Ajinomoto

2802.T | Tokyo Stock Exchange Prime | 2026-10-07

Q4 2027 model ceiling: JPY 4,399.81

Analytical Base 44/60 = 73 | Diversified compounder with a dominant qualified ABF franchise

20x rolling Q+next3 IFRS operating profit after a 12% non-Functional-Materials minority proxy, plus only the probability-weighted acquired Malaysian minority profit; subtract matched financial claims and divide by window-end diluted common shares.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in JPY m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: JPY 5,372.00 per share (2026-10-06 close); 955.354 million common shares (2026-06-30 legal ordinary outstanding; includes BIP trust stock); estimated equity capitalization JPY 5,132,160.3 million. Cross-date estimate: Yahoo Japan daily close times issued977.735616m less corporate treasury22.381875m. Reported accounting treasury23.173875m includes0.792m BIP trust shares, added back for legal outstanding. Model diluted count is separately953m initially after known subsequent buybacks and the BIP allocation. This dated common-share snapshot is separate from forecast diluted shares.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	233,734.2	20x	953.800	4,399.81

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Fully expensed IFRS OP retains production D&A, R&D, SBC, corporate costs and net other operating charges. Equity-accounted profit retains issuer IFRS operating classification; no extra investment NAV credit.. 20x rolling Q+next3 IFRS operating profit after a 12% non-Functional-Materials minority proxy, plus only the probability-weighted acquired Malaysian minority profit; subtract matched financial claims and divide by window-end diluted common shares.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use JPY m unless a different unit is stated.

Thesis

Ajinomoto combines a dominant package-insulation franchise with a much larger food, ingredient and healthcare business. The model gives a **Q4 2027 ceiling of ¥4,399.81 per ordinary share**, using **20x forward-four-quarter IFRS operating profit attributable to common shareholders**, matched financial claims and 953.8 million diluted shares at the end of the valuation window. The analytical Base is **73/100**, or 44/60 before scaling. A strong engineering position does not by itself establish attractive valuation headroom.

The active valuation window is **Q4 2027 through Q3 2028**. These are calendar quarters. The company's FY2026 runs from April 2026 through March 2027. The model has 18 operating quarters through Q4 2030 and 15 rolling valuation windows through Q1 2030; confidence declines materially beyond 2027.

The product and the profit pool

Ajinomoto Build-up Film, or ABF, is an insulating material between copper wiring layers in semiconductor package substrates. It is not the completed substrate, a copper foil, the glass core, or the chip. Package manufacturers are the direct customers; semiconductor companies influence specifications downstream. The valuable product is a qualified formulation that can be processed reliably at the customer's required dimensions, wiring density and operating conditions.

The June 30 management briefing claims a market share above 95%. That is an issuer statement about ABF's relevant market, not a 95% share of all packaging materials. It also does not mean 95% of Ajinomoto revenue is semiconductor revenue. In the August forecast, Functional Materials generates ¥120.6bn of group sales of ¥1,732.0bn, only about 7%. Its ¥65.5bn business profit is disproportionately valuable, but central expenses and other operating charges still have to be paid.

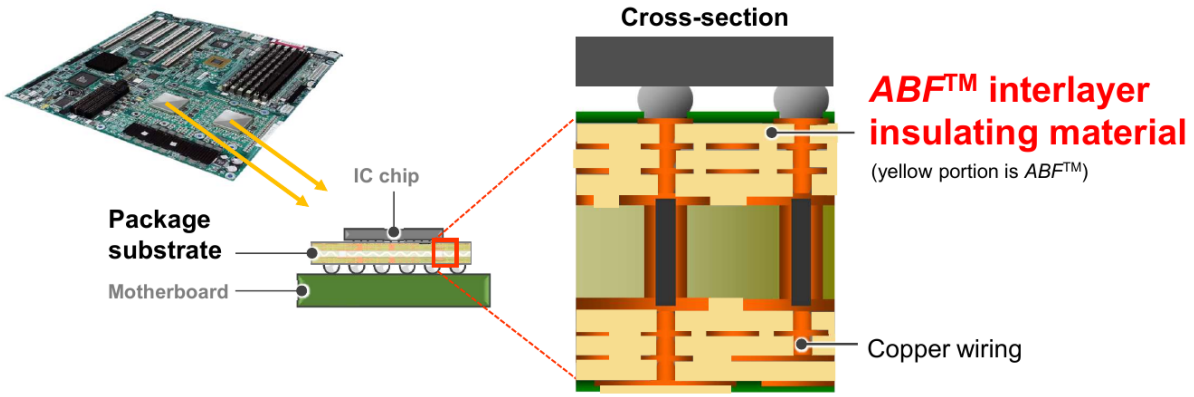

Functional Materials includes ABF, adhesives, magnetic materials, activated carbon and release paper. Ajinomoto Fine-Techno reported FY2025 sales of ¥98.383bn and operating profit of ¥53.012bn; those numbers corroborate the size and profitability of the franchise but do not provide a pure ABF income statement. The model keeps Functional Materials as a disclosed business vector and uses a separately labeled 90% ABF weight only for a narrow pricing sensitivity. This is not derived from the >95% market-share claim.

The other vectors matter. Seasonings and Foods covers consumer sauces, soups and coffee as well as industrial ingredients and sweeteners such as aspartame. Frozen Foods has lower margins and recently experienced recalls and higher logistics costs. Bio-pharma includes amino acids, culture media and CDMO services; it is not all a high-margin drug royalty business. Other healthcare and miscellaneous operations remain separate.

Eat Well, Live Well.
AJINOMOTO

ABF™: An Interlayer Insulating Material Supporting Logic ICs

The main product of our Electronic Materials Business, *ABF*™, is an insulating film used between layers of package substrates for logic ICs. *ABF*™ sees use in PCs, network equipment, servers, AI-related equipment, gaming devices, and more.

Main categories of logic ICs

CPU Central Processing Unit	GPU Graphics Processing Unit	ASIC Application-Specific IC
A processor with advanced arithmetic processing functions, for use in servers and PCs	A parallel computing chip used in image processing and AI	ICs designed and manufactured for specific applications such as AI

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

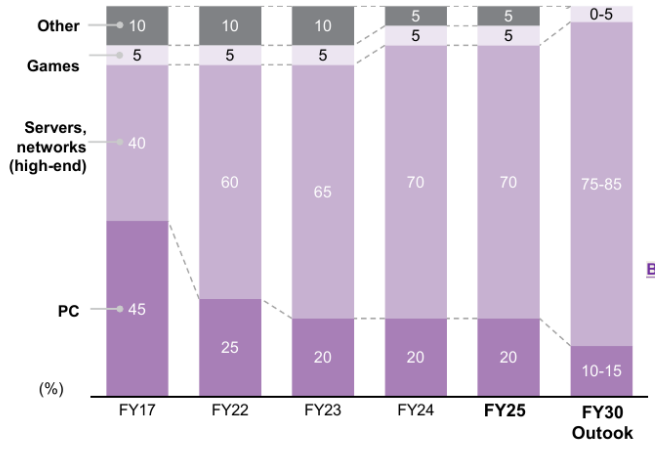

abf | ABF is the insulating film between copper layers, not the whole package substrate.

