Micron Technology | MU

AI memory supply bottleneck | Framework 8.0 | Analytical Base 54/60 (90/100) | Protected Excel Base 90/100

Report date: October 30, 2026, America/Toronto. Financial values use USD millions with tables identifying billion conversions; shares are million economic diluted-equivalents. Current forecasts begin Q4 2026; published history retains its original vintage.

Active Q4 2027 ceiling: USD 1,788.09 per share

Selected current case	Value
Active Q4 2027 rolling ceiling	USD 1,788.09 per share
F4 OP x multiple / shares	289.376757B x 6.75 x 1,000 / 1,092.391939M
Analytical / protected Base	54/60 = 90/100 / 90/100
Forecast scope	Q4 2026 through Q4 2030; 14 complete rolling windows
Cash / dividend addition to target	0 / 0

Current standalone model: MU_Micron_DeepDive_model.json

Current owning workbook: v3_2_master_portfolio.xlsx

1. AI memory and the qualified-output bottleneck

Micron supplies working memory and persistent storage across HBM, server DRAM, LPDDR/SOCAMM and data-center NAND. These products have different bandwidth, latency, capacity, power and endurance requirements. Process capability, capital intensity and customer qualification support Micron's position in an industry supply bottleneck.

The cycle is in volume deployment with exceptionally high current profitability. Management expects demand to exceed supply through 2027 and 2028. Cleanrooms, equipment, node transitions, packaging, yield and customer qualification determine the supply response.

Customer spending reaches Micron through accepted memory content and realized prices. The current case retains guidance-calibrated BU growth, prices partial HBM margin convergence and delayed normalization, deducts DRAM/NAND price risks and carries a visible residual compensation cost. Qualified output and cash conversion remain explicit dependencies.

2. Four business units and product exposure

CMBU supplies memory for large hyperscale customers and HBM for all data-center customers. Its disclosed products include HBM, DDR, LPDDR and GDDR. CDBU supplies storage for all data-center customers, including SSDs and component NAND, alongside OEM, enterprise and neocloud memory. MCBU serves mobile/client customers; AEBU serves automotive, industrial and intelligent-edge applications.

The source quarter's $14.102B NAND revenue is allocated by a model proxy: CMBU zero, CDBU $10B, MCBU $3.5B and AEBU $0.602B. Nearly $10B of data-center SSD sales and the segment definitions support the concentration in CDBU. Exact technology revenue by BU is unpublished; the allocation is a low-confidence calibrated input.

The four reported BUs sum to $54.223B against $54.229B consolidated revenue. The $6M residual stays separate. Applying rounded BU margins gives $47.25145B GP, $47.45M above consolidated $47.204B. This rounding and unallocated-scope difference remains unassigned. Consolidated figures control the actual anchor. DRAM, NAND and other output components scale separately; manufacturing cost uses each BU's qualified-output ratio. Price-only increments leave manufacturing cost unchanged.

Table of Contents

Products by Business Unit and Market

Cloud Memory Business Unit ("CMBU")

CMBU is focused on memory solutions for large hyperscale cloud customers, and HBM for all data center customers. In addition to HBM, CMBU sales include DDR, LPDDR, and GDDR.

Data Center: CMBU sales to the data center end market are driven by server demand across the cloud market and include our portfolio of HBM, high-capacity dual in-line memory modules ("DIMMs"), and low-power server DRAM solutions.

Overall cloud growth continues to be driven by strong demand for generative AI capabilities by enterprises across multiple verticals, sovereign AI, and the shift of both infrastructure and workloads from on-premises to the cloud. Cloud servers supporting AI and data-centric workloads require significantly increasing quantities of DRAM, including HBM, and NAND as the task of turning data into insight becomes increasingly memory-centric.

In 2026, HBM3E 12-high represented the majority of our HBM shipments. In 2026, we began volume production of our HBM4 36GB 12-high with increased bandwidth and superior power efficiency enabled by our 1β (1-beta) process node, and we delivered samples of HBM4 48GB 16-high to multiple key customers to power next-generation AI platforms. Our HBM4 uses advanced complementary metal-oxide-semiconductor ("CMOS") and advanced metallization process technologies on the base logic die and DRAM core dies, which are designed and manufactured in-house. This, along with our unique HBM design, packaging, and test capability, enables our industry-leading performance and low-power leadership. Development of HBM4E, our next-generation HBM product leveraging our 1γ DRAM technology node, is well underway, and we expect to ramp volume in calendar 2027.

As modern servers pack more processing cores into central processing units ("CPUs"), the memory bandwidth per CPU core has been decreasing. Our DDR5 alleviates this bottleneck by providing higher bandwidth than previous generations, enabling improved performance and scaling. In 2026, we delivered qualification samples of our 256GB DDR5 registered dual in-line memory modules ("RDIMMs"), built on 1γ DRAM technology and advanced 3D die stacking. This module provides capacity, speed, and power efficiency, helping data center architects scale AI infrastructure more efficiently. We also began volume production of LPDDR5X in a small outline compression attached memory module form factor designed to enable higher memory capacity, substantially lower power consumption, and faster performance for a variety of AI and general-purpose computing workloads.

Total reported CMBU revenue was $43.09 billion in 2026, $13.52 billion in 2025, and $3.79 billion in 2024. CMBU sales to the data center market in 2026 consisted primarily of our DDR5, HBM, and LPDDR5 products.

Core Data Center Business Unit ("CDBU")

CDBU is focused on storage solutions for all data center customers, including data center SSDs and NAND components, and memory solutions for OEM data center, enterprise, and NeoCloud customers. NeoCloud customers are AI-focused cloud service providers that are distinct from traditional hyperscale cloud providers.

Data Center SSDs and NAND: The rapid proliferation of AI, cloud computing, and big data are fueling demand for high-performance and high-capacity storage in data centers. In 2026, we began volume production of our G9 NAND-based PCIe Gen6 high-performance data center SSDs, which accelerate AI training and inference workloads with faster data transfers and improve energy efficiency. In 2026, we also began shipping our 245TB 6600 ION SSD, built with G9 QLC NAND, with improved rack-scale storage density for data centers and designed to support AI, cloud, enterprise and hyperscale workloads, including next-generation AI data lakes and cloud-scale file and object storage.

Data Center DRAM: CDBU sales to OEM data center customers are driven by server and storage demand to support enterprise and NeoCloud customers, and our sales consisted primarily of DDR5 and DDR4.

Source figure E4. Micron FY2026 annual filing, page 9: Cloud Memory and Core Data Center business-unit definitions. All-data-center storage belongs in CDBU; exact current technology-by-BU dollars remain unpublished.

Source actual BU scope and modeled technology allocation | USD B					
BU	Revenue	GM %	NAND proxy	DRAM proxy	Other proxy
CMBU	16.283	83.000	0.000	16.283	0.000
CDBU	18.002	90.000	10.000	8.002	0.000
MCBU	13.114	90.000	3.500	9.614	0.000
AEBU	6.824	84.000	0.602	5.866	0.356

Source BU revenue totals 54.223B; consolidated revenue is 54.229B. Source DRAM 39.771B, NAND 14.102B and other 0.356B sum to consolidated revenue. The unallocated 0.006B BU residual remains separate. Reference product allocations inherit this rounding scope.

3. Latest results and the guidance anchor

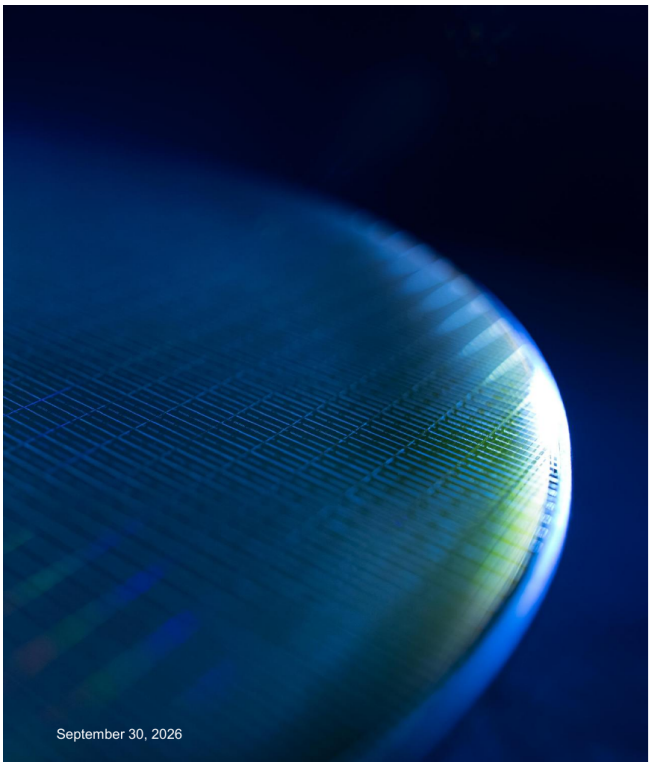

Fiscal Q4 FY2026 covered 14 weeks ended September 3. The September 30 release reports $54.229B revenue, $47.204B non-GAAP GP, $2.568B opex and $44.636B operating profit. The forecast and valuation retain this non-GAAP basis.

Fiscal Q1 FY2027 guidance is $61.5B revenue at midpoint, approximately 86.25% GM, $2.06B opex and approximately 1.150B diluted shares. Derived midpoint OP is $50.98375B. The established Q4 2026 calendar label represents this 13-week fiscal quarter, predominantly September-November.

Guided EPS is $38.15 plus or minus $1. At 1,150M shares, the midpoint implies $43,872.5M net income. Derived OP of $50,983.75M at 15.5% tax gives $43,081.26875M before non-operating items, leaving a $791.23125M midpoint NI bridge gap. The cash model's separate $49.25M interest-paid proxy gives $43,039.6525M after-tax NI and an $832.8475M gap to EPS-implied NI. Both gaps remain unallocated. Source actual EPS times 1,149M diluted shares gives $38,399.58M against $38,398M reported NI, a $1.58M rounding gap. Operating-profit valuation is unchanged.

Q4 2026 modeled company totals match the guide. Future BU allocation and cash conversion are assumptions around it. Peer October-December outlooks overlap much of Micron's guided period. Management expects this first fiscal quarter to be FY2027's GM floor and revenue to grow sequentially.

Underlying FY2027 opex is $9.341B, allocated $2.060B/$2.280B/$2.430B/$2.571B. The last three quarterly amounts are model allocations around the issuer's annual increase. Additional residual bonus expense is displayed separately.

FQ1-27 Guidance
Non-GAAP

Revenue	$61.5 billion ± $1.5 billion
Gross margin	Approximately 86.25%
Operating expenses	Approximately $2.06 billion
Diluted earnings per share*	$38.15 ± $1.00

*Based on ~1.15 billion diluted shares.
See non-GAAP reconciliations in Appendix.

