SANDISK CORPORATION

SNDK | Earnings, inference storage, contracts and capital returns | FY2027 Q1 deep dive

USD millions for financial schedules and millions of shares; USD per pre-split-equivalent economic share. Nominal calendar quarters. Future quarters are modeled.

Selected measure	Current value	Scope
Analytical / Excel Base	87 / 87	Full framework score
Q4 2027 ceiling	USD 2,424.87	Pre-split-equivalent economic share
Forward-four-quarter OP	USD 50,964.15M	Current quarter + next three
Absolute multiple	6.75x	Retained sanctioned schedule
Valuation denominator	141.866741M	Opening/ending economic-share average
Nominal model horizon	Q4 2026 – Q4 2030	Current/future forecasts; historical displays preserved

1. Pre-analysis: inference demand and the NAND cycle

Sandisk participates in the framework's DB6 memory demand cycle through enterprise SSDs, persistent context, Edge devices and consumer storage. Longer prompts, agent orchestration and reusable context increase the need for fast, persistent data. Qualified NAND output, controller compatibility, packaging and customer deployment determine the portion that becomes revenue.

The current business combines exceptionally high scarcity profits with longer customer commitments. Management sees allocation beyond calendar 2027 and an NBM pipeline extending past fiscal 2030. The percentage of eventual peak demand already reached remains unmeasured. The near-term guide and accepted production provide stronger anchors than the distant price and margin path.

NAND economics remain exposed to industry supply, customer inventories, device affordability and architecture. The operating build therefore separates physical output, realized selling price, manufacturing cost and operating expense. Capital spending supports production over time; its contribution depends on node transitions, equipment, yield and product qualification.

2. Products, technology and whole-company capture

BiCS8 is the main production platform. Its CMOS directly bonded to array architecture separates array and logic development. Management describes BiCS9 as the established BiCS8 cell array with faster next-generation CMOS, while BiCS10 advances both TLC and QLC. The BiCS10 announcement does not establish a current commercial production ramp; management says the company is still ramping BiCS8.

Sandisk and Kioxia develop and manufacture through the Flash Ventures ecosystem. Sandisk's share is 49.9% and Kioxia's 50.1%. Customer products, controller design, firmware, back-end operations, sales mix and contracting determine each company's economics. Joint capacity information can inform production assumptions while customer prices and funding obligations retain their company-specific scope.

The five operating cohorts are Datacenter NBM, floating Datacenter, Edge, Consumer and HBF. The company reports Datacenter, Edge and Consumer revenue within one reportable segment. Its NBMs span Datacenter and Edge. The contracted/floating Datacenter split and cohort margins are analytical allocations; an Edge blend can contain both contracted and market-sensitive business.

Product advantages earn value through accepted bits, realized price, cost, working capital and cash generation. Nodal productivity can increase bits without the same percentage increase in wafers. TLC, QLC and SLC allocate the same underlying production capability to different endurance, capacity and cost requirements.

The cohort schedules use four ordinary-NAND source-output indices and a separate HBF reference-revenue unit. End-market revenue weights allocate modeled output; actual cohort bit volumes and contract margins remain undisclosed.

3. Latest earnings, guidance and the newest two calls

Fiscal Q1 2027 ended October 2, 2026 and maps to nominal calendar Q3 2026. The October 29 release reports revenue of $11,031M, including Datacenter $4,802M, Edge $5,832M and Consumer $397M. GAAP gross profit was $9,378M, operating expenses $598M and operating profit $8,780M. Non-GAAP gross profit was $9,384M, opex $513M and operating profit $8,871M.

GAAP pretax income of $9,319M included $513M of net equity-securities gains; GAAP tax was $1,218M and net income $8,101M. Non-GAAP pretax income was $8,900M, tax $1,276M and net income $7,624M. Current stock-based compensation totaled $91M, split between $6M in cost of revenue and $85M in opex. The selected valuation profit basis remains non-GAAP operating profit.

Fiscal Q2 2027 maps to nominal calendar Q4 2026. The company guides $12,200M-$12,600M revenue, 84.5%-85.5% non-GAAP gross margin and $540M-$560M non-GAAP opex. The guide assumes approximately 151M diluted weighted-average shares and pre-split non-GAAP EPS of $55-$57. Its non-GAAP tax estimate is 14.3%. Exact nonoperating income and a complete GAAP EPS reconciliation remain unavailable.

Midpoint revenue of $12,400M multiplied by 85% gross margin, less $550M opex, produces $9,990M non-GAAP operating profit. Applying the stated 14.3% tax and 151M shares mechanically gives net income of $8,561.43M and EPS of $56.6982. The stated EPS range has midpoint $56, or $8,456M on the same share count. The $105.43M difference remains unreconciled because exact nonoperating income and interactions among the guide ranges are undisclosed. The operating model uses the revenue, gross-margin and opex anchors with a separately stated $2M cash-interest assumption.

Both full Quartr call texts were reviewed: October 29 for fiscal Q1 and August 5 for fiscal Q4. They include prepared remarks, Q&A and closing. Official replay audio remains unreviewed. Current Quartr attributes the equity gain to Kioxia; another publisher identifies Nanya, consistent with the annual Nanya investment. The primary current statement labels the amount as a generic net equity-securities gain.

Issuer actual and next guide | USD M except margins, shares and EPS

Measure	FY27 Q1 actual	FY27 Q2 guide	Guide/model scope
Nominal calendar mapping	Q3 2026	Q4 2026	Actual source bridge; earlier published forecasts remain frozen
Revenue	11,031.00	12,200.00–12,600.00	Issuer range
GAAP gross profit	9,378.00		Current reported
Non-GAAP gross profit	9,384.00	10,540.00	Guide midpoint derived
Non-GAAP gross margin	85.1%	84.5–85.5%	Issuer range
Non-GAAP opex	513.00	540.00–560.00	Issuer range
Non-GAAP OP	8,871.00	9,990.00	Guide revenue × GM − opex
Non-GAAP net income	7,624.00		Separate nonoperating/tax scope

Issuer actual and next guide | USD M except margins, shares and EPS			
Measure	**FY27 Q1 actual**	**FY27 Q2 guide**	**Guide/model scope**
Non-GAAP EPS	49.51	55.00–57.00	Pre-split equivalent
Diluted average shares M	154.00	151.00	Quarter-average denominator
Period-end legal shares M	144.00		Rounded legal outstanding

Current end markets | issuer revenue USD M			
End market	**Current**	**Previous quarter**	**Previous year**
Datacenter	4,802.00	2,977.00	269.00
Edge	5,832.00	5,432.00	1,387.00
Consumer	397.00	556.00	652.00

4. NBMs: demand visibility, pricing and financial guarantees

Sandisk has NBMs with eight customers, a minimum $93.9B of expected revenue at floor prices, $88.9B of quarter-end remaining performance obligations and $16.5B of financial guarantees. Weighted duration exceeds four years and maximum disclosed duration is five years. Management describes roughly half of fiscal 2027 bits and two-thirds of fiscal 2028 bits as committed under NBMs.

