SOI.PA - Soitec SA

Full investment research | Model assumptions and source evidence

Framework 8 | Research cutoff: 17 October 2026

Status: Covered engineered-substrate bottleneck. Workbook inclusion does not establish an actual holding.

Excel Base: 82/100. Analytical Base: 49/60 = 82/100. The current lattice score is retained. The probability of the bank forecast outcome is a separate model judgment.

Active Q4 2027 ceiling: EUR 262 per share. It values Q4 2027 through Q3 2028 recurring operating profit at the sanctioned **25x** multiple, using **37,260,936 modeled diluted economic shares**. All financial tables are EUR millions unless labeled otherwise.

What determines the case: Qualified engineered-wafer output and customer conversion drive the thesis. The existing 30% joint JPM fiscal FY27-FY29 product-and-cost case remains active, including weaker mobile/auto sales, adverse near-term profit and weak cash conversion. A separate 25% low-confidence near-term photonics outcome is now included only above that complete earlier case. Product cost assumptions and the signed unallocated GP reconciliation remain explicit. Source credibility is not certainty about unknown output, costs or cash.

October 17 update: stronger near-term sales, unchanged main horizon

The new evidence improves the near-term profit forecast; it does not justify adding a second long-term factory revenue stream. Modeled FY27 recurring operating profit rises from about EUR 109 million to EUR 113 million, about 4%. The Q4 2026 ceiling moves from about EUR 143 to EUR 146, about 2%. The main Q4 2027 ceiling remains about **EUR 262**, with the existing 25x valuation, quarterly share schedule, Excel Base 82 and analytical Base 82.

BofA's October 15 management-meeting note reports strong customer commitments, effectively booked calendar 2027/2028 capacity and growth toward the upper end of a cited prior range. The latest original issuer trading update is still September 2. It describes FY27 photonics sales at **250-300% of the previous year's sales**, whereas the bank note describes a prior **200-350% range**. This mismatch has not been resolved; the source sentence also does not explicitly name the fiscal year. A literal USD 350 million FY27 interpretation is therefore a bounded low-confidence conditional outcome, not official guidance.

ASTRA assigns that conditional outcome a **25% probability**, with the other 75% retaining the entire previous active FY27 photonics forecast of about USD 282 million. This produces expected sales of about **USD 299 million**. It does not average competing bank forecasts: the older JPM whole product-and-cost outcome remains at 30%, and its complete contribution is included in the amount subtracted before adding this residual. The resulting expected revenue sits near the upper end of the official range on the model's USD 100 million comparison proxy; the actual issuer comparator is slightly above that amount.

Human-readable figures in this artifact are rounded to whole numbers. The linked model and workbook retain exact calculations. Rows may not sum from displayed rounded values. Original source images retain the authors' precision. Dollar amounts mean USD unless otherwise stated; group model tables use EUR million. The retained currency assumption is **$119 per EUR 100**.

Qualified output, factory overlap and funding

Figure N2. Soitec original May 28, 2026 results presentation, slide 45. Installed capacity, full-fab potential, product allocation and PR1A extension are distinct. The original image retains source precision.

The July issuer release confirms Singapore 300mm Photonics-SOI high-volume qualification with initial customers, while other customer qualifications remain in progress. This is stronger than an unequipped building, but it does not qualify every product specification or all nominal factory capacity. Reservations and deposits are not recognized revenue.

The original May results presentation already showed roughly **750,000 installed 300mm wafers a year at Bernin 2 and 800,000 at Singapore**. The annual report gives Bernin 2 about 800,000; that modest source difference does not create another factory. The old installed footprint is therefore roughly 1,500,000-1,600,000 across all relevant SOI products. Singapore full-fab potential was already shown as about 2,000,000, with its extension deployed progressively as customer demand develops. The annual report's **2,800,000 maximum group capacity includes the future extension**. It must not be added to installed capacity.

The October 15 note describes current overall 300mm capacity of about 1,500,000 wafers annually, an existing-site path adding about 500,000, and another potential Singapore expansion of about 1,000,000. These are overlapping factory stages, not three independent demand shocks. Roughly 70% common tools do not make all capacity interchangeable: photonics uses more oxidation time, and customer qualification, yield, utilization and other-product allocation can constrain good-unit output. TFLN and Photonics-SOI run in separate fabs; complementary materials are not another copy of the same production line.

The bank's example of **USD 1 billion annual revenue per 1,000,000 300mm wafers** assumes full allocation to photonics and depends on mix and utilization. It is not an accepted wafer order or a realized ASP rate card. Applying that example to our already modeled sales gives the following footprint check. A separate 85% effective-output assumption is a diagnostic derating for processing, yield and availability, not a reported utilization or a new demand forecast. It is not applied again to reduce modeled sales.

Calendar year	Already modeled photonics USD M	Revenue-equivalent wafers	Share of 1,500,000 nominal	Share of 2,000,000 at 85% effective
2027	533	533,011	36%	31%
2028	817	816,778	54%	48%
2029	1,086	1,086,300	72%	64%
2030	1,428	1,428,000	95%	84%

This check establishes substantial overlap with the saved ramp, rather than demonstrating actual wafer counts. For example, calendar 2030 already requires about USD 1,428 million photonics sales, equivalent to about 1,428,000 wafers under the bank's simplifying example. That would use about 95% of today's overall nominal 300mm capacity before reserving tools for other products, or about 84% of a 2,000,000 footprint at the diagnostic effective rate. The later forecast therefore already needs mix reallocation, productive improvements and expansion execution; the new capacity language is not unused revenue to add again. Exact qualified product output, gross-to-good yield, oxidation tool time, spend, commissioning and customer acceptance dates remain open.

At the separate diagnostic 85% effective rate on today's 1,500,000 footprint, the calendar 2030 sales-equivalent requirement would be about 112% even before allocating tools to other SOI products. This reinforces the dependence on future expansion and conversion rather than proving a current capacity surplus. It is a risk diagnostic, not an unsupported reduction to the active forecast.

For the limited near-term case, existing qualified footprint and throughput conversion are assumed sufficient; no unfunded new greenfield fab is presumed. FY27 capex guidance remains around EUR 100 million, not a verified budget for all later expansion. New future-capacity sales require their own capex, depreciation, staffing, material, qualification and working-capital bridge. September's announced EUR 500 million financing was scheduled to provide funding flexibility, with matching liability and potential settlement claims; completion and current proceeds are not independently verified here. Financing does not itself create profit or a target increase.

The mobile recovery comment is also overlapping evidence. Existing calendar 2027 Mobile sales of about EUR 354 million and calendar 2028 sales of about EUR 408 million already exceed FY26 reported Mobile sales of EUR 309 million by about 15% and 32%, respectively; these are different period conventions and are used only

as scale checks. The note's roughly USD 400 million RF-SOI revenue figure has no explicit period. Its statement that shipments are about half underlying demand does not authorize doubling group Mobile sales: RF-SOI is only part of the segment, POI can replace applicable RF-SOI content, and wafer size, timing, pricing and allocation remain unclear. No separate recovery revenue is added from that sentence.

Long-term memory optionality remains a source-level watch. No identified product, qualified customer, unit volume, timing or cost/profit bridge supports an additional active revenue line. The zero increment reflects those missing economics after the bounded capacity exercise, rather than treating a source author's caution as a modeling instruction.

even smaller geometries. PLAB does not directly encounter some of these suppliers outside their captive ecosystems. The business remains profitable, but mgmt is taking the outlook quarter by quarter.

- **High-end IC mix:** High-end IC represents roughly 44% of Semi revenue and includes applications from 28nm down to 7nm. Node migration supports ASP growth through more layers and greater mask-set complexity. PLAB expects self-help from Allen, Boise and Korea to improve the mix over time.
- **Capital intensity:** Allen spending can be approximated from the increase in annual capex since FY24, although the total project cost remains below $100mn. Advanced-node investments are materially more expensive as PLAB moves closer to 8nm and eventually EUV. Initial revenue from a new 8nm investment could begin in fiscal Q4.
- **Cash availability:** Roughly 75% of PLAB's cash sits within the Taiwan and China JVs. Accessing that cash outside the JVs requires dividends and creates tax leakage, while using it for JV capex preserves its full value. Part of the current capital program can therefore be funded directly within the JVs.

