SpaceX

SPCX | Space Exploration Technologies Corp. | Full deep dive | 20 October 2026

WATCHLIST / integrated physical infrastructure with competitive AI exposure

Decision variable	Current assessment
Analytical score	73 / 100; 44 / 60
Excel Base	70; protected owner value
Active ceiling quarter	Q4 2027; earnings window Q4 2027-Q3 2028
Active modeled ceiling	$296 per ordinary share; provisional accounting and funding assumptions
Valuation method	Each state: 20x F4Q GAAP operating profit / its starting-quarter economic ordinary shares; probability-weighted ceilings
Latest reported financials	Q3 2026; quarter ended September 30; October 20 release
Quote snapshot	About $148 per share; October 20 regular close, 4:00 pm EDT
Market capitalization snapshot	About $2,007 billion; same close multiplied by September 30 issued shares. Award dilution is separate.

The alpha

SpaceX is turning unusually fast construction of powered compute into revenue while Starlink supplies an established, growing customer business. The main opportunity is the speed at which newly energized capacity can earn cash and finance the next phase of expansion.

The call provides a stronger near-term anchor: management guides to $33-37 billion of total company sales in Q1 2027 and describes a path to roughly 13,000 MW of compute by the end of that year. Enterprise agents could increase the revenue generated by each useful watt. The advantage creates value only when customer receipts cover equipment wear, development, employee compensation and the capital required to keep expanding.

Our model gives the management-capacity state the largest weight while explicitly retaining delayed and stretch outcomes. Each state pays for its own construction, retains costs and issues the shares needed for its conditional funding. The upside depends on successful deployment and monetization; financing availability and the resulting ownership dilution are material assumptions.

All financial model tables use USD millions and millions of ordinary shares unless labeled. Displayed values use whole units; saved model and workbook retain full precision. The earnings multiple, share convention and owner Excel Base are preserved.

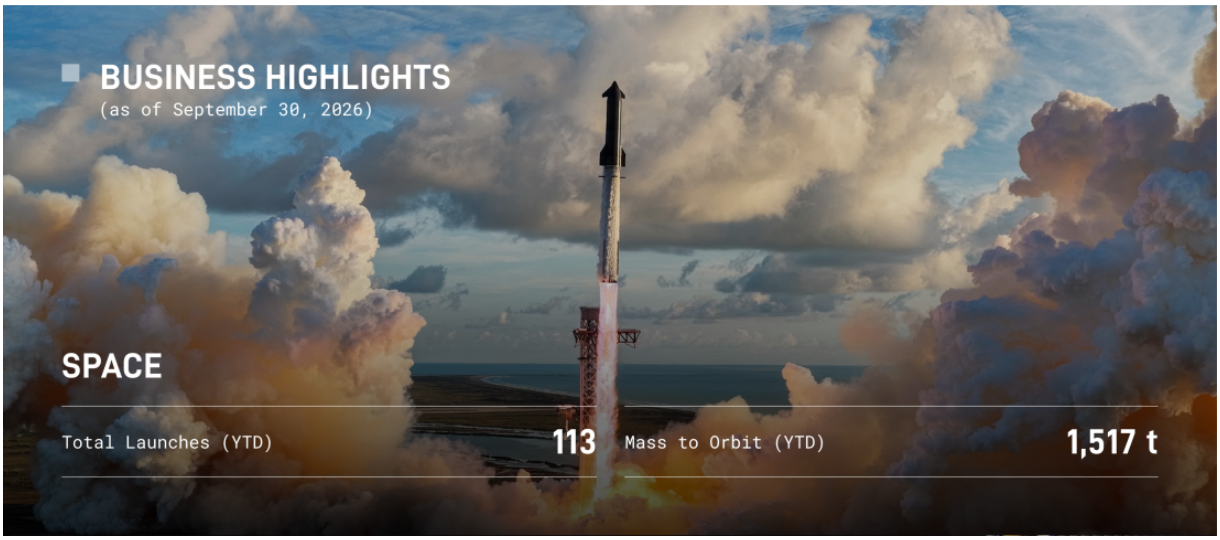

The company and its economic engine

One consolidated group: launch, connectivity, compute and owned applications

Business	Revenue mechanism	Economic constraint
Space	External launch and development contracts	Payloads, cadence, launch cost and continuing Starship research
Connectivity	Broadband, enterprise, aviation, maritime and government subscriptions	Useful satellite capacity, terminals, geography, spectrum and customer activation
Compute infrastructure	Third-party cloud service agreements	Available power, commissioned chips, useful utilization and renewal pricing
Owned applications	Grok, agents, Cursor and related paid products; X advertising is separate	Paid adoption, compute consumed internally and competing software

Reusable launch, satellite manufacturing, constellation operations and customer distribution reinforce each other. Scale can reduce deployment cost and support new service capacity. Falcon is commercially established; Starship still needs repeatable rapid recovery and reuse to achieve its wider economic ambition.

