SK hynix

Full earnings deep dive | SKHY

Publication/update: October 28, 2026 America/Toronto. Issuer release/event: October 28, 2026 Seoul, corresponding to October 27 America/Toronto. Private research. Current results are preliminary; forecasts and undisclosed product allocations are analyst estimates.

At a glance - active Q4 2027 horizon

Measure	Common	ADS
Price ceiling	5,366,364 KRW	540.441 USD
Prospective cumulative eligible gross dividend	87,343.37 KRW	5.86418 USD at model FX
Ceiling plus separate gross dividend	5,453,708 KRW	546.305 USD
Sanctioned OP multiple	6x	9x; deliberate 50% model premium
Cash rights	1 common share	0.1 common share
Analytical score / protected Excel Base	88 /90	88 /90

Financial confidence: LOW. The current earnings strength and contracting visibility support the operating thesis, while forward prices, high margins, undisclosed HBM allocation and dated global market denominators remain material uncertainties. Price ceilings are modeled values, not promised market prices. Gross dividends require eligibility and are separate from settled after-tax cash.

Reading map: thesis and source facts; contracts, manufacturing and capacity; full financial model and valuation; dividends/cash/shares; market-share hurdles; risks and monitoring; numerical Rule 16b event bridges; independent sensitivity cases; complete source register. Each chart has its complete numerical table immediately beneath it.

Investment thesis

SK hynix supplies a scarce input to AI infrastructure: qualified high-bandwidth memory delivered at acceptable yield, power and cost. The competitive advantage combines DRAM process technology, stacking and testing, customer qualification and coordination with logic and packaging partners. Announced wafer capacity is only one component of saleable output. This supports a bottleneck thesis while leaving the company exposed to memory pricing and competitive supply. [S02, S24, S25]

The business has three complementary routes into inference: HBM beside accelerators, conventional DRAM for system working memory, and NAND/eSSDs for persistent data and cache tiers. HBM is included within DRAM; Solidigm is included within consolidated NAND. Neither should be counted again as a separate market. More memory-intensive workloads can expand revenue, but higher utilization and pooling can also reduce the bits required for a given task. Follow delivered memory content and value per workload rather than multiplying the entire AI investment budget by an assumed share. [S02, S26]

The central test is whether strong customer demand becomes recognized sales and durable operating profit after capacity, product mix, pricing, manufacturing costs and operating expense. The long-range case requires price realization and share assumptions that go beyond disclosed company guidance. It should be read with the product, market-share and execution sensitivities, rather than as a contractual earnings floor.

Current results and management guidance

Preliminary Q3 2026 consolidated revenue was KRW 104.6155 T, operating profit KRW 83.3338 T and net profit KRW 39.7756 T. Revenue and operating profit rose 32% and 38% sequentially. Operating results benefit from server DDR5, HBM4 and data-center NAND. Net income also reflects non-operating items; it is not the recurring operating-profit valuation input. The figures remain preliminary K-IFRS results. [S01]

For Q4, the company guides DRAM bit growth in the mid-20% range and NAND in the mid-single digits, including Solidigm. These are shipment bits, not revenue or ASP forecasts. The model selects 25% and 5% midpoints, then separates physical growth from prices and costs. It does not apply 25% independently to both HBM and conventional DRAM. [S02]

The operating plan raises 1c-process server DRAM production, increases DDR5 and LPDDR5 SOCAMM sales and takes M15X to full capacity by year-end. HBM4 is expected to exceed HBM3E in both HBM shipment and revenue share during Q4. The 321-layer node should exceed half of domestic NAND capacity in Q4; this is not a claim that it exceeds half of all worldwide or Solidigm capacity. 2027 HBM negotiations are finalized, but the company has not disclosed the price uplift or product gross margins. [S02]

Management expects memory demand to exceed supply through 2030. Its presentation places 2027 market achievable DRAM bit-demand growth in the mid-20% range and NAND in the high teens. This is a market outlook, not company volume guidance or an unconstrained order forecast. The associated CSP capex, secured-power and infrastructure-growth figures are explicitly market-research estimates, not direct guidance from every cloud customer. [S02]

Reported financial facts and scope

The issuer release is more precise for revenue, operating profit and net profit; supporting presentation tables are rounded in KRW billions. Consolidated totals include Solidigm. Product allocations are model estimates, not reported segment profit. [S01, S02]

Reported income statement - KRW T

Line	Q3 2026	Q2 2026	Q3 2025
Revenue	104.615	79.319	24.449
Cost of goods sold	14.963	13.327	10.420
Gross profit	89.653	65.991	14.029
SG&A	6.319	5.449	2.646
Operating profit	83.334	60.543	11.383
Net financial profit/loss	0.434	0.150	-0.103
FX transaction/translation	-11.633	1.147	0.209

Line	Q3 2026	Q2 2026	Q3 2025
Associates/joint entities	0.027	-0.020	-0.023
Other non-operating	-21.452	60.889	3.324
EBITDA	87.675	64.563	14.949
Pretax profit	50.708	122.708	14.790
Income tax expense	10.933	28.786	2.193
Net profit	39.776	93.923	12.598

Reported EPS and weighted shares

Measure	Unit	Q3 2026	Q2 2026	Q3 2025
Basic EPS	KRW	54,773	132,126	18,242
Diluted EPS	KRW	54,454	131,478	17,850
Basic weighted shares	million	722	710	690
Diluted weighted shares	million	722	712	712

Weighted EPS denominators, issued shares, record-date dividend shares and the future distributed-share valuation proxy are different measures. The preliminary note set does not fully reconcile every denominator.

Reported balance sheet - KRW T

Line	Q3 2026	Q2 2026	Q4 2025
Expanded cash	114.460	87.958	34.942
Receivables	59.116	47.821	18.199
Inventory	19.356	17.986	14.289
PP&E	97.211	88.889	77.503
Interest-bearing debt	15.800	18.587	22.248
Total assets	391.800	348.862	176.108
Equity	309.088	262.693	120.667

Expanded cash includes financial instruments/investments; it is not verified unrestricted cash-equivalents-only. The fresh deck does not supply a full lease/debt/restriction note set. The valuation adds no net cash.

Reported cash-flow bridge - KRW T

Line	Q3 2026	Q2 2026	Q3 2025
Operating cash flow	54.781	65.710	14.368
D&A	4.335	4.030	3.560
Working capital/other	10.670	-32.243	-1.789
Investing cash flow	-42.892	-28.747	-5.154
Cash PP&E acquisition	-12.670	-10.671	-5.033
Long-term financial investments	-30.845	-22.064	-0.001
Financing cash flow	10.781	-4.666	1.375
Cash dividends paid	-0.272	-1.594	-0.259
Treasury acquisition/disposal/other	10.308	0.014	0.022
FX cash effect - source table	3.831	1.332	0.303
Expanded cash change	26.502	33.628	10.892
Ending expanded cash	114.460	87.958	27.854

Q3 reported CFO is 54.781 T and cash PP&E is 12.670 T. Normalized model CFO is not an actual reconstruction. The source cash-flow waterfall shows FX3.881 T while its table shows 3.831 T; the table is used. Cash-flow D&A4.335 T and EBITDA minus precise release OP4.3412 T have a 6.2 B rounding/scope residual. Balance-sheet and cash-flow expanded-cash footnotes have different investment wording.

The deck identifies an FX-related loss of about 11.63 T and an investment-asset-related loss of 22.92 T. The reviewed sources do not attribute the entire investment loss to Kioxia or establish a complete realized/valuation/cash-tax bridge. Neither that accounting loss nor earlier investment gains are recurring memory operating profit or automatically a same-period cash flow. [S01, S02]

Contracts improve visibility without eliminating the cycle

Signed LTAs cover 14 major customers, generally run for five years and include deposits and market-reflecting price ranges. Secured volumes exceed 50% of total capacity for 2027 and 2028. The disclosed capacity measure is not an exact revenue-weighted coverage ratio for every product. Deposits improve commitment and funding visibility, but are not recognized product revenue merely because cash has been received. [S02]

Current Korean reports of management Q&A describe customer HBM requests exceeding twice available HBM supply. They also describe DRAM/HBM as effectively sold out through 2029 when secured LTAs are combined with concrete demand under discussion. Requested quantities and discussions are not the same as binding orders, a fixed price, or cash collection. The statement does not establish that all NAND output through 2029 is sold. [S03, S04]

Price bands create a trade-off. They can protect economics when merchant pricing weakens, but can limit participation when spot and contract prices rise rapidly. TrendForce specifically notes that some suppliers’Q4 price increases lag the market because of LTA mechanisms. A modeled LTA benefit therefore represents conditional avoided discounting against a defined no-LTA price path; it is not a universal contractual premium. [S13]

The selected model uses a 50% coverage proxy and an 8% conditional pricing-retention benefit, with durability probabilities of 80% in 2028, 50% in 2029 and 25% in 2030. The resulting 3.2%, 2.0% and 1.0% are coverage-weighted aggregate price levels on total modeled DRAM sales, including HBM and conventional DRAM, not successive annual growth rates. The 50% coverage is applied once and is not applied again. Coverage conversion, the benefit and probabilities are analyst assumptions. A zero-benefit case and conditional 2-10% advantage range remain necessary, with no second volume credit for demand already in the forecast.