The two agreements closed in fiscal Q1 had already been announced during the August 5 call. Their completion updates execution status; their expected demand was already in the prior announcement. Current discussions include extensions with existing customers and additional customers. Management says 95% of NBM business is with investment-grade companies; the precise weighting basis remains unspecified.

NBM pricing contains fixed and variable elements with floors and ceilings. Exact customer price resets, product quantities, collar levels, delivery schedules and contract-specific mix remain undisclosed. A contract count, an industry price forecast and RPO each describe a different part of the commercial bridge. The selected company realization assumptions are a selected 2% realized-ASP increase for calendar Q4 2026, followed by a joint scarcity-price state with 60% probability and conditional sequential increases of 2.5% in each calendar 2027 quarter. The weighted company price level is applied once, with dated cohort erosion from 2028.

Most financial guarantees are held or provided by third-party financial institutions. The CFO says prepayments on Sandisk's balance sheet carry no legal restriction. Contract liabilities reflect advance consideration; refundable deposits carry later repayment obligations. These balances require explicit recognition and cash schedules when determining excess cash.

Current NBM evidence | issuer amounts		
Measure	**Reported value**	**Scope**
Customers	8	Datacenter and Edge
Minimum revenue at floors, USD M	93,900.00	Contract life
RPO, USD M	88,900.00	Quarter-end remaining
Financial guarantees, USD M	16,500.00	Mostly third-party held/provided
FY27 committed bits	50.00%	Company bit exposure
FY28 committed bits	66.67%	Company bit exposure

5. Accepted output, product mix and annual capacity

The company retains its mid-to-high-teens physical bit-growth plan for fiscal 2027. The preceding call described mid-teens sellable growth after building inventory to support NBMs. Gross capital intensity is expected to be in the mid-single digits as a percentage of fiscal 2027 revenue, with spending increasing in the remaining quarters and most investment supporting BiCS8.

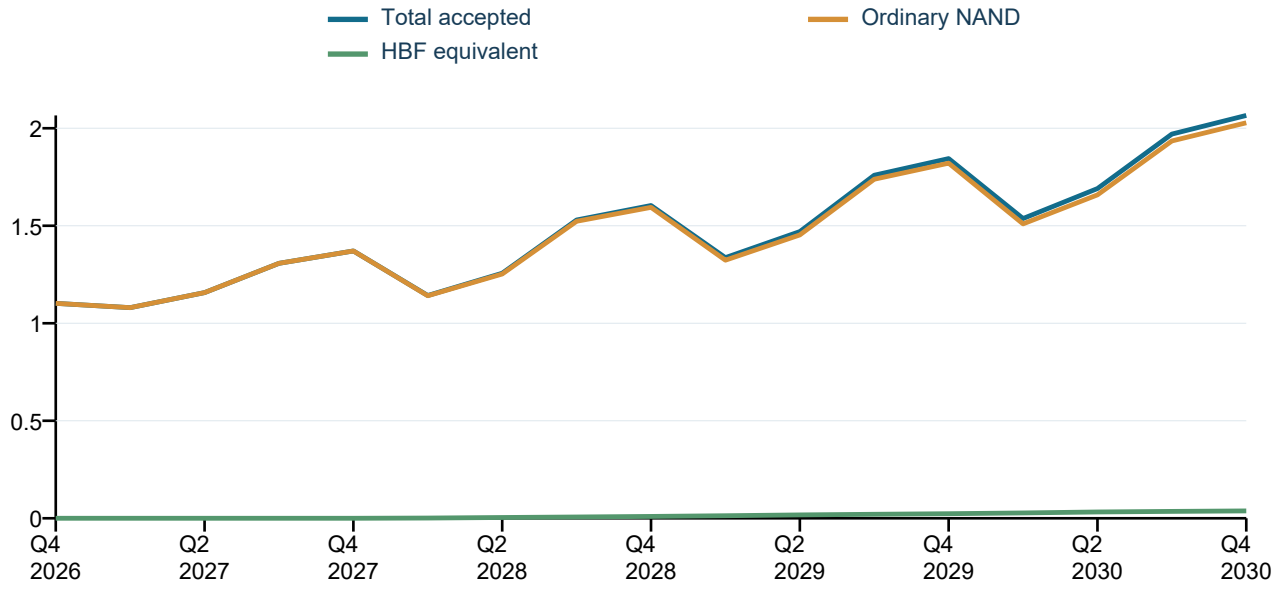

Current revenue growth was approximately 60% volume contribution and 40% price contribution. The previous quarter's increase was approximately one-third volume contribution and two-thirds price. These are decompositions of revenue growth. They leave standalone bit and ASP changes, interaction terms and product mix unquantified.

The two calls and current deck supply an incomplete fiscal 2026 quarterly bit series. Management cites a historical 19% sequential bit decline for the normally weak March/fiscal Q3 comparison. The actual fiscal 2026 annual physical denominator remains unavailable. The current actual unit index is 1.0000; the calendar Q4 guide implies 1.102064 under the selected 2% price increase. March and June output proxies equal 98% and 105% of that Q4 output. Fiscal 2028 and 2029 output grows 17% annually, fiscal 2030 grows 15% and fiscal 2031 grows 12%, each normalized against all four quarters of the preceding modeled fiscal year. Seasonal weights are 1.03, 1.08, 0.90 and 0.99. The fiscal 2027 source growth guide provides a qualitative check; its exact year-over-year reconciliation remains open.

Management keeps a roughly 70/30 TLC/QLC portfolio mix for the current fiscal year and says a wafer takes roughly 120 days to produce. Short-term supply allocation must fit available TLC/QLC, die and node inventory to customer requirements. Longer-term shifts have more flexibility. Calendar2027 Datacenter industry bit demand is expected to grow about 40%; company capture requires its own qualified product mix and output.

The capacity dependency check assumes 15% annual bit productivity. Fiscal 2028 and 2029 growth of 17% then requires approximately 1.74% more wafer-equivalent starts; fiscal 2030 growth of 15% requires flat starts, and fiscal 2031 growth of 12% permits approximately 2.61% fewer starts. Actual wafer starts, yield, utilization and productivity remain undisclosed. The HBF allocation consumes output inside this production envelope.

Source-output / wafer-equivalent index

Model figure M1. Accepted production and HBF capacity allocation. Numerical table follows; all values use the model.