Soitec

We met with Laurent Rémont, CEO, Albin Jacquemont, CFO, and Alexandre Petovari, Head of Investor Relations, Financing and Treasury.

- **Photonics-SOI outlook:** Soitec accelerated its trading update after gaining better visibility into demand and its ability to increase output. Signals discussed in May continued to convert and the company stretched operations to capture incremental demand. Mgmt now expects Photonics-SOI growth to finish closer to the upper end of its prior 2-3.5x range.
- **Customer visibility:** Photonics demand is supported by improving multiyear customer commitments, with CY27/CY28 capacity effectively booked. Soitec does not plan to require customer financing because it wants to retain flexibility across products and customers.
- **Photonics pricing:** Mgmt does not intend to use current demand strength for a short-term pricing gain. Pricing is managed to preserve LT customer relationships and support capacity conversion from Mobile Communications into Data Center applications. The starting economics are already attractive because Photonics-SOI carries the portfolio's highest pricing.
- **Photonics profitability:** Photonics-SOI contribution margin is roughly 20pts above the group average on the current product and pricing mix. Both 200mm and 300mm products contribute meaningfully. The favorable mix should support stronger profitability and FCF as revenue scales.
- **Capacity expansion:** Soitec has already increased Photonics-SOI output materially and continues to improve throughput at existing facilities. Singapore has an unequipped building that could be converted into additional cleanroom capacity and support up to ~1mn wafers. Mgmt is also pursuing incremental output across the existing footprint before committing to an entirely new fab.

Figure N3. Original BofA SEMICON West management-meeting note, October 15, 2026, page 18. Source growth-range mismatch, booked calendar capacity, pricing restraint and contribution-margin distinction remain explicit; source precision retained.

1. Thesis, products and competitive position

SUBSTRATE CHOKEPOINT CANDIDATE. Smart Cut processing, wafer quality and foundry qualifications support a strong position in Photonics-SOI. The substrate can serve pluggables, near-packaged and co-packaged optics, which broadens demand beyond a single architecture. A cited market-share estimate is not proof that every optical architecture must use Soitec.

September 2 issuer guidance calls for roughly 50% Q2 FY27 growth at constant currency/scope, FY27 Photonics revenue at 250-300% of FY26 sales, which were slightly above USD 100M, Q2 approximately USD 75M and H1 approximately USD 115M. Agreements with eight of roughly ten major photonics customers are expected in coming weeks; that future milestone is not marked completed. The rest of the business is broadly unchanged. Sources: SOI-1, SOI-2.

Engineered wafers as the starting material

Soitec's Smart Cut process and engineered-wafer expertise support controlled material layers, uniformity and qualified starting substrates. Photonics-SOI is valuable where the device architecture requires that wafer stack. Customer qualification, licensed processes and production know-how can create strong switching friction, but market-share claims must be tied to the particular substrate class.

The broader portfolio includes RF/mobile, power, automotive and other engineered-substrate demand. A photonics ramp can therefore coexist with mobile inventory correction and uneven group utilization. Customer reservations or deposits improve visibility but are not themselves recognized wafer sales or a reported operating-profit figure.

Competition and the economics of architecture

The original map identifies Shin-Etsu's licensed position, prospective GlobalWafers supply and Simgui's 200mm/China exposure. Their process rights, wafer sizes and customer qualifications must be distinguished. Silicon nitride can complement silicon photonics in some systems and substitute for particular functions in others; an architecture label alone cannot determine Soitec's captured substrate content.

Singapore qualification, wafer output and high-value product mix are the practical production checks. POI pricing, subsidies, compensation and FX also affect recurring profitability. The current sales update is not a complete quarterly OP disclosure; the margin and grant treatment below explicitly distinguishes model assumptions from reported results.

Research provenance: the product and competitive analysis in this section synthesizes the supplied archived product research. Dated market-share, process and channel claims retain their original evidence status; this integration is not a new independent verification of those claims. Current earnings and model assumptions are set out below.

Verified competitive response

GlobalWafers' August 4 presentation states that RF-SOI and silicon-photonics products have entered small-volume production at St. Peters and describes SOI production ramping with demand exceeding supply. This provides a concrete second-source competitive threat; it does not establish enormous shareholder upside for a new candidate. The neighboring claims about full utilization and 30% completed / 20% underway expansion refer to GaN, not SOI. They are excluded from Soitec capacity math.

GWC's Local Manufacturing Footprint is Aligned with Customer Capacity Expansion

GlobalWafers Co., Ltd.
環球晶圓股份有限公司

- GWC's global manufacturing footprint is increasingly aligned with customer localization requirements, enabling closer customer collaboration and more resilient regional supply, and greater support for customers' traceability and sustainability requirements.
- Localized manufacturing is strengthening strategic customer relationships, as demonstrated by its recently announced long-term collaboration with Micron in July 2026 to support US wafer supply chain localization.
- GWC's expansion investments are beginning to bear fruit, with the focus shifting from fab construction to customer qualification and production ramp-up as new capacity begins contributing to revenue and earnings.

	Site	Status	Ecosystem Capacity Highlights
On-going Expansion	Sherman, Texas, US	■ Successfully completed qualification with multiple customers. ■ Ongoing process optimization.	>$600B of announced U.S. expansion by leading semiconductor manufacturers supports localized manufacturing demand
	St. Peters, Missouri, US	■ Customer sampling activities are ongoing. ■ RF-SOI and silicon photonics products have entered small-volume production.	>$10B of announced investment by leading semiconductor manufacturers reinforces long-term demand for specialty wafers, including SOI
	Novara, Italy	■ Initial customer qualifications are progressing smoothly. ■ Capacity utilization will be steadily ramped up in line with customer qualification progress and market demand.	>$10B of announced investment by leading semiconductor manufacturers supports Europe's power semiconductor ecosystem
Recent Completion	Utsunomiya, Japan	■ Capacity expansion has been successfully completed, with all additional capacity fully in place. ■ Overall capacity utilization remains at a high level. ■ Operational and financial performance continue to improve.	>$30B of announced investment by leading semiconductor manufacturers supports advanced semiconductor manufacturing in Japan

Figure S1. GlobalWafers original August 4, 2026 issuer presentation, page 14. Small-volume SOI and silicon-photonics supply is competitive context. Neighboring GaN capacity claims are excluded.

The repost attributes an 80% Soitec share forecast in FY30 to JPM. That number is not visible in the supplied table and is not verified company guidance. The active bank outcome is treated as already incorporating its own competition assumptions; no second 20% revenue haircut is layered on the same forecast. Qualification at a site does not establish volume at every customer's wafer specification.

2. New evidence and fiscal-period discipline

Original evidence and source status

The owner supplied the table below on October 10, attributed by @OptionKing666 to an October 9 JPM report. The full report, exact post permalink, detailed wafer/ASP build, accounting adjustments and capex/working-capital schedule have not been recovered. The visible table is substantive attributable forecast evidence and receives a numerical weight under Rule 16b. The report date is supplied in the repost, not visible in the crop.

Table 2: Soitec, JPMe vs. Bloomberg consensus @OptionKing666

€ million

	JPMe			BBG			Diff.		
	FY27	FY28	FY29	FY27	FY28	FY29	FY27	FY28	FY29

Figure S2. Owner-supplied JPM forecast crop, received October 10, 2026. October 9 report date is attributed by the repost. Estimates, not issuer guidance; original image precision is retained.