HBM mix, stack height and accepted output

HBM4's commercial ramp and completed 2027 negotiations strengthen near-term visibility. September product demonstrations and June 12-high HBM4E samples also argue against a blanket assumption that every advanced stack is technically unworkable. Samples, exhibits and management yield claims still do not independently establish good-stack yield, accepted volume, rework or cost at scale. [S05, S06, S24, S25]

Lowering a stack from 12to 8 dies can permit more accelerator packages to be built from a limited supply of HBM bits. It does not automatically lower the selling price or manufacturing cost per bit. Every stack still requires a base die; equal bit output can require more cubes, packaging and testing. Greater per-die density can offset part of that burden. Management's reported statement that shipment plans are unchanged should be tested against actual accepted output, not turned into a universal 50% increase in backend requirements. [S03]

TrendForce's September 29 industry forecast puts 2027 blended HBMASP growth at 121% year-on-year and estimates an 8-high per-Gb premium of 10-20% over 12-high. This is a research forecast influenced by product mix and the HBM4/HBM4E ramp; it is not SK hynix's signed price schedule. It cannot be inserted mechanically as a single quarterly company price increase. The model's 80% probability of a 20% conditional 2027 uplift produces a 16% expected price level; its timing and realization are analyst assumptions, although negotiations themselves are already complete. [S12]

The official application chart labels a separate Graphics(incl. HBM) band above Server. Its Q3 band is visually in the mid-to-high teens of DRAM revenue, with roughly two percentage points of reading uncertainty; no exact HBM share is disclosed. Absent evidence of another classification, HBM must fit within that broader graphics category. The model selects HBM at 12% of DRAM revenue, with an 8-15% sensitivity range, leaving a positive conventional graphics component. This is a chart-constrained proxy, not an issuer-reported segment. [S02]

With DRAM at 75% of consolidated revenue, the selected allocation is 9% HBM, 66% conventional DRAM, 24% NAND and 1% other. The assumed 3× HBM price per bit implies a 4.347826% HBM share of DRAM bits. At 40% HBM bit growth, conventional DRAM growth must be 24.31818% to reproduce the combined 25% Q4 midpoint. The arithmetic reconciles shipment bits, but does not prove wafer, base-die, TSV, packaging or test capacity.

The 8-high branch uses a 15% conditional per-Gb price premium within the research range, 60% adoption probability and 40% net-new exposure after overlap. On 50% exposure in 2027-28, this adds a 1.8% HBM price level. Additional backend cash cost is modeled separately, not assumed away. These weights and the cost allocation are analyst estimates. The branch must not duplicate the broader HBM repricing or acceptance-risk case.

A 20% subjective probability is assigned to a CY2027 commercial execution shortfall, with a 7.5% conditional net reduction in accepted HBM sales and 5-10% severity sensitivity. The endpoint is net of product substitution. The model retains D&A and unavoidable manufacturing and operating burdens, avoids only half of eligible cash manufacturing cost and allocated operating expense attached to missed sales, and includes rework. Removing the specified event in 2028 is a timing assumption, not evidence that future execution risk disappears; no catch-up revenue is added.

Product gross margins, cost splits and depreciation allocations are analyst estimates calibrated to consolidated results. Depreciation is allocated in proportion to the anchor manufacturing COGS of HBM, conventional DRAM and NAND: about 11.33%, 60.23% and 28.44%, with zero allocated to Other. The acceptance branch avoids only eligible cash manufacturing cost and operating expense. It does not avoid D&A or other non-cash manufacturing charges when accepted sales are lost. No reported product gross profit or asset allocation is implied.

Inference broadens the memory hierarchy

AI-serving systems place data across HBM, DRAM and SSD according to latency, capacity, reuse and cost. The company's OCP demonstrations include CXL pooled DRAM, hybrid DRAM/SSD cache management and computational memory. Its NAVER Cloud work is described at proof-of-concept level, and HBF performance comparisons use internal simulations. These are credible product directions, not disclosed orders or a new stand-alone revenue pool. [S26]

The NAND opportunity includes high-capacity QLC eSSDs and lower-latency tiers. The reported Q&A describes SALT-KV placement software and CXL hybridmemory that keeps the full KV cache on SSD while prefetching useful data into DRAM. This supports a system-level value proposition. Actual monetization depends on customer qualification, software integration, SSD endurance, delivered performance and total cost; theoretical cache capacity is not automatically purchased NAND. [S08]

The selected NANDASP changes are 20% in Q4 2026 and 15% in Q1 2027. They apply once in their specified quarters. The Q4 selection is at the top of TrendForce's 15-20% contract-price range; company realization can differ by contract, product and recognition date. Solidigm is already included. Later incremental AI-storage demand is heavily overlap-adjusted and remains an analyst scenario rather than an announced shipment forecast. [S13]

Optical interconnects, pooled LPDDR, CXL and near-memory computing can alter the mix of local HBM, system DRAM and storage. They can expand aggregate memory use while reducing a particular product's attachment or pricing power. A link demonstration does not establish comparable application latency, utilization, power or complete memory-system cost. Evaluate named customer cohorts and net displaced/recovered sales before assigning company dollars; do not treat each architectural route as an independent additive TAM.

Capacity is a sequence of economic milestones

M15X and advanced-node migration support the near-term volume ramp, while Yongin and other infrastructure expand the longer-term opportunity. Capex is not a physical shipment unit. A shell, cleanroom, installed tool, qualified process and accepted customer shipment are separate milestones, with different cash and depreciation consequences. Faster process migration can improve bits per wafer while introducing yield and cost risk. [S02, S07]

The announced Indiana project illustrates the timing distinction: the cleanroom is scheduled for October 2028 and mass production for the second half of 2029. It packages and tests wafers produced in Korea. It cannot supply the model's Q4 2027-Q3 2028 earnings window, and packaging an existing wafer is not a second chip sale. The schedule is a company plan, not a completed milestone. [S23]

Customer LTAs can support investment discipline, but competitors also respond to high returns. Samsung and Micron can improve qualification, yields and product mix; NAND suppliers can migrate to higher layers, and Chinese suppliers can alter lower-end supply and price competition. The relevant cycle indicators are accepted good output, inventory, negotiated prices and customer absorption. Building announcements alone establish neither immediate oversupply nor permanent scarcity. [S16, S17]

The model’s 2027 DRAM bit growth is about 8.11% from Q4 to Q4, while NAND grows about 17.9% on that basis. These rates differ from the presentation’s calendar-year market demand outlook. Price, mix and the starting-quarter level carry much of the revenue growth. The capacity review must test both physical supply and earnings sensitivity to pricing; strong demand is not a complete production bridge.

Competition and lessons across the research universe

HBM leadership must be judged against good-stack cost and accepted customer supply. SK hynix’s TSMC coordination and packaging experience can protect qualification and time to volume, while rival process improvements, alternative base-die arrangements and successful customer qualification can erode the premium. An award or product exhibit is evidence of collaboration, not a perpetual market share. [S24]

Advanced MR-MUF samples and 12-high demonstrations make universal technical-failure claims too strong. They do not dismiss interface, thermal, mechanical and reliability constraints. Likewise, lowering stack height changes package economics but does not lengthen the bit interval at an unchanged signaling rate. The economic test is accepted performance and cost under customer workloads, not a single product specification. [S24, S25]

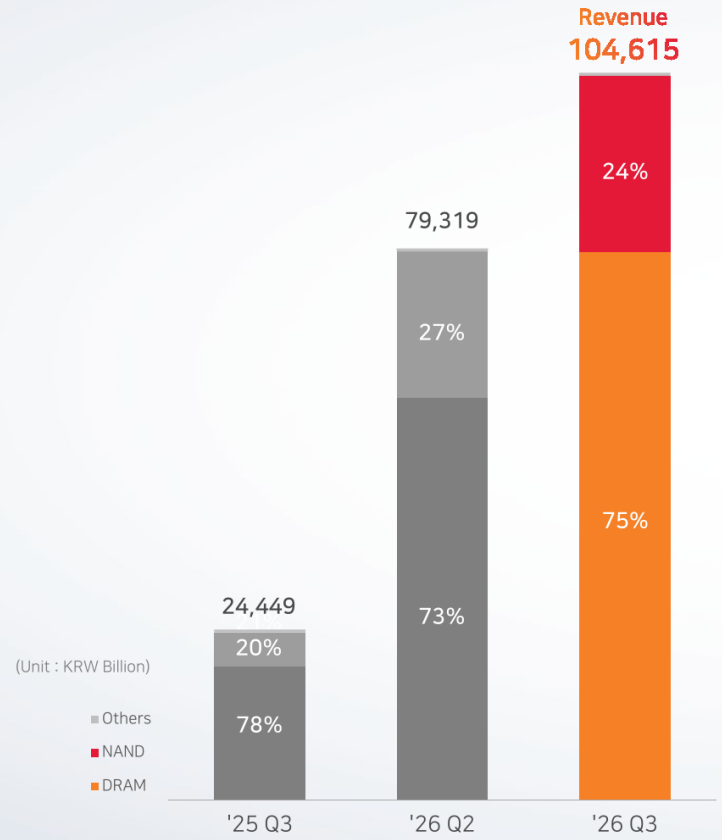

Samsung and Micron share the HBM/server-DRAM opportunity but have different qualifications, product mix and pricing realization. SanDisk and Kioxia share NAND pricing and enterprise-storage demand but differ in contracts, wafer economics and customer exposure. No company’s price collar, deposit provision or margin is imported into another issuer merely because the macro thesis is shared.

Packaging, test and equipment suppliers can benefit from more complex memory production, subject to their own design wins and installation dates. A move to more cubes per bit can raise backend demand without raising memory bit shipments by the same percentage. Optical links and pooled memory can shift where memory value is captured rather than destroying or duplicating all memory revenue. These are cross-book research implications, not automatic changes to other companies’ models.