Source figure E1. Micron September 30, 2026 earnings deck, page 29: FQ1 FY2027 non-GAAP guidance. The selected consolidated current-quarter model uses these midpoints; BU allocation and cash conversion are separate assumptions.

Primary actual and current guide | USD B; shares M

Scope	Revenue	GP	Opex	OP	GM %	Shares M	EPS USD
FQ4 FY26, 14 weeks	54.229	47.204	2.568	44.636	87.046	1149 NG	33.42
FQ1 FY27 midpoint	61.500	53.044	2.060	50.984	86.250	1150 approx.	38.15 +/-1

Guide EPS and unallocated NI bridge | USD M

Measure	Value	Scope
Guided EPS midpoint / range	38.15 / 37.15-39.15 USD	Issuer non-GAAP guide
Shares	1,150M	Approximate diluted guide
EPS-implied NI	43,872.50000	38.15 x 1150
OP after 15.5% tax	43,081.26875	50,983.75 x 0.845; before non-operating items
Unallocated midpoint NI bridge gap	791.23125	No non-operating or earnings plug
First-quarter interest paid	49.25000	Separate cash proxy; interest income zero
Cash NI proxy after interest and tax	43,039.65250	Separate cash proxy; zero interest income
EPS-implied NI less cash NI proxy	832.84750	Unallocated; no non-operating earnings plug

Source actual arithmetic residuals | USD M		
Actual measure	**Source arithmetic**	**Unallocated residual**
BU revenue	54,223.000 versus 54,229.000	6.000
Rounded BU GP	47,251.450 versus 47,204.000	47.450
Rounded EPS x diluted shares	38,399.580 versus 38,398.000	1.580

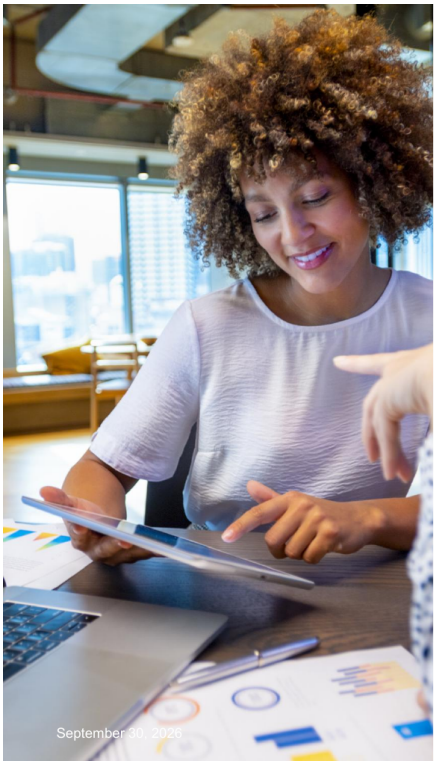

4. Contracts, pricing bands and customer financing

The September 30 deck reports 26 SCAs expected to exceed 35% of revenue through 2030. Three-quarters of that estimated SCA revenue has a defined pricing framework, mostly floors and ceilings; the remaining quarter is periodically negotiated. The denominator is SCA revenue.

More than 75% of 2027 output is committed across SCAs and other arrangements. This output measure has a different scope from revenue coverage. Management's $150B minimum RPO follows the September 3 filing's $134B balance; their dates remain explicit.

Customer financial commitments total $32B, mostly deposits. Annual receipts of $12.747B are financing cash, already excluded from reported CFO/FCF. The model reserves the full $12.895B noncurrent contract liability. Its $6M movement residual remains unallocated.

The vast majority of 2027 HBM volume agreements are completed at significantly higher annual prices. The model captures the margin opportunity through CMBU convergence. Contract bands, resets, budgets and qualification govern company realization.

Source figure E2. Micron September 30, 2026 earnings deck, page 11: SCA revenue coverage, pricing-band scope and customer financial commitments. Revenue coverage, output commitments and cash balances have separate denominators.

Contract scope, cash scope and dates		
Measure	**Dated amount**	**Denominator / treatment**
SCAs, September 30	26; >35%	Expected revenue through 2030
Pricing framework	75%	Estimated SCA revenue
Committed 2027 output	>75%	SCAs and other arrangements; physical output
RPO September 3 / September 30	134B / minimum 150B	Different observation dates
Customer commitments / deposit liability	32B / 12.895B	Commitments mostly deposits; full existing liability reserved
FY26 deposit receipts	12.747B	Financing cash; reported CFO/FCF excludes receipts

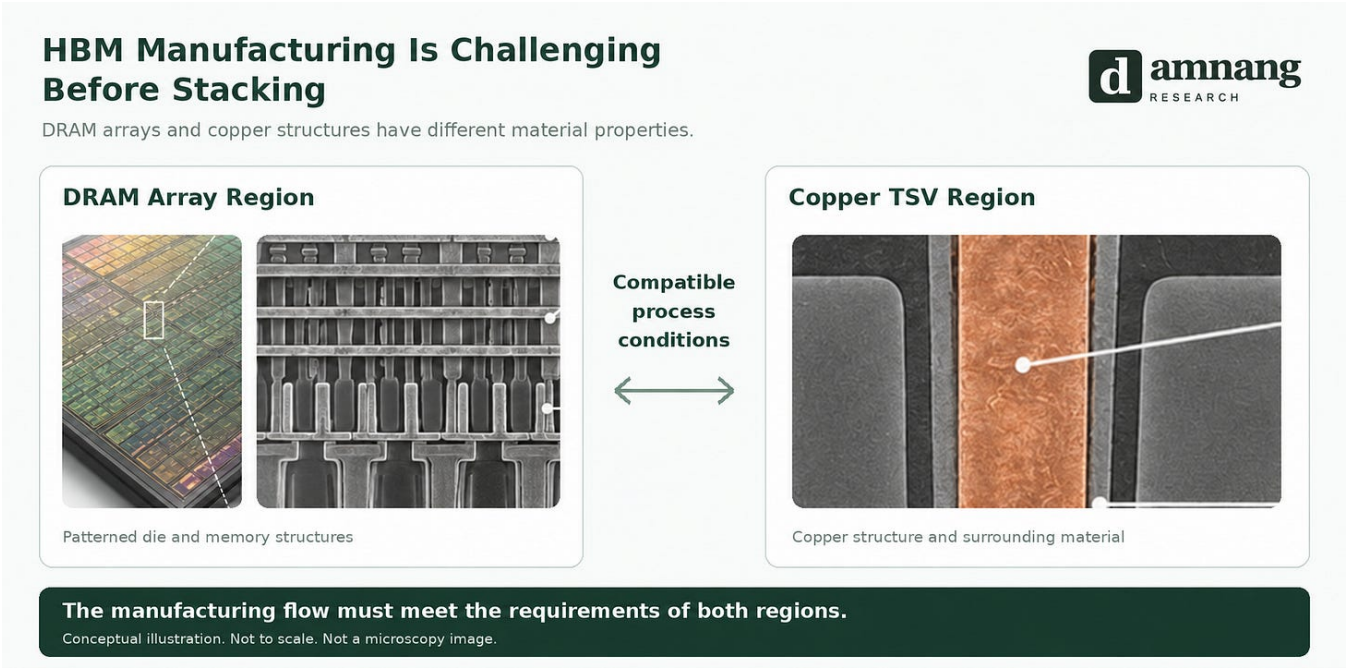

5. Qualified output, productivity and capacity

Fiscal FY2027 source-normalized accepted-output indices are DRAM 1.08/1.14/1.20/1.26 and NAND 1.10/1.18/1.26/1.34. These are Root proxies supporting the retained sales path. A matching company-wide bit guide and a complete actual FY2026 quarterly bit denominator are unavailable.

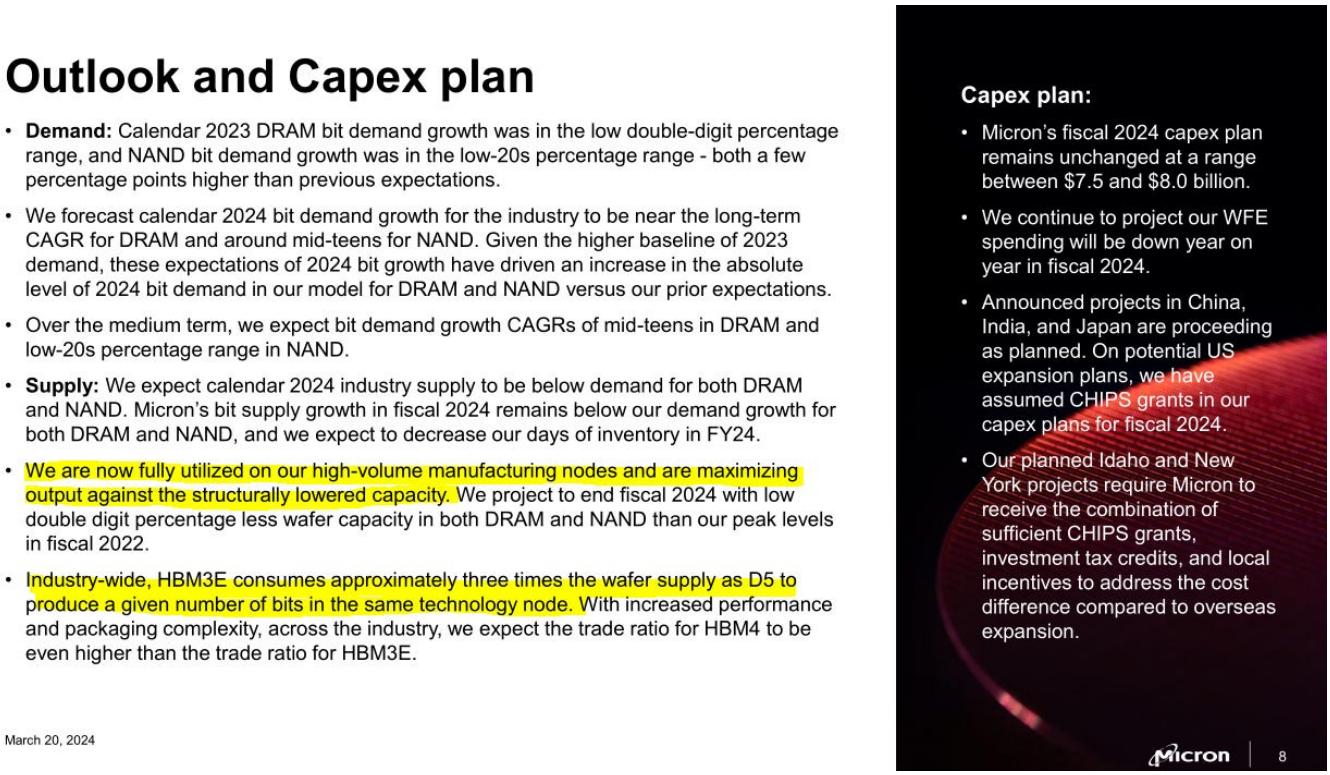

FY2028 accepted annual output grows 22% DRAM and 23% NAND from the full modeled FY2027 sum. FY2029 uses 18%/20%, FY2030 15%/18%, and FY2031's unit-only dependency 12%/15%. Weights 0.98/1.00/1.00/1.02 normalize each complete fiscal-year cohort.