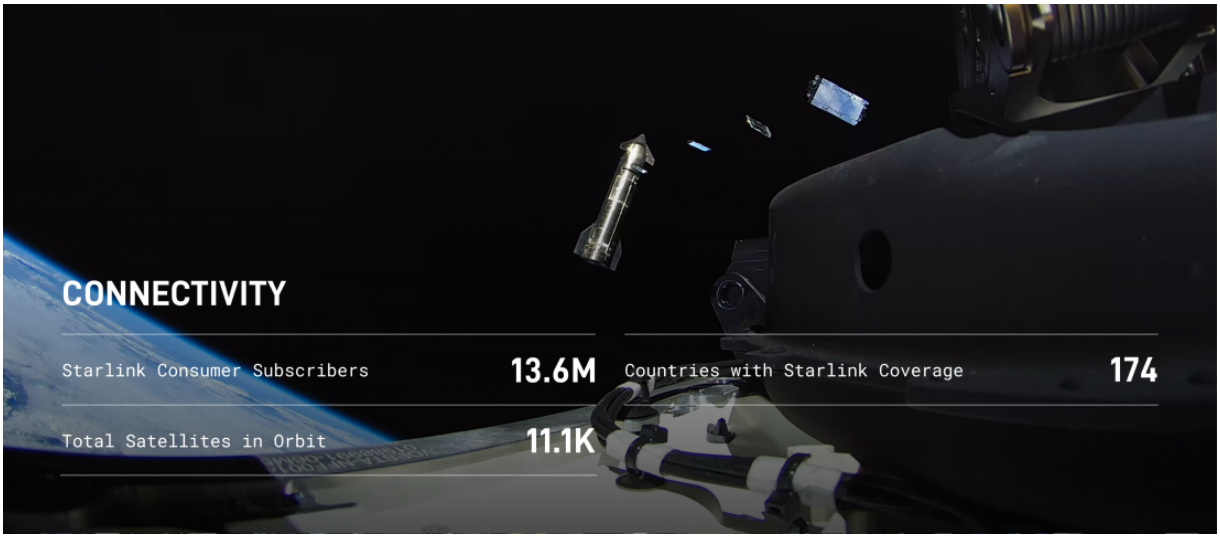

Cloud rentals and owned AI applications face capable competitors. Their shared infrastructure creates allocation choices: serving a Grok or Cursor customer internally uses capacity that could otherwise be leased. The revenue model allocates one monetization pool rather than stacking wholesale rent and application receipts for the same work.

Original issuer exhibit: Q3 results, page 2. Launch and mass figures are year-to-date. The original PDF and full image resolution are retained. [Q3R]

The latest operating footprint

Reported scale and the next physical milestones

Original issuer exhibit: Q3 results, page 2. Consumer subscriptions are period-end; total satellites now include de-orbit-approved satellites. [Q3R]

Reported September 30 metric	Value	Scope
Consumer subscribers	14 million	Exact source: 13,600,000; managed enterprise/government excluded
Countries with coverage	174	Available markets differ from paying subscriber cohorts
Satellites in orbit	11,100	Definition includes approximately 400 de-orbit-approved satellites
Aircraft equipped	3,800	Compared with approximately 12,000 contracted aircraft on the call

Contracted aircraft must be installed and activated before the full service revenue appears. Geographic mix, terminals and customer onboarding separate network capacity from recognized revenue. [Q3R, Q3T]

The earnings call: scale, monetization and commitments

October 20 management comments; reported facts, guidance and aspirations separated

Evidence	Management statement	Model interpretation
Reported	1,700 MW nameplate compute at September 30	Starting physical footprint; ending capacity differs from quarterly average utilization
Near-term target	Nearly 2,200 MW by October end; 2,500-3,000 MW by December end	Commissioning path and recognized service quarters require a timing bridge
Revenue guidance	$33-37 billion for Q1 2027, total company	A recognized-quarter guide, separate from December run-rate ambitions
2027 confidence	An additional 10,000 MW of compute; roughly 13,000 MW total	Joint execution depends on power, cooling, chips, networking, funding and customers
2027 stretch	20,000 MW incremental power/cooling; larger compute possible	Power and cooling infrastructure differs from energized revenue-producing compute
Exit ARR aspiration	$500 billion-$1 trillion by end-2027	Company exit run rate; full calendar-year sales depend on the ramp

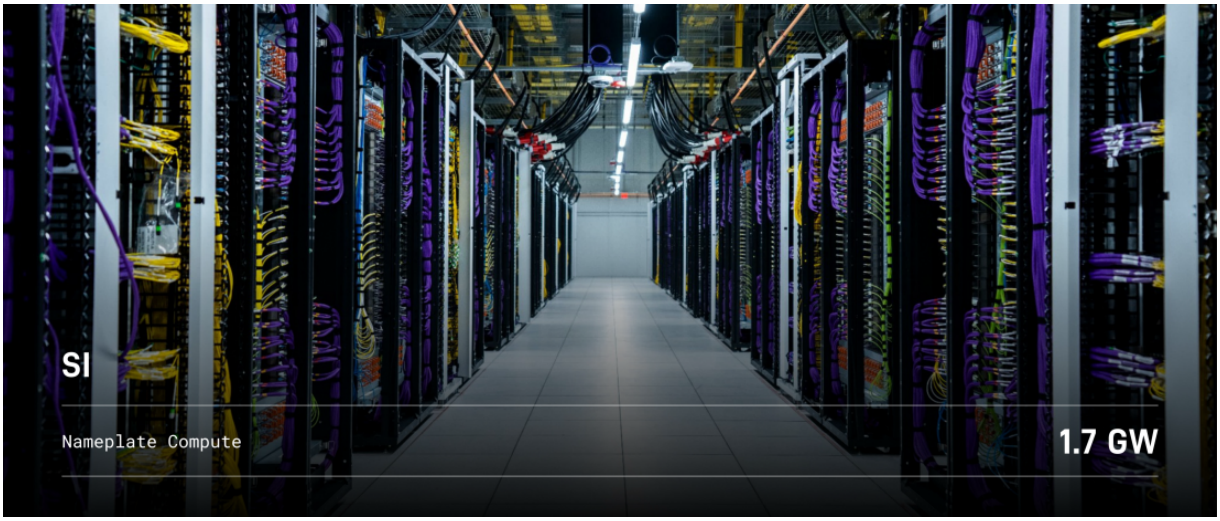

The $500 billion lower ARR bound appears in the preserved management clip and both caption tracks. The automated full transcript has a $100 billion transcription conflict. The clip places the remark after discussion of Grokbot enterprise deployment and internal compute. The completed call transcript was reviewed through analyst and individual-investor Q&A; an official downloadable full transcript remains pending. [Q3T, Q3V]

The CFO reaffirmed a $100 billion end-2026 annualized revenue goal based on December sales. Our Q4 reference uses average commissioned capacity and a recognition ramp; December revenue is not earned for all three months.

