FRAMEWORK 8.0 / Model October 2; competitive evidence October 8, 2026

Chroma ATE

2360.TW | Bottleneck / diversified test-platform supplier

AI power test / SLT / photonics test

Chroma sells the testing equipment needed when AI systems become harder to power, harder to cool and slower to test. Reported growth and management order evidence are strong; the model gives additional SLT, AI-power and CPO contributions explicit probabilities, while excluding property and investment gains from operating value.

ACTIVE CEILING	BASE SCORE	OP MULTIPLE	ACTIVE WINDOW
TWD 2,479 / share	82 / 100	20x	Q4 2027 - Q3 2028

20x forward-four-quarter consolidated operating profit / maximum modeled diluted shares in the same four-quarter window; no net-cash addition or net-debt deduction.

Status: Active research model. Model inputs, probabilities and scoring are analyst estimates. Financial units: NT$ billions; share counts: millions.

Current full artifact; numerical model retained from October 2, with October 8 competitive evidence: G:/My Drive/1amInvesting/Artifacts/2360TW_ChromaATE_DeepDive.pdf

The investment case: every harder-to-test AI system expands the wallet

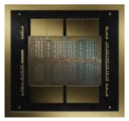

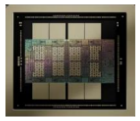

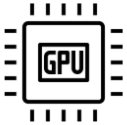

Chroma makes instruments, automated test systems, semiconductor handlers/system-level test equipment and photonics test solutions. The company participates in power conversion, batteries, high-power logic, optical engines and precision metrology. Its equipment helps customers measure whether increasingly expensive systems actually work.

The bottleneck is qualified measurement, thermal handling and test throughput. More power and longer test occupancy can require more test capacity even without equivalent chip-unit growth. But software efficiency, parallel test sites, improved yields and reusable installed equipment can offset demand. This is a qualified test-platform supplier, not a proven universal monopoly.

Framework DB10 compute complexity and DB1 photonics map directly to product requirements. The first phase is AI-server power and SLT deliveries already visible in results. The next phase is optical-engine and CPO-switch insertions. Later architecture shifts expand options, with competitive capture and timing modeled explicitly.

Results are strong; the recurring profit anchor is operating income

H1 2026 revenue was NT$ 25.389128 bn and operating profit NT$ 10.038769 bn. Q2 revenue was NT$ 13.529459 bn, GP NT$ 8.185188 bn and OP NT$ 5.241403 bn after NT$ 2.943785 bn operating expenses. All additive Q2 lines reconcile to H1 less Q1.

Reported net income contains material below-operating items. Q2 property-sale gain was NT$ 0.444229 bn and financial-asset valuation gain NT$ 0.562888 bn; FY2025 had even larger asset-disposal gains. The valuation uses operating profit and does not annualize those gains or the reported EPS.

July and August actual sales totaled NT$ 11.066641 bn. September is not yet available in the official monthly table. A flat-August September produces the Q3 reference NT$ 16.699042 bn, then Q4 reference grows 8%. These are explicit model assumptions, not reported Q3 actuals or numerical company guidance. A small weighted new-configuration premium is separate.

July 30 management guidance is qualitative: semiconductor, AI/HPC/ASIC SLT and optical/CPO contributions support stronger H2 momentum. The most recent exact financial filing controls where deck rounding or transcript numerals disagree.

Year 2026 Guidance

- In the first half of 2026, Chroma delivered consecutive quarters of record-high consolidated sales revenue. Total consolidated revenue in the first half reached NT$25 billion, marking a robust 91% YoY. The parent company revenue increased 92% YoY to NT$20 billion. Performance was supported by strong momentum from two key business units, Test Instruments & ATS and Semiconductor surging 136% YoY and 62% YoY, respectively.
- Year 2026.2H Business Outlook:
  - ✓ For second half of the year, the strong momentum remained.
  - ✓ The second half will be fueled mainly by semiconductor contributions, outperforming the first half with drivers of SLT from AI / HPC / ASIC and Photonics from optical communication / CPO.
  - ✓ The sales revenues of Test Instruments & ATS for power testing continuously contributes from AI server power (included HVDC) and ESS markets.

C3 | H2 operating outlook, issuer presentation p 10. This supports direction and product mix, not a precise 2027 revenue number.

C3 | H2 operating outlook, issuer presentation p 10. This supports direction and product mix, not a precise 2027 revenue number.

Parent product categories must reconcile to the consolidated company

The often-quoted semiconductor/photonics mix of 38% refers to the parent's H1 NT$ 20.360 bn sales. The semiconductor bucket itself is NT$ 7.796 bn and includes SLT, conventional test, metrology and photonics; it is not a CPO-only business. The model retains the separate overseas increment and other subsidiaries before arriving at consolidated revenue.

Product gross margins are not disclosed. We use independent category proxies and calibrate the overseas net-increment margin so the H1 category bridge exactly reproduces reported consolidated GP. This is a modeling allocation, not evidence that any named product earned that margin. The annual and quarterly tables expose every assumption.

FY2025 calibration also reconciles: parent NT$ 22.012 bn + overseas net increment NT$ 5.154591 bn + other subsidiaries NT$ 1.144344 bn = NT$ 28.310935 bn. The Q3/Q4 category weights are projections consistent with stronger semiconductor contribution; monthly revenue does not disclose those weights.

2026.2Q & 1H Product Mix and Consolidated Sales Breakdown

Three operating breadcrumbs, with separate eligible pools

AI power: management said AI-server power exceeded 60% of the power business and described full-year orders and delivery pressure. Our 2027 reference already grows the power category 20% from Q4's annualized level. The additional conditional AI outcome combines 25% system growth with 20% test content, equivalent to 50% growth on the eligible 60% pool. Only the residual receives 55% probability.