Model figure M1 data: Accepted production and HBF capacity allocation

Full modeled fiscal output normalization | auxiliary unit quarters included						
Fiscal year	Prior annual index	Annual growth	Annual index	Q1 / Q2 indices	Q3 / Q4 indices	Required starts
2028	4.339252	17.00%	5.076925	1.307308 / 1.370770	1.142308 / 1.256539	1.74%
2029	5.076925	17.00%	5.940003	1.529551 / 1.603801	1.336501 / 1.470151	1.74%
2030	5.940003	15.00%	6.831003	1.758983 / 1.844371	1.536976 / 1.690673	0.00%
2031	6.831003	12.00%	7.650724	1.970061 / 2.065695	1.721413 / 1.893554	-2.61%

Fiscal 2027's modeled output sum is 4.339252. Its actual fiscal 2026 denominator remains unavailable. Fiscal 2031 normalization includes two auxiliary physical-only quarters after Q4 2030; they complete the annual output denominator without extending the earnings or valuation horizon. The capacity check uses the selected 15.00% productivity assumption.

6. Company pricing, enterprise SSDs and normalization risk

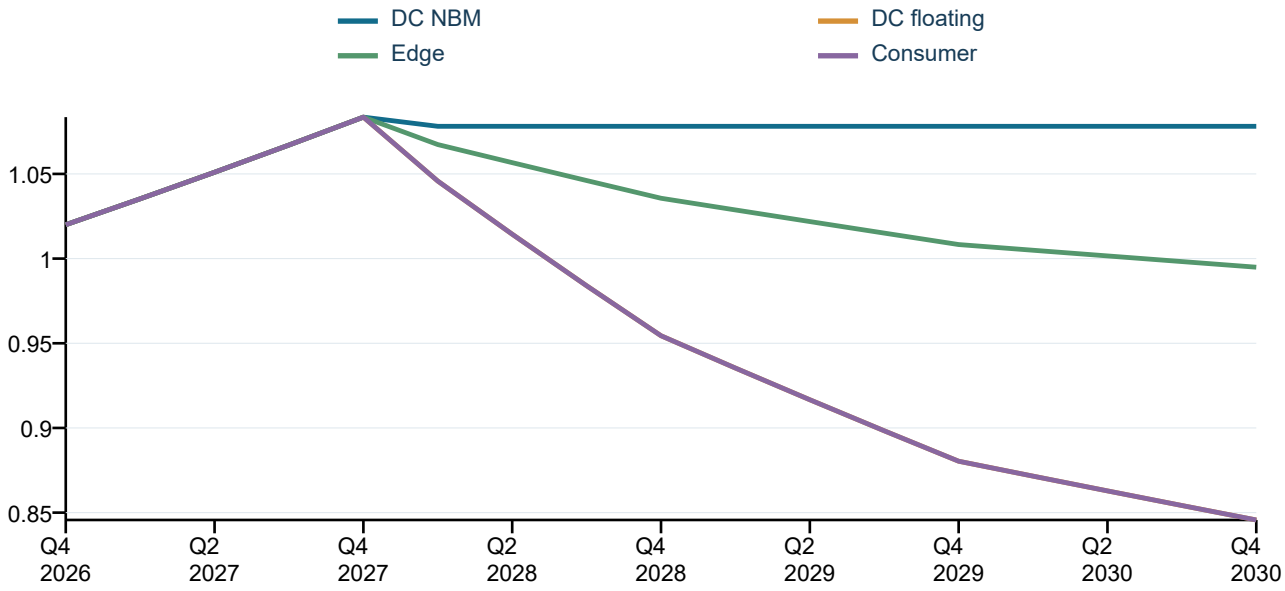

The owner-selected industry benchmark includes 20% NAND pricing growth in calendar Q4 2026 and 15% in Q1 2027. Sandisk's new guide describes modest like-for-like price increases, with modest increases continuing through the fiscal year. Current reported revenue and the new guide therefore require a company-specific bridge for contract timing, product mix and realized ASP.

The enterprise-SSD pricing signal has a 40% realization probability and 100% overlap with the current actual, new guide and selected company-price path. Separate incremental enterprise-SSD revenue and profit are zero. The source industry contract-price forecast is 23%-28%; company contract timing, product mix and price collars determine realized receipts.

The October 9 bank evidence includes slower later NAND pricing and an industry decline in 2028. The selected company risk has 30% probability, a 10% conditional realized-price shortfall and 50% overlap removed for existing erosion. From calendar 2028 it applies to the one-third uncovered receipt proxy, producing a 0.5% reduction in ordinary-NAND revenue. Manufacturing cost and dollar opex retain their selected paths. The original evidence and earlier decisions remain archived.

Any normalization shortfall applies to the eligible company receipt pool after existing price erosion and enterprise-SSD overlap. Accepted bits, manufacturing cost, support costs, opex, tax, capital funding and shares carry through the same selected scenario. Customer-specific fixed/variable exposure and price-floor headroom remain uncertain.

Current source comparable price = 1

Model figure M2. Realized ordinary-cohort price indices. Numerical table follows; all values use the model.

Endpoint controls hold the other selected parameters fixed. Conditional ΔOP equals Δrevenue minus ΔCOGS minus Δopex. Active ΔOP compares the selected path with its probability-zero reference. Capacity allocation and subsequent cash/share calculations can create nonlinear differences between a weighted price signal and weighted endpoint valuation.

Source: BofA Global Research estimates, industry data. Chg = change. Equiv = equivalent

Original October 9 bank NAND exhibit. Its industry 256Gb-equivalent price path and dated forecasts retain their source units. Company receipt exposure, overlap and probability are applied in the current model.

7. Manufacturing, gross profit and operating expense

The current source reports one company-wide gross-profit pool. Product and contract-cohort costs are analytical allocations calibrated to that total. Cohort revenue equals its accepted-output index multiplied by comparable realized ASP and the stated calibration amount. Cohort manufacturing cost follows output, unit cost, yield, controller and packaging assumptions.

Gross profit equals revenue less manufacturing cost. Operating profit deducts the retained operating-expense path and explicit incremental launch, support, R&D or customer-service costs. Product-level gross margins are derived from those dollars. The selected cost and opex assumptions are source cohort manufacturing costs calibrated to the current $1,647M non-GAAP COGS total, using relative allocation weights of 1.1, 1.1, 1.0 and 1.2 for the four ordinary cohorts. Q4 guide calibration sets a net unit-cost factor of 1.021558 relative to that source allocation. The net factor then declines 1% sequentially through 2028 and 0.5% sequentially thereafter. These factors include the assumed combined effects of productivity, mix, labor, controllers, packaging and other input costs. Base opex starts at $550M and grows 2.5% quarterly; launch/support expense retains 5% of the original unshifted HBF reference revenue.