The $500 billion-$1 trillion end-2027 ARR statement is a management aspiration in the discussion of enterprise agents. It does not establish full calendar-year revenue or a committed supplier order book. The three model states test the physical scale, realization and funding needed to approach that exit rate.

Compute economics and customer allocation

External rental and owned products share the same useful capacity

Original issuer exhibit: Q3 results, page 2. Nameplate compute is 1,700 MW. The issuer does not provide a PUE or IT-versus-facility power definition in this release. [Q3R]

Question	Evidence and treatment
Pricing	CFO says new deployment pricing is slightly above the prior $30-50 per watt range. Actual billed capacity, term and cost boundary remain incomplete.
Allocation	Management aims for approximately half internal and half rented; the mix can move. Internal use earns application revenue and displaces a rental opportunity.
Contract length	Management prefers short arrangements near spot rates and says renewals are higher. Availability supports pricing while repricing risk remains.
Payback	New deployment payback under a year is a management claim. Six months in 2027 was described as possible. Cash return and GAAP profit require separate bridges.
Hardware pace	Prepared remarks describe roughly 200,000 monthly GB300 turn-ons; Q&A says 220,000. GPU-versus-system definitions and configurations require reconciliation.

The realization input is effective annual revenue per average nameplate watt. It absorbs utilization, internal consumption, mix and recognition timing. It is a composite operating proxy, distinct from a posted rental tariff. The main state reaches $35 per watt in late 2027 while the delayed and stretch states use different paid realization. Aggregate effective yield equals four times weighted AI receipts divided by weighted average capacity; it is not the arithmetic mean of state yields. The exit run-rate diagnostic separately weights state ending receipts.

Power/cooling infrastructure, energized compute and billed useful output have different timing. A nameplate GW claim and a monthly chip turn-on count cannot both be added as independent revenue increments. The call leaves IT-versus-facility power definitions and exact hardware configurations unresolved.

Reported financials and retained costs

Q3 2026 | USD millions | Exact source controls, whole-unit presentation

Segment	Revenue	COGS	GP	R&D	SG&A	Restruct.	GAAP OP	Adj. EBITDA	Capex
Space	1,767	435	1,332	1,225	114	0	-7	357	1,606
Connectivity	5,248	2,368	2,880	188	325	0	2,367	3,499	1,543
SI	7,560	2,675	4,885	3,183	1,268	3	431	4,953	16,444
Total	14,575	5,478	9,097	4,596	1,707	3	2,791	8,809	19,593

Group operating profit = gross profit less research, selling/general/administrative and restructuring costs. Internal launch and compute transfers do not create additional consolidated revenue. [Q3R]

SI profit reconciliation	USD millions
GAAP operating profit	431
Depreciation and amortization	2,473
Ordinary share-based compensation	821
Acquisition-related share-based compensation	1,217
Acquisition costs and restructuring	11
Adjusted EBITDA	4,953
Adjusted EBITDA margin	66%
GAAP operating margin	6%

Adjusted EBITDA removes major economic costs. The operating-profit model retains ordinary depreciation, application development, stock compensation and the recognized cost of acquired assets. [Q3R]

Historical accounting and calibration

Six reported or explicitly derived quarters | USD millions

Quarter	Revenue	COGS	GP	R&D	SG&A	Restruct.	GAAP OP	D&A	SBC	Capex
Q1 2025	4,067	1,962	2,105	1,557	493	4	27	1,444	231	4,140
Q2 2025	4,071	2,282	1,789	1,958	606	190	-970	1,526	463	2,825
Q3 2025	5,576	2,705	2,871	2,291	575	278	-273	1,814	350	6,880
Q1 2026	4,694	2,388	2,306	3,514	746	-11	-1,943	2,442	639	10,107
Q2 2026	7,814	3,495	4,319	3,548	912	2	-143	2,848	831	18,369
Q3 2026	14,575	5,478	9,097	4,596	1,707	3	2,791	3,644	1,146	19,593

The six rows are the inspected Q1-Q3 comparatives for 2025 and 2026; Q4 2025 is not invented to create a continuous sequence. Q1 figures are derived from the inspected first-half and second-quarter disclosures where indicated. SI comparatives reflect the issuer's common-control presentation.

A derived quarter is labeled when calculated from a cumulative report. Latest recognized revenue, functional operating costs, depreciation and compensation provide the calibration; forecasts remain analytical estimates.

Cursor and the acquisition cost boundary

Partial-quarter actuals replace the earlier run-rate proxy

SI Segment Operating and Financial Data

$, in millions (except where noted)	Three Months Ended			Nine Months Ended	
	September 30, 2026	June 30, 2026	September 30, 2025	September 30, 2026	September 30, 2025

Original issuer table: Q3 results, page 6. SI revenue includes infrastructure, applications and advertising. The reconciliation exposes the large gap between GAAP operating profit and adjusted EBITDA. [Q3R]

Cursor contributed $608 million of revenue from its August 14 closing. The company attributes about $23 billion of equity awards to future employee service, subject to forfeitures. Management describes roughly three years of vesting. The actual quarterly charge and a full forward award schedule require separate treatment. [Q3R, Q3T]

The Q3 actual row uses the issuer's reported R&D and SG&A, which already contain $1,217 million of acquisition-related stock compensation. The model adds no second acquisition-compensation charge to that actual quarter.