Annual productivity assumptions are 10% DRAM and 15% NAND. Required starts growth equals (1 + output growth)/(1 + productivity) - 1, implying approximately 10.91% DRAM and 6.96% NAND for FY2028. Actual starts, yield and utilization remain undisclosed.

HBM adds wafer processing, base dies, TSVs, stacking, packaging and test. Engineering and wafer-trade exhibits explain qualified output and cost per good unit. ID1/Tongluo mid-2027, Singapore packaging early-2027, ID2/Japan late-2028, Singapore NAND second-half 2028 and New York 2030 are production/qualification dependencies.

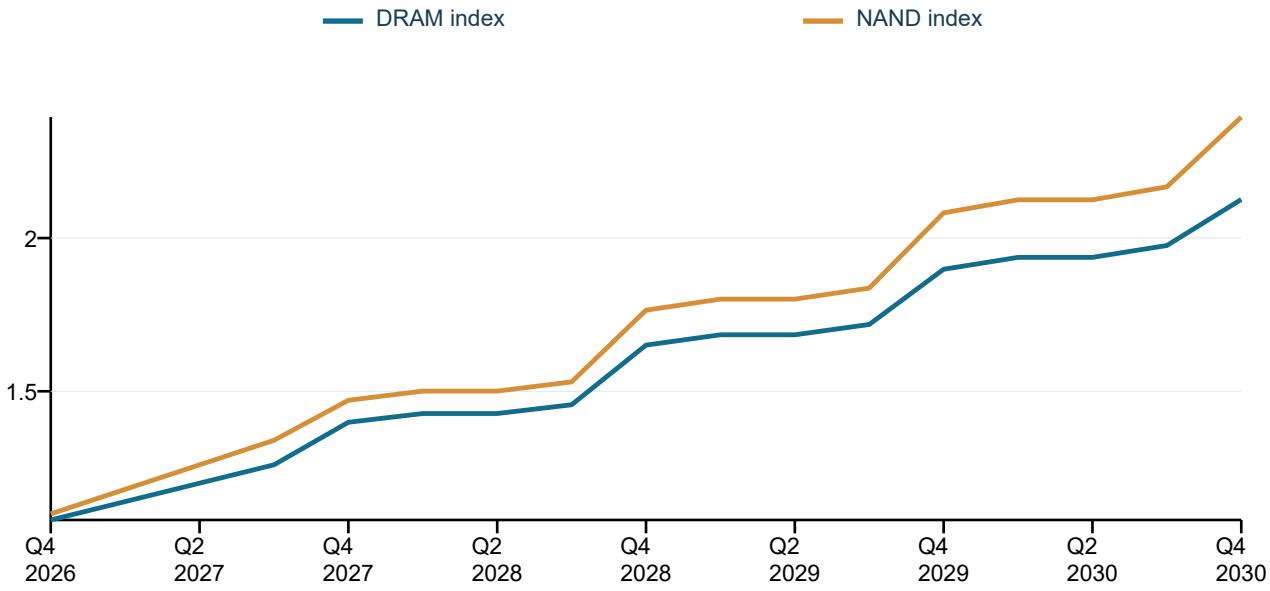

Source figure E5. Damnang, October 7, 2026: conceptual DRAM-array and copper-TSV process-condition illustration. The original schematic is explicitly conceptual; measured Micron yield and process dimensions are unavailable.

Source figure E7. Micron's March 20, 2024 earnings excerpt, reproduced in the owner-supplied May 31 article. The approximate three-to-one wafer comparison concerns equal bits of HBM3E and same-node DDR5; qualified cohort transfer governs the economic bridge.

Source-quarter accepted-output index

Model figure M1. Accepted-output dependencies | source-quarter index. Numerical table follows; all values use the model.

Model figure M1 data: Accepted-output dependencies | source-quarter index		
Quarter	**DRAM index**	**NAND index**
Q4 2026	1.080	1.100
Q1 2027	1.140	1.180
Q2 2027	1.200	1.260
Q3 2027	1.260	1.340
Q4 2027	1.399	1.471
Q1 2028	1.427	1.501
Q2 2028	1.427	1.501
Q3 2028	1.456	1.531
Q4 2028	1.651	1.765
Q1 2029	1.684	1.801
Q2 2029	1.684	1.801
Q3 2029	1.718	1.837
Q4 2029	1.898	2.082
Q1 2030	1.937	2.125
Q2 2030	1.937	2.125
Q3 2030	1.976	2.167
Q4 2030	2.126	2.395

Fiscal output and required starts | proxy annual index; percent						
FY	DRAM index	NAND index	DRAM growth %	NAND growth %	DRAM starts %	NAND starts %
2028	5.710	6.002	22.000	23.000	10.909	6.957
2029	6.737	7.203	18.000	20.000	7.273	4.348
2030	7.748	8.499	15.000	18.000	4.545	2.609
2031	8.678	9.774	12.000	15.000	1.818	0.000

FY2027 modeled annual sums are DRAM 4.68 and NAND 4.88. Full-year source FY2026 bit denominators are unavailable. Required starts = (1 + accepted output growth)/(1 + productivity) - 1, using 10% DRAM and 15% NAND productivity. Absolute bits, wafer starts, utilization and yield remain unavailable. FY2031 is an output dependency beyond the financial horizon.

6. Active probabilities and company realization

HBM convergence carries 75% probability and a conditional additional 2 percentage points on CMBU reference revenue: half strength in Q1 2027, full through 2028, half in 2029 and zero in 2030. Contracted repricing, peer results and the observed CMBU margin gap support this bounded improvement.

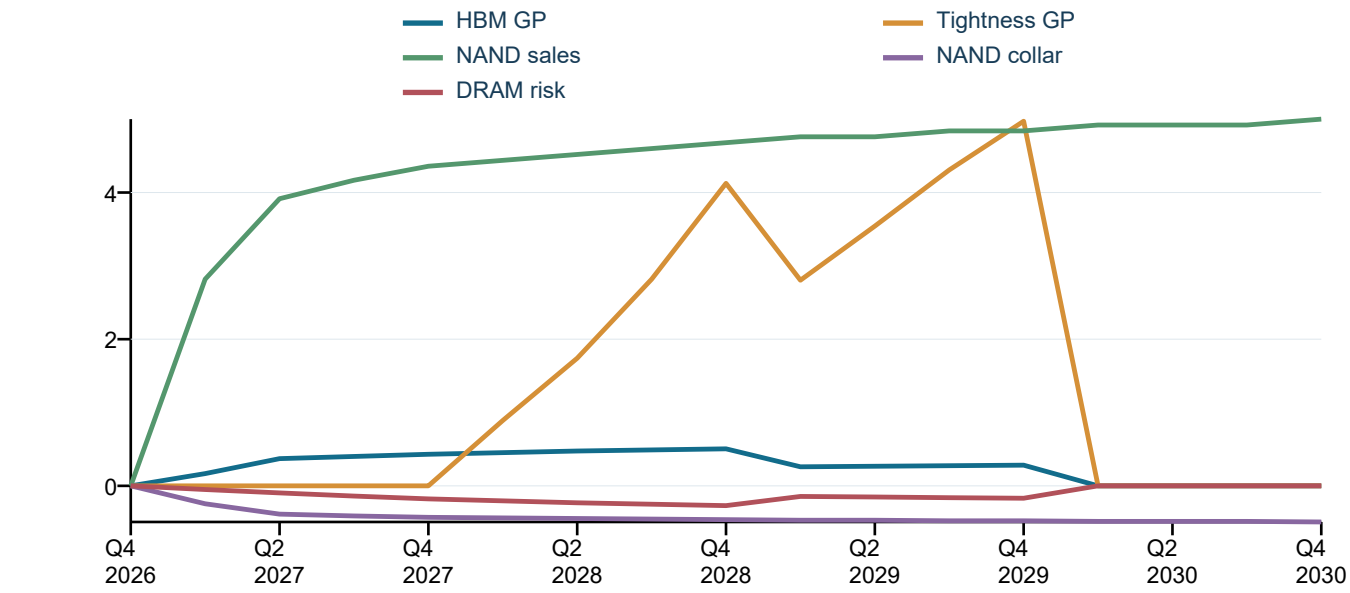

Normalization deferral carries 75% probability. Its conditional GP benefit uses each BU's positive margin gap to the Q3 2027 reference, applies fully in 2028, halves in 2029 and ends in 2030. Overlapping shortage evidence shares this one durability bridge.

Calendar NAND changes of 23%/20%/15% produce levels 1.2300/1.4760/1.6974. The fiscal guide index is 1.3940; the following fiscal quarter uses 1.6236, then 1.6974. Future sales capture only the increase beyond the guide. A 25% collar probability applies 54% conditional exposure to the level above 1.4760. That exposure is an inherited industry proxy with unresolved vendor/product scope.

DRAM risk carries 15% probability of losing 10% of positive post-guide CMBU+CDBU DRAM growth through 2028, halving in 2029 and ending in 2030. NAND is separately allocated. Price-only deductions retain manufacturing cost, so lower revenue reduces GP dollar for dollar. The ledger shows each active quarterly contribution and its conditional endpoint.

Active probability ledger and bounded conditional outcomes			
Driver	Probability	Conditional input	Timing / overlap
HBM convergence	75%	CMBU +2pp GP	Half Q1 2027; full through 2028; half 2029; zero 2030
Normalization deferral	75%	Positive gap to Q3 2027 BU GM	Full 2028; half 2029; zero 2030; shared shortage branch
NAND collar	25%	54% of level above 1.476	Fiscal guide denominator 1.394; price-only cost unchanged
DRAM shortfall	15%	10% positive post-guide DC DRAM growth	Full through 2028; half 2029; zero 2030
Residual bonus	60%	1% positive after-tax OP less next capex	75% guidance overlap; pool weight 0.15%; zero added guide-quarter pool

Q4 2030	1.697	1.394

7. Labor status and the residual compensation bridge

The October 22 company briefing introduces a globally eligible FY2027 quarterly bonus with 50% cash and 50% stock, alongside existing incentives. Direct briefing reporting describes the pool base as quarterly net income less the following quarter's forecast capex. The profit-share rate and dollar pool remain undisclosed.

I model 60% probability of incremental residual cost beyond the guide, a conditional 1% rate on positive reference after-tax OP less next-quarter capex, and 75% overlap with already-guided compensation. Together these equal 0.15% of the positive pool base. These are analytical inputs.