Appendix

SK hynix

Revenue by Application

* NAND Revenue by application is based on USD revenue including Solidigm

We Do Technology

Official Q3 presentation p 17. Graphics (including HBM) is separate from Server. Its band is visually about 16% +/-2 points of DRAM; exact HBM share is undisclosed. Selected HBM12%, sensitivity 8-15%, is an analyst proxy. [S02]

Application-chart bound versus model proxy

Item	Value / status
Graphics including HBM	Approximately 14-18% of DRAM, visually estimated
Selected HBM share	12% of DRAM; analyst proxy
HBM sensitivity	8-15% of DRAM
HBM issuer revenue share	9%=75% DRAM x 12%
Conventional DRAM issuer share	66%=75% DRAM x 88%

Self-contained operating derivations

The anchor is Q3 2026. All quantities below are estimates except the explicitly identified consolidated preliminary results and guidance. Physical bits, ASP and unit costs are independent indices. An ASP rise therefore does not create wafer capacity or reduce manufacturing costs automatically.

Anchor product derivation

Product	Revenue T	GM proxy	COGS T	D&A T	Cash COGS T
HBM	9.415	83.00%	1.601	0.491	1.109
Conventional DRAM	69.046	87.68%	8.508	2.611	5.897
NAND	25.108	84.00%	4.017	1.233	2.784
Other	1.046	20.00%	0.837	0.000	0.837

Operating equations and units

Step	Derivation / scope
Revenue allocation	HBM =104.6155 x 75% x 12%=9.415395 T; conventional DRAM=104.6155 x 75% x 88%=69.046230 T; NAND=104.6155 x 24%; other=1%.
Chart constraint	Graphics (including HBM) is approximately 16% +/-2 percentage points of DRAM in the source application bar; HBM is a subset. The selected 12% is not a disclosed exact HBM share. Sensitivities 8-15% retain a positive graphics-memory residual.
HBM bit share	(0.12/3) / (0.12/3+0.88)=0.04347826. The 3x per-bit price ratio is a proxy; product revenue share is not bit share.
Q4 DRAM bits	25%=0.04347826 x 40% +0.95652174 x 24.31818%. The combined 25% midpoint reflects mid-20% guidance; the HBM split is selected.
Conventional margin	(89.653 -9.415395 x 83% -25.107720 x 84% -1.046155 x 20%) /69.046230 =87.678221%. This is a residual model GM, not reported segment margin.
D&A weights	Hardware COGS weight = product anchor COGS / sum of HBM, conventional DRAM and NAND COGS. Other receives zero. D&A allocation changes with the mix calibration. Cash COGS=manufacturing COGS minus allocated D&A.

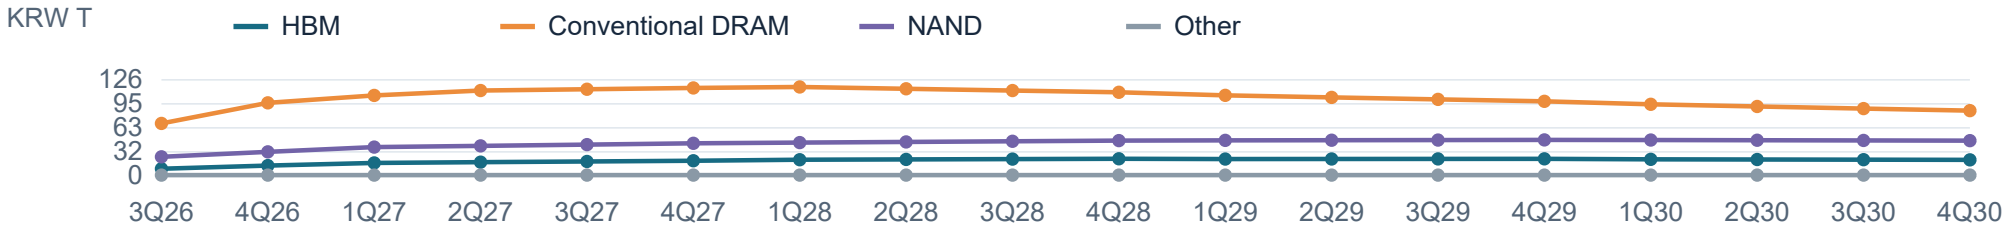

Step	Derivation / scope
Revenue before acceptance risk	Product anchor revenue x cumulative delivered-bit index x cumulative ASP index x applicable LTA level x applicable stack-price level. NAND delivered bits additionally include the incremental storage level. Other remains indexed 1.
Manufacturing cost before risk	Anchor cash COGS x [60% x delivered bits x unit-cost index +40% x 1.02^quarter index] x HBM stack-cost level when applicable + allocated current D&A + allocated new-fab cash cost. Fixed cost and D&A persist when acceptance risk reduces deliveries.
D&A schedule	Legacy 4.335 T x max(0,1-quarter index/20), plus new equipment capex 75% /20 quarters and facilities capex 25% /80 quarters. Depreciation starts after a 2-quarter commissioning lag. These are modeled useful lives and commissioning proxies.
Operating expense	Anchor 6.3192 T x [60% x 1.03^quarter index +40% x reference revenue/104.6155] +3% x positive incremental reference GP above 89.653 T. Product opex is allocated by reference revenue; acceptance-risk avoidable opex is then deducted.
HBM acceptance risk	2027 probability 20% x net conditional lost HBM sales 7.5%. Only 50% of proportional ex-D&A manufacturing cost and allocated opex is avoidable. Add rework 2% of conditional lost sales. All D&A remains. No catch-up sales; risk expires after 2027 by assumption.
Gross/operating profit	GP=revenue -manufacturing COGS; OP=GP -opex. Product sums reconcile exactly to consolidated modeled amounts before display rounding.
Cash conversion	Cash tax=25% of positive OP; working capital=15% of revenue. CFO=OP -cash tax +D&A -change in working capital. FCF=CFO -cash capex. This normalized bridge is not the reported statutory cash-flow statement.

Price, overlap and cycle overlays

Input	Selected law / timing
HBM 2027 ASP	80% realization x 20% conditional increment=16% Q1 2027 ASP increase, applied once; no second industry 121% uplift.
Conventional DRAM ASP	80% realization x 15%=12% in Q4 2026; in 2027,80% x[10%,5%,0%,0%] gives[8%,4%,0%,0%] quarter changes, compounded in the ASP index.
Owner NAND scenario	Q4 2026 ASP+20%, Q1 2027+15%, each once; neither is an extra storage/AI revenue pool.
8-high stack economics	60% probability x 40% non-overlap x 50% exposure x 15% per-Gb premium =1.8% HBM price level in 2027-28. Cash cost uplift=60% x 40% x 50% x 20% backend fraction x 50% more cubes=1.2%;2029 exposure halves;2030 zero.
LTA durability	50% coverage x 8% conditional advantage x[80%,50%,25%] durability gives aggregate DRAM price levels+3.2%,+2%,+1% in 2028/29/30. Applies to total modeled DRAM; coverage is included once. Levels are not successive annual growth rates.
Additional AI NAND	50% probability x 25% non-overlap x[2%,4%,6%] conditional bit levels yields+.25%,+.50%,+.75% extra delivered NAND bits in 2028/29/30, with variable cost and opex.
Normalization	All subsequent quarterly price, bit, unit-cost and capex changes are shown in the complete driver tables. Level overlays must not be compounded again.

Quarterly product and consolidated operating model

All product allocations, product gross profit and operating expenses are MODEL estimates. Q3 2026 consolidated revenue/GP/OP are calibrated to preliminary reported totals; this does not make the product split reported. Every future quarter is a forecast. Amounts are KRW trillions.

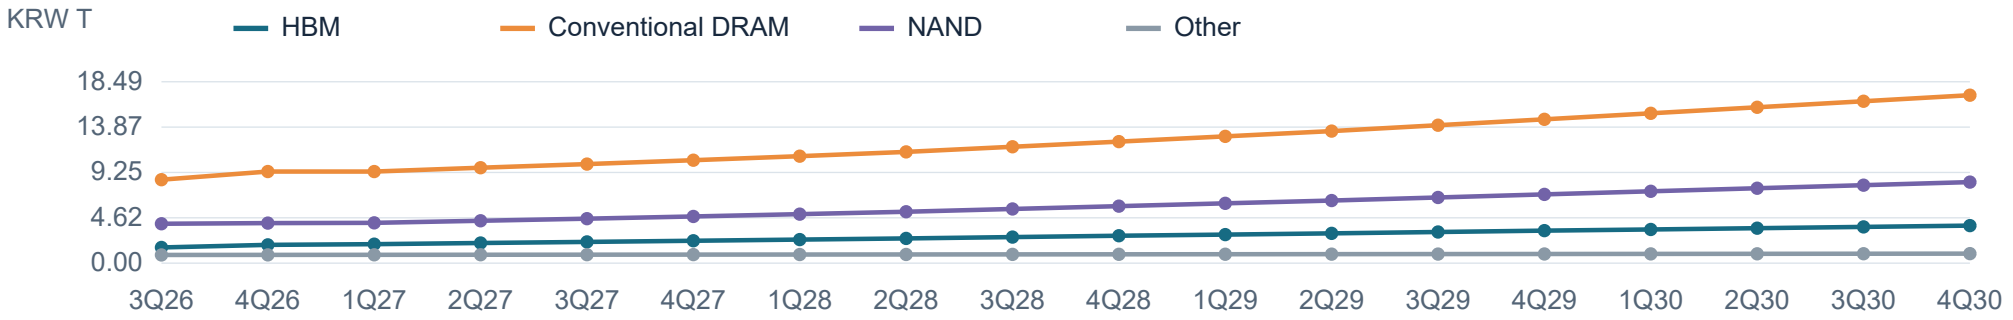

Modeled product revenue. Full values are directly below; no reported product margin is implied.