Forward functional cost anchors remove that embedded acquisition charge before a separate $1,950 million quarterly service-award proxy is deducted. The proxy is capped at the remaining $22,183 million, then ends. This straight-line timing is an analytical estimate; vesting and forfeitures can change the actual schedule.

Q3 depreciation and amortization already contain the acquisition expense recognized during the partial ownership period. That actual anchor does not establish a full-quarter purchase-accounting charge. The old $600 million assumption is removed to avoid unexamined duplication, while a separate incremental amortization diagnostic retains the unresolved full-period cost risk.

The unresolved acquisition cost gap

Separate diagnostic | Active economics unchanged pending full purchase accounting

Unresolved acquisition amortization diagnostic	USD millions / per share
Additional quarterly expense range	0 to 539
Additional F4Q expense at extreme bound	2,156
Active modeled ceiling, unchanged	296
Ceiling with extreme additional expense	293
Status	Separate diagnostic; unimplemented; full Q3 purchase accounting pending

The Q3 actual acquisition period is only part of a quarter. Its recognized amortization does not establish the cost of a complete forward quarter. The release supplies no stand-alone Cursor intangible allocation or amortization schedule.

For an extreme bound, attribute all $588 million of the Q2-to-Q3 SI D&A increase to the 48-day acquired period. Extending that amount over another 44 days implies $539 million of additional quarterly amortization. The increase also includes compute asset growth and other changes, so the full attribution is unsuitable as a central estimate. It is a bounded stress diagnostic, separate from the saved active model.

The diagnostic subtracts four quarters of additional expense from each state's forward operating profit and retains its funded starting-quarter shares and 20x multiple. State probabilities are applied once. The full Q3 filing must replace this unresolved assumption with inspected purchase accounting.

Market expansion and the Ford principle

Lower deployment cost can create new uses; paid company capture still needs an operating bridge

Opportunity phase	Company mechanism	Economic treatment
Established demand	Commercial launch, broadband, government, cloud agreements, paid applications and advertising	Actual receipts and the near-term formal revenue guide anchor the model. Future volumes and margins still vary by state.
Commercial expansion	Enterprise agents, denser V3 broadband coverage, more installed aviation and next-generation mobile	More useful work per watt and satellite can raise paid demand. Adoption, utilization, geographic prices and serving costs determine the receipts.
Structural options	Rapid Starship reuse, orbital compute, new fabrication and distributed inference	Lower physical deployment cost can make previously uneconomic services viable. Qualification, useful capacity and customer willingness to pay remain unresolved.

The Ford principle is an operating mechanism: a large fall in cost can unlock enough additional use to expand the market. SpaceX can capture value through its integrated deployment and distribution system, but cheaper useful output can also reduce selling prices. The model therefore requires paid realization and retained costs rather than assigning the whole industry opportunity to one company.

The phase labels organize opportunity maturity. Their generic starting heuristics are not multiplied onto the current joint-state probabilities. The active three-state model contains one revenue pool and one funding path for each outcome; broad telecom spending, global AI capex and the end-2027 ARR aspiration are not separate additions.

Starship and orbital infrastructure

Current achievements support a longer roadmap with technical and commercial constraints

Evidence / next step	Company economics	Remaining test
Flight 14 actual	The issuer reports 26 V3 satellites and roughly ten Falcon 9 launches of capacity from this mission	Satellite checkout and monetized capacity remain distinct from launch success.
Full recovery and reuse	Higher cadence and lower replacement cost can improve future constellation economics	Flight 15 recovery, repeat flights, refurbishment time and reliability.
V3 ramp	Management targets more than twenty times current Falcon 9 downlink capacity per future loaded Starship launch	Useful regional capacity, terminals, paying adoption and network service quality.
Orbital AI	Launch scale and engineering partnerships can support new capacity options	Average useful power, radiator heat rejection, radiation, communications, replacement cost and paid workloads.
Louisiana spaceport	Additional launch capacity could widen deployment scale	Published first-launch target 2029; management internal aspiration 2028. Permits, construction and actual cadence remain.

Vacuum requires heat to leave through radiators; useful output depends on power generation, thermal performance, duty cycle and availability. An orbital fleet must also recover its launch, satellite and replacement costs from actual customers. These engineering requirements matter even when a proposal describes very large peak capacity.

The current forward states quantify terrestrial nameplate buildout and composite realization. They add no independent orbital revenue prize on top. Orbital service, the fabrication roadmap and new mobile opportunities remain explicit catalysts that can later change a company-specific state after their capacity, timing, costs and customer capture are bounded. [Q3R, Q3T]

Capacity, pricing and funded outcomes

Joint outcomes preserve the dependency between earnings, capital and dilution

State	Weight	End-2027 MW	Exit annual $/W	Exit group ARR, $bn	Gross equity to end-2027, $bn	Active shares, m	Active ceiling
Delayed	30%	8,000	30	291	10	14,730	164
Management	65%	13,000	35	506	99	15,389	329
Stretch	5%	23,000	42	1,017	273	16,685	662

The delayed state receives 30%, the management-capacity state 65% and the stretch state 5%. These are subjective joint economic probabilities. Each includes the shared dependence on commissioned hardware, power, customer realization, operating costs and conditional equity funding. They describe complete outcomes and sum to 100%.