The guided first quarter has zero added residual pool. Subsequent cash-service cost is 70% manufacturing with one-quarter inventory lag and 30% current opex. Cash payment follows the earned quarter. CFO adds back the recognized service cost and deducts its cash payment once.

The stock half converts at the independent cohort price and enters economic shares after four quarters. The cohort schedule separates earned stock value, service expense, cash payment and vesting.

Taichung has a signed agreement with member challenge. Taoyuan talks continue, with the next meeting tentatively November 6. Eleven union officers participated in the reported one-day warning action. Measured company-wide production loss remains unavailable. Further localized year-end action carries 25% qualitative weight and zero separately quantified revenue loss.

Taiwan pension, shift, leave and wage changes require eligible payroll and budget-overlap data. Their distinct unbudgeted amount remains unresolved. Bonus-rate, overlap and extra $100M quarterly cash-cost sensitivities bound exposure. The earlier 15%-of-global-OP union demand supplies zero input to the announced programme.

Residual employee pool | USD M

Dated employment terms and bounded gaps		
Item	Dated term / source	Incremental model scope
Bonus	Global eligible; 50% cash/50% stock; one year stock vesting	Pool rate undisclosed; residual 1% conditional rate is Root assumption
Pension	8% to 10% regular pay	Eligible payroll and guidance overlap unavailable
Shift allowances	Day 1500 to 4500 NTD/month; evening/night 15%/20%	December timing; distinct unbudgeted base charge zero
Other terms	Three paid leave days; wage alignment next Lunar New Year; IPP caps	Exact combined formula and eligible pay scope unavailable
Warning action	11 union officers; one day	No measured company-wide good-output loss
October 28 status	Signed Taichung terms challenged; Taoyuan continues	Next talks tentatively November 6; later outcome unavailable

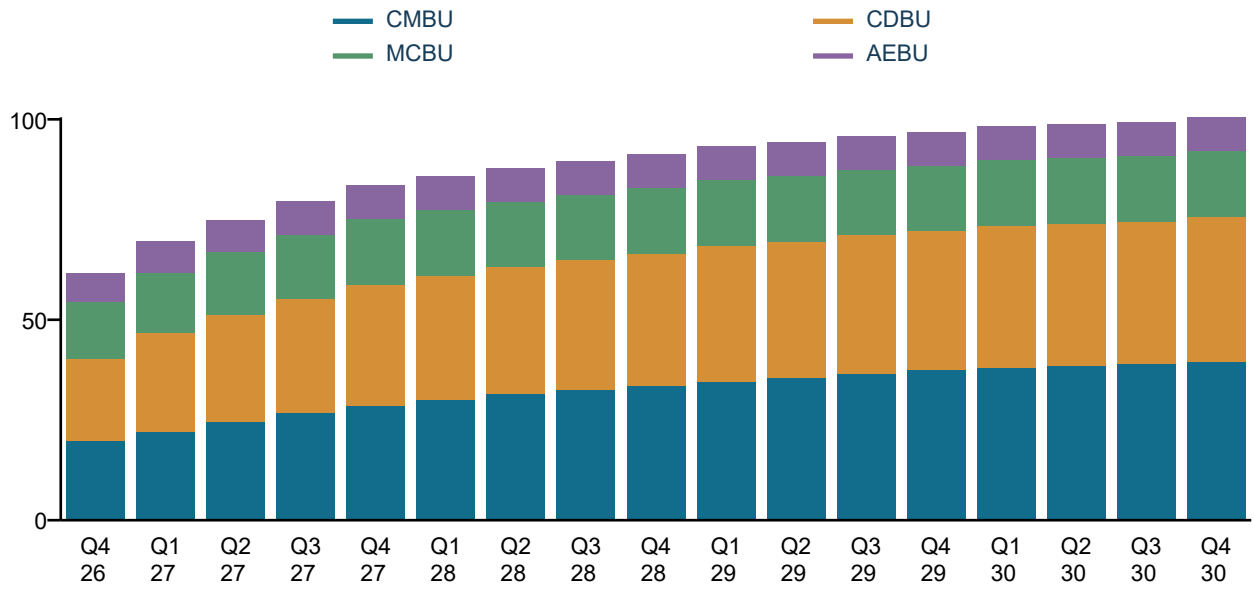

8. Business-unit costs and consolidated profit

Reference manufacturing cost is BU reference revenue x (1 - reference GM), with a 25% fixed/75% variable cost proxy under output deviations. HBM convergence and tightness benefits reduce modeled manufacturing cost. Source normalization and separate BU paths retain mix effects; exact product margins remain undisclosed.

BU GP/GM tables are before unallocated residual bonus COGS. Consolidated GP equals their sum less bonus_COGS once. Total opex equals base opex plus bonus_opex; OP equals consolidated GP less total opex.

The full standalone schedule spans Q4 2026 through Q4 2030. Outer-year margins decline under the retained normalization path. Price, output, cost, funding and dilution stresses use the same selected operating and cash equations.

USD B

9. Memory hierarchy and longer-term opportunities

Persistent context, KV offload and data staging use HBM/DRAM working state and SSD persistence. The retained SanDisk source's 2030 AI-data-center estimate is 1.2ZB annual NAND shipments. Its workload and TLC/QLC breakdowns describe one pool. An illustrative 550EB storage exposure at 10% nonoverlap gives 55EB conditional volume. Applying the retained 25% realization weight once gives 13.75EB, or 1.145833% of the 1,200EB reference. Micron capture, ASP, yield and support economics remain unmeasured. The current point estimate assumes full overlap with existing BU demand and adds zero separate revenue or profit.

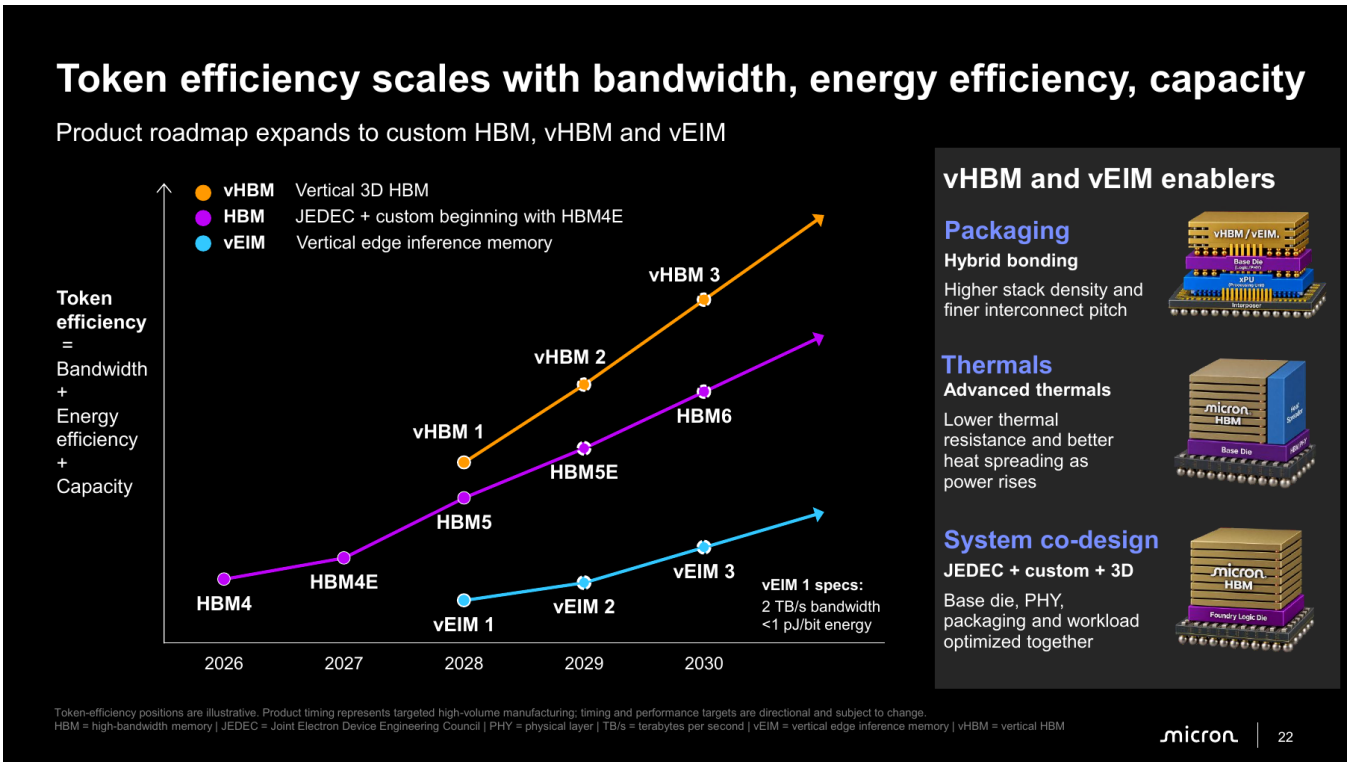

Physical AI retains 50% framework confidence within AEBU growth. Ubiquitous computing retains 20% confidence with zero separate sales increment. Device content examples require deployed units, qualification, capture and economics before an incremental company wallet can be measured.

Micron's October 21 roadmap targets 1-delta DRAM and more-than-400-layer G11 NAND in second-half 2027. Node density and I/O gains support the selected output and productivity assumptions; an exact measured mapping to the model indices remains unavailable. HBM4E custom base dies, vHBM and vEIM require foundry execution, hybrid bonding, thermals and system co-design. Issuer timing/performance targets remain directional.