Product revenue - complete values

Quarter	HBM	Conventional DRAM	NAND	Other
Q3 2026	9.415	69.046	25.108	1.046
Q4 2026	13.577	96.137	31.636	1.046
Q1 2027	17.056	105.905	37.909	1.046

Physical, price, cost and capacity drivers

Shipment bits, selling prices and cash unit costs enter independently. The complete tables below show quarterly changes and cumulative indices from the Q3 2026 anchor; combined Q4 DRAM guidance constrains the first physical growth step, while product allocation and subsequent paths remain analyst estimates.

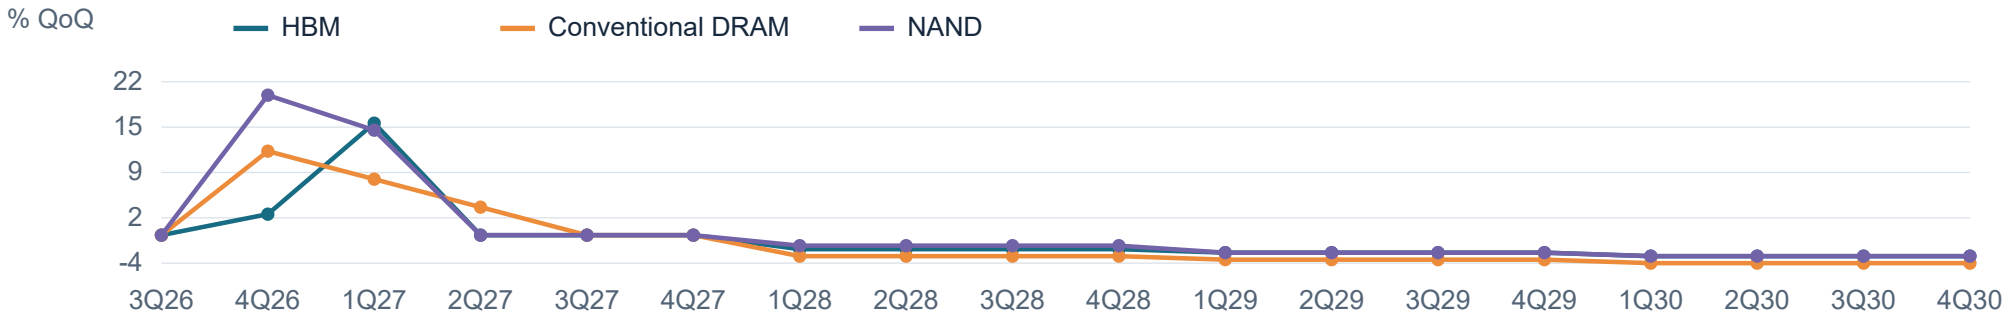

Quarterly bit growth; Q3 is zero by calibration. Company guidance and model assumptions are distinguished in the text.

The price ceiling uses each displayed quarter and the following three quarters, not the preceding four quarters. Four-quarter OP is multiplied by the sanctioned quarterly multiple and divided by that valuation quarter's distributed-share proxy. No cash balance is added. The Q3 2026 reconstruction is an input bridge, separate from immutable historical Excel displays; it is excluded from this current/future ceiling schedule.

Forward-four-quarter operating profit

Fourteen complete windows, Q4 2026 through Q1 2030. The last three modeled quarters lack a complete four-quarter window and have no invented ceiling.

Common price = F4 OP in KRW T x multiple / shares in millions x 1,000,000. ADS price = F4 OP x ADS multiple / shares M x 1,000,000 x 0.1 / 1,489.44. Fixed model FX is not a prediction of the future exchange rate.

Active horizon exact derivation

Measure	Value	Unit / definition
Horizon	Q4 2027	OP window Q4 2027-Q3 2028
F4 OP	602.768963	KRW T
Distributed-share proxy	673.941180	million common
Common multiple	6.000000	x F4 OP
Common ceiling	5,366,364.133024	KRW/common
ADS multiple	9.000000	x F4 OP
ADS ceiling	540.441119	USD/ADS
Common-equivalent ADS ceiling	360.294079	USD/ADS at 6x
ADS multiple premium	0.500000	fraction; deliberate owner model convention
Common shares represented per ADS	0.100000	same proportionate issuer cash rights
Fixed model FX	1,489.440000	KRW/USD

The ADS uses a deliberately owner-sanctioned 9x multiple at the active horizon versus 6x for common shares: a 50% model premium. It is not extra issuer profit or 50% more dividend. One ADS represents 0.1 common share. At the common 6x convention the economically equivalent ADS diagnostic is USD 360.294079. The core ADS ceiling retains the sanctioned 9x convention. Liquidity, currency conversion, depositary terms and market pricing can prevent realization of this premium.

Capital allocation, dividends and the two listings

The company discontinued its review of a Solidigm IPO after considering financial-market conditions and the expected outcome. This is not an announced IPO cash inflow. Solidigm remains within the operating NAND exposure. The decision also makes the balance between internal investment, liquidity and shareholder distributions central to the cash analysis. [S01]

For FY2026, management plans approximately KRW 100 T of shareholder returns, including cash dividends of at least KRW 30 T and share acquisition/cancellation of at least KRW 60 T. These are announced plans and approximate/minimum amounts, not an exact algebraic split. Its stated principles link dividends to operating performance, investment gains to additional special dividends, and repurchases to quarterly board decisions. [S01, S02]

The declared Q3 dividend is KRW 20,000 per common share: KRW 10,000 earnings-based and KRW 10,000 Kioxia special. The Korean record date is November 30, 2026; payment is within one month, expected in December 2026, with no exact day announced. A new common-share buyer can qualify through settled ownership at the future cutoff; ownership during Q3 is not required. The declaration does not establish a perpetual KRW 20,000 quarterly payment. [S19, S02]

The new acquisition decision estimates 14.92 M common shares for KRW 20.00772 T, to be purchased from October 29, 2026 through January 28, 2027. Its quantity uses the October 27 close of KRW 1,341,000 and can change with execution prices. Approximately KRW 10 T is for shareholder value and approximately KRW 10 T for

employee stock compensation; compensation allocation can change. Estimated purchases, acquired treasury shares and completed cancellation are different stages. [S20]

For future quarters, the owner scenario sets the ordinary cash-dividend pool at 7.05173324/83.3338 of positive quarterly operating profit, or about 8.462%, and the shareholder-cancellation buyback budget at 10/83.3338, or about 12.000%. The buyback budget therefore scales with earnings; it is not a fixed KRW 10 T every quarter. Employee-compensation purchases remain separate. Future unannounced Kioxia specials are zero in this scenario; the current declared KRW 20,000 is included once if the holder qualifies.

Future programme cash is assigned 70% to the following quarter and 30% to the second quarter; 90% probability-weighted retirement occurs in that second quarter. Execution prices start from the current filing's KRW 1,341,000 reference and then rise 10% quarterly as an independent model proxy. These are analyst timing, execution and completion assumptions, not new board resolutions or a price guarantee. Cash spending and legal retirement are not the same event.

The company discusses sharing Kioxia gains through both Q3 and FY2026 year-end specials. Only the current amount is declared. Excluding unannounced future specials is the owner scenario, rather than a claim that the company has withdrawn its year-end plan. The current KRW 14.10346648 T cash total consists of KRW 7.05173324 T ordinary and the same special amount at 705.173324 M decision-date eligible common shares; the actual aggregate can change by the record date. [S02, S19]

The FY2025-27 policy footnote references fixed annual DPS of KRW 1,500 and additional returns over 50% of three-year cumulative FCF after financial goals are achieved. That is different from a guaranteed annual 50% cash-dividend payout. The future ratio scenario is anchored to operating profit because current net income includes non-operating items; it is not an announced statutory payout formula. Declared cash, projected ordinary cash and uncertain payment timing remain separate. [S02]

Both listings represent the same operating business. One SKHY ADS represents 0.1 common share. The sanctioned price ceilings use separate common and ADS forward-operating-profit multiple schedules and fixed model FX; the wrapper does not create additional earnings. A separate prospective gross-return display may add eligible dividends to the terminal share price without reinvestment. Cancellation spending is not added again as cash to an individual shareholder.

The captured Citi page lists the prior ADS distribution but no current Q3 ADS notice. New ADS record, ex-dividend and payment dates, conversion FX, fees and withholding remain unverified. KRW 2,000 per ADS is the unconverted gross ratio of the declared common dividend, not a promised USD net payment. Actual personal entitlement has not been established by portfolio status alone. [S21]

The forward cash bridge is a normalized funding diagnostic, not a full statutory cash-flow or balance-sheet forecast. Taxes, working capital, capex and payment dates remain modeled where undisclosed. The 50% FCF comparison is a policy comparator; its shortfall is not an additional distribution, automatic cancellation, or extra operating profit. The price-ceiling method adds no balance-sheet cash credit.

Share-price ceiling and prospective gross cash income

At Q4 2027, the model prices operating profit from Q4 2027 through Q3 2028. Forward-four-quarter OP is KRW 602.768963 T and the probability-weighted distributed-share denominator is 673.941180 M. Applying 6× for the common and 9× for the ADS, with 0.1 common share per ADS and fixed KRW 1,489.44/USD, gives price ceilings of KRW 5,366,364.13 per common share and USD 540.441119 per ADS. These are model values, not company guidance or current quotations.