The main state reaches 13,000 MW by end-2027. The delayed state reaches 8,000 MW; the stretch reaches 23,000 MW. The small stretch weight reflects management describing compute above 20,000 MW as a small possibility. The ending run rate and recognized quarterly sales use different denominators.

These states replace the older long-range endpoint branch and separate AI-realization haircut. A prior consumer risk remains only as a limited service-ARPU adjustment. The same customer or capacity is not charged for those old branches again.

Overlap control	Treatment
Capacity and hardware	A single commissioned capacity path; monthly hardware turn-ons provide a check, not another sales pool.
Internal and leased compute	One pool divided across external hosting, own AI and Cursor.
ARR and recognized sales	Ending capacity determines the exit-rate diagnostic; quarterly average capacity drives reported-period estimates.
Backlog and customer contracts	Evidence of demand and timing; not stacked on top of capacity-derived receipts.
Old probability branches	Superseded AI outcomes removed; only the specified consumer-service risk survives.
Capital sources	Existing cash counted once; future issuance conditional and dilutive; no assumed Tesla cash or new debt commitment.

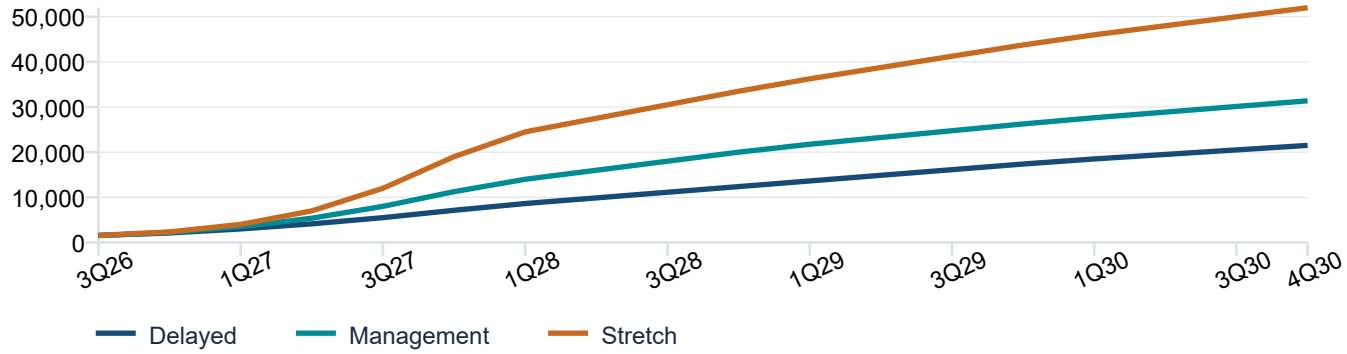

The call reports about $63 billion of group backlog, including deferred revenue, with about $42 billion expected within twelve months. It covers multiple segments and does not represent an additional annual sales amount. Short contract structures, customer concentration and recognition timing remain important tests.

Main operating driver: useful compute

Our model | Whole megawatts retain the source scale without decimal display

Useful compute capacity

MW

Our average useful-capacity proxy for each coherent state. Numbers below use whole MW. Average commissioned nameplate differs from ending capacity, facility power availability and billed utilization.

Quarter	Delayed avg. MW	Management avg. MW	Stretch avg. MW	Weighted avg. MW
Q3 2026	1,550	1,550	1,550	1,550
Q4 2026	2,100	2,225	2,350	2,194
Q1 2027	3,000	3,500	4,000	3,375
Q2 2027	4,125	5,375	7,000	5,081
Q3 2027	5,500	8,000	12,000	7,450
Q4 2027	7,125	11,250	19,000	10,400
Q1 2028	8,625	14,000	24,500	12,912
Q2 2028	9,875	16,000	27,500	14,738
Q3 2028	11,125	18,000	30,500	16,562
Q4 2028	12,375	20,000	33,500	18,388
Q1 2029	13,625	21,750	36,250	20,038
Q2 2029	14,875	23,250	38,750	21,512
Q3 2029	16,125	24,750	41,250	22,988
Q4 2029	17,375	26,250	43,750	24,462
Q1 2030	18,500	27,625	46,000	25,806
Q2 2030	19,500	28,875	48,000	27,019
Q3 2030	20,500	30,125	50,000	28,231
Q4 2030	21,500	31,375	52,000	29,444

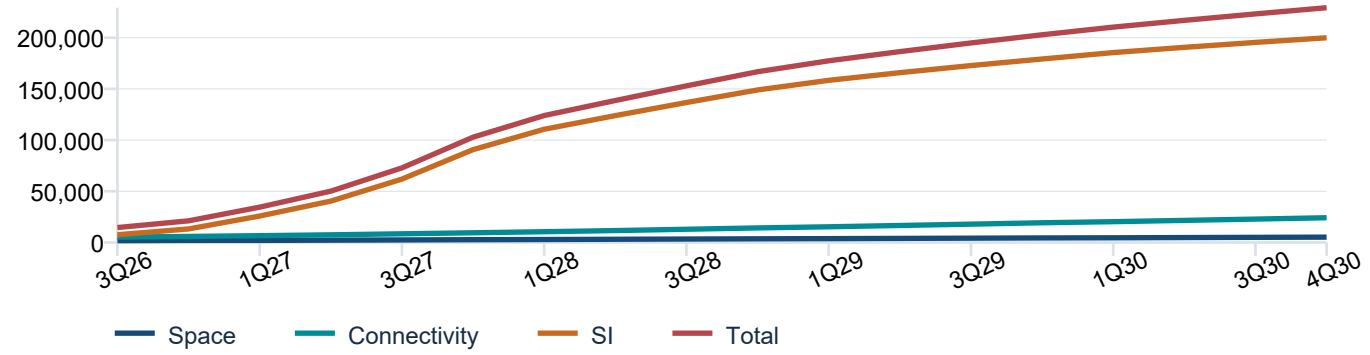

Actual Q3 average capacity is a midpoint proxy between reported June and September endpoints. Later average capacity assumes a quarter midpoint commissioning pattern. Real opening dates and utilization can materially change the revenue quarter. The investor should test actual energization and paid workloads against this model.