Own consolidated depreciation and amortization was $43M. The JV funding table separately identifies $132M of tool-depreciation funding included in wafer costs, $44M of external funding and $148M of Sandisk net JV cash capex against $324M of Sandisk gross JV investment. Own cash PP&E was $54M. The total cash-capex bridge is $202M and gross-capex bridge $378M.

Starting from non-GAAP earnings already incorporates the company's exclusion of current SBC. A second $91M SBC cash addback would repeat that exclusion. Future equity award expense, share issuance and vesting-tax cash use require their own schedules. The current $755M financing cash outflow for award withholding has a different valuation and timing basis from $91M of current compensation expense.

The selected forecast requires sustained scarcity margins. Calendar operating margins are 2027 81.8152%, 2028 81.8661%, 2029 81.5675%, 2030 81.4539%. Sandisk's August 13, 2026 Investor Day framework for fiscal 2028-2030 used approximately 80% gross margin, 75% operating margin and 5% opex. That company reference retains its original date and fiscal scope. The current forecast's realized ASP path, net manufacturing-cost factors and dollar-opex growth derive the higher calendar margins. These later-year percentages are analytical forecasts. The October 29 near-term guide implies 80.5645% operating margin at its revenue, gross-margin and opex midpoints. Sustained margins near 82% require continuing price realization, node productivity, contract performance and cost discipline; weakening evidence in any of these inputs is a major falsification test for the forecast.

The full-path price and manufacturing-cost controls quantify that margin exposure. A 10% reduction in ordinary-cohort realized prices gives a Q4 2027 price ceiling of $2,121.70, a decline of $303.17 (12.50%) from the selected $2,424.87. A 20% increase in manufacturing cost gives $2,337.39, a decline of $87.47 (3.61%). Each one-input control reruns the operating, tax, cash, buyback and economic-share paths while retaining the sanctioned multiple schedule. The sensitivity table contains the underlying profit, share and liquidity outputs.

Each ordinary cohort's unit is its own current source-output index. The HBF unit corresponds to its retained reference-revenue calibration. Product COGS equals the tabled unit cost multiplied by the matching cohort output index. These are model allocation units; actual dollars per physical bit remain undisclosed.

8. HBF, SLC and the overlapping inference storage market

HBF reached memory-die tapeout during fiscal Q1 and fabrication is underway. Management still identifies a controller/base-die tapeout and customer integration as subsequent steps. Initial product samples are targeted for calendar 2027. Management explicitly excludes HBF from its long-term financial model; any forecast HBF revenue, customer capture, margin and production schedule are analytical assumptions.

The selected HBF commercial reference begins in Q1 2028 after the calendar 2027 sample milestone. A joint 60% execution state delays shipments one further quarter and uses 80% gross margin during its first four selling quarters. The remaining 40% follows the 85% reference. Expected HBF revenue uses existing NAND wafer-equivalent capacity at a selected four-times revenue-per-wafer proxy. Launch and support opex retains 5% of the original scheduled HBF reference revenue. Customer qualification, die and controller integration, yield and commercial capture remain uncertain.

SLC discussions are early and management reports no current SLC sales in this new architecture opportunity. Running cells in SLC mode exchanges TLC/QLC bit density for endurance and other workload attributes; management cites 3:1 or 4:1 bit trade ratios. The potential use can expand NAND into some DRAM workloads while consuming existing wafer capacity. The selected active economic treatment is a 20% adoption probability with 100% overlap assumed within the selected accepted-output, Datacenter mix and cost path. Separate incremental SLC revenue and profit are zero. Production trade-offs, qualified customer products and commercial prices remain unquantified.

The retained Investor Day source estimates 1.2 ZB of annual AI-Datacenter NAND shipments in 2030. Its 40% staging,35% KV-cache and25% fast-data-lake split describes one shipment pool; 66% TLC/34% QLC is a separate technology split of that same pool. Current management expects KV cache to represent roughly one-third of the AI-Datacenter flash market by decade-end.

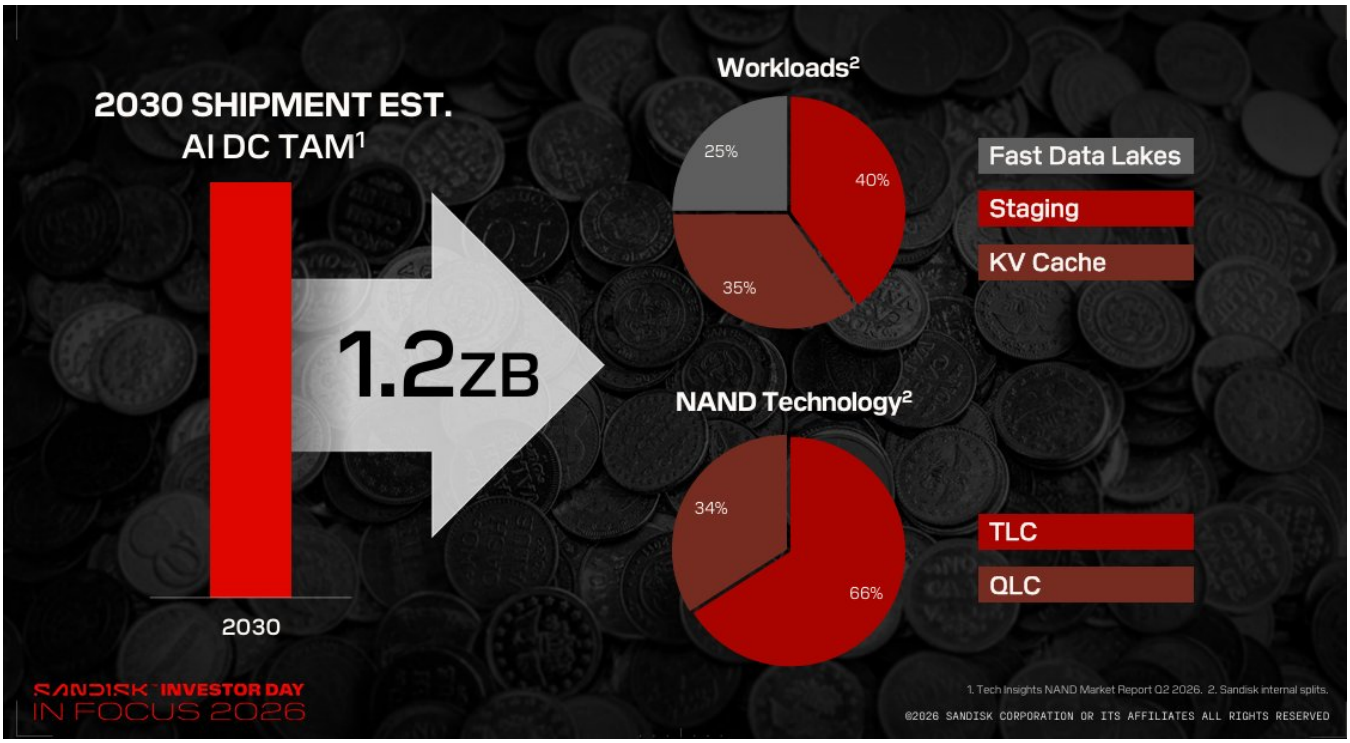

Persistent context, dedicated agent environments and reusable state are already present in the company's inference discussion. An additional 500-600EB claim requires its annual-shipment versus installed-stock definition, retention, replacement and overlap before conversion into company sales. Automotive and physical-AI Edge applications are further demand channels with undisclosed standalone revenue and margins.