I-10. Functional Materials (Electronic Materials and Others)

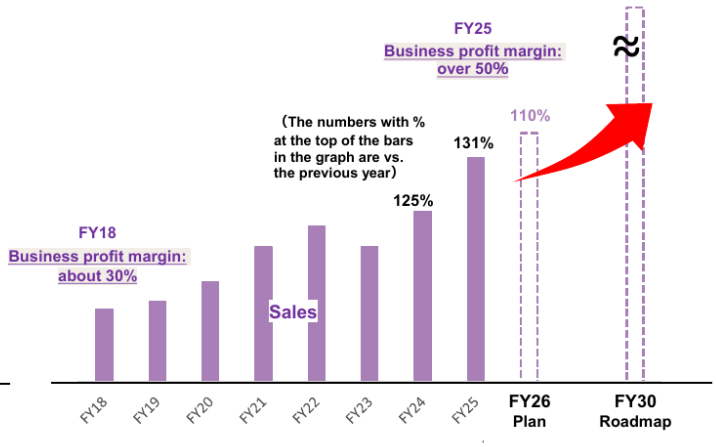

Revenue and profit increased significantly in FY2025 against a backdrop of strong sales of *ABF*™* for high-performance boards related to AI, servers, networks, etc. throughout the year. We foresee continued growth centered on *ABF*™ products in high-value-added and cutting-edge fields.

**Ajinomoto Build-up Film*™. "*ABF*" is a registered trademark of our company.

Quantities by *ABF*™ Application

Functional Materials, sales and business profit margin

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

fy_slides | Quantities by application are not revenue mix. FY25 high-end server/network use70%; issuer FY30 outlook75-85%.

Engineering content and qualified capacity

The issuer illustrates a progression from a roughly 70mm-square package with nine build-up layers per side, to a 100mm-square package with eleven per side, and eventually a 120mm-square package with thirteen per side from 2031 onward. Holding processing losses and film thickness constant, area times layers gives about **2.49x** material content for the first transition and a further **1.70x** for the second. These are geometry diagnostics for the illustrated packages, not forecasts for every package or a license to multiply all company sales by those factors.

Larger substrates can raise dielectric-film consumption while also worsening warpage, registration, contamination and manufacturing yield. The film manufacturer may sell material that ends up in rejected substrate panels, but repeated poor yields can delay customer adoption and damage long-term demand. The model therefore treats qualified content, price/mix and yield as connected economics rather than three independent demand shocks.

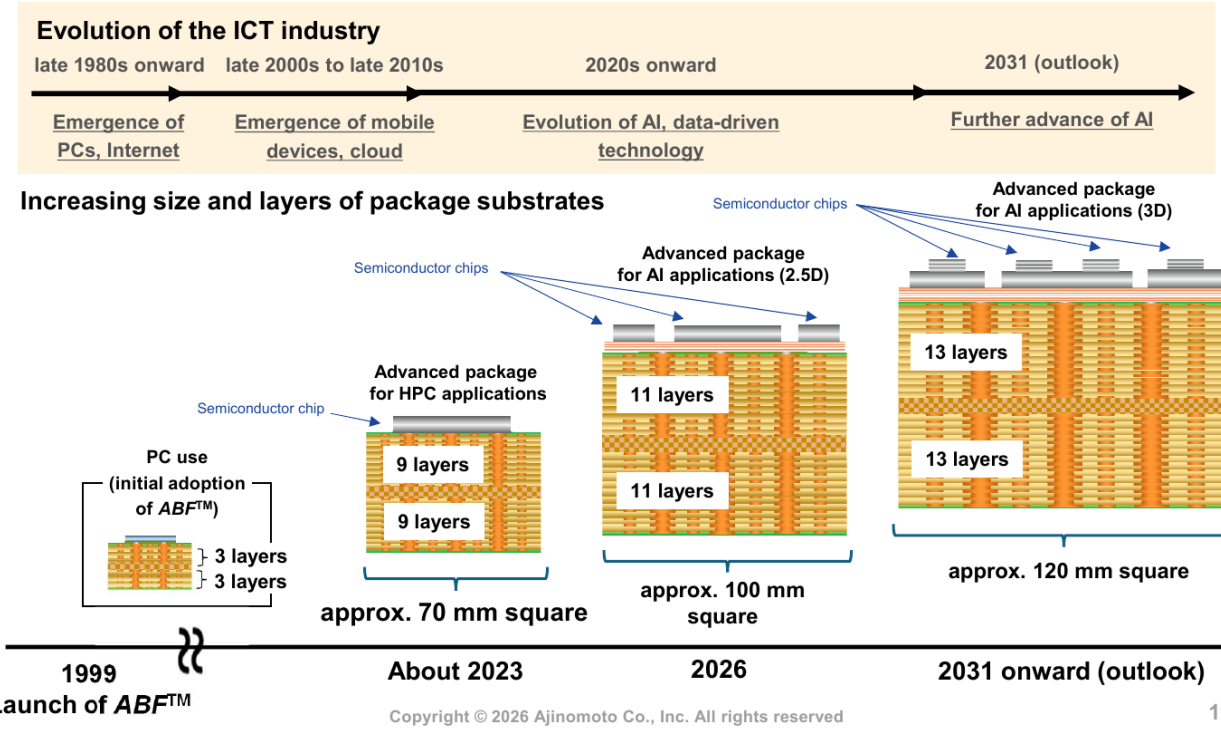

Ajinomoto's qualification system reproduces customer processes: vacuum lamination, via formation, copper wiring, reliability testing and warpage measurement. Formulation must balance low loss, insulation, adhesion, heat resistance and mechanical behavior. Changing material can require process and reliability requalification across more than one participant in the supply chain. This accumulated process compatibility is a stronger barrier than a patent count alone.

The production chain is also specific. Ajinomoto manufactures varnish through precision weighing, mixing and filtration. Coating onto PET film, cutting, storage and refrigerated logistics involve outsourced partners. Installed varnish capacity is therefore not identical to qualified shipped film. A bottleneck in coating, contamination control, freezing or substrate-customer qualification can prevent nameplate output from becoming recognized revenue.

Eat Well, Live Well.
AJINOMOTO

Increasing Size and Layering of Package Substrates and Increasing Amount of *ABF*™ Used per Substrate

As technology evolves in the ICT industry, semiconductors are becoming larger and having a higher level of integration, and package substrates are also becoming larger and having more layers. In line with this, the amount of *ABF*™ used for high-performance semiconductors is also increasing.

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

abf | Issuer examples:70mm/9+9 layers,100mm/11+11 layers, and120mm/13+13 layers from2031 onward. Do not move the final example into2027.