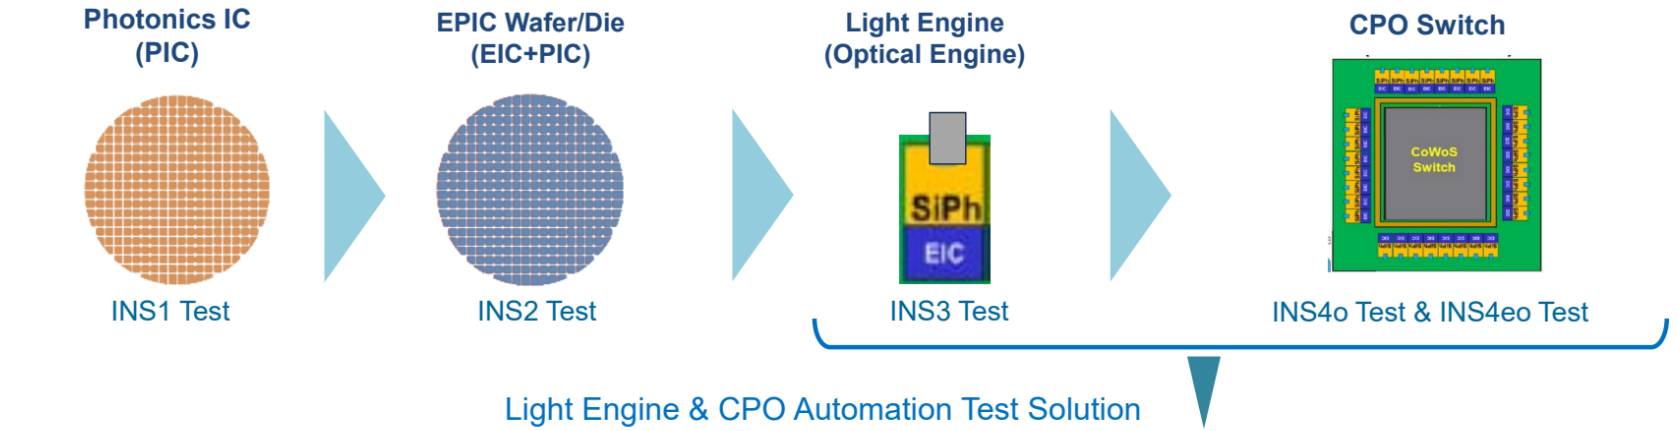

SLT: management described a customer's test plan expanding from four hours to six-eight hours and an approximately 70% revision to requested units. The transcript's device model names are inconsistent, so no precise AMD platform booking is asserted. Reference semiconductor growth is already 35%; the residual 35 points applies to an assumed 60% SLT pool and receives 65% probability. It is a bounded program envelope, not a disclosed segment forecast.

CPO: management described received INS3/INS4O orders and larger order quantities, with Nvidia named and Marvell not yet ramped. Reference semiconductor growth includes an estimated CPO share. The active increment is 55% of the difference between a larger conditional CPO wallet and that embedded share. Costs include qualification/R&D in addition to ordinary SG&A.

The 2027 power and semiconductor references are not simple analyst consensus extrapolations. They combine monthly actuals, disclosed product scope, management order intensity and a calibrated demand/content proxy. End-customer capex dollars cannot be uniquely allocated because most customer identities and tool wallet shares are not public. The broader AI capex scenario is a cross-check only.

Pricing power needs a cost bridge, and competitors still matter

The call indicates possible product-specific pricing action, especially new products, but its numeric price-transcription is ambiguous. Rather than adopting that number, the active model carries 35% probability on a one-time 3% new-configuration premium, on a defined eligible part of reference power and semiconductor sales. Production/support costs absorb 25% of the premium and variable SG&A absorbs another 10%. It is not a repeated annual escalator.

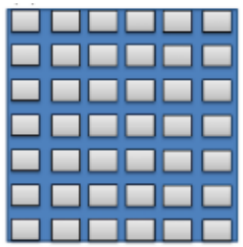

Memory, passive components and IC costs already pressured Q2 gross margin. Reference margins therefore remain near the calibrated current mix and ease slightly in later power/semiconductor years. Operating leverage comes through explicit fixed and variable SG&A, not through assuming all extra sales become profit. Future factory depreciation remains in product cost; cash-flow D&A is added back only in the cash bridge.

Phase II capacity began ramping in early 2026 and the issuer says major construction is largely complete. This supports shipment feasibility, but no public tools/year ceiling or CPO-dollar backlog was found. Manufacturing uses many low-volume configurations, making component availability, acceptance and engineering resources material constraints.

Teradyne Photon 100, Advantest/OpenLight, FormFactor and Yelo cover overlapping or adjacent optical-test functions. Some are complements at one insertion and competitors at another. The model does not translate a current INS4 claim into permanent all-CPO share. Advanced metrology and tentative 2027 FT-handler/CPU expansion are retained in the semiconductor reference, not stacked as new whole-market increments.

Two management calls: what changed between April and July

The April 30 and July 30 issuer-call transcripts were retrieved through Quartr/TradingView and compared using management responses rather than analyst premises. Audio was not separately transcribed. Current filing tables control financial numbers where automated captions contain errors.

April management said the original 2026 forecast excluded CPO. By July it described received and larger optical orders, while still withholding dollars, units and ASP. That progression supports a weighted incremental CPO pool; it does not make the analyst question about a 15-20% photonics mix a management forecast.

April expected a battery-cell contribution in Q2; July discussed Q3 shipments. This is an observed timing caution. The power model does not add a second battery stream on top of its AI-power and BBU reference.

April management expected the retained Phase II towers to provide physical capacity for roughly three to five years. That helps the feasibility of the expansion model, but physical space is not a guaranteed throughput, trained-engineer or qualified-component limit.

Management described optical 4O as a kind of SLT. The model therefore defines ELECTRONIC SLT as its separate 60% eligible pool and CPO as a distinct optical pool, with the remaining products in other semiconductor uses. The nomenclature alone is not permission to count the same optical order in both signals.