The separate prospective cash display includes modeled cumulative eligible gross DPS of KRW 87,343.3731 through Q4 2027, including the current declared dividend once under assumed eligibility. The corresponding ADS amount is USD 5.864175 at model FX. Adding those amounts to the price ceilings gives gross shareholder values of KRW 5,453,707.51 per common share and USD 546.305294 per ADS, without reinvestment. These conditional gross values are not verified cash receipts or net-of-tax returns.

The Korean current record date and current ADS distribution terms must be verified for each holding. Future dividend payment quarters are proxies. An accrued entitlement and its later cash payment cannot both be counted, and buyback cash is not a second personal distribution when the share denominator already reflects retirement. The prospective display adds no additional operating gains or cash balance to the sanctioned price ceiling. [S19, S21]

The sanctioned ADS 9× multiple carries a deliberate 50% owner-model premium over the common 6× multiple. At the common 6× multiple, the same issuer earnings and 0.1 share ratio give an ADS diagnostic of USD 360.294079; the owner 9× ceiling remains USD 540.441119. The premium does not create additional issuer profit or 50% more dividends. The two wrappers have proportionate underlying cash rights, subject to conversion, fees, withholding and eligibility.

Capital allocation, cash funding and per-share income

Source declarations and owner scenarios are separate. The current ordinary dividend is KRW 10,000 and the known special is KRW 10,000, total KRW 20,000 once if eligible. The source common record date is November 30, 2026; payment is within one month, expected December, with the exact day unannounced. An actual holding and settlement record is needed to establish entitlement. The new ADS distribution dates, conversion, fees and withholding are not confirmed; net ADS receipts remain unknown. [S02]

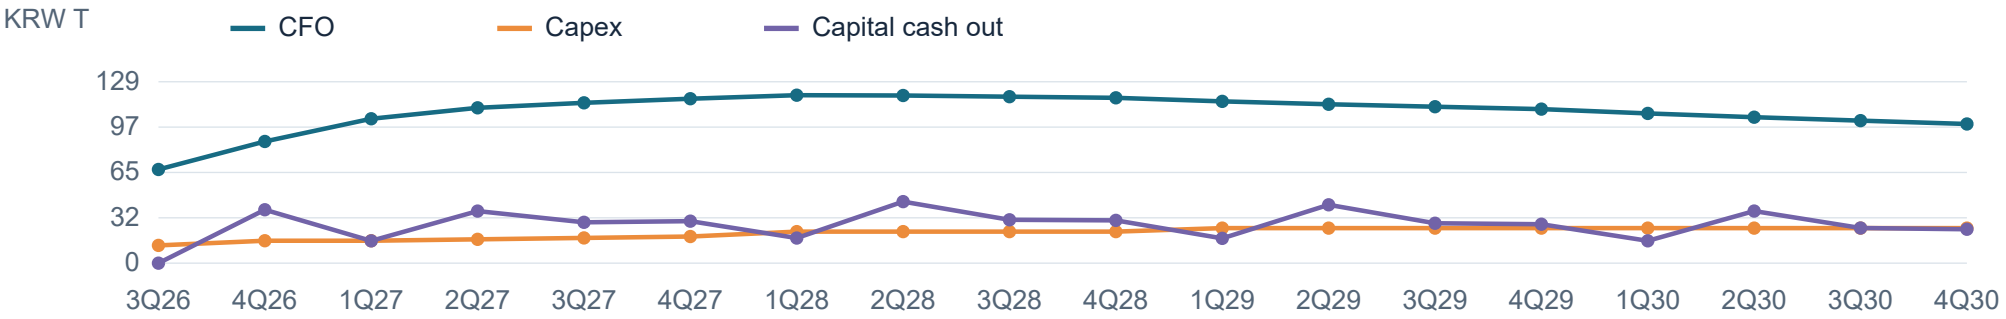

Source capital facts and distinct share measures

Measure	Value	Unit / status
Issued common shares	730.492365	million; source register
Treasury shares at October 26	25.319041	million; do not treat all as cancelled
Declared eligible shares	705.173324	million; decision-date aggregate basis
Declared ordinary pool	7.051733	KRW T =10,000 x 705.173324 M /1,000,000
Declared ordinary plus special pool	14.103466	KRW T; may change by record date
Prior acquired shares to cancel	23.693272	million; scheduled November 5, 2026
Prior acquisition cost	40.004339	KRW T; already purchased, remaining settlement separately modeled
New estimated acquisition	14.920000	million common; not actual executed shares
New estimated cash budget	20.007720	KRW T =14.92 M x 1,341,000 /1,000,000
New reference acquisition price	1,341,000.000000	KRW; October 27 close, not future execution guarantee
New acquisition window	October 29, 2026-January 28, 2027	announced acquisition period
Shareholder cancellation leg	10.000000	KRW T approximately; only this leg gets retirement credit
Compensation leg	10.007720	KRW T modeled residual; cash outflow, no cancellation credit

Owner scenario capital laws

Step	Definition / derivation
Recurring ordinary ratio	7.05173324 T /83.3338 T OP=8.4620325%. Future ordinary cash pool =this ratio x positive earning-quarter OP. Not a fixed board promise.
Recurring shareholder-repurchase ratio	10 T /83.3338 T OP=11.9999328%. Future programme budget =this ratio x positive earning-quarter OP, not a fixed 10 T every quarter. Employee compensation is excluded.
Future ordinary payment	Q4 earning-quarter pool pays after two quarters; other quarter pools after one. Future DPS =cash pool paid / modeled payment-quarter distributed shares M x 1,000,000. This is not a forecast of the record-date register.
New programme cash	Current estimated 20.00772 T splits 70% Q4 2026/30% Q1 2027 as a timing proxy. Only 10 T is the current cancellation budget; compensation is a separate cash component.
Future programme cash and retirement	Each earnings-quarter future budget pays 70% next quarter/30% the following quarter. Expected retirement occurs two quarters after earnings and equals 90% x budget / execution price x 1,000,000 in millions. Cash budget is spent in full even when expected cancellation is below 100%.
Execution-price proxy	Current reference 1,341,000 KRW; future programme price=1,341,000 x 1.10^quarter index. It is independent of the valuation ceiling. More expensive execution retires fewer shares.
Distributed-share denominator	730.492365 M minus 99% x 23.693272 M prior scheduled cancellation from Q4 2026, minus 90% x(10 T /1,341,000 x 1,000,000) current new cancellation from Q1 2027, minus completed expected future programme retirements. Treasury is not subtracted twice.
Dividend nonduplication	Declared current 20,000 DPS counts once if eligible. All future unannounced Kioxia special DPS=0. The ordinary Q3 source pool is not paid again on top of the declared 20,000.
Cash waterfall	Capital cash outflow=ordinary cash paid +current declared dividend cash +prior programme settlement +new cancellation cash +recurring repurchase cash +compensation cash. Ending expanded-cash proxy=prior cash +FCF -capital cash outflow.
Policy comparator	Issuer policy references 50% of cumulative FY2025-27 FCF, subject to financial goals. The model's quarterly 50% FCF column is a comparison only, not an annual dividend floor or extra cash spend. No automatic residual cancellation is assumed.
Gross shareholder value	Price ceiling plus cumulative gross eligible DPS from now, without reinvestment. ADS gross dividend =common gross DPS x 0.1 /1,489.44 at model FX. Gross modeled entitlement is separate from settled net receipts.

Normalized funding bridge

Modeled cash conversion; not a statutory cash-flow forecast. Q3 reconstructed normalized CFO is different from reported actual CFO.

Funding stress - additional hypothetical reserve

Diagnostic	KRW T
Additional reserve	100.000
Minimum remaining expanded-cash proxy	47.168
Minimum remaining net-cash proxy	31.368

The reserve test is a normalized funding-headroom calculation, not an actual available balance, a board allocation or an extra valuation benefit.

The market opportunity and the required share hurdle

The available annual market estimates are forecasts with materially different vintages. TrendForce's May forecast has 2027 DRAM revenue of USD 903.3 B and NAND of USD 379.4 B, totaling USD 1,282.7 B. Gartner's August forecast has USD 1,075.5 B for broader memory. A newer October TrendForce supplier report exists, but its full numerical tables are not available in the reviewed public summary. The September HBM pricing revision is a reason to treat the May denominator cautiously, not to invent an updated market size. [S14, S15, S18]

The selected 2027 company revenue case is KRW 687.71 T, with operating profit of KRW 577.18 T. At the fixed valuation convention of KRW 1,489.44 per USD, revenue translates to USD 461.73 B; this is an illustration, not a forecast of the global market's exchange rate. Combined DRAM revenue is KRW 522.07 T, or USD 350.51 B, and NAND is KRW 161.46 T, or USD 108.40 B. Against the May denominators, these imply about 38.80% of DRAM and 28.57% of NAND.

For context, TrendForce's Q2 actual-quarter estimates put SK hynix at 24.9% of branded DRAM and SK hynix Group, including Solidigm, at 18.2% of NAND. The NAND table's USD 68.8702 B is only the top-five total, representing 87.6% of its wider market; it is not the whole NAND denominator. Annual future shares can differ from a single observed quarter, but a large gain requires an explicit product, price and capacity explanation. [S16, S17]

Holding the Q2 shares constant, the modeled company revenues would require 2027 global DRAM revenue around USD 1,407.7 B and NAND around USD 595.6 B-roughly 55.8% and 57.0% above the May forecasts. The case therefore requires larger sector revenue, meaningful company share gains, or lower company realization. Current public evidence does not identify which combination will occur. Confidence in long-range company capture is LOW; the vintage, share and physical-output counter-tests remain central.