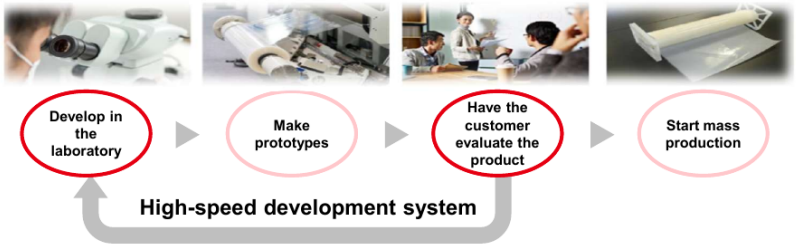

Development and Production Structure

Eat Well, Live Well. AJINOMOTO

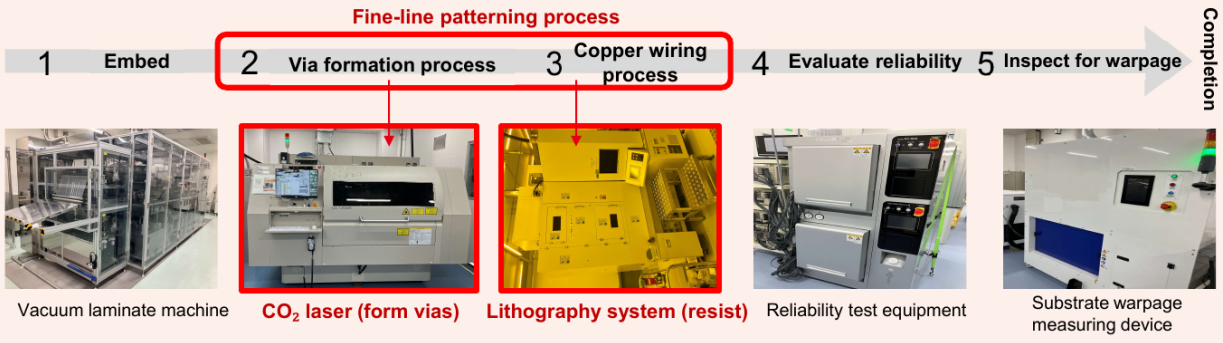

Reproduction of Customer Processes to Support High-Speed Development

Substrate design premised on *ABF*™ has become standard due to our high-speed development, which is grounded in our track record and reliability. Also, our structure that reproduces customers' manufacturing and evaluation processes in our Group is a key foundation supporting high-speed development.

Steps in *ABF*™ development

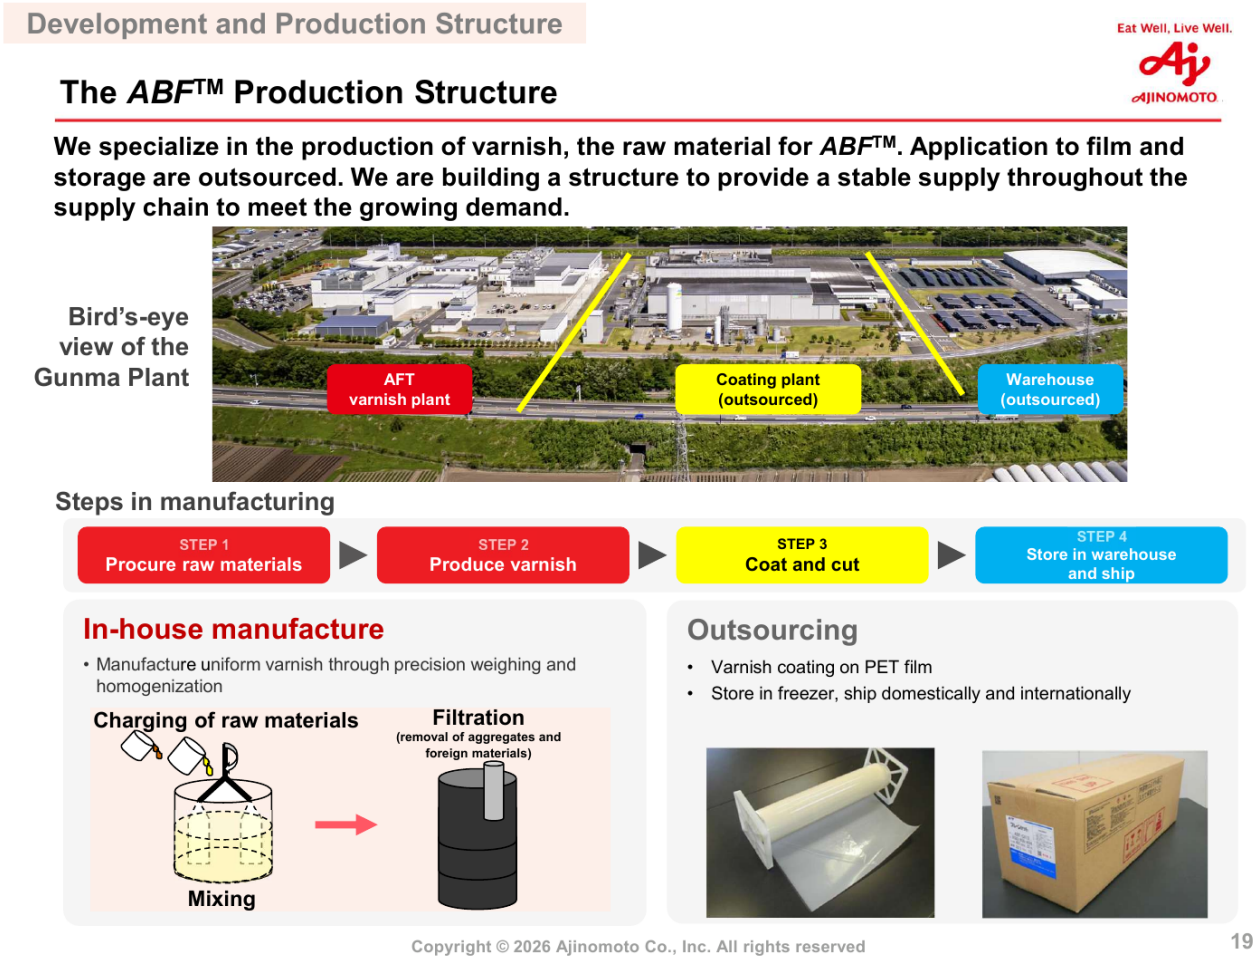

Customers' manufacturing and evaluation process

▶▶**Our in-house reproduction of the fine-line process in particular is a key foundation that supports compatibility with the increasing size and layers of substrates**

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

abf | Qualification reproduces customer lamination, via formation, copper processing, reliability and warpage tests.

abf | Varnish is in-house; coating/cutting and refrigerated logistics are outsourced parts of the same good-output chain.

Capacity, capital and recognition timing

The new Gunma varnish plant entered operation in 2025. Management describes a ¥25bn ABF investment budget across 2023-2030, including approximately ¥10bn for the new Gunma plant. This supports staged growth before 2030. The reference already includes that capacity response, rather than treating all future demand as permanently constrained.

The Gifu land purchase is a different project. The approximately ¥1.2bn disclosed amount is the land cost, not the completed factory budget. Construction is planned from 2028 and operations from 2032. The model recognizes **no Gifu output before 2032**, while the funding test includes an illustrative ¥20bn construction reserve during 2028-2030 inside total group capex. The full project cost and milestone schedule remain gaps.

Management said on June 30 that there were no concerns about the current supply chain overall. This is material counter-evidence to an immediate film-shortage thesis. Substrate-maker constraints in glass cloth, copper processing, equipment or good-panel yield can strengthen Ajinomoto's strategic importance without proving that Ajinomoto itself can charge an emergency surcharge.

