Besi | research snapshot and valuation discipline

BE Semiconductor Industries is a precision assembly-equipment supplier exposed to logic chiplets, memory, optical interconnects and conventional packaging. Strong current orders support adoption, but customer capacity reuse, qualification and competing process choices constrain capture.

The update uses the latest reported Q3 results and distinguishes the dated 2030 company objective from a guaranteed sales path. The annual reference allocations and event assumptions below are research assumptions, not issuer product forecasts. Analytical score and protected Excel Base remain unchanged.

The Q4 2027 model ceiling falls by 8.12%, from €254.25 to €233.60. The main change is the later-year sales path: the issuer's €1.7–2.2bn objective is explicitly dated 2030 and covers hybrid bonding plus other submicron processes. The prior €2.983bn reference for 2030 did not have a separate economic bridge above that dated objective. Strong new orders support a lower modeled nonmemory-capacity risk, but do not establish that larger revenue path.

Ceiling quarter	Previous model	Current model	Revision
Q4 2026	190.62	187.39	-1.6949%
Q4 2027	254.25	233.60	-8.1231%

The selected 2030 reference is the €2.2bn upper endpoint of the company plan, rather than an issuer low case. The probability-weighted model reaches €2.219bn after the separately identified power/mobility and limited Gen2 price increments. Those increments remain research estimates with overlap removed; they are not an updated company revenue objective.

Saved reference quote and selected financial basis

Measure	Value	Meaning
Saved quote	221.40	EUR; date unverified, not a refreshed official market quote
Analytical score	78	47/60 rounded; advisory thesis score
Protected Excel Base	78	78 points; separate protected owner control
F4 OP multiple	25	25x IFRS-style operating profit; no SBC addback
Diluted-share proxy	80.951856	Million shares; dated H1 weighted-average proxy
Q4 2026 ceiling	187.39	EUR per share; current and next three quarters
Q4 2027 ceiling	233.60	EUR per share; current and next three quarters

The ceiling is a model-derived valuation, not a guaranteed future trading price. No net-cash add-on, debt/lease subtraction, automatic buyback share benefit or positive floor is introduced. Saved-file calculations and affected native-workbook tests passed within the scope described in the companion section.

Business, revenue recognition and technology scope

Besi develops, manufactures, sells and services semiconductor assembly equipment. Its customers include chip manufacturers, foundries and assembly subcontractors. It captures selected placement, bonding, molding and plating steps rather than the complete chip, HBM, CoWoS or optical-module bill of materials. Accuracy, throughput, qualification and process integration matter alongside the number of chips or packages being built.

The H1 notes identify Die Attach, Packaging and Plating as operating segments and aggregate them into one IFRS reporting segment because of similar economic characteristics. They separately disclose product-line revenue. Hybrid bonding is part of Die Attach; it is not an extra reported segment. Shared sales, service and spares are not separate operating segments.

An order, delivery request, shipment, acceptance and recognized revenue are different stages. The October release attributes Q4 timing to customers aligning deliveries of Q3 orders with H1-2027 capacity plans. It does not label those requests cancellations. The current research artifact requires delivery and customer acceptance before recognizing modeled sales; the exact contractual acceptance and transfer-of-control policy is not recertified by this abbreviated source set.

Hybrid bonding and TC Next address different interconnect processes. The issuer describes submicron fluxless TCB for memory, CoWoS, optical and other packages, complementing hybrid bonding. Its mainstream Evo platform also handles multiple transceiver assembly steps. The optical application label therefore does not uniquely identify a hybrid bonder or an Engine2 sale. A specific package may use different tools at distinct steps; an application headline alone does not prove additive demand for each tool family.

The issuer labels Engine1 Traditional Advanced Packaging and Engine2 Submicron Accuracy. TC Next belongs within the submicron discussion, while photonics also appears under mainstream die attach. The decks do not disclose a numeric HB-versus-TCB-versus-Evo split inside either engine. Product allocations must be labeled model assumptions and reconciled once to the chosen engine wallet; the same CPO, memory or CoWoS program is not three independent customer budgets.

Latest actuals and guidance

The latest captured results are the quarter and nine months ended 30 September 2026, released on 22 October. These are reported actual totals; the nine-month period is not full-year 2026.

For Q4 2026, management guides revenue approximately flat within 5% of Q3, gross margin of 63–65%, and operating expenses 5–10% above Q3, mainly because of higher strategic consulting costs. Customer delivery timing is linked to H1 2027 production plans. These ranges are guidance, not reported results or forecasts selected by this source review.