Soitec's fiscal year ends in March: **FY27 = April 2026-March 2027; FY28 = April 2027-March 2028; FY29 = April 2028-March 2029.** Edge & Cloud AI includes products beyond Photonics-SOI. EUR 1,042M must not be labeled pure photonics wafer sales or compared directly with dollar-denominated photonics guidance.

Bank forecast	FY27	FY28	FY29
Mobile	238	282	342
Auto / industrial	72	80	91
Edge & Cloud AI	394	696	1,042
Group revenue	704	1,057	1,475
Gross profit	193	434	684
Operating profit	65	303	545
Free cash flow	262	80	67

The FY28 rounded segment values total EUR 1,058M while group revenue is EUR 1,057M. The model isolates the EUR 1M rounding reconciliation in Other Edge, rather than inventing extra sales. FY29 group revenue and segment totals agree. From the displayed rounded inputs, FY29 Edge is 38% above Bloomberg, OP 96% above and EPS 94% above. These are forecast differences versus consensus, not target revisions or realized growth.

Cash conversion is a material counterweight

The table forecasts FY29 FCF of **EUR 67M**, versus EUR 137M consensus, despite EUR 449M net income and EUR 545M OP. FCF is approximately 15% of net income. The source excerpt does not identify whether capex, working capital, deposits, financing definitions or other adjustments explain the gap. Do not infer free cash flow from the operating-profit ceiling, and do not invent a dividend or buyback capacity. This lowers confidence in the bank endpoint and is an explicit follow-up.

Funding and cash are separate from the profit increase

At March 31, the issuer reported EUR 562 million cash and EUR 56 million net debt under its stated definition. These are dated historical balances, not verified October cash. The September EUR 500 million ORNANE announcement provides a potential funding source with a matching claim; no independently verified closing cash is added to this valuation.

The limited new sales case may consume cash while raising accounting profit. As a diagnostic, working capital equal to 30-50% of the added probability-weighted sales would absorb about EUR 4-7 million. A simple 20% cash-tax proxy on the added EUR 4 million operating profit, less that working-capital requirement, gives roughly **minus EUR 1-4 million before existing capex**. This is an illustrative operating-profit-to-cash proxy, not a forecast of total company free cash flow; actual tax, non-cash charges, deposits and payment timing can differ. The existing FY27 EUR 100 million guided capex remains part of the baseline, and no new greenfield factory spend is presumed. Any extra binding tool or capacity budget requires its own cost and cash revision.

Latest issuer anchors and call coverage

The September 2 update expects FY27 Photonics-SOI revenue at 250-300% of FY26 sales, whose value was slightly above USD 100M, Q2 photonics around USD 75M and H1 around USD 115M. Q2 group growth is around 50% at constant currency/scope. The existing EUR 209M calendar Q3 2026 group estimate retains the roughly EUR 139M comparative base and neutral translation assumption; it is not exact reported-euro guidance. Q1 FY27 group revenue is EUR 113M actual, while rounded divisions sum to EUR 114M.

The model's USD 119 per EUR 100 translation assumption is retained. The Q3 2026 photonics forecast remains USD 75M translated at USD 119 per EUR 100. The issuer expects agreements with eight of roughly ten major customers; this expectation is not relabeled completed contracting. The July full management call was previously read. The May full call remains unavailable; written issuer results and the registration document remain the disclosed fallback.

3. Analytical score

The category arithmetic gives **49/60 = 82/100** after the -4-point risk deduction. The portfolio Excel Base is **82/100**. Risk-class detail appears in section 8.

Category	Points	Max	Basis
Core thesis	19	20	Qualified Photonics-SOI platform, Smart Cut process and ecosystem position.
Cycle stage	8	10	Photonics accelerating; mobile inventory digestion remains.
TAM expansion	9	10	Optical connectivity across pluggable, NPO and CPO architectures.
Catalysts	5	5	Singapore qualification, capacity reservations and raised September guide.
Macro	8	10	AI interconnect demand is strong but legacy end markets differ.
Alpha	4	5	Architecture-agnostic substrate demand improves breadth of evidence.
Risks	-4	0	Ramp, input costs, subsidies, customer concentration, alternative substrates and dilution.

4. Probability ledger and operating bridge

Retained joint JPM outcome, 30% probability

The hypothesis is that the attributed JPM fiscal FY27-FY29 product and cost outcome occurs, against a reference that already contains the September guidance, strong photonics growth, product margins and operating leverage. **Retained JPM operating case = reference + 30% x (conditional - reference).** The separately identified October 17 residual below is then added only in the remaining FY27 quarters. This is one joint outcome, not independent additions for Edge sales, total sales, gross profit, EPS and consensus beats. The other 70% retains the existing operating assumptions. Probability is not multiplied into the ceiling a second time.

The 30% judgment sits within the framework's single credible source band. A visible company forecast and primary photonics demand evidence support modeling now. Missing full-report cost definitions, an unverified report date, competitive supply and weak cash conversion restrain the weight. Revenue, GP and opex all share that probability so favorable and adverse elements stay coherent. No analyst price target is imported.

October 17 incremental operating bridge

The eligible conditional revenue is the difference between USD 350 million and the complete previous active FY27 photonics forecast, about USD 282 million. At $119 per EUR 100, that is about EUR 57 million conditional incremental sales. At 25% probability, the active sales addition is about EUR 14 million. Manufacturing gross profit captures 50% of that increment; recurring qualification, production support, R&D and administration consume another 20% of incremental sales. Net incremental operating profit is therefore 30% of the sales increment, about EUR 4 million after probability. Normal compensation, depreciation and support costs are not added back.

The cost assumptions are analytical bounds rather than disclosed product margins. The diagnostic range uses probability of 15-40% and net operating-profit conversion of 20-40%. The lower case allows greater production and support costs. No 80% contribution-margin statement is treated as group operating margin. No separate pricing premium is inserted because management explicitly rejects a short-term price gain in the source note.

The added shipments sit only in **calendar Q4 2026 and Q1 2027**, the remaining H2 of FY27, using the existing photonics sales profile. Q1 FY27 reported revenue and its labeled GP/opex proxies, and the September-quarter guidance anchor, stay fixed. Calendar Q4 2027 and later quarters receive no permanent step from an ambiguous near-term growth range. Their already substantial growth, reservations and capacity assumptions remain in the existing active trajectory.