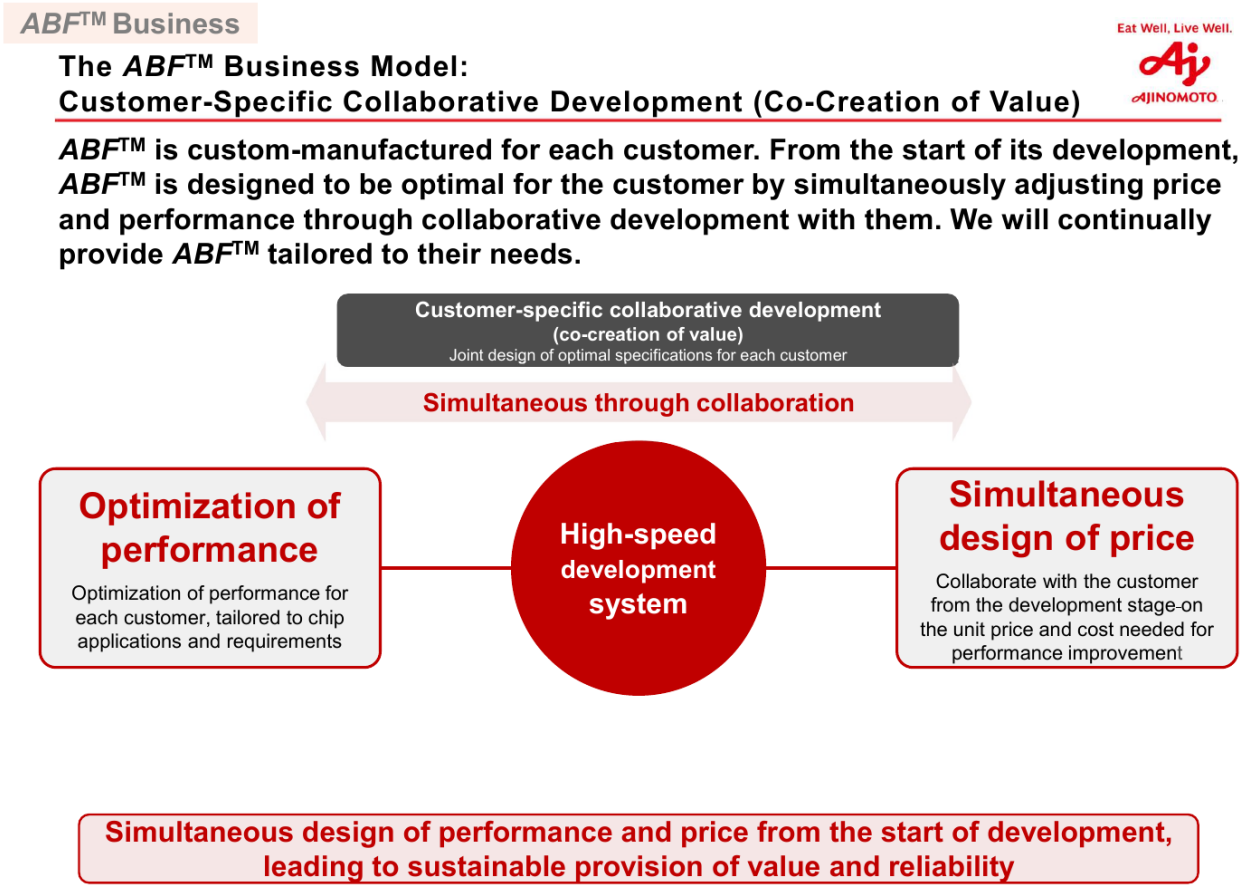

abf | Operating Gunma expansion and future Gifu site have different dates; total2023-30 ABF investment budget isJPY25bn.

Price, mix and customer economics

ABF pricing is developed alongside performance and customer requirements. The May management script explains that higher unit prices have largely reflected a richer mix of higher-performance products. Cost increases in raw materials or utilities can also be passed through after customer discussion. Both mechanisms differ from a pure scarcity premium on an unchanged product.

Customers have a high cost of failure: unusable substrates can delay much more valuable processors. That supports willingness to pay for reliably qualified material and faster adoption. Nevertheless, Ajinomoto must pay for R&D, testing, rejects, coating, logistics and production equipment. The incremental margin calculation does not assume that every extra yen of price is profit.

The reference grows Functional Materials sales to ¥150bn, ¥180bn, ¥210bn and ¥240bn in calendar 2027-2030. One equivalent decomposition uses a volume/content index of 120, 140, 158 and 175 relative to the FY2026 sales base, with price/mix indices of approximately 1.04, 1.07, 1.10 and 1.14. These are calibrated indices, not disclosed square meters or a forecast for a single product. Business margins are 55%, 55.5%, 55% and 54% before separately modeled group expenses. The later fade allows for capacity response, qualification cost and competition.

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

abf | Performance and price are co-developed. Higher product mix does not establish a blanket scarcity surcharge.

Verified financial position and management guidance

FY2025, ended March 2026, produced sales of ¥1,583.719bn, gross profit of ¥597.148bn, business profit of ¥181.163bn and IFRS operating profit of ¥199.412bn. A ¥40.6bn gain on the head-office land and building transfer inflated reported operating profit. That gain is not repeated in the forecast.

For April-June 2026, sales were ¥412.105bn, gross profit ¥164.630bn, business profit ¥60.116bn and IFRS operating profit ¥55.895bn. Common net income was ¥36.452bn and minority net income ¥2.860bn. Cash from operations was only ¥18.409bn, partly because inventory absorbed ¥28.633bn; cash capex was ¥33.412bn. A high quarterly margin is not equivalent to equally high free cash flow.

The latest August guidance is **¥1,732bn revenue, ¥202bn business profit and ¥184.2bn IFRS operating profit**, with ¥123.5bn common net income. Business profit excludes net other operating expenses; treating the ¥202bn as the valuation numerator would omit ¥17.8bn of guided costs. The model exactly reconciles April-June actuals plus the next three calendar-quarter reference forecasts to ¥1,732bn sales and ¥184.2bn IFRS OP.

The August revision added ¥9bn sales and ¥5bn profit entirely in Functional Materials. It is embedded once in the reference. No new operating probability overlay begins before April 2027. Disclosed subsegment tables are rounded; the model places small reconciliation residuals in other healthcare rather than inventing another growth business.

Gross margins by model vector are assumptions because the issuer does not disclose that granularity. Segment selling, R&D, administration and SBC, shared corporate expense, and net other operating charges remain

expensed. Equity-accounted profit is separately visible and follows the issuer's IFRS operating classification; its investment book value receives no additional NAV credit. Ordinary production depreciation is retained in gross profit.

Ⅰ-4. Revised Forecast for FY2026

Assumed exchange rate: ¥150/USD

Revised upward forecasts for Sales, Business Profit and Profit attributable to owners of the parent company, reflecting strong performance in the Functional Materials business. Impact from Middle East tensions, which was not factored into the initial forecast, has also been incorporated.

q1_slides | August revision:JPY202bn business profit versusJPY184.2bn IFRS operating profit.

I-8. Healthcare and Others (Functional Materials)

Reflecting Q1 results, the FY2026 forecast was revised upward (sales: +¥9.0 billion, business profit: +¥5.0 billion).
Sales of *ABF*™* for high-performance boards used in AI, servers, networks, etc. continue to be strong, and our product mix is also improving.