Q3 and nine-month reported results | EUR thousands

Measure	Q3 2026	Nine months 2026
Revenue	283,400.000	718,145.000
Gross profit	184,770.000	466,213.000
Operating expense total	55,091.000	163,823.000
Operating income	129,679.000	302,390.000
Net income	107,193.000	247,774.000
Cfo after interest tax	107,114.000	247,853.000

Reported Q3 operating-profit bridge | EUR thousands

Measure	Q3 2026
Revenue	283,400.000
Cogs	98,630.000
Gross profit	184,770.000
Rd expense	23,541.000
SG&A	31,550.000
Operating expense total	55,091.000
Operating income	129,679.000
Financial expense net	6,075.000
Tax	16,411.000
Net income	107,193.000

Q4 issuer guidance | not selected endpoints

Measure	Low	High	Reference
Revenue QoQ (%)	-5	5	Q3 EUR283.4m
Gross margin (%)	63	65	Q3 65.2%
Operating expenses QoQ (%)	5	10	Q3 EUR55.1m

Order momentum and customer adoption

Q3 orders reached EUR 342.6m, up 17.0% from Q2. The issuer order series shows five consecutive quarterly increases from Q3 2025 through Q3 2026. That momentum supports the demand catalyst; orders still require delivery, acceptance and revenue conversion. The same release ties some Q3 orders to customers' H1 2027 delivery plans.

Evidence	Value	Meaning / provenance
Q3 2026 orders (EURm)	342.600	Issuer PR pp1–2; orders rather than revenue
Orders growth vs Q2 (%)	17	Issuer PR pp1–2
Consecutive quarterly increases	5	Derived from the issuer p9 sequence below
HB customer adoption	23	Issuer PR p2 and Q3 deck p10
Cumulative HB unit orders exceed	215	Systems; cumulative orders/unit demand, not shipments
TC Next customers	7	Management statement in saved secondary Q3 call Q&A #29; not an issuer written count or a full-call coverage claim

Quarter	Orders (EURm)
Q2 2025	128.000
Q3 2025	174.700
Q4 2025	250.400
Q1 2026	269.700
Q2 2026	292.900
Q3 2026	342.600

The captured Q3 call excerpt attributes seven TC Next customers to management. The written PR separately confirms HB and TC Next orders from a leading memory customer for distinct device roadmaps. The secondary excerpt is useful adoption evidence, but it does not disclose customer economics, a shipment count, or an independently complete spoken record.

Management records, adoption and dated capacity

October materials report 23 HB customers and cumulative unit demand/orders above 215; neither is a 2026 shipment or installed-unit total. A leading memory customer ordered both HB and TC Next. In June, management planned increased supply-chain capability for 35 HB systems per month; the October deck expected completion of a Vietnam assembly facility in Q4. These are distinct facts and dates, not a verified annual 250-system baseline. The June/August HBM 2027 and 16-high HBM4e scenarios remain dated alongside October wording about adoption across stack heights over the next two years.

The newest captured earnings records are 22 October for Q3 and 23 July for Q2. Issuer releases and decks are preserved, and issuer replay wrappers lead to registration pages. Saved secondary written texts contain speaker segments and closing material, but retain first-half/API preview banners. The source review records reading all 73 Q3 and 58 Q2 saved segments through closing; that observation does not independently certify a complete spoken record. No full audio was downloaded, heard or transcribed in this source pass.

2030 target wallets, TAM and no-overlap constraints

June and August target tables set Engine 1 revenue at €1.1bn and Engine 2 at €0.6–1.1bn, totaling €1.7–2.2bn. Executive summaries expressly identify 2030 revenue and operating-margin targets. The product and year-by-year allocations needed to reach them are not issuer segment forecasts. A model at €2.2bn occupies the upper endpoint of the total target range, irrespective of a model case named LOW.

The three-phase thesis lens distinguishes established precision placement, expanding submicron applications and longer-dated 3D/panel opportunities. Thematic phase weights are not blanket revenue discounts or company capture rates. Customer budgets, accepted production tools and distinct process steps determine the route from industry demand to Besi revenue.

The reference 2030 allocation reaches the upper end of the issuer objective. LOW describes confidence in research allocations, not an issuer low case or a conservative guarantee. Photonics spans HB, TCB and mainstream Evo; the selected Other Die Attach submicron component is already inside Other Die Attach and is not an additional wallet.

EUR 2.2bn is the calibrated 2030 reference at C=0.6, not a ceiling for each conditional state. The C=1, R=W=P=0 outcome has its own volume and cost bridge: its higher hybrid volume can already take company revenue and the associated Engine2 allocation above the issuer objective before either W or P contributes. The probability-weighted mean and individual conditional cases must therefore be distinguished. The company objective remains an objective rather than a hard cap; the state excess is a research-model outcome, not additional issuer guidance.

2030 C=1, R=W=P=0 context	EURm	Definition
Hybrid bonding	976.667	Sum of four approved state-quarter HB revenues
Other Die Attach	1,050.000	Includes the submicron allocation below
Packaging	260.000	Approved state output
Plating	40.000	Approved state output
Company revenue after C/R, before W/P	2,326.667	No W/P increment in this state
Submicron already inside Other Die Attach	250.000	Existing research allocation; not additional revenue
Engine2 HB + within-OtherDA submicron	1,226.667	Context reconciliation, not an issuer segment forecast

Accounting, financing, dilution and source limits

R&D expense and capitalized development are different P&L and cash measures. H1 reports €46.469m R&D expense and €11.813m capitalized-development cash outflow. Its €19.606m depreciation, amortization and impairment cash-flow addback is aggregate, not development-only amortization. Q3 supplemental amortization is labeled intangible amortization and rounded. Lease principal payments and total interest cash are distinct; the packet does not identify a separate exact lease-interest allocation.