Original Sandisk Investor Day source exhibit: 2030 annual AI-Datacenter NAND shipments. Workload and technology allocations describe the same shipment pool; company capture is constrained by the physical and pricing schedules.

9. Framework score and protected portfolio Base

The selected analytical score is 52/60, producing an analytical Base of 87/100. The protected portfolio Base is 87/100. The category table provides the final arithmetic, risk-class deductions and company-specific reasons.

Technology/JV control, accepted production and customer-backed visibility support the thesis. Inference storage, enterprise SSDs and new Edge uses support the addressable market. Broad market coverage limits information asymmetry. Every probability-weighted economic state enters the operating dollars once; its corresponding score rationale retains its separate framework role.

Framework score | selected category arithmetic			
Category	**Points**	**Maximum**	**Company-specific rationale**
CoreThesis	19	20	BiCS/JV production, controllers and qualified customer products
CycleStage	10	10	Accepted output and near-term guide in a tight memory market
TAMExpansion	10	10	Inference storage, persistent context and Edge workloads
Catalysts	5	5	Shipments, qualifications, NBMs and capital returns
Macro	10	10	Customer infrastructure investment and storage demand
Alpha	1	5	Broad coverage limits information asymmetry

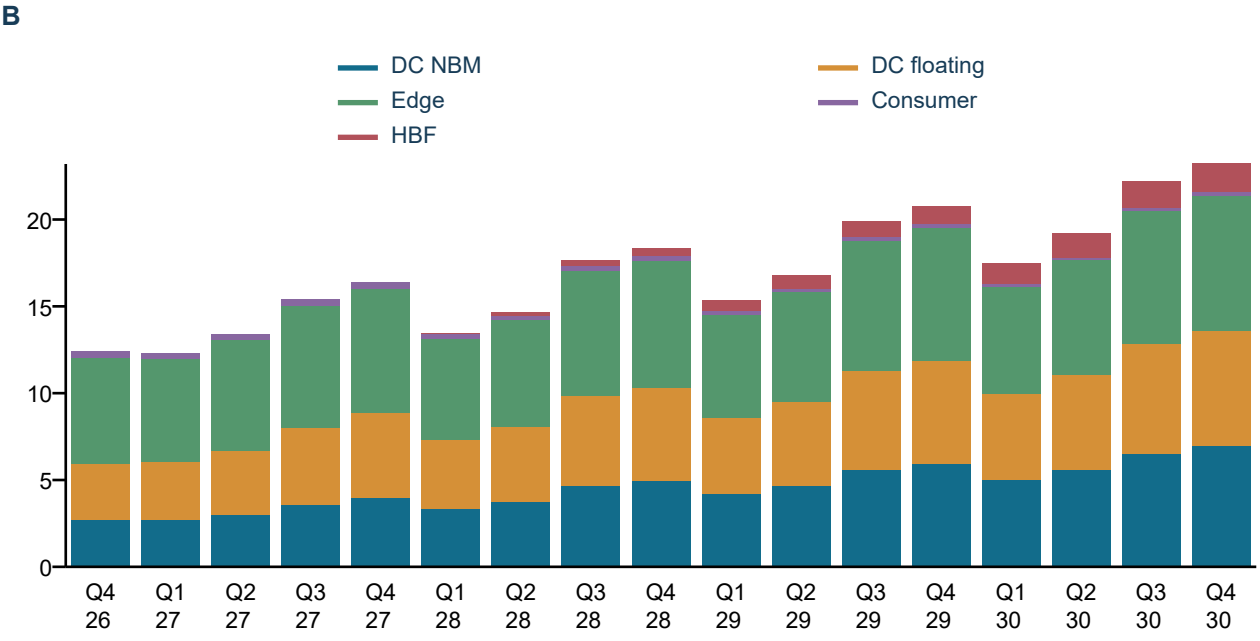

Framework score | selected category arithmetic			
Category	**Points**	**Maximum**	**Company-specific rationale**
Risk	-3		Industry price/output; technology/JV/HBF; contract exposure
Total	52	60	Analytical Base 87; protected Excel Base 87

10. Complete quarterly operating build

The schedules cover all 17 modeled calendar quarters from Q4 2026 through Q4 2030 and preserve the nominal fiscal-calendar mapping. They show each cohort's output, comparable price, manufacturing cost, revenue, gross profit and margin. The operating table then reconciles gross profit less opex to non-GAAP operating profit.

Each regenerated chart is accompanied by its numerical table. Annual revenue, gross profit, operating profit and accepted-output sums provide cross-checks against the selected fiscal and calendar assumptions. Quarter shapes, seasonality, inventory and product capture remain explicit inputs.

The latest October 2 actual bridge remains separate from immutable published calendar Q3 2026 and earlier forecast displays. Their original formulas, rolling ceilings, share conventions and zero/text/blank semantics retain their information vintage.

Model figure M3. Revenue by five operating cohorts. Numerical table follows; all values use the model.

11. Four-quarter valuation and the announced stock split

The price ceiling uses current-quarter plus next-three-quarter non-GAAP operating profit, multiplied by the sanctioned absolute multiple and divided by the opening/ending average of modeled economic diluted shares. Financial amounts and shares are both in millions, so the unit factor is 1. The multiple is 4.5x for Q4 2026, 5.25x for Q1 2027, 6.0x for Q2 2027 and 6.75x from Q3 2027 onward.

The active Q4 2027 ceiling is $2,424.87 per pre-split-equivalent economic share on the stated basis. It uses $50,964.15427M of forward-four-quarter profit, 6.75x and 141.8667415M economic shares. Every eligible quarter has its exact four-quarter earnings derivation. The final three model quarters have incomplete windows and blank ceilings.