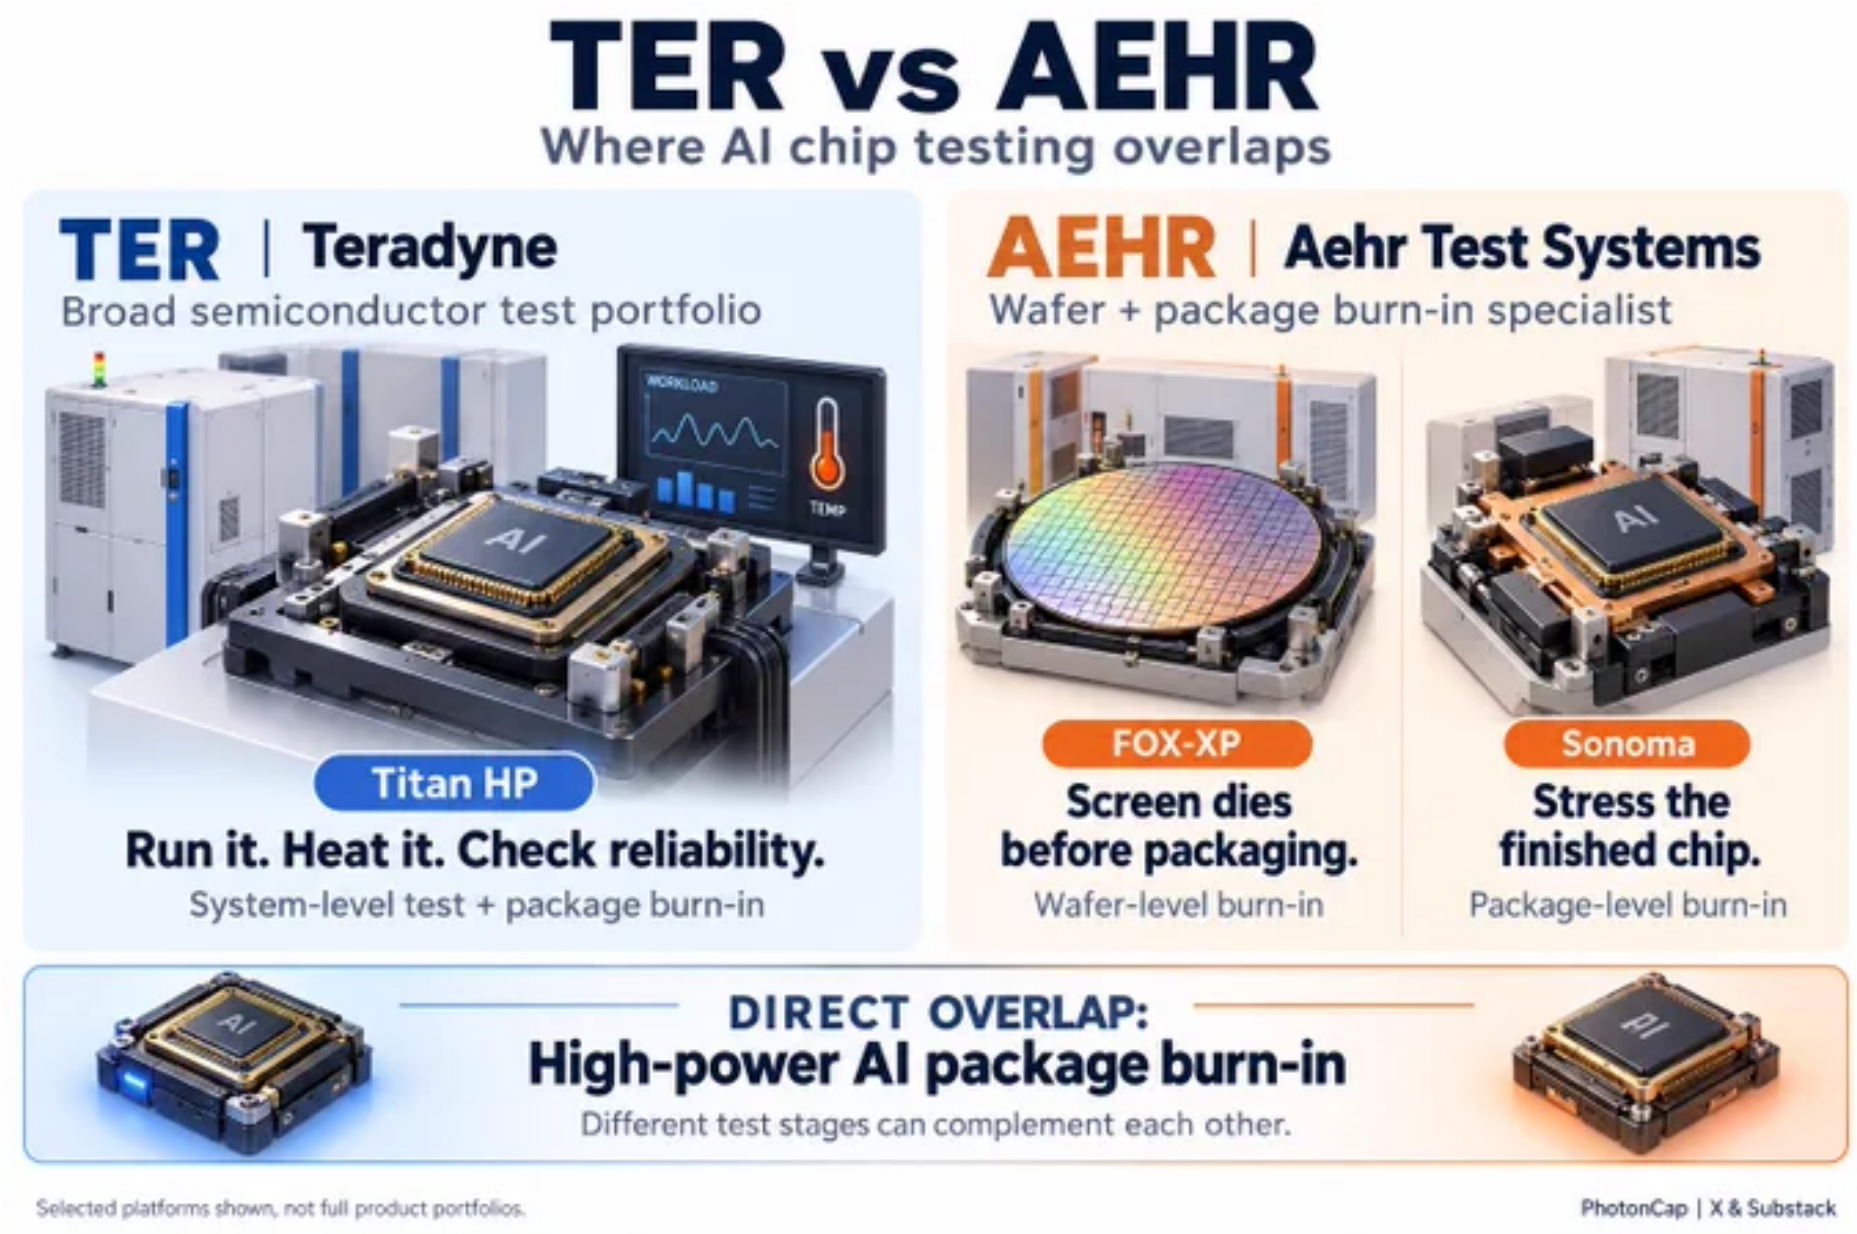

April 30 call reference: official quarterly results and recordings; official Q1 2026 video. The narrative comparison uses the retrieved transcript; audio was not independently transcribed.

Titan HP: distinguish electronic SLT from package burn-in

Teradyne's October 6 release describes Titan HP production deployment combining package burn-in and system-level test, independent device thermal control and kilowatt-class power. It strengthens competition for high-power finished packages. It does not establish a lost Chroma customer or general displacement of AI power, optical CPO, contactors or wafer-level burn-in.

Chroma already serves high-power electronic SLT through thermal-control/test-system combinations. Titan SLT competition belongs in that baseline; the new burn-in insertion should not become a fresh loss across the whole semiconductor segment. Chroma's primary AI-test material describes high-power thermal solutions including 31000R and A31000 configurations. These are different systems/configurations, not directly comparable throughput benchmarks against Titan.

Teradyne issuer release, October 6; Chroma AI test applications.

PhotonCap stage-comparison graphic, October 7, 2026. It identifies package versus wafer burn-in; no Chroma customer loss, price or comparative throughput measurement is supplied.

Bounded competitive diagnostic; no active numerical addition

Assign **30% research probability** to an incremental scenario: a **5% net price concession on 10% of already probability-weighted incremental electronic SLT revenue**. Reference SLT, AI power and optical CPO are excluded. The 10% is an unallocated contestable-program bound, not reported customer share; the growth probability is not treated as certainty. The current Q4 2027-Q3 2028 weighted SLT increment is approximately **NT$4.311bn**.

This diagnostic gives **NT$6.4665M lost revenue**, **NT$0.323325M expense savings** at 5% of lost revenue, and **NT$6.143175M lower OP**. At 20× and about 430.088845M diluted shares, that is **NT$0.29/share**, under 0.02% of the ceiling. Bounds of 25-35% probability, 5-20% contestable exposure and 3-7% concession produce about **NT$1.54-20.07M OP loss**. These are analyst assumptions, not observed discounts.

Active incremental revenue and OP remain zero for this source. Existing electronic-SLT competition is already recognized; the new package-burn-in function does not identify an additional Chroma program or allocable price pool. The small unallocated diagnostic remains a watch item instead of an invented deduction. This is not zero probability or a confirmation gate: a named contested insertion, accepted competing tool, measured pricing or comparable test economics can support a branch before reported earnings.

No additional optical CPO penalty is applied. The 65% electronic SLT, 55% CPO, AI-power and new-configuration pricing branches, 20× valuation, share schedule and **analytical/portfolio Excel Base 82** remain. Longer customer test times, increasing device complexity and market growth can support several qualified suppliers. Next checks are accepted SLT orders, customer concentration, test parallelism and realized system pricing.