Do not add HBM to DRAM market revenue a second time, sum capital spending with component sales, or count the same KV-cache data separately across memory tiers. Physical AI, sovereign demand and future HBF/CXL products are routes to memory consumption, not separate dollar markets that can be added without customer and

timing bridges.

Independent market-size plausibility: four denominator cases

HBM is included inside DRAM and Solidigm inside consolidated NAND. They are not extra market pools. Supplier revenue translated at fixed model FX is compared with dated industry denominators only as a plausibility diagnostic. The denominator vintages and scope differ; they do not support a precise current market-share forecast. The model requires a larger sector, substantial share capture, or both. Confidence in this hurdle is LOW.

Four market-denominator cases - USD B

Case	Denominator / required market	Company numerator	Implied share / hurdle	Scope and vintage
1. TrendForce DRAM	903.300	350.513	38.80%	May 2026 forecast for 2027; HBM inside DRAM
2. TrendForce NAND	379.400	108.403	28.57%	May 2026 forecast for 2027; Solidigm included once
3. Gartner all memory	1,075.500	461.725	42.93%	August 2026 forecast for 2027; whole-company numerator includes small other business
4a. Constant Q2 DRAM share	1,407.682	350.513	24.9% held; 55.84% above older DRAM market	Required 2027 sector at source Q2 supplier share, not a fresh sector forecast
4b. Constant Q2 NAND share	595.621	108.403	18.2% held; 56.99% above older NAND market	Required 2027 sector at source Q2 supplier share, not a fresh sector forecast

The sum of the older TrendForce 2027 DRAM and NAND forecasts is USD 1,282.7 B. Whole-company modeled revenue USD 461.725 B is approximately 36.00% of that sum, with small other-business and FX scope caveats. The Q2 top-five NAND total of USD 68.8702 B represents 87.6% of that market, not the whole industry. No current October whole-market denominator has been invented.

September industry research projected a 121% year-on-year blended HBM ASP increase for 2027, affected by HBM4 packaging and negotiated pricing. This is neither a 121% per-bit increase for every Hynix product nor company guidance. Lower 8-high stacks were associated with 10-20% higher per-Gb pricing and more base-die/backend work per bit. Those effects are overlap-adjusted in the model; the industry forecast is not applied again. [S12, S13]

A falsification would be a combination of realized ASPs below the selected path, weaker accepted bit shipments, rising cash unit costs, or industry revenue that cannot support the required company share. The latest full-industry revenue denominator, signed contract economics and output accepted by customers matter more than multiplying announced wafer starts by aspirational selling prices.

Risks and falsification

Prices and the cycle

High utilization and scarce supply can coexist with slowing ASP gains, mix dilution or weak consumer demand. LTAs can protect a downturn while limiting upside. Failure signal: realized company prices or product profitability lag the selected curve even as headline industry demand remains strong. [S13]

HBM execution

Yield, stack reliability, base-die supply, packaging/test throughput and customer qualification jointly determine accepted output. Failure signal: the HBM4 crossover slips, rework rises, shipments are delayed, or customer acceptance falls. Strong demonstrations reduce blanket-failure concerns but do not provide measured good-stack cost. [S02, S03, S06, S25]

Competitive supply and market share

Rival qualification and cost improvement can narrow the premium before the overall market peaks. A company case implying about 38.8% of DRAM revenue against an older annual market forecast requires evidence beyond scarcity. Failure signal: accepted capacity grows but company share or realized value per bit fails to support the implied capture. [S16]

Customers and contract enforceability

Fourteen counterparties do not remove common exposure to cloud monetization, financing and infrastructure constraints. Signed terms, minimum purchases, deposits, delivery conditions, cancellation remedies and discussed demand must be distinguished. Failure signal: renegotiations, deferred deliveries, unused capacity commitments or weaker customer funding. [S02, S04, S07]

Capacity, capex and cash

Infrastructure outlays can precede good-unit output by years. Node migration, commissioning and advanced packaging can consume cash before revenue and increase depreciation later. Failure signal: cash payments, capex intensity and working capital exceed the modeled funding bridge without matching qualified output. [S02, S23]

NAND and architecture substitution

Storage demand can rise while customer efficiency, pooling and cache reuse reduce unit content or shift value between memory tiers. New NAND supply and lower-end competition can pressure the price path. Failure signal: platform adoption, realized ASP, endurance or customer TCO fails to support the projected high-value mix. [S08, S17, S26]

Capital-return execution and dilution

Announced acquisition is not completed retirement. Actual prices change the shares purchased; compensation shares can return to circulation. The ordinary-dividend and buyback ratios are owner scenarios, not fixed future board decisions. Failure signal: a smaller cancellation leg, a longer retirement lag, compensation distribution or cash needs cause the denominator or dividend case to miss. [S19, S20]

Non-operating income and balance-sheet attribution

Investment valuation and realized disposal gains, FX, taxes and other non-operating items can dominate net income without establishing recurring memory operating profit. Failure signal: an investment-related residual is relabeled as product earnings, or a realized gain funds both a dividend and an additional undiscounted cash-value credit. [S01]

Geography, currency and market access

The common share earns and distributes in a different currency from the ADS quotation. Export controls, regional manufacturing exposure, customer concentration and funding conditions can alter the operating path. Fixed valuation FX is an owner convention, not protection against actual currency movement. Wrapper fees, conversion restrictions and listing premiums can change shareholder outcomes.

Decision triggers

Monitoring tests

Checkpoint	Supporting evidence	Failure signal
Q4 volume and product mix	DRAM and NAND bits land within guidance; HBM4 exceeds HBM3E in both shipment and revenue share.	Missed accepted output, slower 1c-process/M15X ramp or a crossover explained only by lower HBM3E shipments.
2027 HBM economics	Customer deliveries and price realization demonstrate profitable negotiated terms after backend costs.	Price uplift is absorbed by more cubes per bit, rework, base-die/test constraints or customer concessions.
LTA demand quality	Disclosed signed coverage, deposits and customer performance support actual deliveries.	Discussed 2029 demand is repeatedly presented as fully binding, or price bands restrict upside more than expected.
Company capture versus market	Updated market data and company sales reconcile a defensible DRAM/NAND share path on matched scope and currency.	The case requires ever-rising share without output, product or pricing evidence, or uses top-five NAND sum as the whole market.
NAND realization	Product ASP and accepted bits support the selected Q4 and Q1 price steps; high-value storage earns incremental margin.	Consumer elasticity, contract timing, inventory or added costs prevent transmission to operating profit.
Capital returns	Declared dividend notices, acquired shares and cancellation filings reconcile to cash, eligibility and the share schedule.	Compensation purchases are counted as retirement, an estimate is treated as completed execution, or a special dividend is assumed to recur.
Longer-term architecture	Named customer systems move from samples/PoC s to qualified deployments with measurable net economics.	Demos or internal simulations are repeatedly treated as production orders; pooling changes product mix without a net issuer bridge.

Capital returns sources: S19, S20, S21

Longer-term architecture sources: S24, S25, S26

Management-call and evidence completeness

The current review includes the official Q3 release and full presentation asset, nine preserved Korean reports of specific management Q&A, and newly available long publisher excerpts. Full Q3 transcript listings now exist, but complete main-text retrieval was unsuccessful; the full official replay audio has not been listened to or transcribed. The exact linked Korean script returned 404. Selected reports and excerpts do not establish full Q3 call coverage, so omitted qualifications and Q&A remain a material source gap. [S01, S02, S03, S04, S05, S06, S07, S08, S09, S10, S28]

The new prepared-remark excerpts report Q3 DRAM bits up approximately 10%, DRAM ASP up high 20%, and NAND bits slightly down with ASP up mid-20%. They describe the investment-asset loss as a valuation loss, without identifying the entire amount as Kioxia. These are rounded publisher-transcribed statements, not exact product gross margins or a substitute for complete call review. [S28]

The newest prior call, Q2 2026, was read through the publisher's complete main transcript: management presentation, Q&A and closing, including the bilingual interpretation. It is a publisher transcription rather than an issuer-authenticated transcript or an independent audio check. Product-name transcription errors are resolved against the official presentation and issuer product announcements. [S11]

Product revenue mix, manufacturing cost allocations, future prices, cash conversion and exact event probabilities remain estimates where the company does not disclose them. Current results are preliminary. Full source assets and precise coverage boundaries support the analysis; they do not turn undisclosed values into reported facts.

Rule 16b: probabilities, conditional outcomes and economic bridges

Each event below is a full one-variable or linked-variable model recalculation against a defined reference. The selected model already contains all selected effects. Incremental bridges are not additive: shared price, opex, tax, cash, buyback and share-denominator interactions make summing them invalid. Probabilities are analytical judgments, except explicit owner scenarios and already disclosed facts. They are not statistical confidence intervals.

2027 HBM repricing realization - definition

Item	Selected definition
Evidence date	2026-10-28 Seoul / source vintages identified individually
Probability / durability	0.8
Conditional outcome	Q1 2027 ASP increase: 0.2
Bounded outcome	[0, 0.3]
Overlap and nonduplication	2027 negotiations are finalized; probability concerns realization of this analyst price increment, not negotiation completion. Industry +121% blended HBM ASP forecast is not applied again.

Item	Selected definition
Economic transmission	Price raises HBM revenue and gross profit; revenue-linked opex and GP bonus rise; cash tax and return budgets respond. No extra bit volume.
Reference inputs	HBM 2027 price repricing probability: 0
Conditional inputs	HBM 2027 price repricing probability: 1
Revision / falsification trigger	Realized HBM ASP/mix, annual agreement prices, cost and yield evidence.