The €175m, 1.875% convertible notes due in 2029 converted in Q2 through approximately 1.5m treasury shares; the stated liability carrying amount was €163.7m. This was a conversion, not fresh financing cash. The existing model uses the H1 diluted weighted average of 80.951856m as a forward share proxy. Q3 diluted EPS shares are 80.897783m, not a verified quarter-end fully diluted stock. A new €100m buyback program starts on 27 October, but authorization is not executed or perpetual share reduction. The saved €221.4 quote remains undated in the retained workbook.

The principal missing disclosures are commercial rather than missing headlines: exact quarterly HB shipments and recognized HB revenue, realized ASP/support mix, product margins, accepted tools by customer/end use, and the split between new demand, installed-capacity reuse and replacement. Future engine allocations, utilization, qualified-capacity conversion and cash/expense paths therefore require explicit research assumptions. Missing data is not zero.

Thesis assessment, competition and monitoring

Qualified placement is a specific competitive position, not a monopoly across advanced packaging. Management says ASML's discussed intra-chip transistor stacking differs from Besi die-to-wafer bonding and describes collaborative placement/stress work. This is an attributed management view, not proof that future competition is impossible. The existing report treats ASMPT and other equipment/process routes as part of a shared customer capex cycle. TCB, conventional bonding and hybrid choice depend on yield, cost, throughput and architecture.

The current production artifact's category points total 47 out of 60, displayed as 78%. It is an advisory thesis assessment, not a 78% chance of success, a customer-order probability, a revenue haircut or an automatic workbook Base revision. The protected current Excel Base is also 78, but its preservation is a separate owner-control requirement. This source review makes no new score selection.

Retained thesis score

Category	Points	Maximum	Evidence
Core Thesis	17	20	Precision and qualification support strong capture, with competing assembly processes and suppliers.
Cycle Stage	9	10	Orders and current shipments are accelerating; some new applications remain in qualification.
TAM Expansion	9	10	Logic, memory, photonics and panel formats increase reachable assembly content.
Catalysts	5	5	Current-quarter delivery, HBM qualification and broader hybrid customer deployment.
Macro	9	10	Advanced packaging investment supports demand across compute and optical networks.
Alpha	2	5	Tool units, throughput, acceptance and dilution require closer analysis than headline packaging TAM.
Risks	-4	0	Four separately scored operating risks.

Retained scored risk classes

Risk	Deduction	Mechanism
Qualification and adoption timing	-1	Yield and cost requirements can defer HBM adoption; installed TCB can remain economic longer.
Customer capex and overcapacity	-1	Tool orders are concentrated and cyclical; excessive packaging capacity can cause a sharp correction.
Competition and technological substitution	-1	Competing bonders and process choices can pressure share, ASP and gross margin.
Export and operating footprint	-1	Market access and geographic concentration affect shipment eligibility and regional demand.

Monitor accepted HB/TC Next systems by customer and end use, delivery conversion versus bookings, installed-capacity reuse, realized price/mix, process yield and throughput, supplier costs, collections, inventory, working capital and actual share changes. Common customer capex and qualification dates can affect several product lines together; the state model's independence assumption is not established by the sources.

Persistent C / R / W / P event law

The four event indicators are fixed along each scenario path. The sixteen paths are not redrawn each quarter. Each joint weight is the product of the selected probabilities or complements. This independence assumption is for tractability; customer and qualification concentration remains a disclosed risk.

Selected probabilities | research assumptions

Event	Probability	Mechanism
C	60.0000%	Capacity confidence: conditional physical/tool-equivalent paths calibrated to the reference mean.
R	20.0000%	Installed-capacity/nonmemory risk; bounded revenue removal and partial recovery assumption.
W	45.0000%	Power/mobility expansion; explicit cohort and overlap removal across selected non-HB products.
P	25.0000%	Limited qualified Gen2 hybrid pricing; only eligible post-C/R HB revenue, excluding W increment.

C changes the hybrid capacity path. R removes only eligible nonmemory hybrid revenue above the selected endpoint; variable support savings follow the removed revenue while R&D stays fixed. W removes explicitly overlapping demand before allocating incremental revenue and cost to non-HB vectors. P applies a net premium only to the selected new/repriceable hybrid pool and has separate incremental GP and SG&A. The full input ledger and financial-law appendix specify every numerical term.

Default R recovery is a model assumption, not a company commitment. The no-recovery-through-2030 sensitivity is displayed separately. The power cohort and eligible Gen2 price pool are also assumptions, not newly reported segments or contracted price increases.