Cash, dilution and the cost of growth

June cash plus current financial investments was NT$ 13.679911 bn, but an NT$ 8.260028 bn cash dividend was payable. Subtracting that dividend, borrowings NT$ 3.780060 bn and leases NT$ 0.672529 bn leaves only NT$ 0.967294 bn on a static balance-sheet bridge. It is not correct to add nearly NT$ 10 bn of pre-dividend net cash as enduring surplus.

H1 operating cash flow NT$ 5.353931 bn lagged net income as receivables and inventory absorbed cash. The forecast uses a 36%-of-annualized-sales working-capital proxy, explicit capex and dividends. It is a planning model with securities included in opening resources; no financial-asset appreciation is forecast and no cash is added to valuation.

Forecast dilution starts at 425.820 m shares, the highest recent reported diluted weighted count, with a stated 0.5% annual allowance. This avoids reverse-engineering shares from a Q2 EPS table whose printed denominator does not fully reconcile. Existing issued restricted shares are not added twice. The same-window maximum share count prices each ceiling.

Future annual growth beyond 2027 moderates by category: power 20%/15%/12%; semiconductor 30%/20%/15%; services 12%/10%/10%; overseas net increment 18%/15%/12%; other subsidiaries 10%/8%/8%. These are medium-to-low-confidence continuation assumptions. The first 12-16 months have substantially stronger evidence than the 2030 tail.

Cross-book implications, risks and the next tests

Chroma and WinWay monetize different pieces of testing: instruments and systems versus contact/interface content. Neither revenue pool can be added directly to the optical-module TAM. ASE, Amkor and Ardentec demand can provide test-adoption context; power and cooling suppliers reveal rack complexity, while AI chip roadmaps reveal test intensity.

The newly supplied Serenity/LITE quote is corroborated by official Optica captions: Lumentum expects to meet only about 30% of customer requests in the 2027 InP/CPO/NPO context, with balance hoped for around 2029-30. It supports scarcity and qualification importance, but can also delay optical assemblies. It allocates no Chroma tool units. It informs CPO probability/timing; no second numerical demand uplift is added to the same production wave.

Three risk points are scored: customer/capex concentration (largest FY2025 customer 18.02%); competition and test-efficiency offsets; execution/working-capital and payout demands. Those risks belong in both the score and the actual cost/timing assumptions, not a fabricated extra discount to the final target.

Near-term tests are September monthly revenue, Q3 product/margin disclosure, CPO acceptance and revised SLT deliveries. Reduce the affected ledger probabilities if tests shorten, optical engine production slips, or cost inflation exceeds pricing. Raise them when company-specific shipments support the residual quantities. No official future amount is required merely to retain a justified nonzero weight.