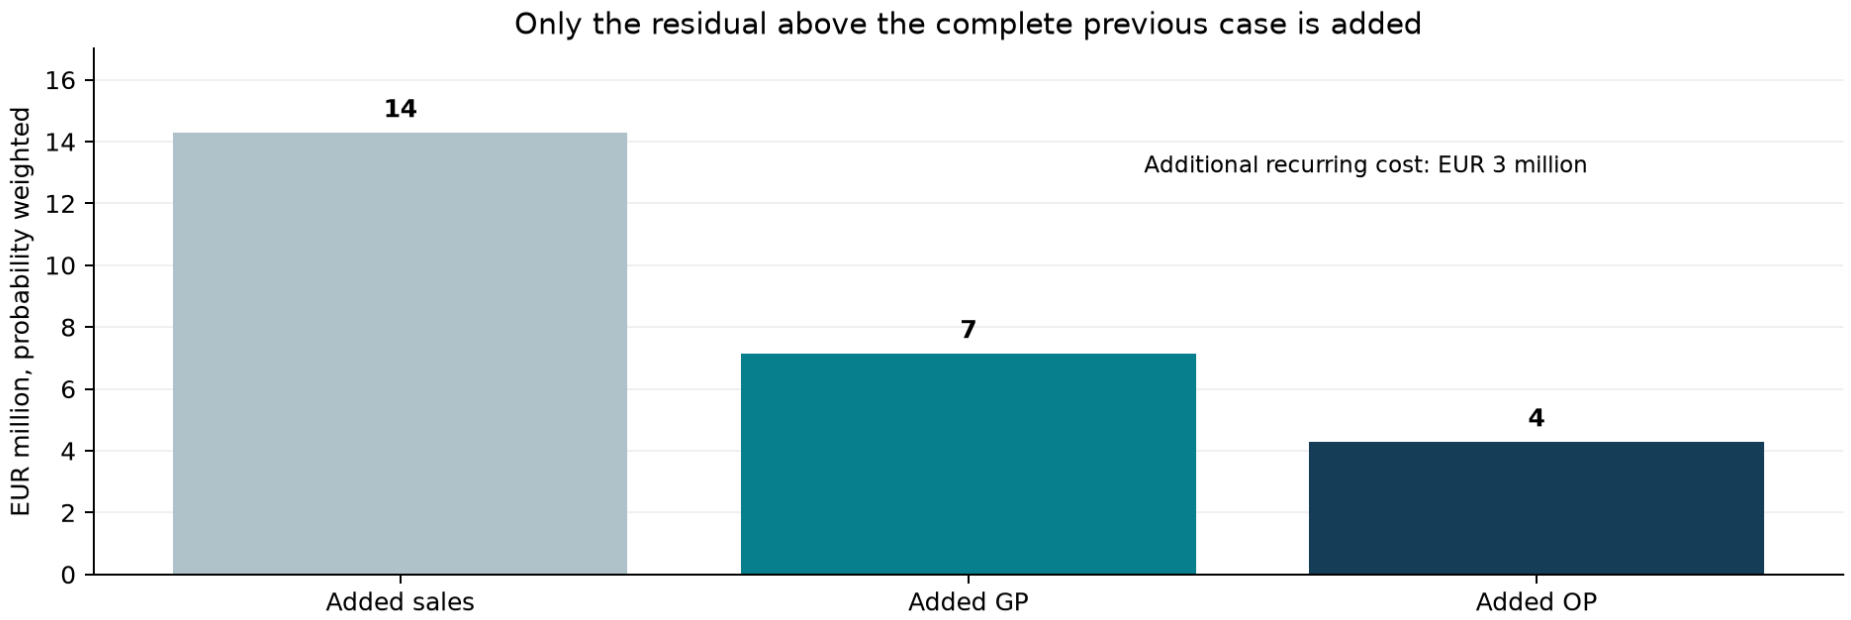

Figure N1. Probability-weighted residual sales, gross profit and operating profit. Additional recurring operating expense is also charged. All plotted figures follow in EUR million.

Bridge	Conditional increment	Probability-weighted addition
Photonics sales above all previous modeling	57	14
Manufacturing GP at 50% of sales	29	7
Additional recurring opex at 20%	11	3
Recurring OP after all these costs	17	4

Period	Added sales	Added GP	Added recurring cost	Added OP
Q4 2026	7	3	1	2
Q1 2027	7	4	1	2

This is an owner-requested implemented model update. The earlier 2-3% potential-rebuild flag is no longer an unimplemented item. The main valuation horizon remains Q4 2027; improving profit before that window cannot mechanically raise that target.

Growth-range interpretation and sensitivity

The interpretation of the bank's upper range matters. Holding the net incremental OP assumption at 30%, the following alternatives show the effect of a USD 300 million versus USD 350 million total FY27 photonics outcome. These alternatives change only the residual above the saved complete active case; they are sensitivities, not six separate increments. All leave the main Q4 2027 ceiling unchanged. The USD 300 million case is a rounded proxy for the issuer's upper end because its prior-year comparator was slightly above USD 100 million.

Conditional total USD M	Probability	Expected total USD M	FY27 OP change	Q4 2026 ceiling EUR	Q4 2026 revision
300	15%	285	less than 1%	143	less than 1%
300	25%	286	+1%	144	less than 1%
300	40%	289	+2%	144	less than 1%
350	15%	292	+2%	145	+1%
350	25%	299	+4%	146	+2%
350	40%	309	+6%	148	+3%

Across the wider probability and cost bounds, the FY27 profit improvement ranges from less than 1% to about +8%. The selected 25% probability and 30% net incremental OP conversion yield about +4%. The unresolved wording and cost bridge therefore matter more than the mere existence of demand; the whole upper-growth outcome is not treated as certain.

Quarterly allocation and costs

Within each fiscal year, segment revenue follows its existing quarterly profile. Other Edge revenue is held at the reference except the EUR 1M FY28 rounding item. Incremental Edge revenue is assigned to Photonics-SOI as a **LOW-confidence allocation proxy**, not a disclosed segment split. Mobile and auto are reduced to their bank conditional totals. Existing product GMs are retained. The difference between conditional product GP and bank group GP appears as a **signed unallocated GP reconciliation**, allocated across quarters using the reference GP profile. It can represent undisclosed manufacturing absorption, mix, grants or accounting treatment; its cause is not established.

Conditional opex is bank GP minus OP: **EUR 128M / 131M / 139M** for FY27/FY28/FY29. Those are derived bank costs, not issuer expense guidance. Quarterly opex follows the reference quarterly cost profile. In FY29 the conditional EUR 101M OP increment comprises EUR 61M more GP and EUR 40M less opex. Its active contribution is **EUR 30M**, comprising EUR 18M GP and EUR 12M expense benefit. This is not all wafer growth.

FY27 proxy and current guidance protection

Q1 FY27 GP and OP were not separately disclosed. To map the annual bank endpoint without changing the EUR 113M actual sales anchor, use a labeled Q1 proxy: GP = EUR 113M x (FY26 GP96 / sales592) = EUR 18M; opex = FY26 recurring104 / 4 = EUR 26M. Q1 division rounding is reconciled by assigning EUR 64M to modeled Edge versus the rounded reported 65. This is allocation arithmetic, not an amended actual.

Calendar Q3 2026 revenue and its current guidance-anchored inputs remain fixed. The bank's remaining fiscal-H2 outcome is then EUR 383M sales and EUR 38M OP. Before the new residual, its active H2 result was EUR 450M sales and EUR 82M OP. After the limited October 17 update, H2 sales are EUR 464M and OP is EUR 86M. The retained JPM conditional H2 OP remains below the old reference; its adverse element has not been removed. This includes the negative near-term implications rather than selecting only the favorable later forecast. The Q1 GP/opex proxy is particularly uncertain and affects near-term ceilings; it has **no effect on the Q4 2027 valuation window**.

For a bounded Q1 proxy check, 10-25% Q1 GM and EUR 24-30M opex imply FY27 H2 conditional OP EUR 26-49M. Weighted H2 OP moves by roughly -EUR 4M to +EUR 3M around the active calculation. Replace these proxies when the missing cost definition or actual first-half margins are available; do not treat the proxy as reported earnings.

Source horizon and overlap

The source supplies no FY30 financial table. No new numerical increment is assigned after March 2029; the existing absolute operating trajectory is retained. Its rising output and profit already catch up to the weighted FY29 endpoint. The model does not extrapolate an unidentified bank accounting benefit indefinitely. The text-only 80% market-share assumption is assessed at 30% as a competitive outcome, with a bounded 10-20% photonics-sales loss versus a counterfactual unchanged share. It is not stacked on a bank path that already assumes competitive supply. Without a matching market denominator, assigning a second independent loss would count the same risk twice.

The bank's EPS and net income are downstream of the same forecast and add zero independent earnings. Broad SiPh wafer growth also adds zero direct revenue to SIVE, LITE, COHR or TSEM here: no new company-specific allocation, qualified unit count, emitter content or price is supplied. Their existing optical demand cases remain separate. These are overlap and scope decisions, not a requirement to wait for official confirmation.