Reference product allocation and margin inputs

Four mutually exclusive vectors are used: Hybrid Bonding, Other Die Attach, Packaging and Plating. The reference tables are model allocations, not issuer product guidance. Hybrid bonding is carved out of Die Attach. Reference margins are input assumptions; event increments, removal and mix can change realized effective margins.

Reference product allocation and margin inputs | panel 1

Quarter	Product revenue / HB	Product revenue / Other DA	Product revenue / Packaging	Product revenue / Plating	Product gm / HB	Product gm / Other DA	Product gm / Packaging

Expected quarterly operating bridge

All current/future numbers below are model outputs except the separately identified reported Q3 anchor. The new Q3 reconstruction is not the published as-then Q3 forecast. Product revenue and GP feed separate R&D and SG&A schedules; operating profit remains after these costs and SBC under the sanctioned accounting policy.

Expected quarterly operating bridge | panel 1

Four-quarter valuation, revisions and preserved history

For each published ceiling quarter, sum that quarter and the next three parent-economic OP values, multiply by the retained 25x, and divide by the retained 80.951856m diluted-share proxy. The source FX/unit multiplier is 1. The native source operator S=(company OP+parent costs)×ownership−parent costs−outside claims is retained at the point-in-time defaults 1/0/0. Company cash scenarios remain on the company basis rather than becoming ownership-adjusted cash.

All fourteen current/future published F4 windows | EUR per share

Historical Master/QC displays and the five Q3 owning rows remain as-then values. The eighteen original calculated displays will be snapshotted with original formulas and vintages recoverable; the other literals and forty physical blanks remain exact. Current Q3 reconstruction is separate. Later tail quarters without a complete four-quarter window have no invented partial-window ceiling.

Q3 actuals now exist in the 22 October release, but the published as-then Q3 model displays remain historical. A new current reconstruction must be separate. The October 1 EPIC partnership and October 6 HBM/MR-MUF engineering context were already incorporated in the current research; repeating them in a new source does not create an extra event. The October 11 nonmemory risk bridge was an analyst proxy based on a clipped UBS image, not issuer guidance.

Sixteen persistent cash states and funding boundaries

Cash and deposits are tracked as a stock, separately from IFRS OP. Each persistent state links working capital, taxes, finance outflows, PP&E, capitalized development, lease payments, dividends, buybacks and withholding. No SBC cash addback or automatic buyback share benefit is taken. Partial NWC leaves an explicitly disclosed residual rather than forcing the bridge. A 20% AR-stock haircut is a stock stress, not a full collection-delay forecast.

State order is C/R/W/P; cash and headroom are EUR millions

#	Bits	Weight	Cash minimum	AR-stress min	Reserve headroom	AR-stress headroom

The 2031 bond principal lies outside the forecast's 2030 ending period. Its absence as an in-horizon payment does not erase the claim or prove refinancing. The selected cash reserve is a research buffer; a larger reserve stress can fail even when default scenarios retain positive cash.

Every scenario's first Q3 2026 row is a closed starting/context row. Reported P&L and starting cash/deposits of EUR 591.886m are meaningful, while all scenario cash-flow entries at that index are inactive schedule context, not reported Q3 cash-flow amounts. For example, PPE cash 6 repeats the Q4 model spend assumption and buyback cash 0 is a placeholder; actual Q3 outflows were 2.825 and 15.759 respectively. Q3 cash flows are not applied again to starting cash. Current/future recurrences begin after that closed quarter.

The following cash-statement amounts are reported Q3 actuals. All monetary amounts in this table are EUR millions; positive outflow magnitudes are labeled as outflows. The model's total D&A cash-addback proxy includes its incremental PP&E depreciation. Company revenue after C/R and before W/P is a scenario-specific intermediate, not the fixed company reference.

Reported Q3 2026 cash item	EURm	Source
PP&E cash outflow	2.825	PR p8: 2,825 EUR thousands
Capitalized development cash outflow	5.651	PR p8: 5,651 EUR thousands
Treasury-share purchase cash outflow	15.759	PR p8: 15,759 EUR thousands
Lease-principal cash outflow	0.943	PR p8: 943 EUR thousands
CFO after interest and tax	107.114	PR p8: 107,114 EUR thousands

State 0000 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 0001 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 0010 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 0011 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 0110 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 0111 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 1000 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state's operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 1011 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 1100 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state's operating or cash sequence is replaced by an average input or a stored expected-output constant.

State 1101 | complete operating and cash schedule

First Q3 2026 row: reported P&L and starting balances plus inactive schedule context. All cash-flow fields at this first index are inactive; PPE 6 and buyback 0 are not reported Q3 outflows. No Q3 cash flow is reapplied. The separately identified Q3 cash-statement actuals appear immediately before these schedules.

Conditional model path. Figures are not issuer guidance. Quarter tables use EUR millions; ratios are labeled. No state’s operating or cash sequence is replaced by an average input or a stored expected-output constant.