Revenue and business mix

Our model | USD millions | One consolidated external revenue pool

Quarterly revenue

USD millions

Our probability-weighted external revenue forecast. Capacity, utilization and monetization are counted once; the mixture is a mean of coherent states rather than a fourth independently funded project.

Q3 2029	194,884	118,241	86,348	44%
Q4 2029	202,874	122,494	89,740	44%
Q1 2030	210,352	126,588	92,338	44%
Q2 2030	216,943	130,068	94,419	44%
Q3 2030	223,248	133,333	96,278	43%
Q4 2030	229,310	136,404	97,933	43%

Forward operating profit = gross profit - R&D - SG&A - separate acquisition service compensation - restructuring. Q3 actuals already include acquisition compensation inside functional costs, so the separate actual line is zero.

Installed compute costs use $25 billion per incremental GW over a five-year depreciation life. The model allocates AI depreciation 70% to cost of revenue and 30% to R&D, starting from the reported Q3 anchor. Functional cost allocation, asset lives and new installed cost are LOW-confidence assumptions; no precise forward issuer cost guide supplies them.

The main Q4 group gross margin is calibrated to the exact Q2 comparator because management expects Q4 margins to be closer to Q2 after Q3 benefits and mix. Later training, serving, employee awards and capacity costs stay in the forecast. Ordinary stock compensation remains inside operating expenses; cash reconciliation adds it back once.

Quarterly revenue by product

Eight revenue vectors consolidate the model's external receipts. AI hosting, owned applications and Cursor sum to one compute monetization pool. Product mix is an analytical allocation; it does not represent disclosed standalone business margins.

The gross-profit table mechanically allocates the saved segment totals. Actual subproducts receive pro-rata segment GP for presentation. Forecast launch vectors use the saved 65% allocation; consumer and enterprise use 49% and 56%. Advertising receives the saved 50% GP allocation. Shared compute/application GP is allocated over hosting, owned AI and Cursor after its retained cash costs and depreciation. These allocations are model assumptions, not separate issuer disclosures.

Quarterly gross profit by product

All 18 operating quarters | USD millions | Estimated product allocations

Quarter	External launch services	Launch and development	Starlink consumer	Enterprise/government/mobile	X advertising	Leased AI compute	Own AI/API/subscriptions	Cursor external software	Total GP

Q4 2030	2,484	904	7,096	5,420	453	60,024	51,620	8,403	136,404

Subproduct gross margins are analytical allocations when the issuer reports only segment economics. They reconcile to the actual segment totals and saved model; source status remains distinct from calibration accuracy.

Quarterly earnings ceilings

Our model | USD per ordinary share | Preserved 20x method

Forward-four-quarter earnings ceiling

USD / ordinary share

Our ceiling estimates. Each coherent state uses its next four quarterly operating profits and its own starting-quarter economic ordinary shares. The active ceiling weights those state valuations once; active horizon is Q4 2027.

Ceiling quarter	Expected F4Q OP	Shares by state, millions	Weighted ceiling	Confidence
Q3 2026	33,391	14,216 / 14,216 / 14,216	47	LOW

Q1 2028	258,458	14,777 / 15,427 / 16,726	334	LOW
Q2 2028	282,570	14,813 / 15,465 / 16,767	365	LOW
Q3 2028	303,205	14,849 / 15,503 / 16,808	390	LOW
Q4 2028	321,485	14,886 / 15,541 / 16,850	413	LOW
Q1 2029	336,911	14,922 / 15,579 / 16,891	432	LOW
Q2 2029	350,537	14,959 / 15,617 / 16,932	448	LOW
Q3 2029	362,846	14,995 / 15,655 / 16,974	463	LOW
Q4 2029	372,776	15,032 / 15,694 / 17,015	474	LOW
Q1 2030	380,969	15,069 / 15,732 / 17,057	484	LOW

A modeled ceiling expresses a conditional earnings valuation. Operating assumptions, probability and financing can change; future market prices can differ. No current-price input enters the forecast or analytical score.

Valuation derivations: Delayed

Q1 2029	240	483	915	432
Q2 2029	252	500	946	448
Q3 2029	262	516	972	463
Q4 2029	270	529	990	474
Q1 2030	276	540	1,002	484

The active Q4 2027 window includes Q4 2027, Q1 2028, Q2 2028 and Q3 2028. Each state uses its own funded share denominator. The weighted ceiling is the sum of state probability multiplied by that state ceiling. An average share count is a diagnostic and does not replace the state-specific denominators.

20x operating-profit valuation is unchanged. No net-cash, Bitcoin, investment-asset or merger-synergy add-on is introduced. Financing affects ownership and cash interest in the model; the method does not convert to an enterprise-value or net-income multiple.

Expected operating profit and expected shares help summarize the three states. Their ratio differs from the weighted state valuation whenever financing dilution differs. The report shows every state's exact denominator separately.