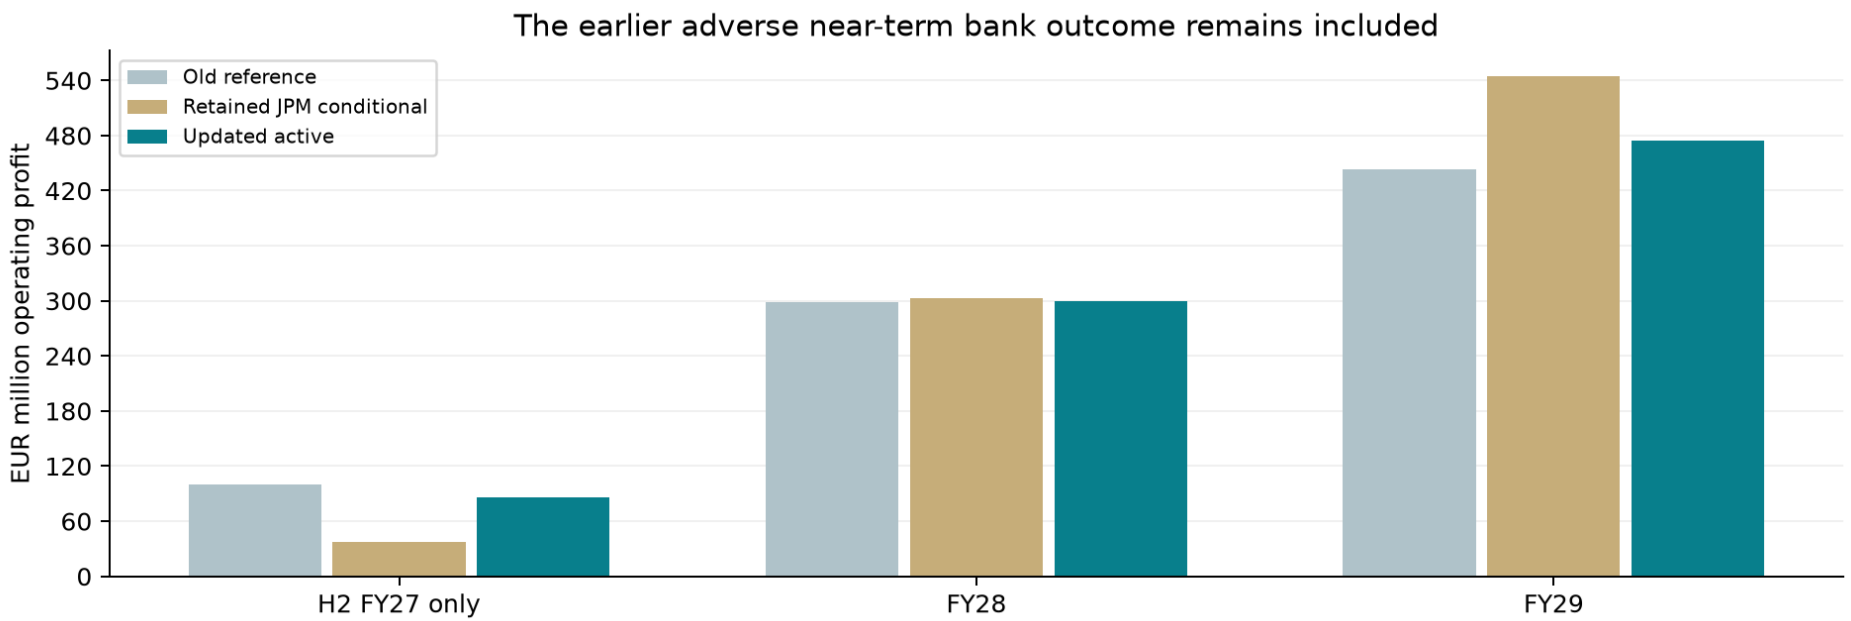

Figure M1. Updated fiscal operating profit. H2 FY27 is only a half year; FY28 and FY29 are full fiscal years. Complete plotted figures follow.

Period	Updated revenue	Updated GP	Updated opex	Old reference OP	JPM conditional OP	Updated OP
H2 FY27 only	464	159	73	100	38	86
FY2028	1,122	452	152	299	303	300
FY2029	1,465	641	167	444	545	474

BofA GLOBAL RESEARCH

BofA SECURITIES

Soitec

Many Architectures, One Upstream Winner – Upgrade to Buy

Rating Change: BUY | PO: 300.00 EUR | Price: 152.40 EUR

Riding the optical wave to 64% EBITDA CAGR

We upgrade Soitec to Buy. Optical ports are growing faster than XPUs due to increased bandwidth requirements in data centers, with silicon photonics growing at an even higher rate. Soitec has 90%+ market share in the key substrate material, enabling it to grow and even expand content as SiPho goes through upcoming architecture changes. After Soitec announced in September that it expects 2.5-3x Photonics-SOI growth in FY27E (YE March 31st), the key question is the shape of demand next year and beyond. We expect rising demand visibility to cause Soitec to announce an extension to its Singapore fab capacity in the coming months, leading to further out-year upward revisions. Our SOTP valuation, implying 16x FY29E group EV/EBITDA, derives a €300 PO.

New PIC wafer model shows that growth is diversifying

We introduce our PIC wafer area model, based on our BofA AI Data Center model and applying assumptions on SiPho mix and content. We project PIC wafer area growing at 60% CAGR from CY26-30E, with growth drivers expanding from mainly 800G pluggables now to a mix of high-speed pluggables, NPO/CPO and DWDM. Soitec has a stranglehold with 3 decades of SOI experience and sells its substrates into all SiPho architectures, leading to our projected Photonics-SOI growth of 172%/74%/57% in FY27/28/29E.

Mobile troughing with cust. inventory correction on track

Soitec's Mobile business segment is not yet out of the woods but is troughing this year, and we project a return to growth from FY28E on both the phasing out of customer inventory correction and POI increasing penetration within SAW filters. RF-SOI customer inventories have declined to 1.7mm wafers as of July and we expect the correction to be mostly over by the end of FY28E.

Gross and operating leverage under-modeled by Street

Soitec's gross margin reached a trough of 16% in FY26 and we project a significant expansion to 29%/39%/44% in FY27/28/29E. The increasing mix of Photonics-SOI, at c80% contribution margin, drives GM upward, while opex growing slower than revenue drives further operating leverage.

Figure S3. Original BofA cover page dated October 9, 2026. Forecasts and accounting definitions remain separate from issuer guidance; original pixels retained.

October 13 evidence review: BofA growth case and margin counter-evidence

Dated October 13 evidence-only review. The comparisons in this subsection use the saved October 13 operating case, before the limited October 17 near-term addition. The later update does not adopt BofA's whole financial forecast. The owner supplied the original BofA cover page dated **October 9, 2026**, reproduced immediately above. This is another forecast for the same photonics expansion, not a new earnings period. ASTRA retains the existing **30% joint JPM outcome**, **25x forward-four-quarter recurring OP**, share schedule, Excel Base 82, analytical Base 82 and all numerical forecasts. The bank's EUR 300 price objective and 16x FY29 EV/EBITDA method are not adopted.

The bank increases its own FY27/28/29 revenue estimates from EUR 675/851/1,087M to **EUR 745/1,017/1,434M**. Those revised estimates are nevertheless below our matched active fiscal-year revenues. Its reported gross margins of **29%/39%/44%** imply the following gross profits. Fiscal years end in March; FY28 is April 2027 through March 2028. These are like-period comparisons, not a calendar-year shortcut.

Fiscal year	BofA revenue	Active revenue	BofA implied GP	Active GP	Active opex
FY27	745	771	216	237	128
FY28	1,017	1,122	397	452	152
FY29	1,434	1,465	631	641	167

FY27 active comparison includes Q1 reported revenue of 113, the already-labeled GP proxy **113 x (96 / 592) = 18**, and opex proxy 26. No missing Q1 product split is invented. BofA's EPS forecasts of EUR 2/6/11 are below-line per-share estimates, not operating profit; its bottom table rounds FY29 EPS to 11.