Sensitivity, no recovery and funding reserve

These are mechanical sensitivities from the selected financial-law stress receipt, not additional active forecasts or probabilities. Axis probabilities are set to zero/one; overlap, cohort, guidance, multiple and shares are varied separately. The no-recovery path retains the risk endpoint beyond the default recovery period. The higher-reserve test is reported honestly as a failure where applicable.

BESI는 CPO를 반영해 HB 장비 시장 전망을 상향

BESI의 2026년 Investor Day 자료에 따르면 2030년 전 세계 하이브리드 본딩 장비의 누적 설치 기반 전망은 기존 960~2,000대에서 1,150~2,200대로 상향됐다. 특히 BESI는 가장 보수적인 Low Case에서도 Logic과 CPO만으로 시장 확대가 가능하다고 설명하고 있으며, HBM 채택이 본격화될 경우 Mid Case, 소비자용 디바이스까지 확산될 경우 High Case로 확대될 수 있다고 제시했다.

표16 BESI의 2030년 HB 장비 누적 설치 전망

시나리오	주요 가정	2030년 시장 판단
Low Case	Logic 및 CPO 도입 확대	누적 1,150대
Mid Case	Logic / CPO에 HBM 적용 추가	Low Case 대비 확대
High Case	HBM 및 모바일·웨어러블 등 추가 응용	누적 2,200대

자료: BESI, LS증권 리서치센터

HB 장비 시장에서는 Logic / HBM / CPO의 수요 구조가 다름

Logic은 이미 확인된 수요 기반으로, HBM은 잠재적인 대형 확장 시장으로, CPO는 새롭게 등장한 상용 응용처로 구분하는 것이 적절하다. 다만 CPO의 공정 수요가 제품 하나당 많아 보인다고 해서 전체 HB 장비 시장에서 HBM보다 큰 비중을 차지한다고 단정할 수는 없다.

HBM은 향후 대량 생산되는 메모리 스택마다 여러 번의 다이 접합이 필요할 수 있는 반면, CPO는 스위치 한 대에 다수의 광엔진이 들어가지만 전체 스위치 생산량과 광엔진당 접합 횟수가 별도로 결정된다. 결국 어느 시장이 더 많은 본더를 필요로 하는지는 각 제품의 생산량과 장비 처리량에 달려 있다.

표17 Logic / HBM / CPO 별 하이브리드 본딩 수요 구조 비교

구분	Logic	HBM	CPO
주요 접합	Logic ↔ Logic / SRAM	DRAM 다이 간 적층	EIC ↔ PIC
접합 방식	주로 D2W	차세대 D2W 중심	COUPE 기준 SoIC 계열
제품당 공정 수요	Chiplet 구조에 따라 변화	적층 단수에 영향	광엔진 개수에 영향
상용화	이미 양산	선별 적용 준비	COUPE 기반 양산 진입
현재 투자 논리	채택 고객·제품 확대	고단수 HBM 전환	CPO 출하 확대
주요 불확실성	제품별 구조 / 고객 CAPA	TCB 대체 시점 / 수율	HB 침투율 / 광엔진당 접합 수

BESI N.V.(AMS: BESI)

2026. 10. 27 반도체

수주 성장과 하이브리드 본딩 적용처 확대

Analyst 정우성
wsjung@ls-sec.co.kr

AI 인프라 투자 확대로 성장하는 첨단 패키징 장비

BESI는 반도체 후공정 장비 업체로, 2025년 매출액 기준 Die Attach 80%, Packaging & Plating 20%로 구성된다. Die Attach는 Hybrid Bonding / TCB / Flip Chip / Multi-Module Attach 등을 포함하며, 최종 수요처별 매출 비중은 Computing 51%, Mobile 17%, Automotive 10% 등이다. AI 데이터센터 투자 확대에 따라 기존 범용 조립 장비에서 고정밀 첨단 패키징 장비로 수요가 확대되고 있으며, 특히 Hybrid Bonding과 TC Next를 중심으로 신규 적용처가 증가하고 있다.

3Q26 Review: 5개 분기 연속 수주 증가

3Q26 매출액은 2.83억유로(+13.4% QoQ, +113.6% YoY), 영업이익은 1.30억유로(+19.2% QoQ), 영업이익률은 45.8%를 기록했다. 신규 수주액은 3.43억유로(+17.0% QoQ, +96.1% YoY)로 5개 분기 연속 증가했으며, Book-to-Bill은 1.21배를 기록했다. 4Q26 매출 가이던스는 전분기 대비 ±5%, 매출총이익률은 63~65%로 제시했다. 3Q26 수주 물량 일부가 고객사의 생산라인 구축 일정에 맞춰 1H27에 인도될 예정으로, 단기 매출 성장 둔화보다는 2027년 수주-매출 전환에 주목할 필요가 있다.