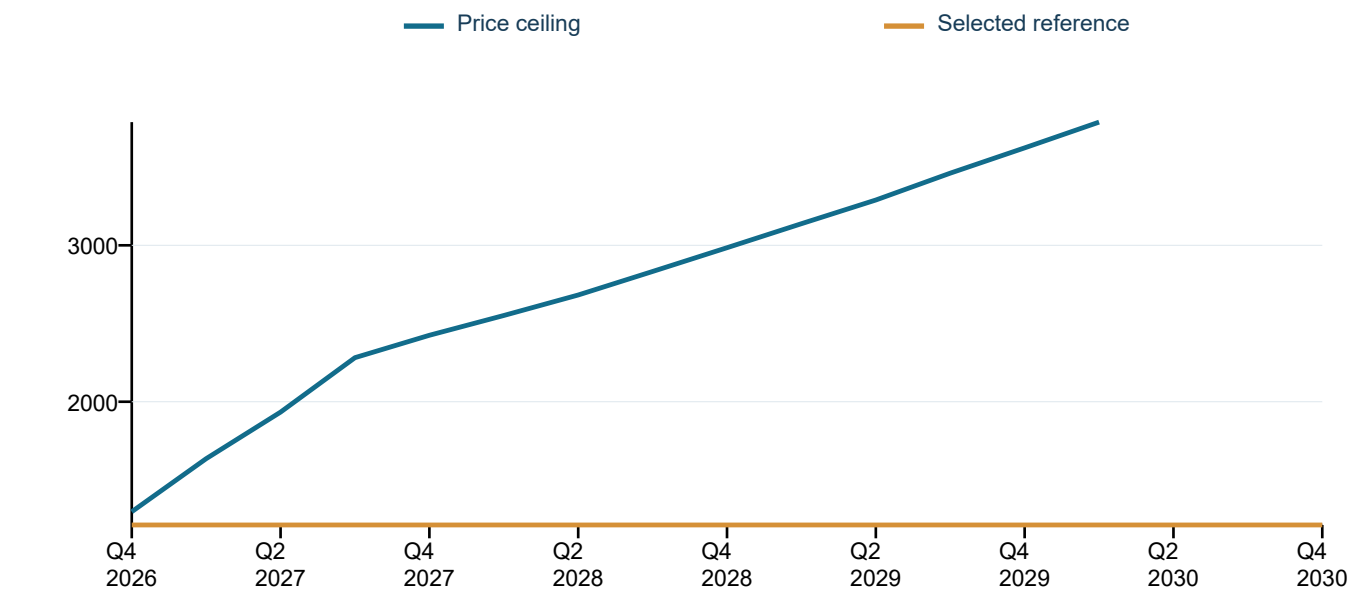

Sandisk announced an eight-for-one forward stock split: November 9 record date, seven additional shares issued after the November 19 close, and expected split-adjusted trading on November 20. Authorized shares increase proportionately from 450M to3.6B. The source release and earnings guide use the pre-split basis.

The report retains the owner's pre-split-equivalent share, quote and forecast basis throughout this rescore. A later display conversion divides price and EPS by 8 and multiplies shares by 8, preserving market capitalization. Cross-period comparisons must use the same corporate-action basis. Dividend income remains excluded from price-target upside.

Q4 2030					1,212.21

The quote reference is the selected saved model input, 1,212.21 USD on the pre-split-equivalent basis. Upside equals ceiling / reference - 1. The final three windows have fewer than four forecast quarters, so the valuation schedule leaves their F4 OP, multiple and ceiling cells blank. Their standalone operating forecasts remain in the

complete operating schedules.

12. Cash conversion, buybacks and economic shares

October 2 cash and equivalents were $5,136M and management reports zero debt. The separate $2,289M marketable equity investment is outside that cash balance. The release does not disclose the current bank/money-market/time-deposit mix or geographic balances. The current opening-cash and NBM reserve treatment is reported cash of $5,136M less a fixed $2,941M modeling reserve for cumulative reported NBM cash receipts, leaving $2,195M available at the cutover. The reserve is an analytical liquidity choice. Combined refund and contract liabilities of $3,126M exceed that reserve by $185M; management describes the prepayments as legally unrestricted.

The complete current cash-flow statement reconciles: GAAP net income 8,101, net noncash adjustments -391 and working-capital/tax/other movements -1,347 produce CFO 6,363. Investing cash is-238, financing cash -5,755 and FX cash 4. Cash rises 374 from 4,762 to 5,136. The $5,000M buyback and $755M employee tax withholding are already included in that endpoint.

Free cash flow is 6,363 less 54 own PP&E, or 6,309. Deduct 148 net JV funding and 465 of NBM prepayments/deposits to reach adjusted FCF 5,696. Current refund liabilities are 1,597 and total contract liabilities 1,529. Their combined increase is 384; the 81 difference from 465 of NBM cash lacks a complete recognition/reclassification bridge in the current release.

The current diluted EPS denominator is 154M weighted-average shares; legal period-end outstanding shares are 144M, rounded. The next-quarter guide assumes about 151M diluted weighted-average shares. Exact period-end legal shares, gross vesting, withholding share counts and future award treatment remain undisclosed. The selected economic-share bridge uses 151M guided diluted-average shares as the Q4 valuation and opening/ending economic proxy, with future new-grant equivalents beginning in Q1 2027. The annual grant-value budget is $251.869M: reported new RSU/PSU grant fair value of 3.3M multiplied by $66.93, or $220.869M, plus $31M of annual ESPP expense used as a low-confidence steady-state proxy for future offering value. The $62.96725M quarterly budget grows 10% annually, compounded quarterly, and is divided by independent future execution prices. The current guide already includes current rights. Future ESPP employee-purchase cash receives zero credit in recurring FCF or buyback funding. These modeled grant equivalents measure economic dilution; actual legal issuance also depends on employee purchase contributions, vesting, forfeiture and settlement. The quarter-average guide can incorporate current-quarter award and repurchase expectations. Exact legal shares at the cutover and purchase-cash settlement remain unconfirmed. The modeled new-cohort purchase schedule begins in the next quarter.

The company returned $5B through approximately 3.2M shares in the current quarter and $9.5B through about 6M shares over two quarters. The current remaining authorization is $10.5B. Management commits to returning 100% of excess cash after investment and a strong debt-free balance sheet; it provides no fixed quarterly purchase amount, minimum cash-reserve formula or legal cancellation schedule. The preceding call identifies buybacks as the preferred return channel. No new dividend declaration appears in the current packet.

The selected shareholder-return schedule uses a desired buyback budget equal to 100% of positive recurring FCF after selected withholding cash. The initial $10.5B fits the remaining authorization; further budgets receive an 80% continuation probability. Purchase cash is scheduled 70% in the next quarter and 30% in the following quarter. The retained owner convention gives 90% expected whole-cohort economic retirement at the end of its final purchase quarter. Modeled ordinary dividends are zero. Source policy, forecast execution timing and expected economic retirement retain their distinct scopes. Its schedule shows cash available, program capacity, purchase price, execution timing, expected economic-share reduction and future grants/withholding. Outstanding shares already reflect historical treasury purchases; the same completed purchases receive no second forward reduction.

