already in service. Opening CIP is allocated between customer delivery basis and retained qualification under LOW class/mix assumptions. A change of intended use transfers carrying basis between PPE and customer inventory while preserving the original manufacturing outlay. Historical basis was incurred; the paid portion remains uncertain because opening capital payables are undisclosed. [annual, PDF96,100; q2_10q, PDF21]

New PPE CIP end =prior CIP +cash PPE additions +capitalized PPE SBC -customer basis transferred -qualified retained assets. D&A begins on qualified assets using the same partial-first-quarter convention as service, never on unqualified CIP. Finite existing assets run off at their class amounts. New retained PPE, software and imagery rights use selected 20/12/24-quarter lives; physical coverage and customer-owned mission life are separate constraints.

Software-development stock includes the LOW 2.0 opening unqualified portion, later cash/SBC additions and explicit qualification. Imagery rights include cash purchases plus noncash customer consideration, with subsequent finite amortization. Noncash rights generate no customer cash. Intended-use transfer preserves carrying basis and expense classification.

New capitalized SBC is allocated 40% software,40% retained PPE and 20% customer inventory. Inventory eligibility is limited by manufacturing workload; ineligible budget is expensed immediately. Eligible inventory SBC releases into delivery COGS once; qualified PPE/software SBC enters finite D&A. Opening source asset balances already include prior capitalized SBC and receive no duplicate addition.

Calendar financials: revenue, cost and functions

All 18 current calendar rows. Amounts are USD millions. I reconstruct product allocations and Q326 cash forward from July 31 using the stated timing assumptions.

Cash is tied to invoices, assets and obligations

Opening liquid cash plus short-term investments 865.418 excludes separately reported restricted 8.498. Historical note/ATM/warrant proceeds are already in the opening balance. Opening AR59.870 is collected once, including any billed-but-unearned customer invoices. Deferred customer revenue 298.579 includes advance invoices. Collection status varies; the balance records obligations to perform. Opening receipts are counted once.

Customer cash =invoice collections +new contract advances +new opening-RPO progress receipts. New invoices =cash-consideration revenue -opening deferred release -progress release -new advance release. End AR follows selected collection days. Noncash rights are removed before computing advances or invoices. Remaining unpaid opening RPO limits progress receipts.

Hardware cash follows fresh manufacturing expense plus the change in prepaid WIP, after carrying-basis transfers. Retained assets use investing cash; customer hardware COGS carries only the appropriate customer basis. Non-D&A/non-SBC expense is converted to cash through customer inventory, manufacturing WIP, funded-research receipts, AP/accrual/prepaid conventions, lease timing, tax and award withholding. The cash bridge separately calculates the amount paid.

CFO before coupon =customer receipts -operating expense cash -other timing -litigation cash -cash tax +cash interest. Net cash before notes =CFO -issuer cash capex -cash licensed imagery -award withholding. Known note coupons and any maturity/conversion cash are placed on their actual dates. Month-opening, before/after 15 th-event and month-end balances all enter the liquidity gate.

The future tax budget uses historical cash income tax paid 3.403 as a LOW nonnegative activity-scaled reference. Loss-making groups can still pay subsidiary cash taxes. Deferred tax credits remain separate from cash collections. Ordinary AP/accrual/prepaid balances use an explicit neutral-stock convention with settlement stresses; litigation 11 and funded-research 4.308 are separately released. [q2_10q; annual]

Convertibles are a real conditional financing exposure

The USD 460 million notes mature 15 October 2030 unless previously converted, repurchased or redeemed. The issuer settlement choice between cash and shares applies upon holder conversion. An unconverted maturity retains its cash repayment obligation. The selected inherited if-converted planning case sets principal cash to zero without assigning a source probability that conversion will occur.

Coupons at 0.5% equal 2.3 per year, paid in April and October. The cash-principal diagnostic leaves raw operating earnings unchanged but can invalidate financial availability. Full 460 principal cash fails both slow cases. Even 25% principal cash fails slow-delayed. These modeled funding gaps identify the amount and timing that require financing action.

Protected planning share denominators are retained under the sanctioned convention. Actual settlement dilution depends on holder decisions, issuer settlement and the note terms; cash and share conversion have different equity economics. No new ATM, refinancing, capped-call recovery or unnamed investor rescue is supplied to repair a failed case. Historical proceeds and capped-call cost remain in opening source cash.

Source: Q2 FY2027 Form 10-Q, PDF27-28 and the original note terms; the source maturity obligation and conversion contingency were visually rechecked. This funding condition is material even though all selected operating paths pass under the conversion assumption. [q2_10q]

Remaining contracts continue beyond the display horizon

The published calendar path contains 18 financial quarters; a further six fiscal quarters preserve contracted deliveries, service, asset and cash tails through July 2032. No new programme awards are created after FY2031. Awarded lifetime consideration remains a gross performance measure; cash, debt and prospective unawarded funnels retain separate definitions.