Capital, shares and ownership

Funded capacity and shareholder capture move together

Share / funding item	Million shares or USD millions / treatment
September 30 Class A + B shares	13,579 issued; includes already issued restricted equity
Prior ordinary award reserve	564; conservative economic dilution proxy, not certified GAAP shares
Cursor remaining award / option reserve	73; prior gross reserve retained pending full filing
Initial economic ordinary share proxy	14,216
Ordinary share growth	1% annually; funding shares compound on the same growth convention
Spectrum issuance	262 from Q4 2027, preserved timing assumption
Conditional new equity	Residual funding at $135 per share with 2% fees; no target-price feedback
Unresolved denominator	Full award, option, withholding and transaction overlap schedules need the Q3 filing

Cash and marketable securities were $89,855 million at September 30. Debt and finance leases were $38,844 million. Derived Q3 operating cash flow was $9,631 million versus $19,593 million of capital spending. The build consumes cash before later operating receipts can help fund it.

The owner's combined-company capital example is a financing possibility: a $3,500 billion valuation assumption and new shares equal to 10% of the old share count imply $350 billion of gross proceeds. Market capitalization supplies no cash until securities are sold, and a 10% pre-issue share increase means about 9% post-issue ownership dilution before fees.

Adding a hypothetical $350 billion raise to September liquidity gives about $440 billion before fees, capex and other needs. Access to another $30-40 billion of Tesla resources would require an approved lawful transaction and explicit allocation. The active states instead raise only their residual needs, with dilution, and credit no Tesla cash.

Historical IPO proceeds are already reflected in available cash. A future equity raise needs a price, shares issued, timing and transaction costs. A potential Tesla combination has no agreed terms; funding access through that route stays conditional. [Q3R, Q3T]

September cash and marketable securities of $89,855 million fund the forecast from Q4 onward. Q3 cash flow is derived from nine-month less first-half reported totals; the opening-to-ending cash/securities movement includes other historical investing and valuation items. Forecast rows use an explicit operating-cash-flow proxy.

Forecast CFO = operating profit + retained noncash D&A and SBC - cash interest - modeled cash taxes - incremental working capital. Capex is a cash use; depreciation is retained in operating profit and added back once for cash reconciliation.

A modeled liquidity floor of $10 billion triggers conditional new equity. This cash balance depends on successful issuance; the model does not show an independently funded commitment to finish the build.

New equity is a residual financing assumption at a fixed $135 issue-price proxy and a 2% fee. The price is a financing diagnostic, separate from the dated quote snapshot. Issuance occurs at the start of each modeled quarter; new shares dilute subsequent earnings.

The prospective capital-cost assumption is $25 billion per incremental GW, plus maintenance and separate connectivity/launch investment. Q4 cash spent ahead of commissioned assets becomes a prebuild credit against later cash purchases, so the same investment is paid once. The higher-cost sensitivity uses $35 billion per GW and changes depreciation, funding needs and shares together.

No uncommitted future debt, vendor loan, customer advance or Tesla cash is credited. Existing debt principal and cash interest remain. The full Q3 filing is needed to refresh exact financing covenants, commitments, lease and award details.

New equity is a residual financing assumption at a fixed $135 issue-price proxy and a 2% fee. The price is a financing diagnostic, separate from the dated quote snapshot. Issuance occurs at the start of each modeled quarter; new shares dilute subsequent earnings.

The prospective capital-cost assumption is $25 billion per incremental GW, plus maintenance and separate connectivity/launch investment. Q4 cash spent ahead of commissioned assets becomes a prebuild credit against later cash purchases, so the same investment is paid once. The higher-cost sensitivity uses $35 billion per GW and changes depreciation, funding needs and shares together.

No uncommitted future debt, vendor loan, customer advance or Tesla cash is credited. Existing debt principal and cash interest remain. The full Q3 filing is needed to refresh exact financing covenants, commitments, lease and award details.

Sensitivity and outcome differences

Model results respond to cost, deployment, realization, funding and dilution

Diagnostic	Q4 2027 ceiling / ordinary share
Delayed commissioning and lower realization	164
Management capacity plan with realization haircut	329
Small-probability power and software stretch	662
Higher installed cost35B/GW: costs, D&A and financed shares	250
Financing price20%lower: same proceeds, more shares	293
Additional acquisition amortization at extreme $539m quarterly gap	293

The installed-cost stress changes capital spending, depreciation, financing needs and per-state shares together. The financing-price diagnostic should only be reported numerically after a complete, validated rerun; unavailable values remain unavailable. The multiple and valuation window stay unchanged.

The acquisition-amortization gap is an extreme diagnostic rather than an expense estimate: attributing the entire $588 million Q2-to-Q3 SI D&A increase to 48 days of Cursor yields another $539 million for the remaining 44 days of a full quarter. Compute asset growth and other mix changes prevent that attribution from establishing actual purchase amortization. The active ceiling stays unchanged; the full filing must resolve it.

Analytical score and independent risks

Business assessment and Excel override remain separate

Component	Points	Reason
Core thesis	17 / 20	Reusable launch and broadband integration remain differentiated; shared AI software/compute market remains competitive.
Cycle stage	8 / 10	Q3 actual SI scale and stronger formal Q1 guidance advance commercialization; very large next-stage capacity remains unbuilt.
TAM expansion	9 / 10	Enterprise agents can increase monetization, but management exit ARR is not captured annual sales.
Catalysts	5 / 5	Dated Q4 capex, Q1 sales, October/year-end capacity and 2027 deployments create measurable tests.
Macro	8 / 10	Demand and short-contract pricing strong; infrastructure, financing and energy constrain supply.
Alpha	2 / 5	Accounting/funding reconciliation provides differentiation; highly followed stock limits informational edge.
Risks	-5	Technical, monetization, financing, regulation and governance risks remain distinct.