*Ajinomoto Build-up Film. "ABF" is a registered trademark of our company.

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

q1_slides | The AugustJPY9bn sales/JPY5bn profit increase is fully embedded before new probabilities.

Probability-weighted forward evidence

The active model has separate incremental bridges with explicit overlap. Probabilities are analytical judgments, not management guidance or certainty scores.

- **60% qualified ABF content conversion:** conditional additional sales of ¥8/16/24/30bn in 2027-2030, above the already growing reference. The selected 2027 amount is 5.3% of reference Functional Materials sales, with a bounded range of ¥0-12bn. Gross margin is 65% after manufacturing costs and incremental customer engineering, R&D and selling cost is 12% of revenue. The 2027 increment is recognized from April onward. - **25% new-term premium:** a 1% additional price on 30% of a 90%-ABF proxy for reference Functional Materials revenue in 2027-2028. The premium fades to 0.8% and 0.5% thereafter. Seventy-five percent survives in GP and 5% funds extra commercial/qualification work. No premium is applied to the new-volume branch. Supply assurance keeps this probability and pool modest. - **40% additional CDMO conversion:** conditional sales of ¥6/10/15/20bn, at 35% GP and 18% incremental operating expense. These equal approximately 3/5/6/8 customer programs at ¥2/2/2.5/2.5bn annual revenue. They are bounded equivalents, not announced contracts. Existing Forge recovery and ordinary small-molecule growth are already in the reference. - **20% ABF qualification loss:** foregone sales of ¥5/8/10/12bn, with a 60% lost contribution after saved variable costs plus ¥1bn annual rework/qualification expense. This covers an adverse conversion outcome beyond ordinary production losses. - **35% residual food cost gap:** ¥5/4/3/3bn of annual unrecovered cost after expected mitigation. The September announced 5-15% increases on selected products support management's existing response to inflation; they do

not create a second margin windfall. The eligible sales pool is undisclosed and price elasticity remains relevant. - **20% CPO materials option:** conditional ¥1bn revenue in 2029 and ¥3bn in 2030 from one and three equivalent qualified material programs. Gross margin is 45%, incremental R&D/validation/selling cost 25%. There is no extra core-ABF sale merely because an existing package adds an optical engine. - **75% Malaysian minority purchase:** only acquired minority earnings and the corresponding cash consideration enter common value. This creates no new consolidated revenue.

In the active Q4 2027 window, the qualified-content branch adds about ¥4.656bn weighted consolidated OP, the small repricing branch about ¥0.083bn, and CDMO about ¥0.648bn. Qualification losses remove ¥1.145bn and residual food costs remove ¥1.680bn before minority attribution. The Malaysian benefit is then paired with its financial claim. The result is ¥233.734bn forward common OP and a ceiling of ¥4,399.81, compared with **¥4,336.98** without the incremental probability branches. The approximately ¥62.82 difference is an economic change at the same quarter, share convention and multiple.

Competition and the next architecture

Ajinomoto has a powerful installed qualification base, but dielectric chemistry is not immune to substitution. Taiyo publicly markets thermosetting interlayer insulating film for semi-additive processing and photosensitive materials for advanced substrates. Product availability is evidence of competition; it is not proof of a qualified high-end replacement at the same reliability, cost or customer volume.

Glass-core substrates do not automatically eliminate build-up insulation. What matters is the surrounding wiring stack, thermal/mechanical compatibility and qualification of the replacement material. Conversely, a design that moves wiring to another interposer or changes to photo-patternable dielectrics can alter the accessible wallet. The model does not assume every new architecture preserves all existing content.

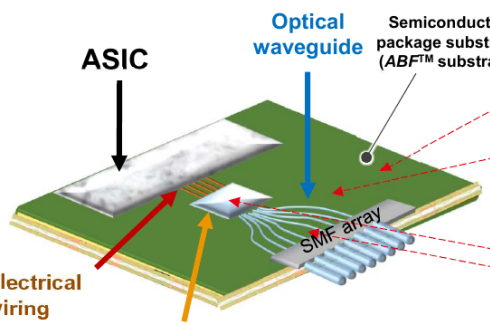

The June deck identifies possible optical waveguides, adhesives and molding materials for CPO. These are opportunities to develop compatible materials around the optical engine, not ownership of the laser, DSP or entire CPO system. Their modest, later probability branch is intentionally separate from current ABF content.

Addressing Future Technologies

Addressing Next-Generation Package Technologies (Evolution from the Current State)

CPO is a technology that performs optical-electrical conversion near ASICs in semiconductor packages to reduce power consumption by shortening the electrical interconnect distance. We will evolve *ABF*™ and leverage our strengths, such as our technologies and infrastructure, built up through *ABF*™, to contribute to the advancement of packages.

CPO substrate

Our business expansion potential (examples)

***ABF*™**

Optical waveguides

- Polymer optical waveguide materials based on formulation design technology
- Design of means of guiding light (path, branching, loss)

Adhesives and molding materials

- For bonding optical engine components and fiber connections.
- Compensation for supporting alignment tolerance and stable optical coupling

- The semiconductor package and ASIC are placed on the PCB substrate. The configuration integrates the optical engine that performs optical-electrical conversion into the same package, and directly connects the semiconductor package to the external optical fiber.
- By significantly shortening the electrical interconnect distance between the ASIC and the optical engine and converting the electrical signal to an optical signal at an early stage, this achieves low power consumption and high-speed transmission.

Copyright © 2026 Ajinomoto Co., Inc. All rights reserved

abf | CPO waveguides and bonding are potential extensions; existing ABF is not incremental merely because the package uses optics.

Capital, ownership and dilution

At June 30, cash was ¥196.979bn and interest-bearing debt including leases approximately ¥623.7bn, giving a starting financial claim of ¥426.721bn. Other current financial assets of ¥38.259bn are not automatically unrestricted cash. Book minority interests of ¥73.845bn are not deducted as a second debt claim.

The model reserves 12% of non-Functional-Materials IFRS OP for minorities. Functional Materials is wholly owned and retains its full profit. The proxy is calibrated to the roughly ¥10bn annual NCI net-income guide using a 27% tax convention; it is not a precise subsidiary valuation. All shared expenses are included before this calculation. The debt/cash ownership allocation is less precise: full consolidated net financial claims are subtracted against common-attributed OP, a conservative treatment until subsidiary balances are available.

The Malaysian proposal concerns the remaining 49.62% of a business already consolidated. Its FYMarch2026 operating profit was MYR79.095m. At the disclosed ¥40.16/MYR reference rate, the acquired annual OP is ¥1.576bn before 4% subsequent model growth. The selected 75% probability applies both to that benefit from Q1 2027 and to ¥24.2bn consideration. September reporting of shareholder approval supports the process, but final legal completion was not verified. The internal merger of wholly owned AFT planned for April 2027 adds no ownership profit; an unquantified possible tax benefit receives no OP or cash bonus.