At the stub end, all six baseline paths have zero unperformed new owned/retained units. If an input stress leaves construction unfinished, its gross owned/retained build cash is reserved before relying on later service receipts, and this implementation withholds financial availability until an explicit funded construction plan is provided. It never hides unfinished units beyond the table.

Shared legacy equivalents receive a full one-replacement cash earmark. Remaining awarded service/data has a LOW direct-fulfillment and incremental-support budget, compared with unpaid contractual consideration net of advances. Any operating top-up adds to reserved cash. This aggregate runoff reserve covers the specified obligations. Event-by-event post 2032 funding requires a separate future financing plan.

The prospective 44-quarter physical reservation calculation includes assumed 8/quarter maintenance continuation beyond the financial stub. That continuation is an explicit future funding obligation. The model treats it as a use of future resources. Remaining useful life, reserves, service rights and accepted-vintage tails must be read together.

Base on-time derivation: Research and net cash reconciliation | six-quarter stub

Conditional base/on-time path. F00=Aug-Oct 2026; F17=Nov 2030-Jan 2031; F18-F23=Feb 2031-Jul 2032. Amounts are USD millions. Carrying-basis transfer preserves the existing cash outlay; qualification precedes finite D&A.

Fiscal	research gross cost	research contra cost	research cash received	CFO before coupon	interest cash	other operating timing cash	litigation cash	net cash before note events
F18	0.000	0.000	0.000	114.725	8.053	0.000	0.000	76.592
F19	0.000	0.000	0.000	123.464	8.532	0.000	0.000	86.578
F20	0.000	0.000	0.000	127.912	9.073	0.000	0.000	94.023
F21	0.000	0.000	0.000	120.880	9.661	0.000	0.000	86.718
F22	0.000	0.000	0.000	130.217	10.203	0.000	0.000	95.778
F23	0.000	0.000	0.000	132.074	10.801	0.000	0.000	97.353

All six paths: remaining awarded performance

Gross remaining consideration at F23 records future contracted performance. Contract advance balances, cash fulfillment, support costs and replacement earmarks remain separate. All selected paths are conditional on the stated note-conversion planning case.

Case	Owned HW	Owned operations	Dedicated service	Annual data	Cash reserve	Pending owned	Pending retained
slow on time	0.000	115.804	121.750	252.868	50.960	0.000	0.000
slow delayed	0.000	130.771	153.500	252.868	50.960	0.000	0.000
base on time	0.000	250.558	260.865	527.137	110.171	0.000	0.000
base delayed	0.000	283.582	327.645	527.137	110.171	0.000	0.000
fast on time	0.000	365.327	378.053	750.769	110.171	0.000	0.000
fast delayed	0.000	412.287	477.675	750.769	110.171	0.000	0.000

Base on-time: each award cohort remains conserved

Award value divides into owned hardware/operations and dedicated lifetime service. Cumulative accepted units enable their own finite service vintages; unearned consideration remains explicit. No new awards begin after F17.

Award	Owned value	Dedicated value	Owned accepted	Retained accepted	Operations tail	Dedicated tail
F00	27.500	27.500	1.196	0.330	4.150	0.000

Demand, customer acquisition and retention

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
FY28 new defense count	8	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY28 new defense ACV	5.000	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY28 new civil count	4	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY28 new civil ACV	1.500	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY28 new commercial count	80	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY28 new commercial ACV	0.200	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY29 new defense count	12	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY29 new defense ACV	5.000	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY29 new civil count	6	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY29 new civil ACV	1.500	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY29 new commercial count	140	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY29 new commercial ACV	0.200	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Demand, customer acquisition and retention (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
FY30 new defense count	18	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY30 new defense ACV	5.000	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY30 new civil count	8	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY30 new civil ACV	1.500	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY30 new commercial count	220	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY30 new commercial ACV	0.200	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY31 new defense count	24	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY31 new defense ACV	5.000	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY31 new civil count	10	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY31 new civil ACV	1.500	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY31 new commercial count	300	customers	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
FY31 new commercial ACV	0.200	USD million/customer/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Demand, customer acquisition and retention (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
slow near funnel award fraction	0.200	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
slow later and new customer multiplier	0.500	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
slow retained customer NDR	1.000	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
base near funnel award fraction	0.550	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
base later and new customer multiplier	1.000	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
base retained customer NDR	1.090	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
fast near funnel award fraction	0.850	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
fast later and new customer multiplier	1.400	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
fast retained customer NDR	1.130	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Manufacturing, capacity and contract economics