Revenue, costs and bounded downside. At our unchanged fiscal opex, those bank GP levels would imply OP of **88 / 245 / 464**, compared with active OP **109 / 300 / 474**. BofA does not disclose numerical opex or an accounting bridge on this page, so these are diagnostics, not its OP forecasts. Allocating BofA annual GP across existing quarters by either active GP weights or active revenue weights, while preserving current quarterly opex, gives **EUR 354-355M** F4Q OP for Q4 2027 through Q3 2028, versus the active **EUR 390M**. This is a bounded downside sensitivity only, with no replacement of the active target. Different expense endpoints can materially change the result: using the already-recorded JPM conditional opex of 128/131/139 against BofA GP instead gives 88/266/492. No bank winner is chosen and no forecast average is inserted.

Denominators and capacity. BofA's **60% CAGR is PIC wafer area during CY2026-2030**, not Soitec revenue. Its separate Photonics-SOI growth estimates of 172%/74%/57% in FY27/28/29 describe overlapping demand. Approximately **80% is Photonics-SOI contribution margin**, not group gross margin or OP margin. The expected Singapore extension is a possible future announcement, not commissioned, qualified wafer output; capex, funding, yields, volumes, customer allocation and acceptance timing are missing. The September 2 issuer update already incorporated in this model supports FY27 Photonics-SOI sales of 250-300% of FY26 sales, which were slightly above USD 100M. It does not establish extra output from this proposed extension.

Cash and inventory counterweights. BofA's FY29 free-cash-flow yield is **-2%**, despite strong EPS growth. Expansion spending and working capital must be reconciled before treating accounting growth as cash earnings. Its RF-SOI customer inventory estimate is 1,700,000 wafers as of July, with correction expected mostly over by end FY28, or March 2028. The mobile paragraph says it is troughing "this year" without specifying the fiscal year; the separate explicit FY26 trough concerns group gross margin. Mobile recovery from FY28 is a bank expectation.

Rule 16b disposition. Incremental positive revenue, GP and OP from this source are **zero**: the same architecture migration, issuer ramp and mix/operating-leverage economics are already represented in the joint growth case, and the page supplies no separate accepted capacity, customer or output to add. The lower GP and

adverse cash evidence remain explicit counter-evidence, not discarded bank commentary. The existing 30% probability is retained because this cover page does not provide a matched product-cost, opex, accounting or quarterly timing bridge that resolves the competing endpoints; the two bounded tests above establish the risk without silently substituting a different expense perimeter. Reassess on the full bank cost/accounting tables, actual product ASP/wafer deliveries, accepted Singapore capacity with capex and financing, and the FY29 cash-flow schedule. This follow-up is an existing-company evidence gap, not a new discovery candidate.

Reassessment triggers

Raise or lower the probability using new independent evidence for accepted wafer output, signed customer allocations, product mix and a reconciled margin/cash bridge. Reduce it for delayed NPO/CPO ramps, lost qualifications, lower wafer pricing or additional qualified supply. Resolve the full JPM note's cost adjustments and weak FCF before giving the endpoint higher weight. The probability is a model judgment, not a statistical frequency or the analytical Base score.

5. Product economics and active quarterly operating model

Product gross margins include manufacturing depreciation and remain analytical assumptions, not company product-margin guidance. FY2026 announced sales592, GP96 and recurring opex104 imply recurring OP-8M; additional charges123 reconcile to statutory OP-131M. EBITDA151 is not OP. July management indicated roughly EUR 30M lower FY27 gross-margin funding, the hedge rate of USD 119 per EUR 100 versus USD 114 previously, and 65%+ average loading versus 48% in Q1. No future IPCEI renewal is assumed. R&D grants and factory subsidies must remain separately reconciled.

Long-range reference production requirements remain LOW confidence: overall installed and maximum factory capacity are disclosed, but no verified product-specific qualified good-unit output or realized ASP schedule is available. The October 17 capacity overlap test below uses a conditional revenue-equivalent conversion, not measured wafer shipments. The additional Edge allocation is not a new measure of installed capacity. Every calendar quarter below is a model forecast, not reported quarterly profit.

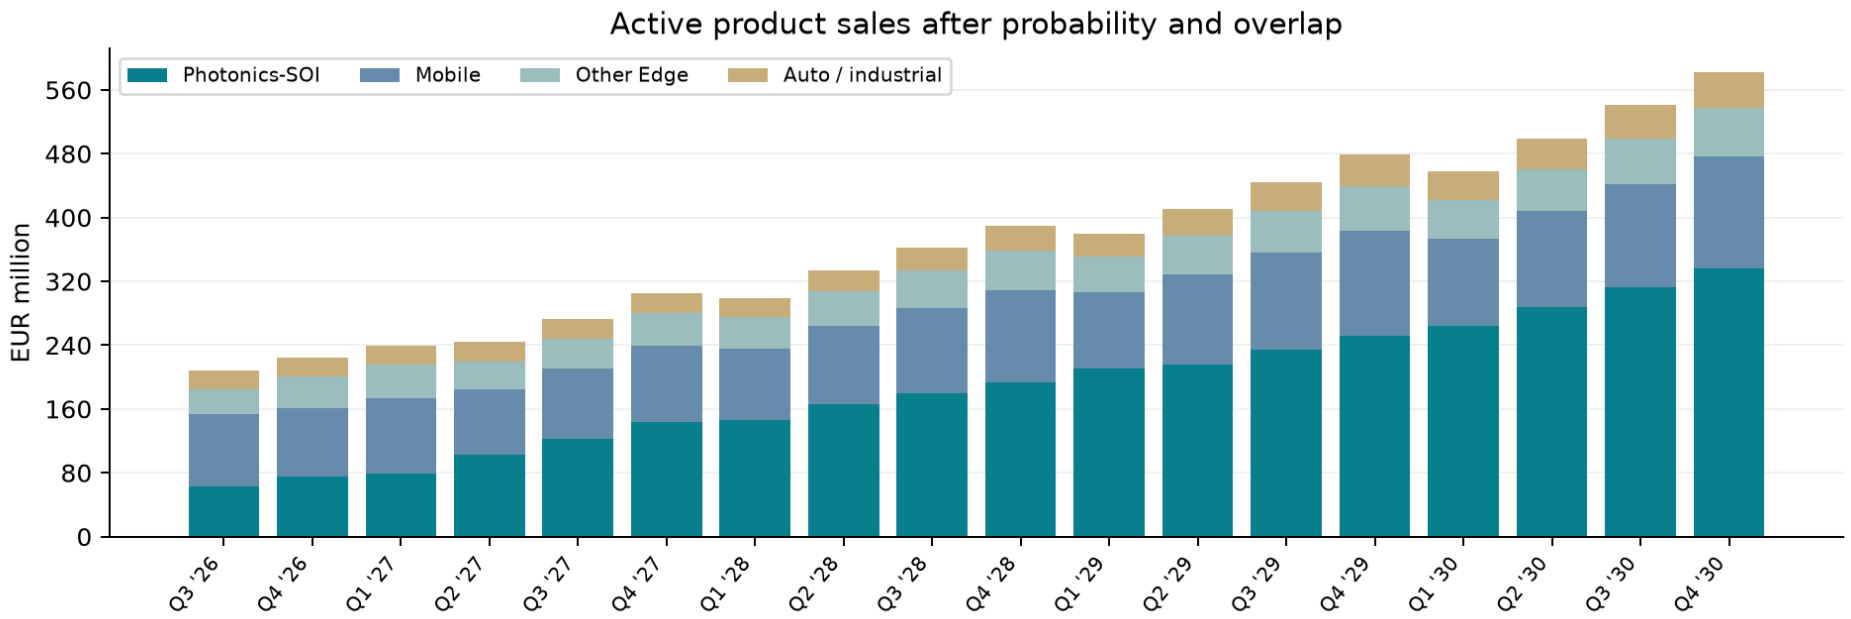

Figure M2. Updated quarterly product revenue in EUR million. Complete plotted figures follow.