(IV) List of suppliers and customers accounting for 10 percent or more of the Company's total purchases (sales) of goods in either of the two most recent years, amount and percentage of total purchases (sales) of goods, and reason for changes in these figures.

1. List of suppliers accounting for 10 percent or more of the Company's total purchases of goods in either of the two most recent years

Information on major suppliers in the two most recent years

Unit: In thousands of NT$

Item	Year 2024				Year 2025			
	Name	Amount	Proportion to net purchases of goods for the entire year (%)	Relationship with the issuer	Name	Amount	Proportion to net purchases of goods for the entire year (%)	Relationship with the issuer
1	Others	8,558,793	100.00	-	Others	12,047,817	100.00	-
	Net purchase	8,558,793	100.00		Net purchase	12,047,817	100.00	

Explanation for any changes:

The total purchase amount in 2025 increased by 41% compared to 2024, mainly driven by the increase in purchases in response to the significant growth in revenue in 2025. There are no suppliers that account for more than 10% of the total purchase amount in the past two years.

2. List of customers accounting for 10 percent or more of the Company's total sales of goods in either of the two most recent years

Information on major customers for the two most recent years

Unit: In thousands of NT$

C8 | FY2025 largest-customer concentration from the issuer annual report. Customer A is unnamed; do not identify it as a particular chip company from this table. Original exhibit, panel 1 of 2; read from top to bottom.

	Year 2024				Year 2025			
Item	Name	Amount	Proportion to net sales of goods for the entire year (%)	Relationship with the issuer	Name	Amount	Proportion to net sales of goods for the entire year (%)	Relationship with the issuer

Operating cost includes fixed expense, the modeled variable expense share of revenue, and explicitly charged incremental expense. Product margins are model assumptions where the issuer does not report them.

Quarterly product gross profit: complete bridge

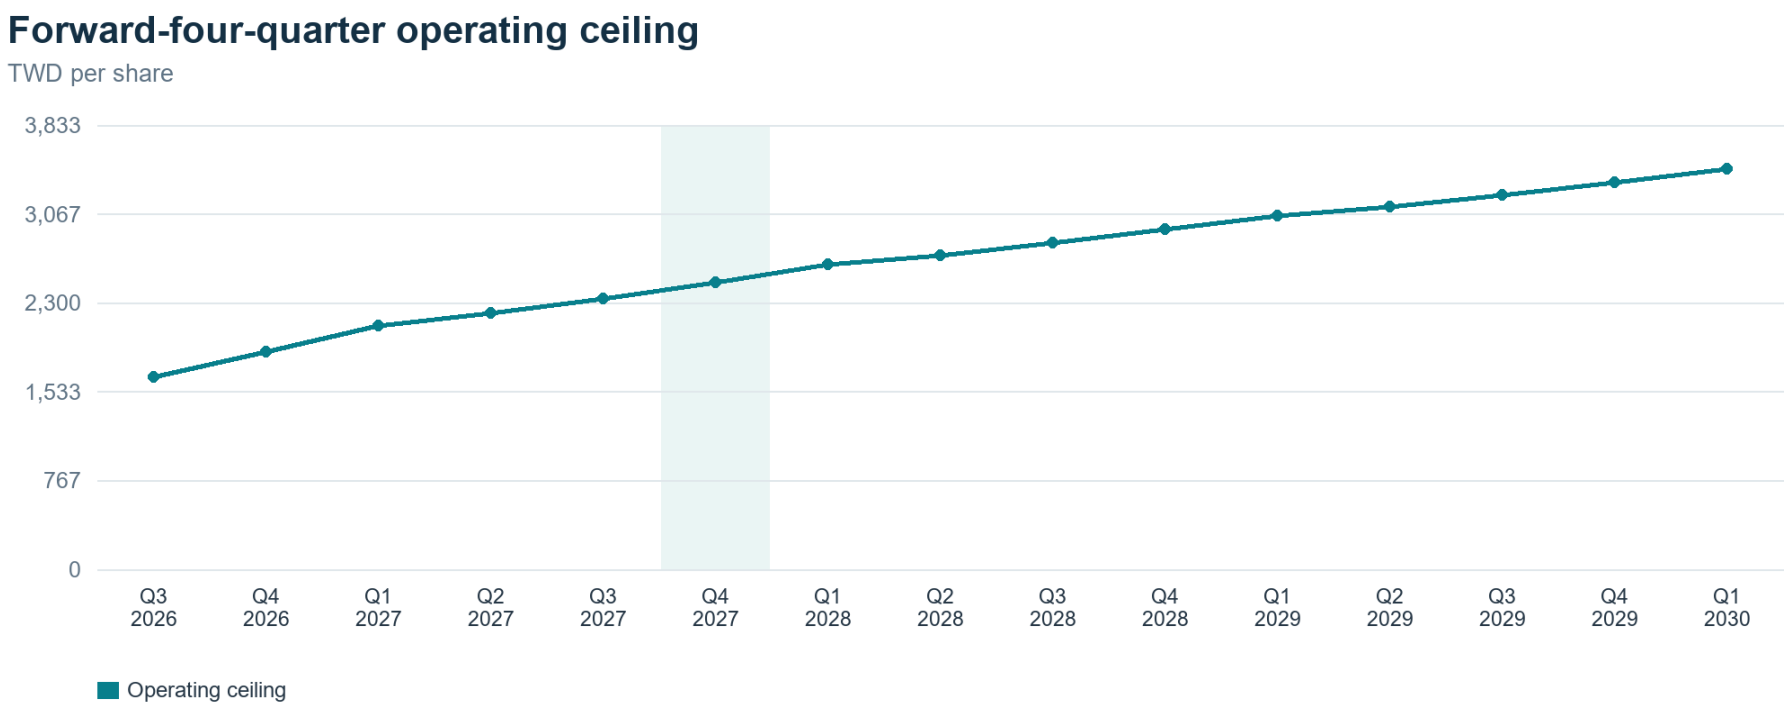

For each product and quarter: modeled GP = reference revenue x reference GM + sum of probability x conditional incremental GP. Consolidated GP is the sum of product GP. Operating profit = consolidated GP - fixed SG&A - variable SG&A rate x modeled revenue - probability-weighted dedicated operating expense.