하이브리드 본딩: HBM에서 CPO와 Logic으로 확대

2026년 누적 Hybrid Bonding 수주는 2025년 연간 수주의 2배를 상회했으며, 고객사는 23개사, 누적 장비 수요는 215대 이상으로 확대됐다. 특히 CPO 적용이 예상보다 빠르게 확대되면서 3Q26에도 관련 장비 신규 수주를 확보했으며, 광스위치, GPU Optical I/O 등으로 적용처가 확대될 가능성이 있다. HBM은 메모리 3사 모두 기술 개발을 지속하고 있으나 실제 양산 전환 시점은 미확정이다. 반면 Logic Chiplet의 양산 적용 확대와 CPO향 신규 수주가 가시화되고 있으며, TC Next 역시 고객사 7개사를 확보해 중장기 성장 동력으로 부상하고 있다.

Target Model Update

Increasing Besi's long term revenue model to range of € 1.7 – € 2.2 billion

- **Up ~15%** at midpoint
- Increasing **Engine 1 (Traditional Advanced Packaging)** revenue target by **10%**
- Increasing **Engine 2 (Submicron Accuracy)** revenue target by ~**21**% at midpoint

Increasing operating margin to range of 45%-55%

- Other targets remain unchanged

Besi Investor Day, 18 June 2026, page 61. Dated 2030 target context is established by executive/CEO summary pages 6/62; the target is not a guarantee or hard cap.

Besi's TC Next Complements Hybrid Bonding to Offer Customers Complete Portfolio for Next Gen AI Applications

Fluxless TCB Adoption Increasing For Next-Generation Applications:

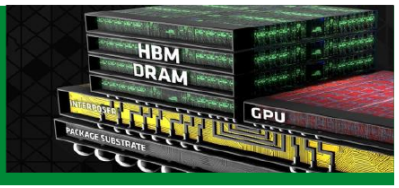

- **Best in Class** C2W TCB for Chiplet Packages
- **Customer adoption increased** to 5 customers including memory, logic and CPO producers
- Customer interest expanding (eg: AI logic chips for automotive)

TC*next*

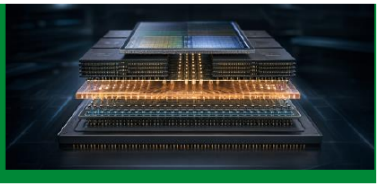

Memory:

Demonstrated best CoO for TC NCF applications
TC fluxless engagement with a leading customer

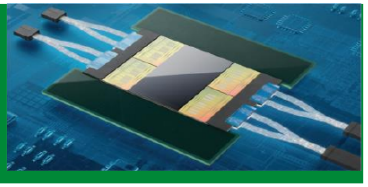

CoWoS:

"Chip On Wafer" and "On Substrate" interconnect requires fluxless TCB due to increased size of components/interposers

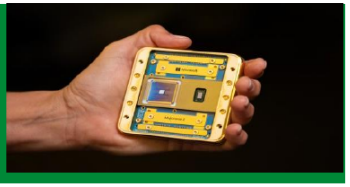

CPO/LPO/Transceivers:

In addition to hybrid bonding, fluxless TCB can be used to avoid any contamination of the optical path

Quantum Computing:

Use of Indium bumps requires fluxless TCB technology with inert environment to avoid oxidation

Besi August 2026 presentation, page 40. TC Next complements HB; application labels alone do not define a unique revenue wallet.

Besi's Multi Module Attach System: Leading Photonics Platform in Rapidly Growing Market

Besi # 1 vendor, engagement with all key players

2200 Evo advanced

2200 Evo ONE

Industry leading system for various **transceiver** assembly steps (800G, 1.6T, LPO)
- 3 µm accuracy
- 325 x 200 mm substrate

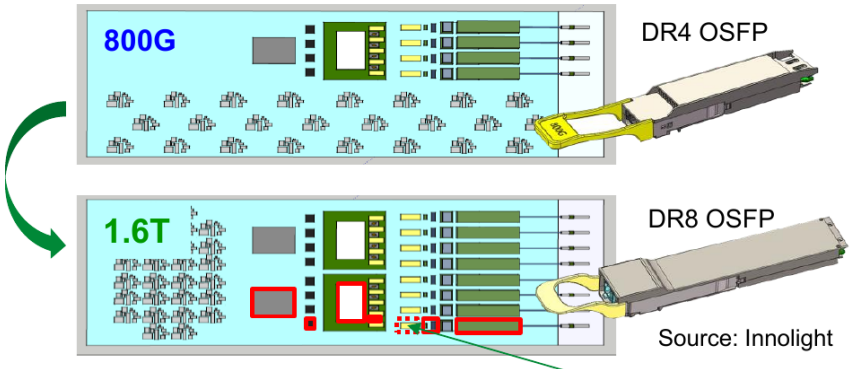

Introducing **new Evo platform** to **expand addressable market**
- 1um accuracy
- 300 mm wafer capability
- Eutectic bonding capability
- Customer evaluations in progress