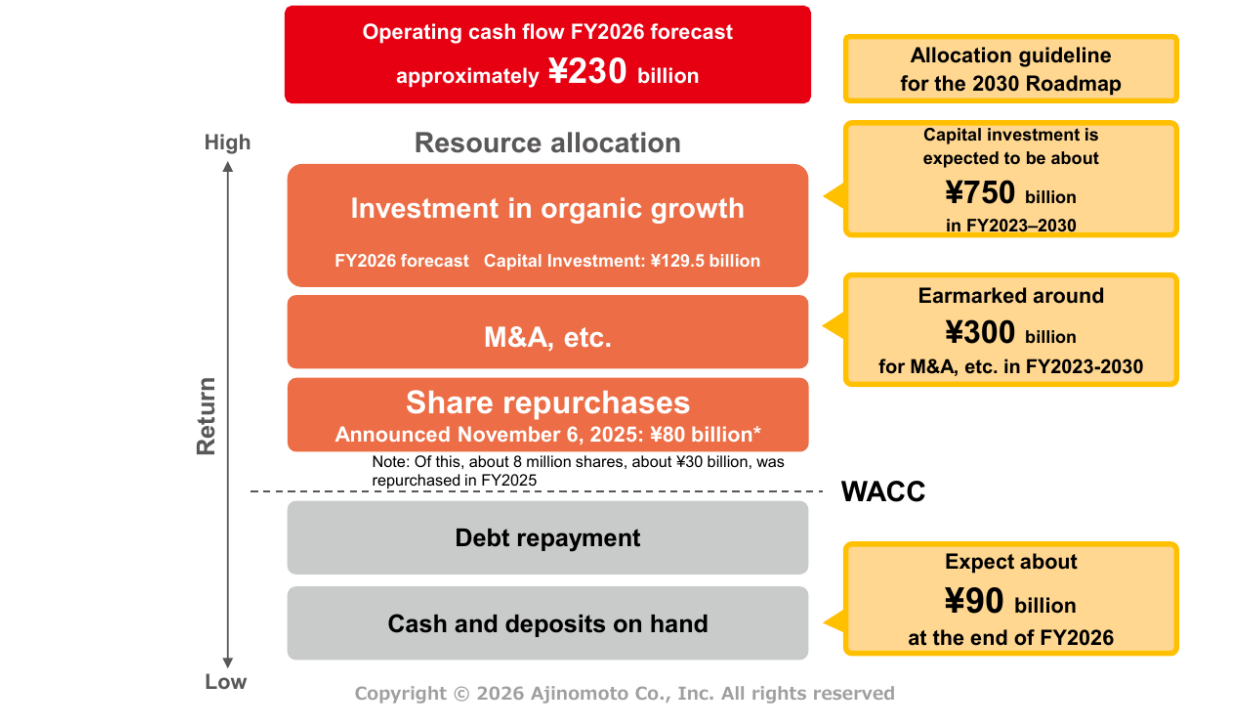

All share figures are after the April 1, 2025 two-for-one split. June issued shares were 977.735616m, with 23.173875m accounting treasury shares including 0.792m in the BIP trust. July-September repurchases totaled

3.6368m. The July resolution allocates another 0.751m shares to the executive BIP trust. Counting existing and allocated awards as future equivalents gives approximately 952.468m; the model starts at 953m and adds 0.1m per quarter. It gives no denominator benefit for the uncompleted buyback authorization, while the funding sensitivity reserves its remaining cash cost. SBC remains expensed.

Reference and active funding repay the June current debt bucket over the next four quarters, retain a commercial-paper rollover assumption, pay leases and dividends, and fund ¥129.5-150bn annual group capex assumptions. Those later capex reserves are deliberately above the issuer's older aggregate roadmap when combined with past investment; they test greater capital intensity rather than claim updated guidance. The March contractual table includes interest, so later principal schedules are approximate and are not presented as exact maturity dates. Contracted March PP&E and intangible commitments of ¥29.567bn and ¥0.462bn are covered within the investment envelopes, not added twice.

The minimum modeled cash is ¥118.4bn in the reference and ¥100.1bn in the active case. Maximum reference net claims after the first valued window are ¥454.7bn; active claims peak at ¥473.1bn. A fixed **¥460bn reference claim floor plus probability-weighted Malaysia consideration** exceeds each relevant funding requirement. This avoids giving an unverified valuation bonus for future cash accumulation or additional repurchases.

The combined stress cuts OP by 25%, raises capex 30%, adds ¥40bn working capital and removes all ¥140bn CP rollover while paying the full Malaysian consideration. It ends with a cash deficit of about ¥381.5bn. The disclosed ¥200bn plus US$100m unused committed lines do not by themselves erase that deficit. The stress requires refinancing, investment reduction or reduced distributions; it is not silently solved through unmodeled equity. Operating sensitivities that exhaust the financial-claim floor require a refreshed funding bridge before adoption.

fy_slides | May capital allocation:JPY129.5bn investment and~JPY230bn CFO forFY26; actual June cash and later disclosures control opening balances.

Model cross-checks and falsification

Active calendar sales are approximately ¥1,849.8bn, ¥1,983.2bn, ¥2,120.1bn and ¥2,259.5bn in 2027-2030. Common OP is ¥192.2bn, ¥237.5bn, ¥269.3bn and ¥298.3bn. Functional Materials sales, including the small probability overlays, are ¥153.9bn, ¥188.1bn, ¥222.7bn and ¥256.3bn. Neither the whole semiconductor market nor a supplier's share price is used to infer these sales.

The Base rubric is Core Thesis18, Cycle Stage7, TAM Expansion8, Catalysts4, Macro8, Alpha3 and Risks-4: **44/60 = 73/100** after rounding. No 30x or higher multiple is needed to manufacture a favorable conclusion. The default20x method applies consistently to fully expensed common OP.

The next high-value checks are actual Functional Materials growth against the revised guide; accepted advanced-package production rather than total substrate orders; comparable-specification price and coating-cost realization; food volume after announced pricing; validated CDMO shipments; Malaysia closing; and cash conversion. A delay in qualified output, evidence of price-only cost recovery, a competitor's named volume qualification, or a larger funding requirement would reduce the relevant branch before waiting for a complete annual earnings disappointment.