2027 HBM repricing realization - Conditional minus reference price-ceiling bridge

Quarter	Common delta KRW	ADS delta USD
Q4 2026	49,892.50379	5.02462
Q1 2027	77,538.14228	8.09800
Q2 2027	92,226.96103	9.90729
Q3 2027	108,855.16936	11.95930
Q4 2027	126,264.16489	12.71594
Q1 2028	133,017.34811	13.39604
Q2 2028	137,120.55722	13.80927
Q3 2028	140,641.83734	14.16390
Q4 2028	143,440.69567	14.44577
Q1 2029	145,489.07335	14.65206
Q2 2029	146,853.30533	14.78945
Q3 2029	147,411.15698	14.84563
Q4 2029	147,204.09571	14.82478
Q1 2030	146,241.12383	14.72780

All monetary operating/cash deltas are KRW T; share deltas are millions of common shares. Positive COGS/opex delta is an added cost. Price-ceiling bridges exclude historical Q3 2026 and unavailable trailing windows. These event bridges must not be summed.

Conventional DRAM upcycle pricing realization - definition

Item	Selected definition
Evidence date	2026-10-28 Seoul / source vintages identified individually
Probability / durability	0.8
Conditional outcome	Q4 2026 conditional ASP growth: 0.15; CY 2027 conditional qoq growth: [0.1, 0.05, 0, 0]
Bounded outcome	Q4 2026 primary industry forecast range: [0.1, 0.15]; CY 2027 analyst conditional qoq ranges: [[0, 0.15], [0, 0.1], [0, 0.05], [0, 0.05]]
Overlap and nonduplication	Expected Q426 increase 12%; CY2027 expected 8%,4%,0%,0%. Latest industry guidance informs the price outcome; not counted again as an independent demand or revenue pool.

Item	Selected definition
Economic transmission	Conventional DRAM price indices compound, physical bit growth unchanged; manufacturing costs respond to volume/capex rather than automatically matching prices. Revenue-linked opex, tax, cash and return budgets respond.
Reference inputs	conventional upcycle price probability: 0
Conditional inputs	conventional upcycle price probability: 1
Revision / falsification trigger	Realized contract ASPs, LTA lag/bands, conventional supply and PC/handset demand destruction.

HBM acceptance and manufacturing shortfall - definition

Item	Selected definition
Evidence date	2026-10-28 Seoul / source vintages identified individually
Probability / durability	0.2
Conditional outcome	net sales shortfall 2027: 0.075; avoidable cash COGS and allocated opex fraction: 0.5; rework per lost sales: 0.02
Bounded outcome	[0.05, 0.1]
Overlap and nonduplication	Net shortfall after supply/qualification overlap; no extra demand haircut and no catch-up sales. Risk expires Q128 by assumption.
Economic transmission	Probability-weighted lost HBM revenue; only half eligible cash manufacturing/opex avoided, all D&A retained; rework added; cash and payout budgets fall.

Item	Selected definition
Reference inputs	HBM execution shortfall probability: 0
Conditional inputs	HBM execution shortfall probability: 1
Revision / falsification trigger	Customer acceptance, yield, qualification delays or disclosed recoveries; persistence beyond 2027.

All monetary operating/cash deltas are KRW T; share deltas are millions of common shares. Positive COGS/opex delta is an added cost. Price-ceiling bridges exclude historical Q3 2026 and unavailable trailing windows. These event bridges must not be summed.

Lower stack height and per-bit mix - definition

Item	Selected definition
Evidence date	2026-10-28 Seoul / source vintages identified individually
Probability / durability	0.6
Conditional outcome	price premium per Gb: 0.15; additional cubes per bit: 0.5; backend cost share: 0.2; exposed 2027 2028: 0.5
Bounded outcome	[0.1, 0.2]
Overlap and nonduplication	Only 40% new after 60% overlap; 2027-28 exposure 50%,2029 25%,2030 zero. Same bits yield more cubes; bit revenue is not doubled.
Economic transmission	Selected 2027-28 HBM price level+1.8% and cash manufacturing cost level+1.2%; 2029 +0.9%/+0.6%; opex/cash respond. No extra wafer/bit volume.

Item	Selected definition
Reference inputs	HBM 8Hi mix probability: 0
Conditional inputs	HBM 8Hi mix probability: 1
Revision / falsification trigger	Stack mix, base-die economics, per-Gb contract realization and backend capacity.

All monetary operating/cash deltas are KRW T; share deltas are millions of common shares. Positive COGS/opex delta is an added cost. Price-ceiling bridges exclude historical Q3 2026 and unavailable trailing windows. These event bridges must not be summed.

Long-term agreement price durability - definition

Item	Selected definition
Evidence date	2026-10-28 Seoul / source vintages identified individually
Probability / durability	2028: 0.8; 2029: 0.5; 2030: 0.25
Conditional outcome	covered fraction: 0.5; conditional price retention level: 0.08
Bounded outcome	[0.02, 0.1]
Overlap and nonduplication	Coverage included once; no separate signed-demand revenue addition.2029 sold-out wording includes discussions and not all legally binding.
Economic transmission	DRAM price levels+3.2% 2028,+2% 2029,+1% 2030; not annual compound growth. Manufacturing volume unchanged; opex and cash follow revenue.

Item	Selected definition
Reference inputs	LTA durability probability by year: 2026: 0; 2027: 0; 2028: 0; 2029: 0; 2030: 0
Conditional inputs	LTA durability probability by year: 2026: 0; 2027: 0; 2028: 1; 2029: 1; 2030: 1
Revision / falsification trigger	Disclosed price bands, deposits, cancellation terms and binding capacity fraction.

All monetary operating/cash deltas are KRW T; share deltas are millions of common shares. Positive COGS/opex delta is an added cost. Price-ceiling bridges exclude historical Q3 2026 and unavailable trailing windows. These event bridges must not be summed.

New and owner-assumed future shareholder repurchases - definition

Item	Selected definition
Evidence date	2026-10-28 Seoul / source vintages identified individually
Probability / durability	0.9
Conditional outcome	initial return budget T: 10; future budget to positive OP: 0.119999328; cash lags: [1, 2]; retirement lag: 2
Bounded outcome	[0, 1]
Overlap and nonduplication	Only~10 T shareholder-return leg retires;~10.00772 T compensation leg is cash expense in capital schedule, not cancellation credit. Future budgets associated with earnings once.
Economic transmission	Full cash budgets 70/30 after earnings; expected shares retired after final purchase. Independent execution price 1.341 M then+10% quarterly; no ceiling feedback, no extra EPS/OP.

Item	Selected definition
Reference inputs	new cancel completion probability: 0; future buyback cancellation completion probability: 0
Conditional inputs	new cancel completion probability: 1; future buyback cancellation completion probability: 1
Revision / falsification trigger	Board budgets, execution cost/quantity, legal retirement vs compensation allocation.

All monetary operating/cash deltas are KRW T; share deltas are millions of common shares. Positive COGS/opex delta is an added cost. Price-ceiling bridges exclude historical Q3 2026 and unavailable trailing windows. These event bridges must not be summed.

Other explicitly considered cases

Owner NAND price scenario

Item	Definition / treatment
Probability	1
Conditional outcome	Q4 2026 ASP growth: 0.2; Q1 2027 ASP growth: 0.15; remaining 2027 growth: 0
Bounds	Q4 2026 industry forecast: [0.15, 0.2]; Q1 2027 owner scenario sensitivity: See the permanent memory-price-level diagnostics; no additional probability haircut.
Economic transmission	NAND ASP index multiplies delivered bits; physical manufacturing, variable cost, opex, tax, cash and return budgets remain linked. Later negative price growth remains explicit.
Overlap	Applied once to NAND price index; not another Solidigm/AI-storage revenue addition.
Source	https://www.trendforce.com/presscenter/news/20260930-13258.html
Revision trigger	Realized NAND ASP, contract lag, bit mix and owner scenario changes.

Owner recurring cash-return scenario

Item	Definition / treatment
Probability	1
Conditional outcome	ordinary dividend cash to positive OP: 0.084620325; shareholder buyback cash to positive OP: 0.119999328
Bounds	Owner scenario; diagnostics 0/0.5/1.5x. Not a fixed issuer commitment.
Economic transmission	Ordinary pool from positive OP; payment-lag shares determine modeled DPS. Buyback budget/cash/cancellation separately linked. No 50% FCF automatic second spend.
Overlap	No second revenue or cash addition.
Source	Owner instruction, this quarter ratios excluding compensation and one-off Kioxia.
Revision trigger	Owner changes or actual board declarations.

Current declared dividend eligibility

Item	Definition / treatment
Probability	1
Conditional outcome	ordinary DPS KRW: 10000; known special DPS KRW: 10000; total once KRW: 20000; record: 2026-11-30; payment: Within 1 month, exact day not announced
Bounds	[0, 20000]
Economic transmission	Gross entitlement counts once if held through relevant settled record. Current special retained once; all future unannounced Kioxia specials 0. ADS net FX/tax/fees/date unknown.
Overlap	No second revenue or cash addition.
Source	https://dart.fss.or.kr/dsaf001/main.do?rcpNo=20261028800045
Revision trigger	Eligibility/ex-date/record changes; depositary notice.

Affiliate construction advances

Item	Definition / treatment
Probability	0.9
Conditional outcome	reported advance T: 4.2462; extra active revenue T: 0; extra active capex T: 0
Bounds	Advance overlaps selected Q4 2026 capex of 16 T; unknown incremental unit capacity. Extra cash-outflow diagnostic may be evaluated separately.
Economic transmission	No added wafers/units until timing/capacity economics quantified; avoids double counting already budgeted construction.
Overlap	No second revenue or cash addition.
Source	Preserved primary native filing and source factpack.
Revision trigger	Incremental project/capacity, construction timing and budget overlap clarified.