Grant-date SBC expense and vesting-tax cash can diverge substantially as share prices and award schedules change. Current withholding is 755 versus 481 in the preceding quarter; current SBC is 91 versus 67. Annual notes identify appreciated senior-leader awards generally vesting in February orSeptember 2028. Their exact future quarterly cash and share effects remain unquantified.

Annual Note 12 reports 0.7M ESPP shares issued for aggregate purchases of $58M as of July 3, 2026. The annual cash-flow statement shows employee-plan proceeds of $5M in fiscal 2025 plus $53M in fiscal 2026, totaling $58M and supporting the cumulative scope. Annual ESPP expense was $31M, while weighted grant-date purchase-right fair value was $89.60. The annual count and value of newly granted ESPP rights remain unavailable; the $31M future offering budget is an explicit steady-state assumption.

The selected future withholding cash proxy is $277M each quarter, equal to fiscal 2026 annual withholding of $630M plus the latest $755M, divided by five quarters. A separate stress repeats the latest $755M each quarter; another applies additional cash in Q1 and Q3 2028 around disclosed senior-leader vesting windows. The additional 1% annual dilution stress tests future award and ESPP uncertainty.

The final two earned buyback cohorts leave $14,205.78036M of future cash purchases beyond the earnings horizon: $10,807.15167M in Q1 2031 and $3,398.62869M in Q2 2031. Expected economic retirements in those quarters are 1.3702551M and 1.4715325M shares. These retained obligations complete the cash/share schedules while the published earnings and ceilings retain their existing 2030 horizon.

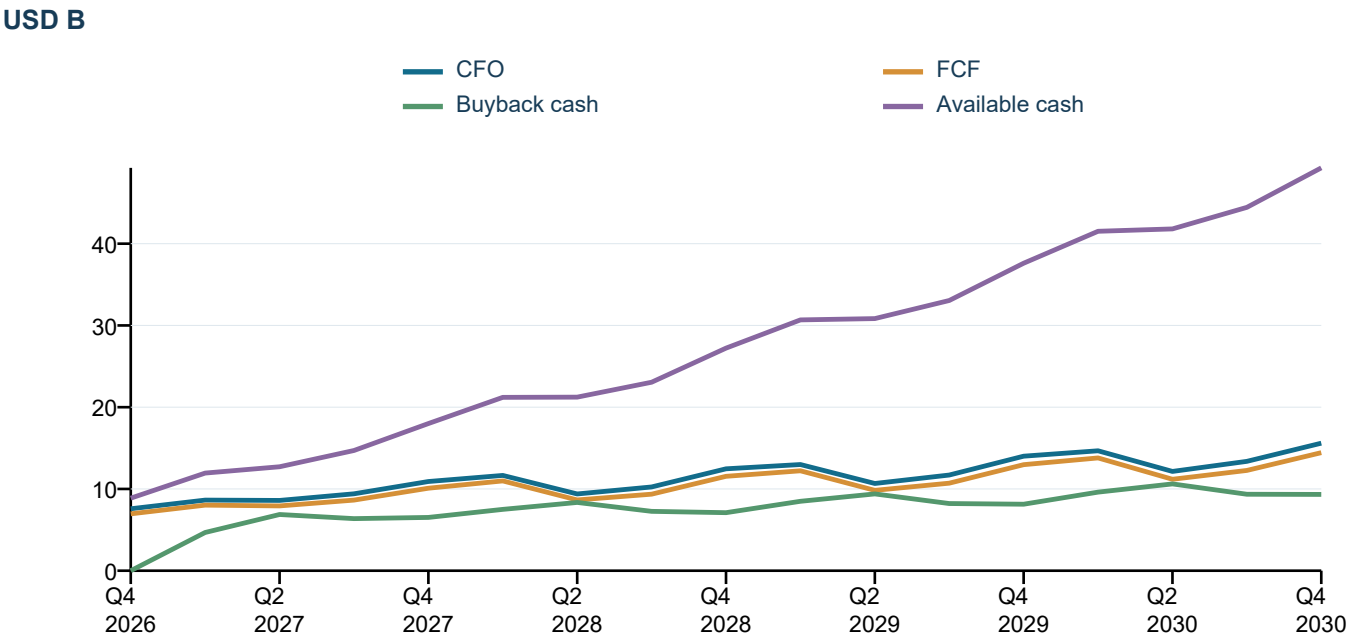

Forecast CFO uses narrow NWC equal to accounts receivable plus inventory less trade and related-party accounts payable. It omits the separate conversion of compensation, accrued operating costs, tax liabilities, deposits and contract liabilities. Cash tax equals 14.3% multiplied by max(OP minus the selected $2M quarterly interest, zero); the source's exact current cash-tax payment is unreported. Own D&A follows $43M divided by $11,031M of source revenue. Inclusive own and net-JV cash capex is modeled at 5% of revenue; the issuer's mid-single-digit guide describes gross capex. Future external funding and wafer-cost financing remain uncertain. The cash bridge includes zero extra addback for the $132M JV tool-depreciation funding already inside wafer costs and the $91M current SBC already excluded from non-GAAP earnings.

Desired budget = max(FCF - award-withholding cash - extra tax settlement, 0) × selected return fraction. Expected budget = currently authorized amount + continuation probability × the amount beyond current authorization. Each cohort's expected retired shares equal its budget × expected retirement fraction × (next-quarter spending fraction / next-quarter execution price + following-quarter fraction / following-quarter execution price). Cohort retirement occurs at the end of the final purchase quarter.

Millions of pre-split-equivalent economic shares

Model figure M7. Economic share denominator after grants and expected retirement. Numerical table follows; all values use the model.

Future grant budget = selected quarterly budget × (1 + annual budget growth)^((quarter index - 2) / 4), starting in Q1 2027. New economic diluted-share equivalents = budget / independent execution price. Ending economic shares = opening shares + new equivalents + any diagnostic extra dilution - expected retirements. Valuation shares are the opening/ending average. Current quarter dilution and purchases embedded in the 151M guide remain an endpoint/settlement uncertainty.

Final earned cohorts retained beyond the earnings horizon		
Settlement quarter	Buyback cash USD M	Expected retired shares M
Q1 2031	10,807.15	1.370255
Q2 2031	3,398.63	1.471533
Total unpaid cash	14,205.78	

13. Catalysts, risks and cross-book tests

Near-term catalysts include guided shipments, customer product qualifications, Stargate QLC ramps, new or extended NBMs and actual buyback execution. Later milestones include HBF controller integration and samples, BiCS transitions, SLC workload decisions and the pace of customer storage deployment.

The principal risk classes are industry output and price response; technology, joint manufacturing and HBF execution; and contract concentration, enforcement and commercial terms. The score retains a one-point

deduction for each class, totaling three points. Existing price normalization, architecture, launch cost and funding states are reconciled through their operating and cash bridges.