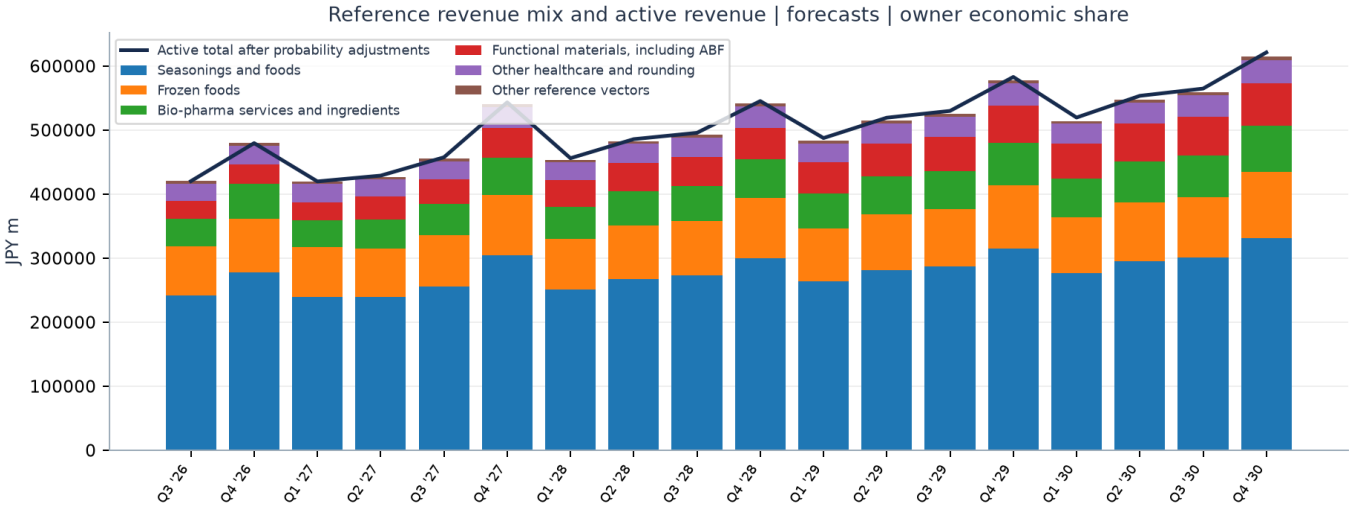

Source and coverage discipline

The primary record includes the annual securities report, May7 complete management script and slides, June30 complete electronic-materials briefing, August6 financial filing and full management deck, October2 and July2 buyback notices, July30 incentive-share notice, the Gifu land announcement, and the Malaysian proposal. Original source pages are embedded at the relevant engineering and financial sections. The current issuer site provides audio for the August call but no verbatim Q&A transcript was located; no claim is made that the audio-only questions were transcribed. The September Malaysian approval report is corroborative coverage, while issuer documents control consideration and operating economics. All post-2026 operating projections and probabilities above are model assumptions.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	18	ABF formulation, customer co-development and qualification create an unusually strong moat, but most group sales remain food.
Cycle	7	New Gunma capacity is operating; mix and content ramp are underway, rather than a newly proven film shortage.
TAM	8	Larger multilayer packages raise material content; CDMO and regional food growth provide separate drivers.
Catalysts	4	November interim results, advanced-package mix, price-cost realization, AFT merger and Malaysia closing.
Macro	8	AI packaging demand and staple-food demand support durability; yen and raw materials create offsets.
Alpha	3	Separate film content from substrate capacity, guide business profit from IFRS OP, and legal minority acquisition from sales growth.
Risk classes	-4	Four risk groups: qualification/substitution, food input and recall risk, investment/ownership, and FX/geopolitics.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

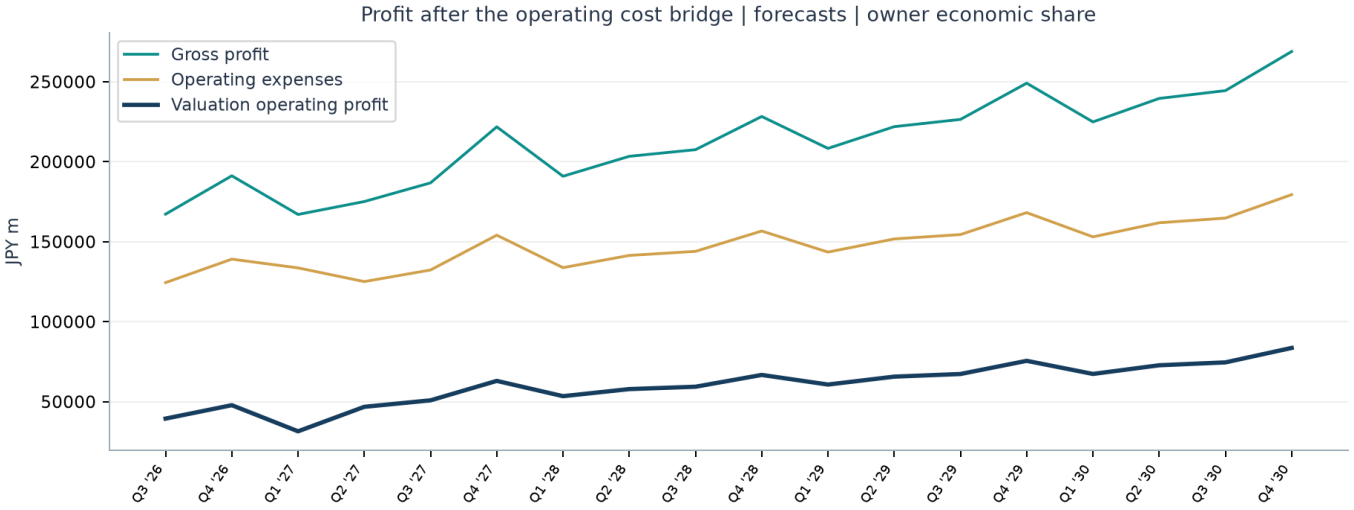

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	420,300.0	0.0	420,300.0
Q4 2026	479,700.0	0.0	479,700.0
Q1 2027	419,895.0	0.0	419,895.0
Q2 2027	427,081.5	1,884.6	428,966.1
Q3 2027	455,553.6	2,010.2	457,563.8
Q4 2027	540,969.9	2,387.2	543,357.1
Q1 2028	453,353.0	2,787.9	456,140.9
Q2 2028	482,919.5	2,969.8	485,889.3
Q3 2028	492,775.0	3,030.4	495,805.4

Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter	Revenue	GP	Opex	Valuation OP	OP margin

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Seasonings and foods	242,000.0	42.0%	101,640.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Wholly owned materials and acquired minority earnings

JPY millions. Functional Materials remains wholly owned. The 12% reserve applies only to other operating profit, including shared costs. The Malaysian minority benefit creates no consolidated sales and is paired with its consideration in financial claims.

Claim decisions, overlap and triggers

ABF_QUALIFIED_CONTENT

p: 0.6

date: 2026-06-30 / 2026-08-06

source: abf pages 10-22; q 1_slides 14-15

hypothesis: Qualified film content and product conversion run modestly above the already growing reference.

reference: Functional Materials reference sales JPY 150/180/210/240 bn in CY 2027-30 already include the August guide increase, Gunma production and ordinary area/layer growth.

Conditional: Additional JPY 8/16/24/30 bn annual sales. For 2027, bounded JPY 0-12 bn; selected 8 bn is 5.3% of reference sales. Begins April 2027, phased 30/32/38% across the remaining quarters.

derivation: An equivalent film-volume index above reference, at unchanged blended price: about 5.3/8.9/11.4/12.5% incremental accepted content. GP 65% after resin, coating, scrap, production D&A and logistics; incremental customer engineering, R&D and sales 12%.

overlap: Entire JPY 9 bn sales/5 bn profit August guide increase already in reference. Do not add AI chip value, substrate-maker selling price, larger area and higher layer count as independent multipliers to the same units.

counter: Reduce to 35% if substrate acceptance or usable varnish/coating yield lags. Raise toward 75% on accepted customer ramps and sufficient qualified coating capacity. Gifu 2032 output is excluded.

ABF_REPRICEABLE_TERMS

p: 0.25

date: 2026-05-07 / 2026-06-30

source: fy_script 26; abf 10,14,19

hypothesis: A small incremental commercial premium on newly negotiated specifications.

reference: Normal premium-product mix already raises the reference margin. Management says no current supply-chain concern and prices are co-designed with performance.