Unspecified future DRAM architecture

Item	Definition / treatment
Probability	0.1
Conditional outcome	incremental active revenue T: 0
Bounds	No quantifiable node/wafer/yield/service timing available.
Economic transmission	No financial increment selected because physical transmission cannot yet be bounded; probability recorded rather than waiting for official confirmation.
Overlap	No second revenue or cash addition.
Source	Current source discussion; no numerical capacity/yield terms.
Revision trigger	Node, wafer allocation, yield, price and service-start economics.

Solidigm IPO review discontinued

Item	Definition / treatment
Probability	1
Conditional outcome	IPO proceeds T: 0; additional NAND pool T: 0
Bounds	[0, 0]
Economic transmission	No IPO financing inflow; existing NAND contribution remains consolidated once.
Overlap	No second revenue or cash addition.
Source	https://news.skhynix.com/en/q3-2026-business-results/
Revision trigger	New formal financing plan.

Sensitivity tests and financial confidence

Financial forecast confidence is LOW. High modeled margins and future OP depend on sustained pricing, shipment growth, cost restraint and allocation estimates; current consolidated profit calibration alone does not validate forward ASPs. The following seventeen cases each rerun the linked model. They are independent diagnostics, not additive bear/bull probabilities or alternative sanctioned valuation methods.

A permanent 20% reduction in the all-memory price level from Q1 2028 reduces active F4 OP from 602.769 T to 500.024 T. The common ceiling falls from KRW 5,366,364 to 4,451,640, and the ADS ceiling from USD 540.44 to 448.32. The 8-15% HBM mix diagnostics change the allocation of a fixed consolidated Q3 anchor; their narrower outcome range does not validate forward prices.

Price-level stress - quarterly operating profit

Permanent price-level shocks start Q1 2028; future return budgets and share counts respond. Full quarterly OP values follow. No extra volume or cost-offset assumption is added.

Price-level stress - quarterly operating profit - complete values

Quarter	Selected baseline	Price -10%	Price -20%

Analytical score and protected Excel control

Analytical framework score

Category	Points
Core	19
Cycle	10
TAM	10
Catalysts	5
Macro	10
Alpha	2
Risks	-3
Total /60	53
Rounded analytical percent	88
Protected owner Excel Base - common	90
Protected owner Excel Base - ADS	90

The analytical score is 53/60, rounded 88. The two protected Excel Bases remain 90 under independent owner overrides. A manual Base is not automatically changed to match the analytical score, and the earnings thesis does not require a forced score upgrade.

Primary and supporting source register

Source dates below describe the underlying evidence, not guaranteed publication completeness. Current financial results are preliminary. Official company/product claims, third-party industry estimates, selected call reports, publisher transcripts and analytical proxies are distinguished at their point of use. All essential model derivations and values are included in this report; links support provenance rather than replace the analysis.

S01 - SK hynix Q3 2026 preliminary results

Date: 2026-10-28. Issuer; full main release read; original HTML preserved.

https://news.skhynix.com/en/q3-2026-business-results/

S02 - Official Q3 earnings presentation

Date: 2026-10-28. Issuer-linked 20-page presentation. Operating exhibits and financial tables reviewed; results remain preliminary.

https://irsvc.teletogether.com/hynix/pdf/hynix2026Q3_eng.pdf?1

S03 - Current call report: HBM requests and stack height

Date: 2026-10-28. Korean journalist direct-call report; not full issuer transcript.

https://www.inews24.com/view/2019777

S04 - Current call report: demand visibility through 2029

Date: 2026-10-28. Korean journalist direct-call report; signed/discussed demand distinguished.

https://www.inews24.com/view/2019751

S05 - Current call report:2027 HBM terms

Date: 2026-10-28. Korean journalist direct-call report.

https://www.inews24.com/view/2019745

S06 - Current call report: custom HBM and yields

Date: 2026-10-28. Korean journalist direct-call report; management claims not independent measured yield.

https://www.inews24.com/view/2019764

S07 - Current call report: capex flexibility

Date: 2026-10-28. Korean journalist direct-call report.

https://www.inews24.com/view/2019761

S08 - Current call report: KV cache/NAND hierarchy

Date: 2026-10-28. Original Korean article preserved; full main article read.

https://www.inews24.com/view/2019795

S09 - Current call report:4F2/3D DRAM readiness

Date: 2026-10-28. Korean journalist direct-call report.

https://www.inews24.com/view/2019779

S10 - Current call report: AI investment durability

Date: 2026-10-28. Korean journalist direct-call report; quoted external growth figures not independently verified.

https://www.inews24.com/view/2019733

S11 - Q2 2026 earnings call transcript

Date: 2026-07-29 Seoul event. Complete publisher transcript reviewed, including prepared remarks, Q&A and closing. Not issuer-authenticated or independently checked against replay audio.

https://www.investing.com/news/transcripts/earnings-call-transcript-sk-hynix-posts-record-q2-2026-results-as-shares-fall-93CH-4818480

S12 - TrendForce HBM2027 pricing forecast

Date: 2026-09-29. Original research forecast; both native and English preserved/read.

https://www.trendforce.com/presscenter/news/20260929-13255.html

S13 - TrendForce Q4 2026 contract prices

Date: 2026-09-30. Original research forecast; both native and English preserved/read.

https://www.trendforce.com/presscenter/news/20260930-13258.html

S14 - TrendForce 2027 annual memory market forecast

Date: 2026-05-29. Original research; older annual forecast vintage; not latest validated October denominator.

https://www.trendforce.com/presscenter/news/20260529-13068.html

S15 - Gartner semiconductor forecast

Date: 2026-08-24. Official web text and table captured; original-page download returned 403. This source uses a broader memory-market definition.

https://www.gartner.com/en/newsroom/press-releases/2026-08-24-gartner-forecasts-worldwide-semiconductor-revenue-to-reach-1-trillion-dollars-in-2026

S16 - TrendForce Q2 branded DRAM ranking

Date: 2026-09-07. Original research; actual quarter estimate; full visible table reviewed.

https://www.trendforce.com/presscenter/news/20260907-13219.html

S17 - TrendForce Q2 NAND ranking, native

Date: 2026-08-18. Original research and quarterly estimate. Full visible table reviewed; the top-five supplier total is distinguished from the wider market.

https://www.trendforce.com.tw/presscenter/news/20260818-13185.html

S18 - TrendForce newer annual supplier forecast report

Date: 2026-10-01. Public native-language summary reviewed and preserved. The full seven-page numerical report requires login and was not read.

https://www.trendforce.com.tw/research/download/RP260929YM

S19 - DART Q3 cash dividend decision

Date: 2026-10-28. Full native-language filing table and footnotes reviewed; original source bytes preserved.

https://dart.fss.or.kr/dsaf001/main.do?rcpNo=20261028800045

S20 - DART new treasury acquisition decision

Date: 2026-10-28. Full native-language filing reviewed and preserved. Planned acquisition quantity is not actual execution.

https://dart.fss.or.kr/dsaf001/main.do?rcpNo=20261028000014

S21 - Citi current SKHY dividend history

Date: Captured October 28, 2026 UTC; page generated October 27, 2026 US. Actual depositary page reviewed. No new Q3 ADS distribution notice appeared in the captured history.

https://depositaryreceipts.citi.com/adr/guides/pgm_dispaDivd.aspx?cusip=78392B206&pageId=15&subpageID=113

S22 - KRX ex-dividend and regular-way settlement

Date: See dated source title / original publication. Primary exchange rule: T+2 settlement. This is not a current issuer ex-dividend-date notice.

https://global.krx.co.kr/contents/GLB/06/0602/0602010204/GLB0602010204T1.jsp

S23 - Indiana groundbreaking and production milestones

Date: 2026-08-28. Issuer-announced schedule, not completed production milestones.

https://news.skhynix.com/en/groundbreaking-ceremony-in-indiana/

S24 - TSMC OIP portfolio exhibition

Date: 2026-09-28. Issuer product demonstration and exhibition, not a commercial-yield measurement.

https://news.skhynix.com/en/tsmc-oip-conference-2026/

S25 - 12-high HBM4E samples

Date: 2026-06-18. Issuer sample announcement, not proof of mass production.

https://news.skhynix.com/en/sk-hynix-ships-samples-of-12-layer-next-gen-hbm4e-2/

S26 - OCP memory-centric server demonstrations

Date: 2026-10-16. Issuer demonstrations, proofs of concept and internal simulation; no disclosed orders or quantified commercial revenue.

https://news.skhynix.com/en/ocp-global-summit-2026/

S27 - Current call report: LTA coverage, deposits and pricing

Date: 2026-10-28. Current Korean direct-call report. Full original reviewed and preserved; corroborates official presentation page 12.

https://www.inews24.com/view/2019720

S28 - New Q3 publisher transcript listings and search-rendered excerpts

Date: Captured 2026-10-28 UTC. New listings and long excerpts reviewed. Full pages returned 403 or were inaccessible; the browser fallback timed out. The complete current transcript remains unread.

https://stockanalysis.com/quote/krx/000660/transcripts/717350-q3-2026/

Additional publisher listing:
https://uk.investing.com/news/stock-market-news/earnings-call-transcript-sk-hynix-posts-record-q3-2026-results-shares-jump-after-hours-93CH-4935915

Linked working model: SKHynix_000660_SKHY_Linked_Model.xlsx. The report and workbook share the same issuer operating model; common and ADS multiple conventions differ as explicitly disclosed. Historical published Excel forecasts through Q3 2026 and their as-then rolling ceilings remain separate from this present reconstruction.