NVIDIA. fabrinet molex eoptolink COHERENT
INNO LIGHT FINISAR Acceiink HG Semiconductor Limited 宏光半導體有限公司

Significant Growth Opportunity

- **Die attach intensity increasing**
  - 1.6T transceivers increasing #die attach steps (more of the same processes per transceiver)
- **Increasing addressable share of transceiver market**
  - Leveraging Evo ONE platform to address additional transceiver process steps

1.6T Transceivers require up to 2x number of die attach steps

BESI process steps DSP, PD, TIA, LD, IS, FAU, **New:** Laser

Besi Investor Day, 18 June 2026, page 57. Mainstream Evo/Evo ONE serves optical assembly; photonics is not wholly Engine 2.

How to reproduce the operating, cash and valuation bridges

Use the complete reference-quarter tables above as inputs: product revenue r, product gross margin g, and reference operating cost O for each quarter. These normalized current inputs remove the need to retrieve an older model to reproduce the new forecast. The old published ceilings are comparison inputs, not a second active forecast. All monetary inputs below are EUR millions.

The capacity split is calibrated before the nonmemory risk. For each year, expected hybrid tool-equivalents equal reference hybrid revenue divided by 3. With calibration probability 0.60 and the disclosed low-case assumption uL, uH=(expected units−0.40×uL)/0.60. Each persistent C state chooses uH or uL and scales that year's quarterly hybrid reference by chosen units / expected units. The assumed 10% service share and €2.7m system ASP reconcile to €3m total revenue per tool-equivalent; these are not disclosed shipments or realized unit prices. Planned capacity is a separate bound, not another revenue increment.

For a persistent R=1 outcome in 2027/28, annual hybrid revenue removed is max(0, 0.70×state hybrid revenue−180). Allocate that loss in proportion to the same state's quarterly hybrid revenue before removal. In 2029, remove 0.5×max(0, 0.70−180/700)×state hybrid revenue; the default 2030 removal is zero. The no-recovery sensitivity instead keeps the capped endpoint through 2030. For R=0, removal is zero. The new 20% R probability is applied once to reference inputs recovered before the prior October risk haircut; the old 25% haircut is not multiplied in again.

For W=1, quarterly incremental revenue uses fixed reference company revenue before the C capacity state and R removal×(0.20−0.15)×(1−0.50 overlap)×the W phase. Phases are 0.25/0.50/0.75/1.00 in 2027, 1.00 in 2028/29 and 0.75 in 2030. Allocate the net increment 75% to Other Die Attach, 20% to Packaging and 5% to Plating. Their incremental gross margins are 60%/50%/45%; R&D takes 5% and SG&A 10% of the company increment. The initial 15% cohort allocation and all these conversion terms are research assumptions. This fixed W base is sum(ref). The separate table column Company revenue after C/R, before W/P is sum(core), a scenario-specific intermediate; it is not the W revenue base.

For P=1, incremental revenue is only post-C/R hybrid revenue×0.15 eligible share×(0.03 gross premium−0.01 already embedded)×the P phase. Its phase is zero before Q3 2027, 0.50 in Q3 2027, 1.00 in Q4 2027 and 2028/29, and 0.75 in 2030. Incremental GP is 60% and SG&A is 10% of that increment. No W revenue, other product pool or fixed backlog is repriced. The eligible share is measured against total hybrid revenue and is a selected qualified Gen2 pool, rather than a claim that all service or system revenue receives a premium.

Start reference R&D at O×46.469/108.732 and reference SG&A at the remainder. SG&A also changes by 3% of the capacity-related hybrid revenue change less the removed hybrid revenue. R&D stays fixed under that removal. Add the W and P costs above. Each state's accumulated prior PP&E spend above/below the fixed calibrated mean is depreciated over 20 quarters: add that incremental depreciation to SG&A and total D&A. Operating profit equals the sum of product GP less R&D and SG&A, including the sanctioned SBC and capitalization treatment.

The Q3 reconstruction uses reported revenue 283.400, GP184.770, R&D23.541 and SG&A31.550; its four-product allocation is a model estimate, not a reported mix. Q4 uses the guide midpoint: revenue283.4, GM64%, and operating cost55.091×1.075=59.222825. The assumed Q4 R&D split23.541×1.025=24.129525 leaves SG&A35.093300. The older 309.5 revenue forecast does not become backlog or automatic 2027 catch-up revenue.

Each state's partial working-capital stock is (274.641/283.4)×revenue + ((122.703−90.559)/(283.4−184.770))×COGS +38.595 held constant. The cash bridge uses the change in this stock, beginning with reported Q3 balances. A3.950m classification residual in the earlier cash working-capital bridge remains disclosed. Cash after the AR-stock stress subtracts20% of modeled AR at that quarter; it is not a dynamic delay/recovery schedule.