2029	1,713	570	33%
2030	2,080	735	35%

6. Forward-four-quarter operating ceiling and capitalization

Each ceiling = OP in that calendar quarter plus the next three quarters, x25, divided by that quarter's retained diluted shares. Shares start at 36,892,016, the prior full-issuance proxy combining 35,772,015 issued shares and 1,120,001 potentially dilutive instruments, with the existing 1% annual dilution schedule. This is not the issuer's current certified diluted-EPS share count. No second probability haircut, bank EPS multiple or generic framework multiple is applied.

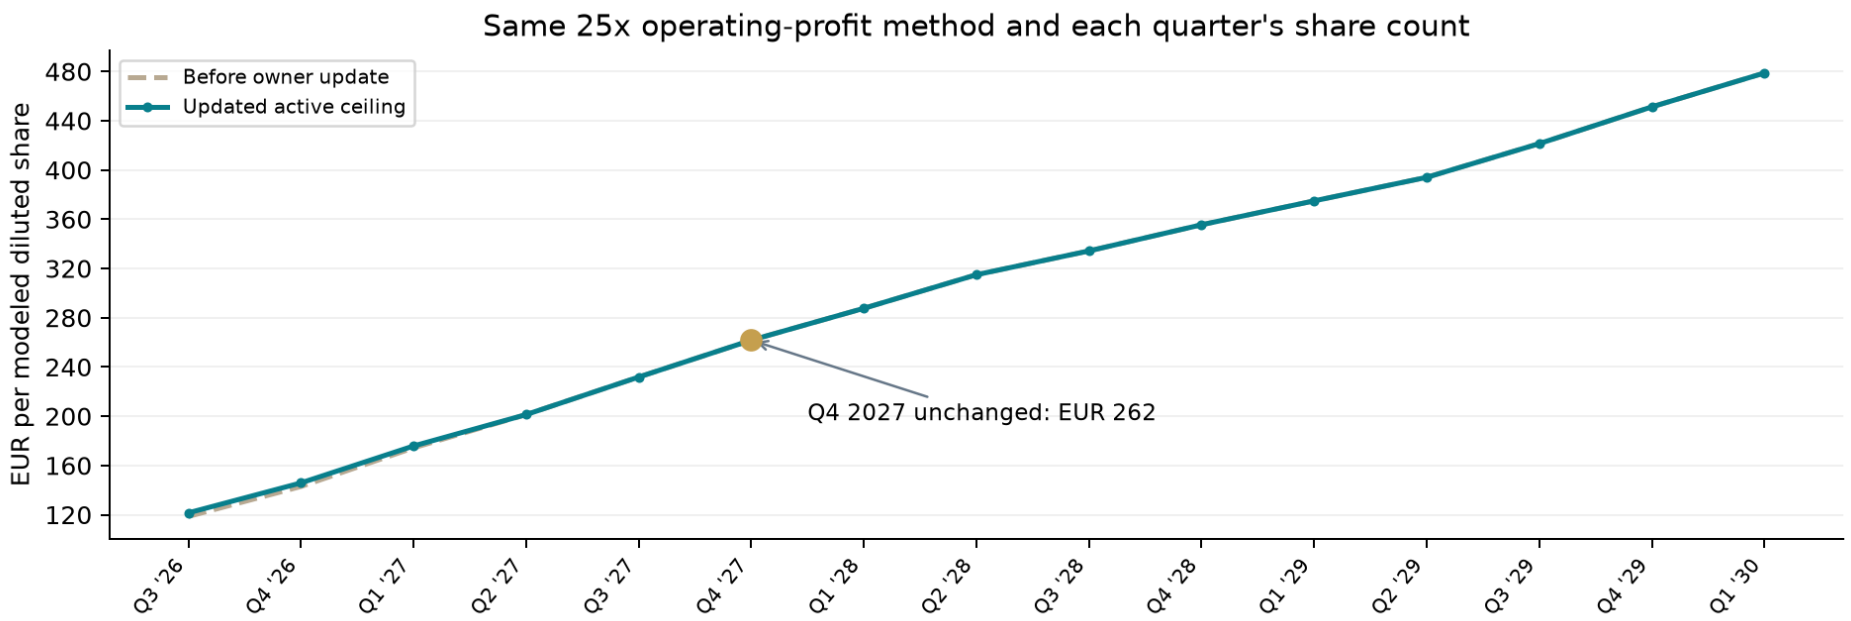

Figure M5. Updated quarterly ceilings. Gold marker identifies the unchanged active Q4 2027 horizon. Complete plotted figures follow.

Ceiling quarter	Exact OP window	Forward 4Q OP	Multiple	Modeled diluted shares	Previous ceiling EUR	Updated ceiling EUR
Q3 2026	Q3 2026 to Q2 2027	179	25x	36,892,016	119	122
Q4 2026	Q4 2026 to Q3 2027	215	25x	36,892,016	143	146
Q1 2027	Q1 2027 to Q4 2027	259	25x	36,892,016	174	176
Q2 2027	Q2 2027 to Q1 2028	300	25x	37,260,936	201	201
Q3 2027	Q3 2027 to Q2 2028	345	25x	37,260,936	232	232
Q4 2027	Q4 2027 to Q3 2028	390	25x	37,260,936	262	262
Q1 2028	Q1 2028 to Q4 2028	433	25x	37,633,546	288	288
Q2 2028	Q2 2028 to Q1 2029	474	25x	37,633,546	315	315
Q3 2028	Q3 2028 to Q2 2029	503	25x	37,633,546	334	334
Q4 2028	Q4 2028 to Q3 2029	535	25x	37,633,546	355	355

Ceiling quarter	Exact OP window	Forward 4Q OP	Multiple	Modeled diluted shares	Previous ceiling EUR	Updated ceiling EUR
Q1 2029	Q1 2029 to Q4 2029	570	25x	38,009,881	375	375
Q2 2029	Q2 2029 to Q1 2030	599	25x	38,009,881	394	394
Q3 2029	Q3 2029 to Q2 2030	641	25x	38,009,881	421	421
Q4 2029	Q4 2029 to Q3 2030	686	25x	38,009,881	451	451
Q1 2030	Q1 2030 to Q4 2030	735	25x	38,389,980	479	479

For Q4 2027, OP EUR 390M x25 / 37,260,936 shares = **EUR 262**. The final three operating quarters have no standalone ceiling because a full forward-four-quarter window is unavailable.

Isolated probability and share sensitivities

All rows retain the same 25x method and share schedule. The 0% row is a diagnostic no-increment reference, not a competing active forecast. The 100% row is the full conditional bank outcome through its stated horizon, not an analyst target.

Joint-outcome probability	Q4 2027 ceiling EUR
0%	252
20%	258
30%	262
40%	265
100%	285

Share diagnostic at active operating case	Q4 2027 ceiling EUR
Retained denominator	262
5% more shares	249
10% more shares	238

Current legal shares and the September ORNANE

The issuer's October 5 notice states **35,814,320 ordinary shares at September 30**, unchanged from its September financing reference. These are legal issued shares, distinct from the forecast economic denominator. Full award and conversion reconciliation remains open; do not add new issued shares to a prior potential-share pool without testing overlap.

The September 18 placement release describes **EUR 500M ORNANEs**, expected settlement September 25, 2026 and maturity September 25, 2033, a half-percent annual coupon and EUR 206 conversion price. The issuer can choose cash, mixed or share settlement. Full share settlement implies up to about 2,421,800 shares, while cash-par plus premium shares can yield much less. Early exercise before March 26, 2033 requires specified events; ordinary scheduled conversion in 2027/28 is not established. The concurrent hedge sale uses existing shares. The original EUR 325M OCEANE was repaid and must not be added back.

Upon settlement, gross cash and debt both rise by EUR 500M; funding is not revenue. Coupon expense would be about EUR 3M annually below operating profit. The existing sanctioned OP-per-share method therefore receives no invented net-income/cash bonus. No automatic full 2,420,000-share dilution is added today. Final settlement, detailed early-exercise thresholds and the complete award reconciliation remain precise tasks. The share diagnostics above bound dilution without changing the established share convention solely from a bank EPS figure.