Modeled quarter	Power / ATS parent	Semiconductor / photonics parent	Turnkey / service parent	Overseas net increment	Other subsidiaries	Consolidated GP

Q4 2029 - Q3 2030	72.497	20x	434.400486	3,338
Q1 2030 - Q4 2030	75.010	20x	434.400486	3,454

Forecast anchor 425.820 m uses the highest recent reported diluted weighted count (Q1), compared with issued 425.245742 m less subsidiary treasury 1.654579 m = 423.591163 m. The 2.228837 m buffer is an explicit dilution reserve, not an outstanding-option count. Annual 0.5% share growth from 2027 is a planning allowance. Already-issued restricted stock is not added again. Q2 printed EPS/share-note arithmetic is inconsistent, so no shares are reverse-engineered fromEPS.

Operating drivers: source anchors and model inputs

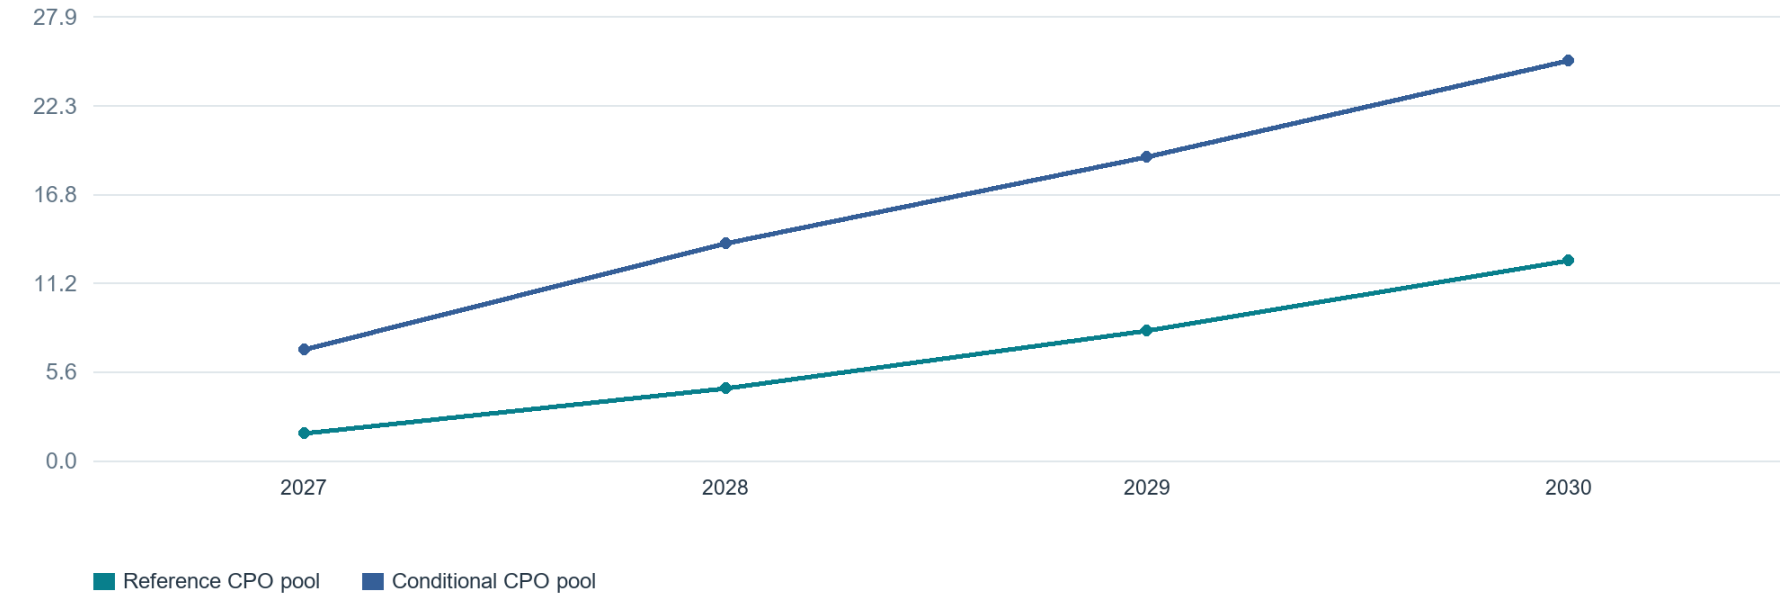

The eligible pools below reproduce the frozen 2027 ledger arithmetic. They annualize the Q4 2026 reference category and apply its stated eligible share. Electronic SLT excludes the separately assigned optical CPO reference pool. These are modeling pools, not disclosed revenue segments.

2027 driver	Q4 annualized category	Eligible share	Eligible pool	Reference growth	Conditional growth	Conditional increment
AI power	31.020	60.0%	18.612	20.0%	50.0%	5.584

2027 driver	Q4 annualized category	Eligible share	Eligible pool	Reference growth	Conditional growth	Conditional increment
Electronic SLT	25.970	60.0%	15.582	35.0%	70.0%	5.454

Modeled optical test pools

NT$ billions

Source: analyst operating model, research cut 2026-10-02. NT$ billions.

Source: analyst operating model, research cut 2026-10-02. NT$ billions.

Modeled year	Parent semi reference	Reference CPO share	Reference CPO pool	Conditional CPO share	Conditional CPO pool
2027	35.060	5.0%	1.753	20.0%	7.012
2028	45.578	10.0%	4.558	30.0%	13.673
2029	54.694	15.0%	8.204	35.0%	19.143
2030	62.898	20.0%	12.580	40.0%	25.159

Only the conditional-minus-reference CPO difference enters the CPO_TEST probability ledger. The table shows unweighted pools; it does not report company optical orders, systems, ASP or revenue. Units: NT$ billions.

Annual reference assumptions before probability increments

The reference path is the starting scenario, before any probability-weighted ledger increment. These are full annual reference assumptions as supplied by the model; the final fiscal year may only be partly present in the 18-quarter operating schedule.