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
owned lifetime programme equivalent value	23.000	USD million	LOW	JSAT lifetime package 230/10 units, including operations and rights; combined bundle proxy.
owned hardware lifetime value fraction	0.350	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
funnel owned fraction	0.500	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
new customer owned hardware full cost	5.600	USD million/programme equivalent	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
customer operations term quarters	28	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
customer owned mission planned service life quarters	32	quarters	LOW	LOW mission coverage; must cover sold service term. Distinct from accounting depreciation.
dedicated service term quarters	20	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
annual revenue per capacity equivalent	5.000	USD million/equivalent/year	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
dedicated initial new asset fraction	0.300	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
initial uncommitted retained capacity equivalents	6.000	programme equivalents	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
initial existing service capacity reserved	9.000	programme equivalents	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
opening retained CIP capacity reserved for existing data fraction	0.700	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Manufacturing, capacity and contract economics (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
opening retained capacity remaining life quarters	10	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
SF new qualified output per quarter	6.000	programme equivalents/quarter	LOW	LOW24/year planning assumption including prior commitments and replacement; actual current capacity remains undisclosed.
Berlin ramp 2	2.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 3	3.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 4	4.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 5	5.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 6	6.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 7	8.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 8	10.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 9	12.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 10	12.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 11	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.

Manufacturing, capacity and contract economics (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
Berlin ramp 12	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 13	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 14	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 15	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 16	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
Berlin ramp 17	15.000	programme equivalents/quarter	LOW	LOW qualified ramp at or below the prospective Berlin-only ceiling of 60/year; actual output remains undisclosed.
old CIP customer transfer fraction	0.250	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
current guided growth PPE spacecraft fraction	0.700	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
new current spacecraft procurement customer transfer fraction	0.250	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
retained fleet planned physical service life quarters	20	quarters	LOW	LOW mission coverage; must cover sold service term. Distinct from accounting depreciation.

Cost, hosting, cash conversion and asset lives

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
actual capitalized SBC	0.897	USD million	Source	Issuer reported actual; see financial source references.
CSS operations cost ratio	0.350	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
inventory SBC release workload reference	8.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
annual manufacturing absorption residual decay	0.850	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
R and D fixed budget weight	0.800	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
R and D activity expense elasticity	0.750	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
sales marketing fixed budget weight	0.550	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
general admin fixed budget weight	0.800	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
customer hardware preacceptance cash fraction	0.500	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
retained hardware preacceptance cash fraction	0.500	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
actual COGS hosting	7.400	USD million	Source	Issuer reported actual; see financial source references.
actual RD Google hosting	0.800	USD million	Source	Issuer reported actual; see financial source references.

Cost, hosting, cash conversion and asset lives (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
future hosting unit cost factor	1.000	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
annual operating cost inflation	1.050	factor	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
maintenance PPE cash per quarter	8.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
future software cash per quarter	3.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
new owned fleet life quarters	20	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
new software life quarters	12	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
imagery rights life quarters	24	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
capitalized SBC software fraction	0.400	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
capitalized SBC customer inventory fraction	0.200	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
eligible inventory SBC to manufacturing cash cost cap	0.050	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
owned cash advance fraction	0.400	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
dedicated cash advance fraction	0.350	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Cost, hosting, cash conversion and asset lives (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
annual data cash advance fraction	0.650	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
award withholding cash anchor	13.020	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
minimum liquidity reserve	50.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
research receipt lag quarters	1	quarters	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Distinct options and research drivers

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
Owl specific PPE FY28 FY29 per quarter	5.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
Owl price premium	0.050	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
Owl eligible data fraction	0.500	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
Owl paid acceptance fraction	0.600	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
NASA evaluation USD per square km	2.000	USD/square km	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
NASA evaluation model area	250,000	square km	Source	Issuer reports more than 250,000 km 2. Model uses the minimum area; price is a separate LOW estimate.
minor pilot fulfillment probability	0.900	probability	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
ESA software prototype fee proxy	0.500	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
NASA operational followon probability	0.250	probability	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
NASA operational followon annual value	2.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
fixed full quarter pilot allocation in current data plan	0.225	USD million	LOW	Fixed LOW fiscal Q4 pilot reference; excluded from continuing NDR even when live pilot price changes.
new Google research reimbursable budget LOW	8.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Distinct options and research drivers (continued)

I select the following LOW assumptions for the financial forecast.

Driver	Value	Unit	Basis	Scope
remaining NASA nominal funding budget	9.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
current quarter NASA research cost budget	1.500	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
current quarter Google research cost budget	3.600	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
future research reimbursement fraction	1.000	fraction	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
future orbital research pilot probability	0.150	probability	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
future orbital research pilot units	2.000	programme equivalents	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
future orbital research nonrecurring engineering	2.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.
future orbital research conditional reimbursement	8.000	USD million	LOW	LOW analyst assumption for future cost, allocation or timing; issuer specificity remains limited.