Risk class	Company-specific mechanism
Technical execution	Power, cooling, electrical equipment, network deployment, compute commissioning, launch reuse and satellite reliability.
Competition and monetization	Short rental renewals, software substitution, useful utilization, regional broadband mix and customer concentration.
Funding and dilution	Uncommitted capital access, issue price, fees, ongoing investment, compensation and debt service.
Regulation and geopolitics	Energy permits, spectrum, country authorizations, launch safety, export restrictions and space-debris requirements.
Governance and concentration	Control, related-party arrangements, key-person exposure and uncertain combination terms.

The analytical score assesses the operating thesis. Probabilities are already reflected in modeled economic outcomes and are applied once. The protected Excel Base is a distinct owner-controlled value.

Equipment, power and longer-term options

What the new call supports, and the next operational tests

Topic	New evidence	Missing economic link
Turbine castings	Management proposes using rocket-engine casting capability for turbine blades and vanes	OEM acceptance, qualification, yields, volume, fuel, permits and energized capacity
Terafab	Internal SRAM test target May-June 2027; volume aspiration Q3/Q4 2028 with large error bars	EUV order confirmation, installed tools, process qualification, good wafers and costs
ASML	Management thanks ASML and other suppliers for equipment delivery support	Orders, accepted systems, revenue timing, pricing and supplier margins
Starlink Mobile	V2 deployment in 2027; service target early 2028	Spectrum closing, licensed service, capacity, paying users and unit economics
Orbital compute	Launch, hardware and satellite roadmap support longer-term engineering potential	Qualified useful capacity, replacement costs, paid workloads and dependable cash returns

A faster turbine component supply chain could accelerate commissioning, but castings alone do not complete a gas power plant. Fuel, permits, electrical equipment and acceptance remain part of the same deployment outcome.

The Terafab and orbital opportunities are assessed through execution and longer-term capacity options. This update adds no separate supplier order revenue from a management aspiration. Equipment lead times may carry pricing implications for suppliers, but each requires its own eligible order and cost bridge.

Catalysts, invalidation and portfolio connections

Reassess the affected economics as new evidence arrives

Test	Positive evidence	Adverse evidence / response
October and December 2026	Nameplate reaches the stated near-term milestones and is energized	Delay average capacity and receipts; retain costs of idle hardware.
Q4 report / Q1 2027	Realized sales and margin reconcile to the $33-37 billion guide	Revise recognition, utilization, cost or funding if results miss.
2027 physical build	Power, cooling and chips support increasing usable capacity	Reweight coherent states as commissioning, capital and customer evidence changes.
Renewals and own applications	Stable or rising paid realization, durable enterprise adoption	Lower realization for price cuts, churn or a weaker own-product mix.
Funding and dilution	Capital arrives on explainable terms and ownership math reconciles	Change issue price, fees, share count, capital cost or attainable build.
Full Q3 filing	Purchase accounting, awards, commitments and debt controls clarified	Replace bounded expense and economic-share proxies with inspected schedules.

NVIDIA's named GB300 and Vera Rubin deployment context supports an accelerated compute-demand case. Memory, packaging, optics, connectors, power and cooling suppliers benefit only to the extent that their own qualified products capture incremental orders above existing forecasts.

Faster SpaceX supply can also compete with hosting businesses. Short-contract pricing and useful utilization matter for NBIS, CRWV and hyperscalers; software adoption can shift internal and external compute mix. The call cannot assign the entire capex budget to every supplier at once.

Forward earnings and the displayed ceiling remain provisional pending the full Q3 filing. The acquired-asset amortization schedule, service-award timing and share-reserve overlap are especially important accounting gaps; the report preserves bounded diagnostics instead of treating them as settled.

Prominent unresolved inputs: commissioning dates; billed utilization and power definitions; true per-watt price and cost boundaries; segment/product cost allocation; installed dollars per GW; tax and working-capital conversion; new-equity availability and price; full award overlap and purchase accounting. These can substantially alter earnings and per-share capture.

The three states require future funding. A forecast cash floor maintained through conditional issuance demonstrates the required capital and dilution rather than proving investors will supply that capital. The delayed outcome also depends on completing its stated funding.

Source coverage and evidence boundaries

Originals, exact source dates and completeness are retained

Q2R | Second-quarter issuer release and comparative financial tables | August 4, 2026
https://s21.q4cdn.com/184289198/files/doc_financials/2026/q2/SpaceX-Reports-Second-Quarter-2026-Results.pdf

Q2F | June 30 Form 10-Q; historical debt, commitments and award terms | August 4, 2026
https://www.sec.gov/Archives/edgar/data/1181412/000162828026052535/spcx-20260630.htm

The complete 13-page official release and all financial tables are preserved with original hashes. Its page 2 images were inspected and placed beside relevant operating claims. The SEC submissions snapshot shows the Q3 release 8-K; the full Q3 Form 10-Q was not yet listed.

The full automated management transcript covers prepared remarks, five analyst questions, two individual-investor questions and closing. Known transcription errors include the lower ARR bound, a Space revenue figure and hardware/product spelling. Official figures govern actual accounting.

The official replay ends after 67 minutes. Full recording media were not downloaded or independently listened to; the disputed ARR excerpt is preserved with all audio/video/caption segments. The two caption tracks and the clip transcript state $500 billion-$1 trillion. A full official transcript remains pending.

Sources are evidence. Numerical probabilities, cost allocations, capacity extensions and financing assumptions are this model's estimates; management ambition does not establish a committed order or a guaranteed return.