Reference product revenue - NT$ billions

Product	CY 2027	CY 2028	CY 2029	CY 2030
Power / ATS parent	37.224	44.669	51.369	57.534
Semiconductor / photonics parent	35.060	45.578	54.694	62.898
Turnkey / service parent	2.655	2.973	3.271	3.598
Overseas net increment	13.072	15.425	17.738	19.867
Other subsidiaries	2.222	2.444	2.640	2.851

Reference product gross-margin assumptions

Product	CY 2027	CY 2028	CY 2029	CY 2030
Power / ATS parent	62.0%	61.5%	61.0%	61.0%
Semiconductor / photonics parent	67.0%	66.5%	66.0%	66.0%
Turnkey / service parent	60.0%	60.0%	60.0%	60.0%

Other subsidiaries	35.0%	35.0%	35.0%	35.0%

Reference fixed and variable SG&A assumptions

Reference year	Fixed SG&A (NT$ billions)	Variable SG&A / revenue
CY 2027	7.509	10.0%
CY 2028	8.710	10.0%
CY 2029	9.930	10.0%
CY 2030	11.121	10.0%

Annual product totals and cost structure

Annual totals cover the quarters present in the 18-quarter model. A period marked fewer than four quarters is partial; it is not a full-year forecast.

Period / quarters	Power / ATS parent	Semiconductor / photonics parent	Turnkey / service parent	Overseas net increment	Other subsidiaries	Revenue
CY 2026 / 2	15.18	12.23	1.19	5.31	0.97	34.90
CY 2027 / 4	40.57	41.76	2.65	13.07	2.22	100.27
CY 2028 / 4	48.68	55.53	2.97	15.42	2.44	125.06
CY 2029 / 4	55.98	66.64	3.27	17.74	2.64	146.28
CY 2030 / 4	62.70	76.64	3.60	19.87	2.85	165.66

Period	Revenue	Gross profit	COGS	SG&A / opex	Operating profit	GM	OP margin
CY 2026	34.90	21.60	13.29	6.77	14.83	61.9%	42.5%
CY 2027	100.27	62.68	37.59	17.68	45.00	62.5%	44.9%
CY 2028	125.06	78.02	47.04	21.47	56.56	62.4%	45.2%
CY 2029	146.28	90.89	55.38	24.86	66.03	62.1%	45.1%
CY 2030	165.66	103.04	62.61	28.03	75.01	62.2%	45.3%

Product assumption provenance

Product	Source / model basis	Confidence
Power / ATS parent	P226 p 9 parent-to-group bridge; H126 consolidated controls; future physical/content proxies	HIGH actual / MEDIUM extrapolation / LOW product-GM and incremental capture
Semiconductor / photonics parent	P226 p 9 parent-to-group bridge; H126 consolidated controls; future physical/content proxies	HIGH actual / MEDIUM extrapolation / LOW product-GM and incremental capture
Turnkey / service parent	P226 p 9 parent-to-group bridge; H126 consolidated controls; future physical/content proxies	HIGH actual / MEDIUM extrapolation / LOW product-GM and incremental capture
Overseas net increment	P226 p 9 parent-to-group bridge; H126 consolidated controls; future physical/content proxies	HIGH actual / MEDIUM extrapolation / LOW product-GM and incremental capture
Other subsidiaries	P226 p 9 parent-to-group bridge; H126 consolidated controls; future physical/content proxies	HIGH actual / MEDIUM extrapolation / LOW product-GM and incremental capture

Probability ledger: conditional outcomes

Each probability applies once to the specified incremental outcome above its reference path. These are analyst judgments, not issuer guidance. Positive and negative interactions remain governed by each stated overlap rule.

ID / outcome	Probability	Active-window incremental revenue	Active-window incremental OP
AI_POWER - AI power-test content and orders outgrow the reference	55.0%	3.513	1.827
SLT - Longer test occupancy converts into incremental SLT installations	65.0%	4.311	2.457
CPO_TEST - CPO insertion orders broaden into a meaningful testing revenue stream	55.0%	4.420	2.210
PRICE - Complex new test configurations earn a bounded price premium	35.0%	0.626	0.407

Active window: Q4 2027 - Q3 2028. Units: NT$ billions. Incremental OP includes variable operating expense and any dedicated incremental expense.

AI_POWER | AI power-test content and orders outgrow the reference

Assigned probability: 55.0% | 2026-07-30 call; October 2 cut

Evidence

July 30 management call: AI server power exceeds 60% of power/ATS; orders cover full year, delivery pressure and PhaseII expansion. Aug 3 power roadmap.

Reference path

Monthly-anchored Q3/Q4 reference, then category-specific annual growth below.

Conditional outcome

2027 conditional AI portion grows 50% versus 20% reference:25% system-volume growth times 20% test-content growth = 50%. Use 60% of Q4 2026 annualized power reference as eligible. Extra revenue = (1.50-1.20)*60%*Q4power*4; later extra grows 20/15/12%. Incremental GP 62%; full variable SG&A 10%.

Probability rationale

55% on this bounded incremental shipment/content outcome; management has direct order visibility, but separate unit counts and wallet shares are not disclosed.

Overlap control

Reference 20% power growth includes existing demand; only 30-point residual on 60% eligible AI portion. Broad AI capex is a demand cross-check, not a supplier award. No whole-company 50% uplift.

Revision trigger

Raise to 70% if next results confirm AI-power delivery acceleration without lead-time dilution; cut to 30% if customers defer delivery or rack-power content is served by existing tools.

Probability-weighted quarterly effect

Quarter	Incremental revenue	Incremental GP	Incremental OP
Q3 2026	0.000	0.000	0.000
Q4 2026	0.000	0.000	0.000

Q4 2030	1.329	0.824	0.691

SLT | Longer test occupancy converts into incremental SLT installations

Assigned probability: 65.0% | 2026-07-30 call; October 2 cut

Evidence

July 30 management call: a customer moved planned 4h tests to 6-8h and revised units about 70%, deliveries beginning Q3.

Reference path

Monthly-anchored Q3/Q4 reference, then category-specific annual growth below.