7. Industry relationships and discovery

Photonics-SOI is the engineered starting wafer. TSEM/GFS/other PIC foundries fabricate devices; SIVE/LITE/COHR supply light-source content; FOCI and related companies attach fibers; packaging and test suppliers capture other wallets. A wafer dollar cannot be counted again as a laser dollar. NPO/CPO broadens the need for optical integration, but the exact substrate stack and customer-qualified sourcing remain decisive.

LPKF, FOCI, Riber and WIN can participate in the optical ecosystem without capturing Soitec's starting-wafer revenue. Silicon nitride may complement or substitute for selected functions rather than eliminating the whole SOI wallet. The bank screenshot alone does not change their models.

GlobalWafers (6488, Taipei Exchange) remains competitive source context for qualified second sourcing that could limit Soitec share or price. Earlier records described a research candidate; those historical records are preserved, but this update does not repeat or promote that recommendation. Specific photonics capacity, ASP, yield, accepted volumes, incremental costs and enormous company-level equity upside versus a dated valuation have not been demonstrated under the current admission policy. No new candidate, To-do entry, portfolio row, model or Base is created.

8. Risks and falsification tests

The following ledger makes the existing aggregate risk deduction explicit. It does not introduce another deduction or change the analytical score.

Risk class	Existing deduction
Production ramp, yield and input costs	-1
Subsidy transition and recurring-cost conversion	-1
Customer concentration and mobile inventory	-1
Alternative substrates, licensed competition and dilution	-1
Total	**-4**

Numbered monitoring tests

#	Checkpoint	Evidence supporting the operating case	Counter-test / failure signal
1	Photonics conversion	Reconcile reservations, deposits, qualified output and accepted wafer sales.	Deposits without delivery or margin conversion do not validate the full ramp.
2	Recurring profit	Reconcile product GP, grants and operating expenses at full results.	Revenue growth without normalized OP leaves the ceiling bridge conditional.
3	Architecture	Identify required substrate type in named customer designs.	A silicon-photonics announcement without wafer specification does not prove capture.
4	Shares and capacity	Reconcile the next equity note and productive-capacity disclosure.	Unverified dilution or yield assumptions require explicit sensitivity.

Add to the existing risk classes, without double-deducting: bank GP adjustments may be non-comparable with recurring OP; FY27 margin timing depends on a disclosed Q1 proxy; cash conversion may lag accounting earnings; GlobalWafers qualification can advance earlier than the source forecast. Monitor the November 18 H1 release for margins/cash, source-note cost definitions, delivery cadence, dilution terms and primary evidence of competitive wafer pricing.

9. Sources and remaining evidence gaps

Sources below are those documented in the supplied earnings review. LOW-confidence product allocations, future margins, capacity bridges and incomplete management-call records remain unresolved where stated. Integrating the original research does not itself establish full completion of the two-call review requirement.

- **SOI-1** · 2026-09-02 · Point sur l’activité de Soitec - issuer release in French. Latest company trading update; other businesses broadly unchanged.
- **SOI-2** · 2026-09-02 · Soitec Trading Update - company newswire. Full numerical FY27 Photonics and Q2/H1 growth guidance.
- **SOI-3** · 2026-07-22 · First-quarter FY2027 revenue - issuer release. Q1 sales and product demand; no quarterly OP.
- **SOI-4** · 2026-07-23 · Q1 FY2027 complete management call reproduction. Full call read, including Q&A; capacity, grants, customer inventory and architecture.
- **SOI-5** · 2026-05-27 · FY2026 French results. Actual revenue, GP, recurring OP, impairment bridge and investment policy.
- **SOI-6** · 2026-06 / July AGM · 2025-2026 Universal Registration Document. Issued shares and all potentially dilutive instruments; expired OCEANE repaid.
- **SOI-7** · 2026-05-28 · Prior earnings call access record. Full transcript unavailable; May issuer results used as written fallback, not claimed as complete call review.

The unchanged original source document is retained separately for full research provenance. It is an archive, not an additional active valuation case. Superseded score/ceiling tables are not incorporated into this active artifact.

- **SOI-8** - Owner-supplied @OptionKing666 screenshot and text, received2026-10-10; report date2026-10-09 as attributed in the repost. Full original note and exact post permalink unavailable. Original exhibit embedded in Figure S2.

- **SOI-9** - Soitec primary September2 trading update. Current photonics/group guidance, broader segment definitions and pending customer agreements.
- **SOI-10** - GlobalWafers August4 Q2 presentation, pages14-15 inspected. Small-volume SiPh/SOI production and qualification response; no exact80% Soitec forecast.
- **SOI-11** - Soitec September18 ORNANE placement release. Placement terms; expected settlement is distinguished from a separately confirmed closing.
- **SOI-12** - September30 legal shares, issuer notice October5. Issued shares are not the diluted model denominator.
- **SOI-13** - Owner-supplied BofA Global Research cover page, **October 9, 2026**, reviewed October 13; original image embedded as Figure S3. Image SHA-256: 44a3158c247926e8613339b12f701b7a0b8fea978b5ea7edadc5d2979bcb2cf9. Full bank financial statements, cost definitions, quarterly phasing and cash-flow build unavailable. Fiscal-period comparison and unchanged-opex sensitivity are ASTRA diagnostics, not bank OP guidance.

October 17 original-source reconciliation

- **SOI-14** - September 2 original issuer trading update: issuer PDF. Guidance range, fiscal periods, currencies and prospective customer agreements checked against original page 1.
- **SOI-15** - July 22 original Q1 FY27 release: issuer PDF. Singapore initial-customer qualification, further qualification work, volumes, commitments, deposits and EUR 100 million capex.
- **SOI-16** - May 28 FY26 original presentation: issuer PDF, slides 13-14, 29 and 45. Installed versus full-fab capacity, R&D preservation, cost/loading and FX sensitivities.
- **SOI-17** - June 10 FY26 original English registration document: issuer PDF, printed pages 29-32. Maximum versus installed production and competitive licensing context. Scoped sections were reviewed; this update is not a fresh audit of every annual-report page.
- **SOI-18** - October 15 BofA SEMICON West management-meeting note, original owner-supplied PDF, pages 18-20, SHA-256 da3e1d2d88683d462ca80a27965f0a4c9d6d844b6b14b14da7aae2f994110835. Original images inspected; bank attribution and range/date/scope uncertainty retained. The source original remains in the verified owner-research archive.
- **SOI-19** - September 18 original ORNANE pricing release: issuer PDF, pages 1-3. Terms confirmed without treating financing as new revenue or changing the protected share method.
- **SOI-20** - Current issuer investor index and regulated-release index, checked October 17. No later issuer operating update than September 2 was located. Next H1 FY27 results are November 18. A file URL named October 6 for annual-report availability is dated June 10 in its original contents; it is not a new October operating disclosure.

Outstanding source questions: confirm the exact prior growth range, fiscal year and interpretation behind the bank's upper-end wording; obtain qualified photonics capacity, realized ASP/mix and oxidation/yield data; reconcile booked reservations with accepted shipments; reconcile product contribution to recurring operating profit and cash; retrieve full bank cost and cash schedules, final financing settlement and complete award/conversion records. The new model outcome remains probability weighted while these gaps are open. Independent complete evidence is used now; official confirmation is not a prerequisite for the bounded addition.

Model snapshot: October 17, 2026. Owner-requested update adds a bounded near-term photonics outcome above the complete earlier active forecast, while retaining the 30% joint JPM case and its adverse elements. Eighteen quarterly operating rows and 15 ceilings remain synchronized. Excel and analytical Base stay 82. The main Q4 2027 ceiling stays about EUR 262, at 25x recurring operating profit and the existing quarter-specific share schedule. The higher near-term forecast is a model assumption; it is not new official guidance. The exact source-range interpretation, full bank note, first-half margin and cash conversion, final financing settlement and award reconciliation remain open.