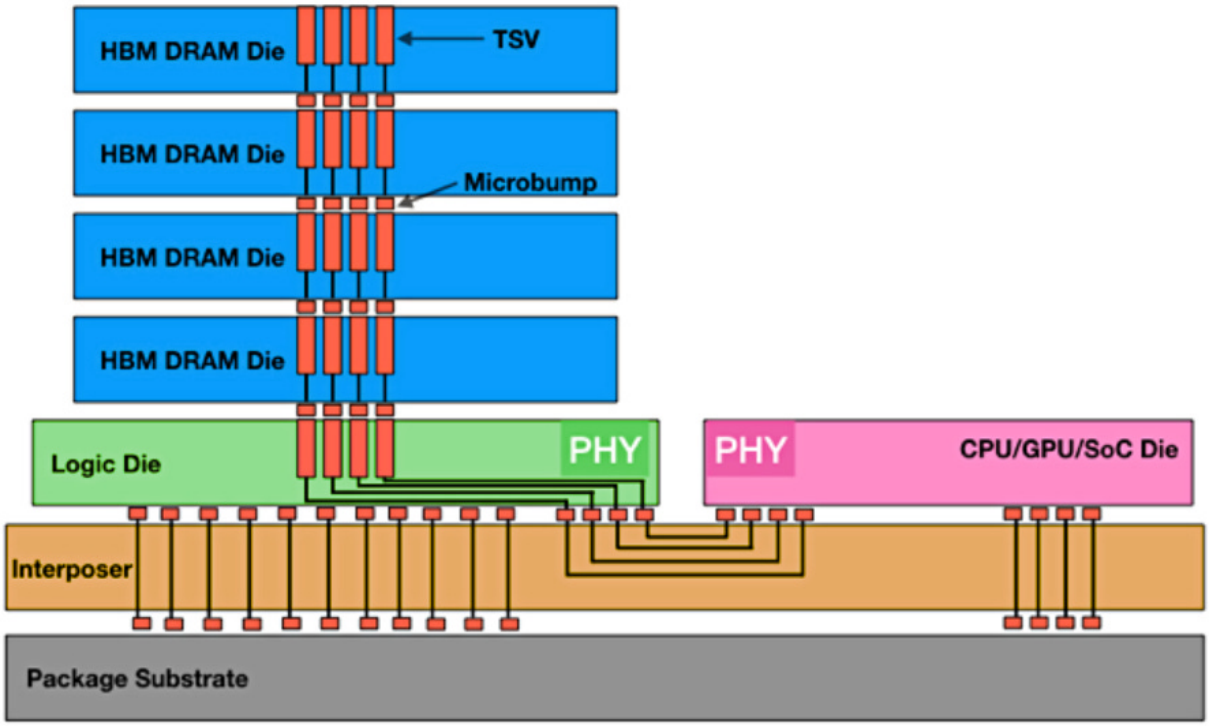

The optical-attached DRAM programme hypothesis retains 25% weight through end-2029. Its bridge combines displaced HBM, recaptured conventional memory, avoided stacking costs and new interface/qualification costs. The affected cohort and net cost/price ratios remain unidentified across the attempted broad envelope, giving zero separate current revenue/OP.

The related 90% peak-volume HBM-decline hypothesis retains 20% weight for 2033-2036. Its undefined peak cohort and later timing give zero contribution within the current horizon. Both hypotheses share a substitution mechanism; the current model retains its own qualified-output and product-capture boundaries.

The complete retained zero-increment ledger contains 13 signals. Its probabilities describe their stated economic or adoption outcomes. Weight 1 records an observed announcement or existing commitment; qualified delivery, timing and incremental cash or profit retain their source dependencies. Current overlap allocations are analytical point estimates. Each row preserves its conditional bounds, manufacturing and support bridge, financing scope and zero selected increment.

Source figure E3. Micron October 21, 2026 technology webinar, page 22: HBM, vHBM and vEIM roadmap. Source footnotes label targeted high-volume manufacturing dates and directional performance; qualified output and full system economics determine realization.

Source figure E6. Owner-supplied May 31, 2026 article: HBM stack, base die and interposer illustration. It maps the manufacturing interfaces relevant to architecture substitution; source contains no measured Micron unit cost.

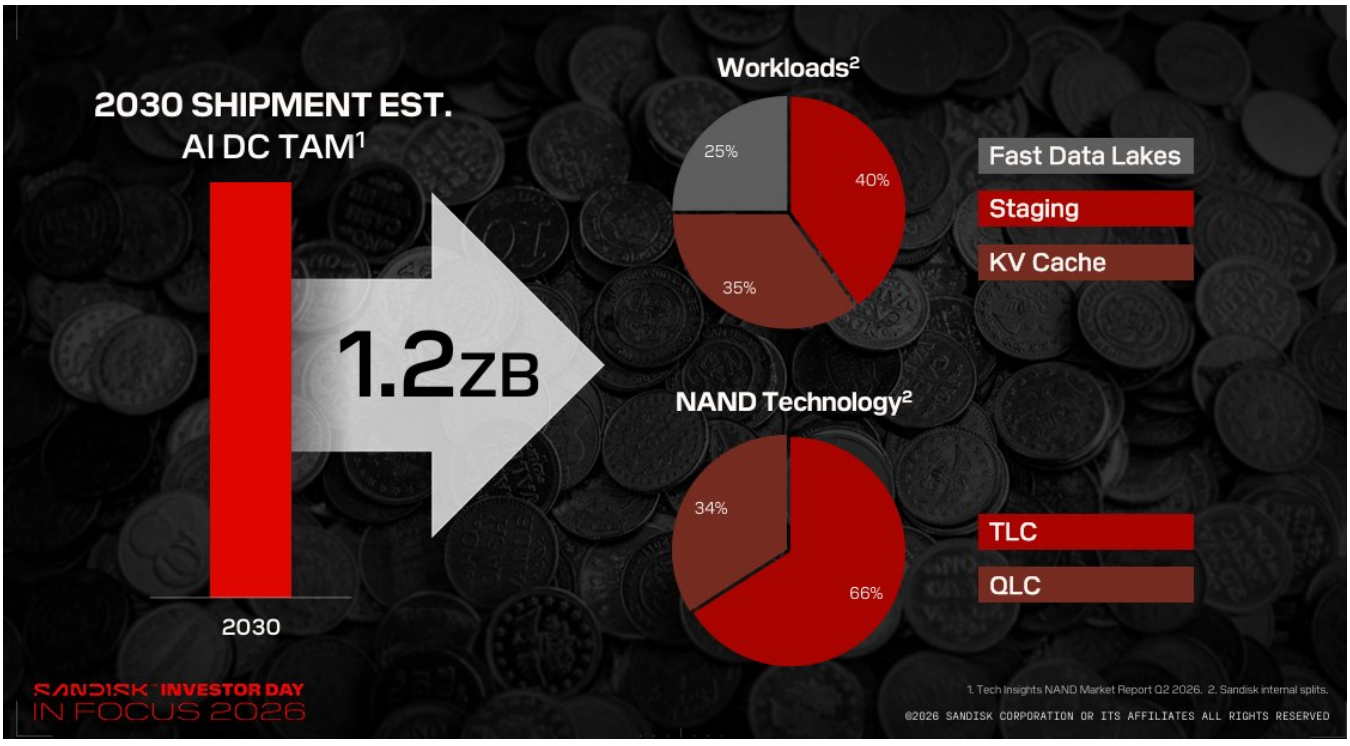

Performance Comparison

Source figure E8. NVIDIA ISSCC 2026 research comparison reproduced in the owner-supplied May 31 article. Link throughput, shoreline and energy retain their original conditions and thermal/laser assumptions. Complete memory-system latency, utilization and qualified cohort economics remain unresolved.

Source figure E9. Owner-retained SanDisk 2030 annual AI-data-center NAND shipment exhibit. Staging, KV cache and fast-lake workloads sum to one 1.2ZB annual pool; TLC/QLC describes the same shipments. The model retains overlapping Micron demand in its existing BU growth.

Complete retained qualitative event ledger | Root-selected scopes			
Signal	**Weight**	**Conditional timing and bound**	**Company realization, costs and disposition**
SCA revenue coverage objective	60%	Through 2030; objective around 50% revenue versus signed >35%.	Durability and pricing mix remain in existing BU sales, manufacturing and support cost. No separate deposit financing credit.
Advanced Taiwan product migration	75%	Continued Taiwan reallocation through 2027; transferred and requalified cohort.	Good bits x ASP, less displaced legacy sales, receiving-site startup and support cost. Existing BU growth and qualification contain the transition; wafer counts and incremental yield remain unpublished.
HBM process-control intensity	80%	Greater HBM process-control intensity through 2026-2028.	Qualified die/stack output, inspection cycle time, avoided scrap and packaging cost enter CMBU and manufacturing. The expert provides no measured deterioration from the source actual.
Inspection and metrology economic intensity	65%	Higher process-control value per accepted cohort through 2027-2028.	Avoided scrap and recovered production time, less tools, support, engineering and R&D. Existing capex and GM contain process control. No new supplier order or measured company cost change is provided.
Additional persistent-agent storage category	25%	Illustrative 550EB x 10% = 55EB conditional. Applying 25% once gives 13.75EB, or 1.145833% of 1,200EB annual 2030 reference.	The 10% nonoverlap is illustrative. Existing workloads cover context, logs and retention. Capture, ASP, yield and support economics remain unmeasured. Root selects full current overlap and zero additional company volume.
Physical AI	50%	Later-decade physical AI; source L4+ example >200GB memory plus multiterabyte storage.	Deployed units x content x qualified capture x ASP, less displaced products, manufacturing, software, support and R&D. Existing AEBU growth contains this demand; adoption and company dollars remain undisclosed.
Ubiquitous computing	20%	Longer-term third-phase ubiquitous computing.	Deployed units, usable content, capture and unit economics remain unavailable. Current product roadmap and BU forecasts retain the identifiable opportunity.

Complete retained qualitative event ledger | Root-selected scopes			
Signal	**Weight**	**Conditional timing and bound**	**Company realization, costs and disposition**
Optical-attached DRAM programme	25%	Material optical-attached DRAM programme by end 2029; attempted exposure 0-100% of unreported company HBM pool.	Displaced HBM plus recaptured conventional DRAM, avoided wafer/stacking expense and new interface, qualification and R&D. Cohort, timing and net price/cost ratio remain unidentified; heterogeneous-memory demand overlaps.
Large long-term HBM substitution	20%	Conditional HBM peak-volume endpoint of 10% in 2033-2036; peak denominator undefined.	Shares the optical substitution mechanism and lies beyond 2030 earnings. The selected terminal multiple remains unchanged.
Further localized industrial action	25%	Further localized action by end 2026; conditional 1-7 lost-production-day stress.	Affected good output x lost days x unrecovered fraction x ASP, less avoided cost plus fixed-cost, yield and recovery expense after catch-up. Participating bottleneck-output denominator remains unknown; active Q4 2027 requires persistent effects.
Taiwan pension, shifts, wages and leave	100%	Observed Taiwan employment announcement: pension 8% to 10%, day allowance +NTD 3,000/month and dated shift, leave and wage terms.	Eligible payroll, participation, cash/equity scope and existing FY2027 budget overlap remain unresolved. Global bonus residual and $100M quarterly cash-cost stress are visible. A separate unbudgeted base-case amount remains unidentified.
New technology density and memory tiers	100%	Observed node/technology roadmap: 1-delta and G11 targeted for second-half 2027; vHBM, vEIM and SLC paths require qualification.	Density and I/O support selected output, productivity and R&D dependencies. Node-level gains add zero second company-wide volume multiplier or additional memory-market pool.
October community and supply-chain commitments	100%	Observed multi-year October community and supplier commitments, including previously announced portions.	The $67M community headline includes >$45M within an earlier commitment. Current $300M expense is in source actual. Indium falls within the prior up-to-$3B programme. Incremental amount, classification and quarter timing remain unresolved.