Conditional outcome

Electronic SLT is assumed 60% of total parent semiconductor reference. This 60% pool excludes optical CPO; the separate reference CPO5% in 2027 leaves 35% other products. Conditional 2027 electronicSLT installation growth 70% vs 35% reference; incremental 35pp*60%*Q4semi*4. Extra grows 30/20/15% in 2028/29/30. Incremental GP 67%, full 10% variable SG&A.

Probability rationale

65% that longer-test deployment supports the modeled residual across eligible programs; this is above the basic management-hint band because actual monthly deliveries also support ramp, but the customer/program scope limits certainty.

Overlap control

70% applies to one described customer program, so using 60% of the segment as eligible is a LOW-confidence upper envelope, probability-weighted. Reference already captures 35% growth. Test time and extra machine count are one signal, not multiplied together.

Revision trigger

Raise if SLT shipments and accepted installations separately support the envelope; reduce to 35% if parallelism, faster tests or customer concentration erode tool-per-chip intensity.

Probability-weighted quarterly effect

Quarter	Incremental revenue	Incremental GP	Incremental OP
Q3 2026	0.000	0.000	0.000
Q4 2026	0.000	0.000	0.000

Q4 2030	1.781	1.193	1.015

CPO_TEST | CPO insertion orders broaden into a meaningful testing revenue stream

Assigned probability: 55.0% | 2026-07-30 call; October 2 cut

Evidence

July 30 issuer call: INS3/INS4O POs and larger orders; Nvidia named, Marvell not yet ramped. P226p 14 product architecture.

Reference path

Monthly-anchored Q3/Q4 reference, then category-specific annual growth below.

Conditional outcome

Reference semiconductor path embeds CPO5/10/15/20% in 2027/28/29/30. Conditional CPO wallet = 20/30/35/40% of that same reference segment. Only 15/20/20/20-point difference is extra. Incremental GP 65%; dedicated qualification/R&D 5% plus general variable SG&A 10%.

Probability rationale

55% on specific extra share-of-wallet proxy: POs establish the route, but dollars, production dates and competitive tool share are undisclosed.

Overlap control

CPO increment applies to a separate product pool from SLT. Management claimed a unique INS4 implementation, not universal CPO-test monopoly. Do not multiply optical module TAM by Chroma revenue share.

Revision trigger

Increase after accepted production-tool orders with dollar scale; reduce to 30% if optical-engine fragmentation delays deployment or Teradyne/Advantest/FormFactor capture the relevant insertions.

Probability-weighted quarterly effect

PRICE | Complex new test configurations earn a bounded price premium

Assigned probability: 35.0% | 2026-07-30 call; October 2 cut

Evidence

Issuer call qualitative pricing room; urgent delivery, larger power and test-time requirements. Exact transcribed price rate is ambiguous.

Reference path

Monthly-anchored Q3/Q4 reference, then category-specific annual growth below.

Conditional outcome

A one-time 3% premium on 50% of parent power+semi reference in H2 2026 and 70% from 2027. Incremental production/support cost 25% of premium, plus full 10% variable SG&A. No repeated annual compounding.

Probability rationale

35% on realized premium over the reference: credible scarcity/complexity, no verified broad percentage increase.

Overlap control

Eligible reference revenue only: neither volume increments nor CPO/SLT weighted additions receive a second premium. Ordinary mix already in reference GM; this covers explicit new-configuration contractual premium.

Revision trigger

Raise on new-order ASP/net-margin evidence; set to 15% if expedite costs consume premium or fixed-price backlog dominates.

Probability-weighted quarterly effect

Quarter	Incremental revenue	Incremental GP	Incremental OP
Q3 2026	0.068	0.051	0.044

Diluted shares +10%	2,254	-225

Planning cash bridge: first ten quarters

June cash plus all current financial investments 13.679911 bn includes market-valued securities; borrowings 3.780060 bn and leases 0.672529 bn. Approved dividend 8.260028 bn is deducted once in Q3 2026. Remaining economic net cash after that dividend and debt/leases was only 0.967294 bn on a static June bridge. Future operating NWC is 36% of annualized quarterly sales; opening 18.280172 bn is a calibrated planning proxy, not a reported NWC subtotal. Annual capex 3/4/4.5 bn and later dividends 12/16/20/24 bn are explicit planning reserves, not company guidance. No investment-sale gains in OP, no cash added to ceiling; negative cash would require financing review.

Quarter	Opening cash	OP	D&A	Interest	Cash tax	NWC change	CFO
Q3 2026	13.68	7.07	0.30	0.04	1.55	5.86	-0.08

Q2 2027	5.85	0.75	0.00	15.24	34.65
Q3 2027	6.56	0.75	12.00	9.04	37.54

Quarter	CFO	Capex	Dividend	Ending cash	Required operating NWC
Q4 2027	7.26	0.75	0.00	15.55	40.43
Q1 2028	10.90	1.00	0.00	25.46	39.62
Q2 2028	7.37	1.00	0.00	31.83	43.22
Q3 2028	8.26	1.00	16.00	23.09	46.82
Q4 2028	9.14	1.00	0.00	31.23	50.42

Planning identities: CFO = OP + D&A - interest - cash tax - change in operating NWC. Ending cash = opening cash + CFO - capex - dividend. Financing and other items are included only when explicitly described in the supplied model. Units: NT$ billions.

Framework score: complete summing table

Dimension	Awarded	Max	Scoring rationale
Core thesis	17	20	Qualified testing know-how and specific CPO insertion advantage; competitors prevent company-wide monopoly classification.
Cycle stage	9	10	AI-power shipments already scaling, SLT order acceleration and CPO production insertions next.
TAM expansion	9	10	Power content, longer test occupancy and optical testing extend different product pools; explicit overlap deductions.
Catalysts	4	5	Upcoming Q3 results, H2 deliveries and 2027 CPO/SLT acceptance; exact next call date unverified.
Macro	9	10	AI electrical/optical complexity is structural, with capex and qualification timing risk.
Alpha	4	5	Parent/group reconciliation, call-level order changes and net-income one-off exclusion distinguish the operating thesis.
Risks	-3	0	-1 customer/capex concentration; -1 competition/testing efficiency; -1 execution, working-capital and payout demands.
Total points	49	60	Base = round(total points / 60 x 100)
Base score	82	100	Risk deductions are included in the total.