Rule16b: opportunities are measured and overlap is removed

Material credible opportunities receive explicit numerical admission before official operating confirmation, with costs and funding. The model assigns an explicit conditional probability and uses bounded price assumptions where the evidence supports an estimate. Current contract, customer and asset scopes determine whether a signal is already included, incremental, a distinct option or outside the active window.

Signal	Numerical capture	De-duplication / uncertainty
Near sovereign funnel	Demand-specific 20%/55%/85% awards from 1,000 lifetime pool	Prospective pipeline; owned/dedicated economics and the acceptance queue determine recognized performance.
Wider funnel	Separate 3,000 pool, selected FY29-FY31 awards	The near 1,000 is removed from the broader 4,000 context.
New data customers	Unique annual defense/civil/commercial acquisition cohorts	Renewal/NDR applied to prior cohorts once; named NASA follow-on outside new-customer count.
Owl	Eligible share x paid acceptance x premium inside data	Dedicated growth capex, launch/qualification and full costs; each identified revenue cohort is counted once.
NASA/ESA evaluations	Price/fee proxies x 90% fulfillment; separate 25% NASA follow-on	Four-quarter finite pilot fromNovember 2026; permanent data reference excludes fixed pilot allocation.
Future orbital research	15% pilot probability; F14-F15 timing, explicit units/engineering/reimbursement	Finite research expense and contra-cost outside the active four-quarter window; commercial scaled-compute receipts require a separate contract.
Existing German/Swedish/JSAT/NGA awards	Opening obligations/current guidance	Existing contracts are counted once, with their overlapping physical infrastructure.
Amazon.ia external grant	Planet receipts unverified	The disclosed grant supports external nonprofit partners; Planet consideration remains undisclosed.

Bounded uncertainty: operating contributions

Analyst diagnostics; each row reruns the complete nonlinear law. Delta OP =control raw active F4 OP minus baseline raw active F4 OP. Each difference includes the full nonlinear response of the model. These overlapping diagnostics cannot be added into a segment-earnings bridge. An unavailable result fails a joint cost/capacity/cash definition and cannot supply a supported target. Baseline active F4 OP: -79.339.

Analyst diagnostics; each row reruns the complete nonlinear law. Delta OP =control raw active F4 OP minus baseline raw active F4 OP. Each difference includes the full nonlinear response of the model. These overlapping diagnostics cannot be added into a segment-earnings bridge. An unavailable result fails a joint cost/capacity/cash definition and cannot supply a supported target. Baseline active F4 OP: -79.339.

Sources, calls and the limits of the public record

The two latest calls occurred on 4 June and 3 September 2026. Complete third-party published management and Q&A bodies, published 5 June and 9 September, were read. Official event metadata was retained; no official replay audio was obtained or heard and no issuer-authored verbatim transcript was found.

Sources: [q2_10q], [calls], [coverage].

The source set also includes issuer contract and engineering releases, customer JSAT material, Swedish government records, the USGS characterization study and two rival capability releases. The issuer's public 2026 news feed contains 43 complete release bodies, with 21 October the newest at the cutoff. A government TED award body and a public price table remain unavailable in the retained website shells. Four BusinessWire-hosted images remained unavailable after repeated timeouts; the associated claim text was retained.

Sources: [nasa], [jsat_customer], [sweden_gov], [usgs], [blacksky], [merlin], [coverage].

Financial-source extraction covers the preserved documents, with critical original pages reviewed visually. Visual coverage is limited to the explicitly recorded source pages. The USGS read was limited to the executive summary, system and measurement tables, conclusions and publication metadata. Exact per-unit construction costs, actual factory utilization, commercially accepted fleet count, realized product pricing and customer-specific margin remain important public-data gaps.

Sources: [q2_10q], [annual], [usgs], [berlin], [p12], [coverage].

No contract-by-contract cost/SSP/advance schedule, actual factory yield/utilization, realized product ASP, accepted paid fleet count or full customer-support cost curve was found. The model therefore identifies these drivers as LOW assumptions and shows bounded outcomes. No official full call audio or issuer verbatim transcript is claimed.

Companion files: PL_PlanetLabs_DeepDive_Model.json contains the complete selected numerical law and 83,188-node typed graph. PL_PlanetLabs_DeepDive_FormulaModel.xlsx is the companion formula workbook. These files supplement the self-contained report; the report presents its assumptions, equations and financial tables in full.

The fresh issuer 2026 feed returned 43 releases with unchanged IDs, headlines and complete bodies against October 25. The latest release remains 21 October. Separate blogs include the 27 October crop article. The 26 October UK Armed Forces Covenant page records an administrative support pledge with zero new contract value. An Oct 30 UK procurement discovery and the German TED body remain unverified because substantive primary bodies were unavailable.