Overlap and selected extra company economics | USD M						
Signal	**Overlap %**	**Extra sales**	**Extra manuf.**	**Extra support/opex**	**Extra OP**	**Financing**
SCA revenue coverage objective	100	0	0	0	0	0
Advanced Taiwan product migration	100	0	0	0	0	0
HBM process-control intensity	100	0	0	0	0	0
Inspection and metrology economic intensity	100	0	0	0	0	0
Additional persistent-agent storage category	100	0	0	0	0	0
Physical AI	100	0	0	0	0	0
Ubiquitous computing	100	0	0	0	0	0
Optical-attached DRAM programme	100	0	0	0	0	0
Large long-term HBM substitution	100	0	0	0	0	0

Taiwan pension, shifts, wages and leave	100	0	0	0	0	0
New technology density and memory tiers	100	0	0	0	0	0
October community and supply-chain commitments	100	0	0	0	0	0

Weight 1 records the observed announcement or existing commitment. Qualified delivery, timing and incremental cash or profit remain uncertain under the source dependencies. Full overlap is the selected current point estimate; the conditional illustrative envelopes preserve their own scopes.

10. Cash conversion, obligations and reserves

The September 3 cutover is $73.453B unrestricted cash and marketable investments. Restricted cash $27M, an undrawn $2B revolver and separate nonmarketable equity receive zero deployable credit. A conservative Root reserve covers $12.895B contract liability and $15.446B legacy tax balances: $5.626B current income and other taxes plus $9.820B noncurrent income taxes. Available cash begins at $45.112B against a $45B operating floor.

Reported CFO/FCF already exclude deposit financing receipts. Future new deposits and debt proceeds are zero. Deposit reserves repay across 2029-2031 under a scheduling proxy; legacy tax reserves settle across 2027. Payments use reserved cash and reduce the associated obligations.

Opening trade NWC is $38.647B: AR $31.793B plus inventory $10.372B less trade AP $3.518B. Forecast AR is 52% of revenue, inventory 1.1x COGS and AP 0.5x COGS. Excluded incentive/tax receivables, capex payables and other accruals have a held-constant ongoing net balance.

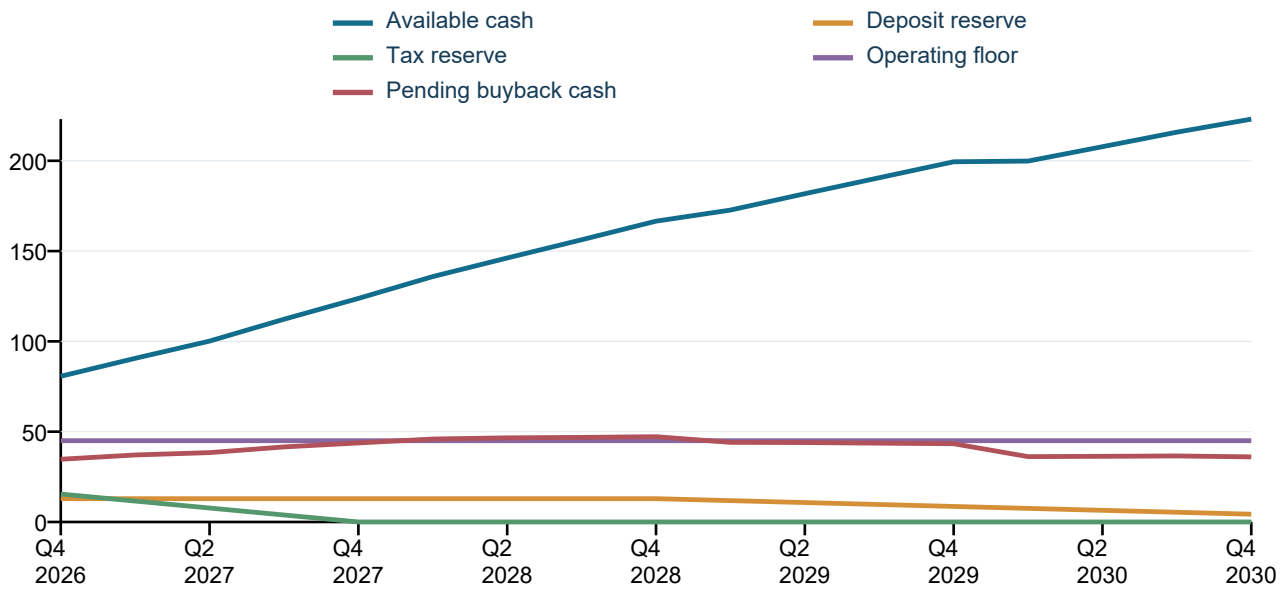

Cash D&A uses the directly reported $2.641B/$54.229B ratio. Cash tax is 15.5% of positive OP less modeled interest. Non-GAAP OP already excludes SBC. Interest income, investment gains and future employee issuance cash contribute zero recurring return funding.

Net capex is $11.5B/$13.5B/$14.5B/$15.5B across FY2027, consistent with the issuer's $25B first-half guide and higher second half. Later fiscal-year assumptions are $72B/$83B/$91B for FY2028/2029/2030. The FY2031 first-quarter and following bonus-base capex proxy are separate inputs.

Finance leases begin at $2.387B and use the source maturity schedule. A 5% lease-interest proxy separates interest and principal; notes debt remains $2.792B. Lease principal, NWC changes, compensation accrual/payment and legacy reserves each have a separate cash bridge.

September 3 cash and balance-sheet cutover | USD M		
Component	**Amount**	**Selected treatment**
Cash + short + long marketable investments	73,453	38,364 + 5,070 + 30,019
Restricted / revolver / nonmarketable equity	27 / 2,000 / 1,300	Zero deployable credit
Deposit liability	12,895	Full Root reserve; legal cash unrestricted
Legacy tax balances	15,446	Current income/other tax 5,626 + noncurrent income tax 9,820; conservative Root reserve
Available cash / operating floor	45,112 / 45,000	Model liquidity buffer
Trade AR / inventory / trade AP	31,793 / 10,372 / 3,518	Opening NWC 38,647
Notes / finance lease debt	2,792 / 2,387	Debt carrying total 5,179; principal total 5,195

CFO = OP - cash interest - cash tax + D&A - change in trade NWC + recognized residual cash-service cost - actual bonus cash paid. FCF = CFO - net cash capex - lease principal. Deposit receipts are financing and have already been excluded from reported source CFO/FCF. No second SBC addback enters the non-GAAP OP cash bridge.

11. Funded repurchases, dividends and shares

The October 8 authorization reported in the filing permits $35.16B discretionary repurchases from December 9. The model allocates this known amount once. Additional funded budgets receive 80% renewal probability, reflecting management's excess-cash return intention.

Desired new budget equals positive FCF less withholding, ordinary dividend budget and an $829M quarterly CHIPS/grant guard. The constant guard is a Root funding assumption throughout the forecast, derived from prior annual global incentives divided by four. Source CHIPS restrictions retain their own award dates and windows. The CHIPS-only amount and contractual excess-cash definition remain unpublished. The guard reduces the new buyback budget and remains in cash.

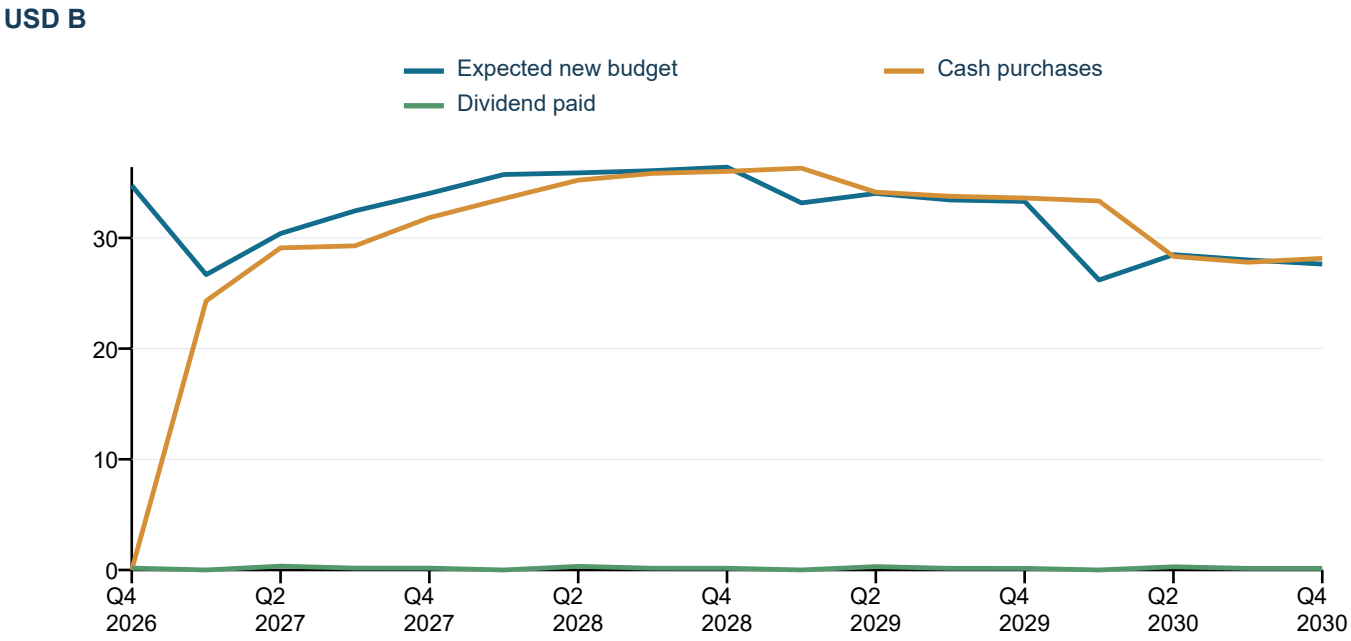

Funding capacity deducts the operating floor and pending buyback/dividend obligations. Purchases spend 70% next quarter and 30% the following quarter, with 90% expected economic retirement at that final purchase quarter's end. Execution reference is the saved $877.57 growing 10% quarterly, independently of the target.