Forward cash CFO equals OP+total D&A−change in partial NWC−4.314 cash financial outflow−max(0,OP−6.075 book finance cost)×13.3% cash-tax proxy. Net-income proxy=(OP−6.075)×(1−13.3%); the Q3 net-income anchor is reported107.193. Q3's already-ended CFO is not applied again to starting cash. The reported Q3 CFO check is (129.679−6.075)+10.202+4.619+6.075−30.333−4.314−2.739=107.114; forward funding conservatively makes no SBC cash addback.

Cash/deposits begin at591.886 after Q3. Each next quarter adds cash CFO and subtracts PP&E, capitalized-development cash, lease principal, dividends, buybacks and withholding. Q2 dividend cash assumes95% of nonnegative prior-year net income; for2027, prior income is nine-month actual247.774 plus the modeled Q4 net income. One100m buyback is modeled as25m per quarter from Q4 2026 through Q3 2027, plus15.344m old-program remaining upper bound in Q4 2026. Withholding cash uses17.65% of buybacks and a separate2.677m prior unpaid proxy in Q4 2026. These are funding proxies, not current statutory tax or confirmed execution claims.

Weight each of the sixteen persistent state outcomes by the product of C/R/W/P probabilities or complements (60%/20%/45%/25%). Sum weighted product revenue, GP and expenses before deriving company OP; do not average a valuation multiple, margin or cash input in place of coherent outcomes. The model retains a100m research cash reserve; the350m reserve test fails18.199m under the AR-stock stress. The350m bond principal due in2031 is outside the modeled horizon, and is not assumed forgiven or freely refinanced.

For each current/future published ceiling quarter, apply the retained parent operator S=(company OP+Q)×P−Q−R to the four quarterly profits, sum those S values, multiply by the same ceiling-quarter multiple and FX/unit, and divide by that quarter's raw share proxy. At the retained defaults this is25×F4 OP/80.951856. There is no positive floor. The separate current-Q3 reconstruction uses reported current company OP plus the next three current/future S values and current B5/H5 controls; it does not read the frozen historical S17/H17/K17. The as-then Q3 published ceiling stays175.45696541250268.

A zero-revenue, zero-GP hybrid outcome is valid. Its displayed product margin uses IF(revenue=0,IF(GP=0,0,NA()),GP/revenue), with no eager zero-division intermediate. This zero-contribution convention is not a valuation floor; nonzero GP with zero revenue exposes an error. All future financial control tests must restore the saved model and leave historical displays intact.

Forecast outputs require valid financial input and physical-capacity constraints. Impossible capacity, share, FX or ownership inputs must show an invalid-input status and unavailable forecasts. A valid loss, cash shortfall or failed funding reserve remains an economic result: it is shown honestly and does not become an invalid assumption or a zero-floored valuation.

For a valid scenario with zero annual hybrid revenue before the nonmemory-risk removal, the selected zero-pool convention allocates zero removal to every quarter. The formula graph evaluates that branch without dividing by zero. This convention does not add a revenue, operating-profit or valuation floor: valid zero-HB outcomes and economic losses remain calculable, while invalid assumptions still produce unavailable forecasts. The published as-then Q3 historical display remains separate and unchanged.

Approved financial source extract | traceability appendix

The source extract preserves the approved function definitions for traceability. It is not a standalone executable file: its loaders and comparison-vintage descriptors are omitted. The complete current reference tables, input ledger and recurrence explanation above provide the current-model derivation without those loaders. Original source line ranges and the financial-law hash remain in the private audit.

Companion and validation scope

The linked standalone workbook passed 36 selected saved-file tests (32 valid-domain and 4 invalid-domain checks). The portable affected-context workbook passed 39 tests (35 valid-domain and 4 invalid-domain checks). Every mutation was restored and saved bytes remained unchanged. Valid tests check numeric, Boolean and declared status-text nodes separately; invalid tests require false validation and unavailable forecasts. The native portfolio package passed independent preservation checks. Its exact four-sheet affected projection then passed two fresh disk imports and all 75 selected probes, with complete restoration and unchanged native and projection bytes. Native Microsoft Excel/Office execution and import of the entire native portfolio into ArtifactTool remain unverified.

Licensed source exhibits are included only as private research material in this report.

The inherited global Master metric caption is clipped by its original header geometry, and its generic dollar-symbol quote and target formats are retained. BESI valuations are in EUR, as labeled in the owning model and current notes. The SDK renders the effective false recovery Boolean as zero; raw Boolean typing, checkbox-off semantics and True/False behavior were checked separately. The retained saved quote remains undated, and complete spoken-call coverage remains unverified.

The companion files are BESIAS_BESemiconductor_DeepDive_model.json, BESIAS_BESemiconductor_DeepDive_CalculationGraph.json.gz and BESIAS_BESemiconductor_DeepDive_FormulaModel.xlsx. Their exact hashes are recorded below. All financial values remain the approved R4 point-in-time source; the formula graph also binds the declared native valuation, live-domain, fixed-prior-comparison and zero-pool adapters.