Test the physical forecast against accepted bits, inventory, wafer productivity and available technology mix. Test price realization against comparable products, contract reset terms and floor/ceiling headroom. Test profit against controller, packaging, NAND cost, support and opex. Test buybacks against after-investment cash, liabilities, award withholding, authorization and execution prices.

Kioxia is the closest manufacturing cross-check. Samsung, SK hynix and Micron supply broader pricing and allocation context with different contract and product exposure. SLC can create an incremental counterweight to broad DRAM assumptions if accepted workloads and production become measurable. Memory-content shifts must pass through each company's capture, cost and timing.

Every sensitivity reruns the selected operating, cash, authorization, purchase-price and share path. Controls preserve the absolute multiple schedule and use the same corporate-action basis. The reported 1% extra annual dilution control supplements the low-confidence ESPP and future award-budget assumptions.

14. Sources, completeness and binding

The official October 29 corporate release provides locally retained original HTML, decoded HTML and financial text. The current 8-K and 25-page earnings deck have complete saved web text extracts; attempted original PDF downloads returned 403. The preceding August 5 corporate release has now been recovered as an original public HTML payload with hash-readback verification.

Both full newest call texts were reviewed under their saved Quartr identities. TradingView and Stockanalysis share that provider lineage. Official replay audio remains unreviewed. Provider discrepancies over equity-investment naming and the prior margin answer are preserved; primary financial statements control the reported amounts and units.

The current fiscal Q1 10-Q was not located after refreshed searches. The issuer release states that closing procedures, auditor review and later adjustments can change the preliminary results. Selected fiscal 2026 annual liquidity, NBM, award and EPS notes provide dated context; the full annual filing has not been newly read in this review.

Product-level contract coverage, margin allocations, quarterly physical denominators, exact current legal shares, vesting/withholding, contract prices and future HBF/SLC economics remain specific gaps. Original source exhibits retain their source dates and units. All operating charts are regenerated from the final selected companion model.

The final report binds the companion model, source manifest, selected financial law, independent calculation proof, validated saved workbook and preserved before-master hashes. Exact staged identities and remaining spreadsheet-specific limitations enter the final calculation appendix.

Complete selected control values | typed companion units retained

HBF early conditional GM	0.8	Probability, share or margin fraction, decimal
HBF wafer revenue multiple	4.0	Relative ordinary revenue per wafer-equivalent unit, x
HBF launch support rate	0.05	Probability, share or margin fraction, decimal
manufacturing cost quarter factor 2027 28	0.99	Dimensionless multiplier
manufacturing cost quarter factor later	0.995	Dimensionless multiplier
opex quarter growth	0.025	Sequential quarterly growth, decimal
price scale	1.0	Dimensionless multiplier
volume scale	1.0	Dimensionless multiplier

Complete selected control values | typed companion units retained		
Selected control	**Value**	**Units / cadence**
manufacturing cost scale	1.0	Dimensionless multiplier
opening total cash	5136.0	USD M; cash flow and grant budgets follow their named cadence
opening NBM reserve	2941.0	USD M; cash flow and grant budgets follow their named cadence
opening NWC	8316.0	USD M; cash flow and grant budgets follow their named cadence
opening debt	0.0	USD M; cash flow and grant budgets follow their named cadence
DA rate	0.003898105339497779	Financial amount / revenue, decimal
NWC rate	0.7538754419363611	Financial amount / revenue, decimal
tax rate	0.143	Probability, share or margin fraction, decimal
cash interest	2.0	USD M; cash flow and grant budgets follow their named cadence
cash capex rate	0.05	Financial amount / revenue, decimal
capex scale	1.0	Dimensionless multiplier
lease principal	0.0	USD M; cash flow and grant budgets follow their named cadence
quarter withholding cash	277.0	USD M; cash flow and grant budgets follow their named cadence
additional vesting cash	0.0	USD M; cash flow and grant budgets follow their named cadence
tax settlement extra	0.0	USD M; cash flow and grant budgets follow their named cadence
future grant quarter budget	62.96725	USD M; cash flow and grant budgets follow their named cadence
grant budget annual growth	0.1	Annual growth or output fraction, decimal
additional annual dilution	0.0	Annual growth or output fraction, decimal
return fraction excess FCF	1.0	Probability, share or margin fraction, decimal
dividend fraction	0.0	Probability, share or margin fraction, decimal
buyback fraction	1.0	Probability, share or margin fraction, decimal
remaining authorization	10500.0	USD M; cash flow and grant budgets follow their named cadence
authorization renewal probability	0.8	Probability, share or margin fraction, decimal

Complete selected control values | typed companion units retained		
Selected control	**Value**	**Units / cadence**
buyback next fraction	0.7	Probability, share or margin fraction, decimal
buyback second fraction	0.3	Probability, share or margin fraction, decimal
expected retirement fraction	0.9	Probability, share or margin fraction, decimal
execution price reference	1212.21	USD per pre-split-equivalent economic share
execution quarter growth	0.1	Sequential quarterly growth, decimal
execution price scale	1.0	Dimensionless multiplier
output productivity proxy	0.15	Annual growth or output fraction, decimal

Rate and probability controls in this appendix use decimal form: 0.10 corresponds to 10%. The named growth controls retain their stated annual or quarterly cadence. The companion JSON preserves full numeric precision.

Native Microsoft Excel recalculation remains unverified under the Office-unavailable policy. ArtifactTool saved-file reimport,45 meaningful perturbation/restoration cases, independent arithmetic/package checks and14 rendered workbook views passed on the exact final native file.

Historical SNDK_Q_Model!AK21 preserves its original formula,cached OK,type,style and raw atom. Comparing frozen historical AE21 with refreshed current/future AC22:AC24 can recompute CHECK. The isolated diagnostic projections capture only the original typed OK; current financial calculations have no dependency on this historical check.

Historical Memory_Returns_Model!E196 andE197 preserve original SUMIFS formulas,numeric-zero caches,types,styles and raw atoms. Six deliberately invalid-input cases exposed propagation from future

calculation errors into these historical checks and their descendants. Exact diagnostic projections capture only their original numeric zero. E195,E220 and all descendants remain live; the fresh current cash/share module bypasses these historical checks. Native invalid-input live recomputation retains failed/unverified status.

The39 approved static-label abbreviations change text only. Every financial formula,value,cache,style,source input and package geometry remains byte-exact against the validated financial candidate; final saved-file checks reran after the overlay.

The library-refresh gate uses the exact validated publication receipt and master hash after serial publication. Final publication, reporting and refresh status belong to their dedicated receipts.

Dated source register

S1. Official fiscal Q1 2027 earnings release | 2026-10-29

Original official response payload and decoded HTML retained and verified; current financial tables and release text reviewed.