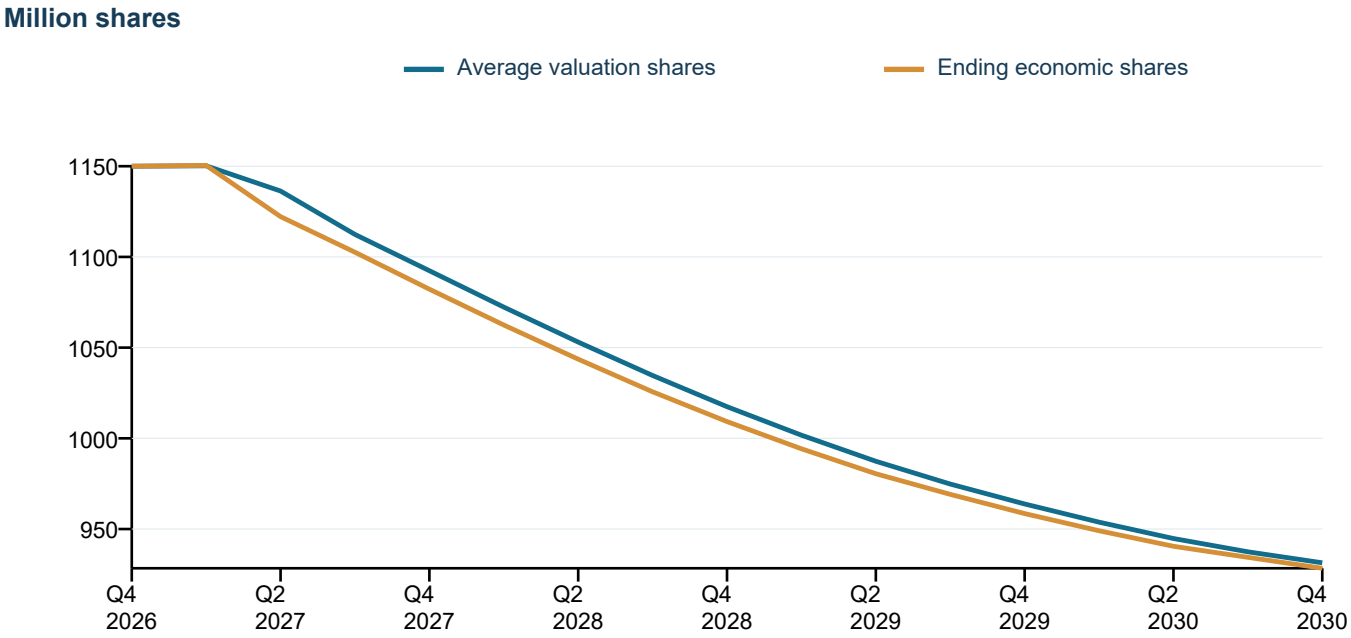

The guided 1.150B diluted share count is the opening economic proxy. Rounded legal shares and actual diluted averages retain separate scopes. After the guided quarter, new award value starts at $457.7275M: (7M rounded restricted grants x $243.13 + $129M ESPP-expense proxy)/4. This budget grows 10% annually. Exact ESPP grant value, options and current-quarter awards remain source gaps.

Withholding cash is $281.75M per quarter from FY2026's $1.127B total, with zero retirement credit. Grants, delayed bonus vesting and funded expected retirement determine ending economic shares. Valuation uses the quarter's opening/ending average.

Future ordinary dividend is $0.15 per average economic share. Payment follows the earned quarter, with Q4 cohorts paying after two quarters. The October 29 dividend is charged once at $169.65M using $0.15 x the September 3 rounded 1.131B legal-share count as an eligible-share proxy. The exact record-date eligible-share count remains unavailable. Dividend income adds zero to price targets. Terminal schedules retain unpaid cash and unvested bonus cohorts.

The 829M quarterly guard remains constant as a Root funding assumption through the forecast. Issuer CHIPS restrictions retain their individual award windows. The 169.65M October 29 dividend uses 0.15 USD x September 3 rounded 1,131M legal shares as the eligible-share proxy; exact record-date eligible shares remain unavailable.

Model figure M6. Repurchase budgets, cash spending and economic shares. Numerical table follows; all values use the model.

Known authorization is allocated once. Expected new budget = known-authorized budget + 80% x conditional renewal budget. Desired budget = MAX(FCF - withholding - dividend budget - 829M guard,0). Funded budget = MIN(desired,funding capacity). Purchases spend 70% in q+1 and 30% in q+2; 90% economic retirement is recognized at q+2 end. Valuation shares = (opening + ending)/2. Award shares use the separate saved execution reference, with 10% quarterly price growth.

Post-horizon obligations retained | USD M; shares M		
Cohort / measure	Cash M	Shares M
Q1 2031 buyback / retirement	27,747.203	5.528054

12. Price-independent score

The score is 54/60: Core Thesis 19, Cycle Stage 9, TAM Expansion 10, Catalysts 5, Macro 10 and Alpha 5, less four risk points. This equals 90/100, matching the protected Excel Base.

Process capability and customer commitments support the thesis. Exceptional profitability and supply response constrain Cycle Stage. Four scored risk classes cover customer/geopolitics, capacity execution, price/cost normalization and forward allocation/share uncertainty. Labor and awards sit within those existing classes.

Analytical score and protected display		
Category	**Points**	**Evidence / risk scope**
Core Thesis	19/20	HBM/server DRAM/SSD technology; manufacturing scale and process
Cycle Stage	9/10	Tight supply through 2028; very high current prices and profitability
TAM Expansion	10/10	Inference hierarchy, storage and edge content
Catalysts	5/5	HBM4E, Singapore packaging and Tongluo
Macro	10/10	AI infrastructure DRAM/NAND content
Alpha	5/5	Cross-product hierarchy and multiyear commitments
Risks	-4	Customer/geopolitics; capacity execution; normalization; allocation/shares
Total / protected Base	54/60 = 90/100	Protected Excel Base 90/100

13. Full quarterly derivations

Schedules show BU references, DRAM/NAND/other components, output, implied ASP/mix, manufacturing costs, BU GP/GM, residual compensation, consolidated OP and funded cash/shares. Defined indices retain their source denominators. Exact absolute bits and dollars per bit remain unavailable.

Calendar-year financial sums and fiscal-year output/capex schedules have different boundaries. A separate frozen-Q3-2026 display preserves its published information vintage, original 6.0x multiple and as-then rolling ceiling. Current selected forecasts start in Q4 2026.

DRAM, NAND and other reference components incorporate their own physical output ratios and recombine before price-only adjustments. BU sales = reference product components + NAND price increment + NAND collar + DRAM risk. BU manufacturing cost = reference sales x (1-reference GM) x (0.25 + 0.75 x actual/reference output ratio), with selected manufacturing-cost scaling. HBM and tightness GP reduce manufacturing cost. BU GP = BU sales - that cost. Corporate GP subtracts unallocated bonus COGS once; corporate opex adds bonus opex once. Absolute dollars per bit remain unavailable.

The frozen historical row preserves its original forecast window and conventions. Current Q4 2026 onward rows use the selected financial case. The source actual and immutable historical valuation display retain distinct scopes. Native historical diagnostic qualifications require the final Root disposition.

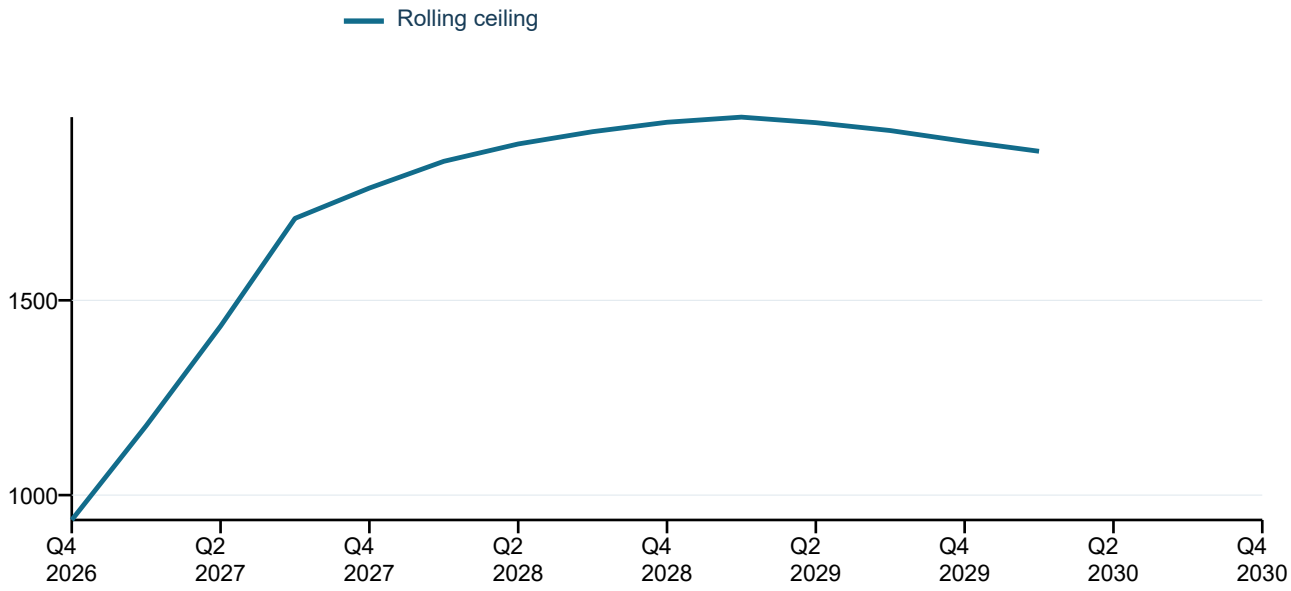

14. Rolling four-quarter valuation

The active Q4 2027 ceiling prices Q4 2027 through Q3 2028, corresponding to fiscal FY2028. Forward-four-quarter non-GAAP OP is 289.376757B. At 6.75x and 1,092.391939M average economic shares, the explicit billion-to-million conversion gives USD 1,788.09 per share.

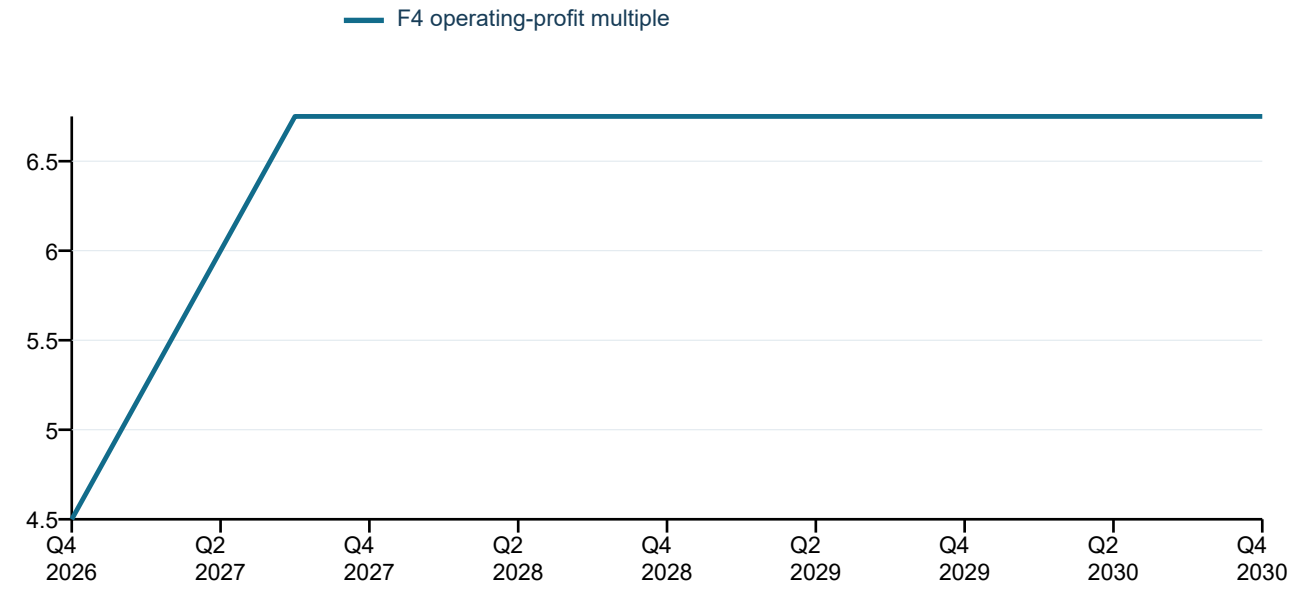

The current absolute multiple path is 4.5x in Q4 2026, 5.25x in Q1 2027, 6.0x in Q2 2027 and 6.75x from Q3 2027. Cash and dividends add zero to the equation. All fourteen complete windows and arithmetic chains follow.

The final three operating quarters have insufficient subsequent earnings within the retained horizon for complete four-quarter ceilings. Their valuation cells remain unavailable. Thirty fully recalculated diagnostic cases display changed inputs and their operating, cash and share effects.

USD per share

Multiple x

15. Counters and cross-book tests

Near-term operating tests are delivery against fiscal Q1 guidance, FY2027's gross-margin floor, CMBU realization after repricing, NAND prices inside bands and qualified new-capacity shipments.

Failed HBM conversion would support reducing its 75% weight toward 30%. Clear normalization or productive supply catch-up would support reducing the 75% tightness weight toward 30%. Company-specific concessions could raise the 15% DRAM and 25% NAND downside weights toward 50%. These are revision tests requiring fresh evidence.

The November 6 labor talks, pool rate, eligible payroll, awards, withholding and output continuity are labor tests. Actual authorization, purchases, diluted shares, tax settlements and cash after obligations test capital returns.

SK hynix/Samsung provide DRAM/HBM/NAND context with different mixes and contracts; SanDisk/Kioxia concentrate NAND exposure. Equipment, controllers and components transmit orders and costs through different wallets. Their evidence enters Micron's own branches and allocation.

Evidence tests for future probability review		
Branch	**Current selection**	**Evidence to revisit**
HBM	75%	Failed realization could support 30%
Tightness	75%	Productive supply catch-up/normalization could support 30%
DRAM / NAND downside	15% / 25%	Company-specific concessions could support 50%
Labor	60% residual; 25% localized action	Pool rate, November 6 talks, payroll, output and guide overlap
Capital	80% renewal; 90% economic retirement	Actual authorizations, purchases, diluted shares and cash after obligations

16. Sources and remaining completeness gaps

The retained set includes six official PDF originals: current/prior earnings materials, the annual filing and the October 21 technology deck. Selected financial, capital, competition and BU pages were reviewed. Relevant original figures sit beside the analysis.

The newest two earnings calls, the post-call and October 21 update were reviewed through provider Q&A and closing. Official replay audio remains unreviewed. An ambiguous post-call cost phrase remains a transcript gap; issuer tables control numerical anchors.

Local government statements, CNA originals and company-briefing reporting provide dated labor coverage through October 28. Full signed terms, briefing audio, pool percentage and eligible payroll remain unavailable. The bounded search retains exact access and later-filing coverage limits.

Product bits, realized ASPs, allocations, contract resets, yields, future grant values and detailed capex/settlement timing remain gaps. The model uses labeled proxies and sensitivity bounds. The final saved-workbook qualifications and validation identity are recorded below.

Current owning workbook: C:\Users\i_am_\Documents\Codex\2026-09-09\files-mentioned-by-the-user-v3\work\rescores_memory_earnings_20261030\workbook\mu_R5\native_staged\v3_2_master_portfolio.xlsx. Final saved-master SHA-256: 209c56f9723bed282990ce04b4e8851e88a1a4d565a7d29309abf14f21993627. Standalone companion: MU_Micron_DeepDive_model.json. The companion retains the exact selected financial CORE; the external publication receipt records publication identity.

Published historical forecast values, original formulas, valuation conventions and protected Base/manual controls are preserved. Current forecast changes begin in Q4 2026.

The original MU Y18 diagnostic formula and native cell remain unchanged. Its expected temporary responses were verified across all52 named saved-file probes; each restoration returned the original formula and OK status with full affected-graph identity.

The dated Memory Multiples reference sheet retains its original formulas and caches, including four legacy MU links. The current financial build and target outputs use MU_Q_Model and the current Master Portfolio and Quarterly Ceilings aliases.

Finite display adjustments expand202 new-module row heights, show52 current bonus-share cells to six decimals and expand three current note rows. Financial values, formulas and caches remain identical to the independently verified financial baseline.

Bundled saved-file recalculation, independent numerical/package checks, meaningful input perturbation/restoration and rendered review passed for the affected calculation graph and portfolio rank aliases. Preserved foreign model parts retain their existing formulas and caches.

Native Microsoft Excel recalculation remains unverified under the saved spreadsheet validation policy. The bundled runtime supplies the completed saved-file checks.

Dated source register

S1. MU Q4 FY26 Prepared Remarks.pdf | 2026-09-30

Complete prepared remarks retained. Current revenue, margin, opex, capacity and contract statements reviewed. Full live audio remains unreviewed.

S21. MU_E6_STACK original retained exhibit | 2026-05-31

Source figure E6. Owner-supplied May 31, 2026 article: HBM stack, base die and interposer illustration. It maps the manufacturing interfaces relevant to architecture substitution; source contains no measured Micron unit cost.

https://irrationalanalysis.substack.com/p/hbm-high-bandwidth-mistake

Retained record: MU_E6_STACK.jpg. SHA-256 a9a21f699d1358506244eabcaef1f50ffc6da793b3c4e9c5ab3c7b670e0ead3d.

S22. MU_E7_WAFER original retained exhibit | 2024-03-20 excerpt /2026-05-31 reproduction

Source figure E7. Micron's March 20, 2024 earnings excerpt, reproduced in the owner-supplied May 31 article. The approximate three-to-one wafer comparison concerns equal bits of HBM3E and same-node DDR5; qualified cohort transfer governs the economic bridge.

https://irrationalanalysis.substack.com/p/hbm-high-bandwidth-mistake

Retained record: MU_E7_WAFER.jpg. SHA-256 8be32f8da1a17a98b506275e882064d63071eb2a7d396a9aca8ade395a77ac04.

S23. MU_E8_OPTICAL original retained exhibit | 2026-02 research /2026-05-31 reproduction

Source figure E8. NVIDIA ISSCC 2026 research comparison reproduced in the owner-supplied May 31 article. Link throughput, shoreline and energy retain their original conditions and thermal/laser assumptions. Complete memory-system latency, utilization and qualified cohort economics remain unresolved.

https://research.nvidia.com/publication/2026-02_32-gbsl-256gbsfiber-half-rate-bandpass-filtered-clock-forwarding-dwdm-optical

S24. MU_E9_AGENTPOOL original retained exhibit | 2026-08-13

Source figure E9. Owner-retained SanDisk 2030 annual AI-data-center NAND shipment exhibit. Staging, KV cache and fast-lake workloads sum to one 1.2ZB annual pool; TLC/QLC describes the same shipments. The model retains overlapping Micron demand in its existing BU growth.

S25. Samsung Q3 2026 results | 2026-10-29

Primary earnings presentation retained and reviewed in the completed Samsung rescore. Memory mix, supply and contract scope inform Micron probability branches; issuer-specific returns and segment dollars retain their own scope.

https://images.samsung.com/is/content/samsung/assets/global/ir/docs/2026_3Q_conference_eng.pdf

Retained record: Samsung_2026_3Q_conference_eng.pdf. SHA-256 f3b09471a839eee5b0360ef9ecf9cd62ec75910174758a13a86562975fc7e241.

S26. SanDisk FQ1 FY2027 results | 2026-10-29

Current primary release and earnings materials reviewed in completed SanDisk workflow. Latest quarter NAND demand, contract and pricing evidence enters Micron company-specific realization; fiscal periods and mixes differ.

S27. SK hynix Q3 2026 results | 2026-10-28 Seoul

Retained official release and native reported Q&A support market pricing and qualified supply context. The completed workflow preserves current full-replay/transcript incompleteness. Customer demand discussions, signed commitments and physical supply retain separate denominators.

https://news.skhynix.com/en/q3-2026-business-results/

Retained record: Q326_OFFICIAL_EN_RELEASE.html. SHA-256 6e15e94c73c068e00453b6e2f7eb6975f1edb1d89f6bfd8b11892b5b3f47a6e1.

S28. Source coverage, financial cash addenda and current freshness record | Reviewed 2026-10-30, America/Toronto

Native issuer event/release retrieval returned HTTP 403 on bounded normal-TLS attempts; retained primary PDFs and reviewed web extracts support dated numerical evidence. Full signed labor agreement, briefing audio, later outcomes and exact CHIPS-only return formula remain gaps. Selected source pages and complete call text have separate coverage records.

Public URL unavailable. Retained source: Local source review and dated primary addenda.

Retained record: MU_Source_Review_And_Completeness_R3.json. SHA-256 711dc7aa3dfff7ffb42bba925d91c6963cbd099685e76ac57519fa51c075152b.

S29. Micron Idaho community investment release | 2026-10-27

Full web-rendered issuer release retained. Multi-year categories and prior commitment overlap reviewed; original normal-TLS HTML download failed. A distinct incremental quarterly expense remains unresolved.

https://investors.micron.com/news/press-release/2026/Micron-Announces-Over-67-Million-in-New-Idaho-Community-Investments-for-Transportation-Housing-and-Children/default.aspx

S30. Micron Indium supplier investment release | 2026-10-20

Full web-rendered issuer release retained. Supplier investment falls within the earlier up-to-$3B programme; exact amount and incremental cash/expense classification remain unpublished.

https://investors.micron.com/news/press-release/2026/Micron-Invests-in-New-York-Critical-Minerals-Processing-With-Indium-Corporation/default.aspx

Retained record: MU_New_Issuer_Releases_Web_Extract_R1.json. SHA-256 b5d33213f4cc20a9bc5b5292a9f762a87cb63bafcca984457c0ee233dc934ae7.

S31. Root retained zero ledger and current actual/guide bridge | Selected 2026-10-30, America/Toronto

Supplemental metadata preserves all 13 qualitative signals, source residuals and zero selected extra revenue, manufacturing cost, support opex, OP and financing credit. Independent review passed 268 checks with specific source and allocation gaps. Financial CORE remains unchanged.

Public URL unavailable. Retained source: Local retained source and Root supplemental authority.

Retained record: ROOT_MU_ZERO_INCREMENT_LEDGER_R2.json. SHA-256 d2375b073699b6f0c7b6d0fd7afb4988ce765a617218757791bd18c3659cdb04.