Conditional: 1% above reference price on 30% of a 90%-of-Functional-Materials ABF revenue proxy in 2027-28;0.8% in 2029;0.5% in 2030. Bounded premium 0-2%. Product-share 90% is an analyst assumption, not the issuer >95% market-share claim.

derivation: 75% of added price survives material/utility and outsourced-coating expense, with 5% additional commercial/qualification cost. No extra physical units.

overlap: Only reference units on genuinely repriceable terms. No premium on fixed contracts or the incremental volume branch. Broad substrate supply deficits do not establish an identical film deficit.

counter: Probability is limited by company supply assurance and performance-linked pricing. Remove incremental premium if new prices only recover cost; raise toward 45% if realized comparable-spec net pricing improves.

CDMO_CONVERSION

p: 0.4

date: 2026-05-07 / 2026-08-06

source: fy_script 28-31; q 1_slides 16

hypothesis: Additional customer-program conversion beyond the existing CDMO recovery.

reference: Bio-pharma revenue grows to JPY 195/218/240/261.6 bn in 2027-30, including normal AJIPHASE, small molecule and Forge improvement.

Conditional: JPY 6/10/15/20 bn incremental annual recognized sales; equivalent to 3/5/6/8 customer programs at JPY 2/2/2.5/2.5 bn annual net revenue. These are bounded equivalents, not announced awards.2027 range 0-8 bn.

derivation: GP 35%, incremental process development, validation, quality and sales expense 18%;17% OP contribution before minority proxy. Includes D&A, with no EBITDA substitution.

overlap: No separate addition of every licensing partner or a whole pharmaceutical TAM. Forge EBITDA breakeven guidance is not treated as IFRS profit breakeven.

counter: Reduce to 20% on delayed validated batches or customer funding; increase toward 60% on paid commercial programs. Downstream drug approval remains an independent risk.

ABF_QUALIFICATION_LOSS

p: 0.2

date: 2026-06-30

source: abf 17-22 and annual risk disclosures

hypothesis: Customer acceptance or outsourced coating yields fall below the reference.

reference: Ordinary manufacturing scrap, depreciation and customer support already in reference gross margins.

Conditional: Lost recognized sales JPY 5/8/10/12 bn in 2027-30 plus JPY 1 bn annual incremental rework/qualification expense;2027 loss range 0-8 bn.

derivation: Lost contribution 60% after saved variable materials and coating cost. This branch removes sales and GP; it does not also cut the same reference share.

overlap: No second loss for the same larger-panel or extra-layer complexity. New Gifu capacity has no reference sales to lose before 2032.

counter: Reduce to 10% after successive qualified ramps. Raise to 35% on customer returns, contamination, delivery delays or replacement-material wins.

FOOD_COST_RECOVERY_GAP

p: 0.35

date: 2026-08-06 / 2026-09-01

source: q 1_slides 10-13; food_price

hypothesis: Some input inflation survives management mitigation and announced pricing.

reference: August management includes a potential JPY 25 bn gross cost headwind with intended price/cost mitigation. September 39-product price rises of 5-15% are delivery-dated November/December and support this existing plan.

Conditional: Additional unrecovered cost JPY 5/4/3/3 bn in 2027-30;2027 range 0-8 bn. No new 2026 headwind on top of the same guide.

derivation: Negative GP, no revenue windfall. Non-functional minority reserve declines with lost profit. Announced selling-price rises are not equal to net operating leverage.

overlap: The pricing event has 100% announcement certainty, but zero separate revenue uplift because the baseline already assumes responsive pricing and the eligible product sales pool is not disclosed. The active residual-cost branch tests failure of full recovery.

counter: Reduce to 15% if volume, raw materials and realized net-price data confirm recovery; raise to 55% if price elasticity or delayed delivery prevents it.

CPO_MATERIALS_OPTION

p: 0.2

date: 2026-06-30

source: abf 26-29

hypothesis: Peripheral optical-waveguide and bonding materials generate small commercial sales.

reference: Core ABF for larger packages already included; no separate CPO material sales in reference.

Conditional: JPY 1 bn in 2029 and 3 bn in 2030, equivalent to 1 and 3 qualified product/customer programs at JPY 1 bn annual net material revenue each; zero 2027-28 because selected qualification timetable starts 2029.

derivation: GP 45%, incremental R&D/customer-validation/selling 25%,20% OP contribution. These are model programs, not issuer orders.

overlap: Excludes existing ABF sold into a CPO substrate, optical engines and substrate-maker revenue. No whole CPO TAM capture.

counter: Reduce toward 5% if paid qualification fails; raise toward 35% on named commercial programs. Timeline and counterparties remain undisclosed.

MALAYSIA_MINORITY_BUYOUT

p: 0.75

date: 2026-06-22

source: malaysia release; September 24 press coverage corroborates shareholder approval, final legal closing unverified

hypothesis: Existing 50.38%-owned Malaysian subsidiary becomes wholly owned by Q 1 2027.

reference: Malaysia sales and full operating profit are already consolidated; a minority reserve remains in common profit.

Conditional: Remove only 49.62% of FYMar 2026 operating profit MYR 79.095 m converted at disclosed JPY 40.16/MYR, initially JPY 1,576.15707024 m annually, then 4% annual model growth. Paired consideration JPY 24.2 bn.

derivation: Probability 75% applies to acquired owner OP and cash consideration together. It does not increase consolidated revenue, capacity or GP. Funded cash payment appears once in the funding ledger and once as the valuation financial claim.

overlap: No book-NCI subtraction and no new-sales branch. Consideration is not an operating expense. Benefits begin only at selected Q 1 2027 closing.

counter: Reduce probability or move timing on court/regulatory delay or changed terms. Existing ownership, operating business and announced consideration support a nonzero outcome without pretending completion is verified.

AFT_INTERNAL_MERGER

p: 0.9

date: 2026-08-06

source: q 1_slides 15

hypothesis: Wholly owned AFT merges into the parent April 1 2027.

reference: All AFT operating earnings already consolidated and fully attributable.

Conditional: Administrative simplification and a possible tax benefit; quantified tax amount is not disclosed.

derivation: Zero added OP or revenue because ownership and economic perimeter do not change. Tax effect is outside the 20 x OP numerator and receives no unquantified treasury credit.

overlap: 100% of existing AFT sales/profit already in Functional Materials. Probability 90% is completion assessment, not a profit margin.

counter: Revisit only on quantified recurring operating savings or dated realizable cash-tax savings; do not capitalize the same subsidiary twice.

Remaining bounded uncertainties

- Physical ABF square meters, usable good-output capacity and product-specific prices are not disclosed. Indexed volume and mix are explicit model proxies.

- ABF market share above 95% is an issuer claim. It is not the percentage of group revenue or guaranteed share in new dielectric architectures.

- The 90% ABF weight within Functional Materials is an eligible-pricing proxy; AFT also sells other materials.

- Segment gross margins and operating expense allocation are assumptions calibrated to disclosed business profit. Equity-accounted profit follows the issuer IFRS operating classification.

- The 12% non-functional minority proxy is approximate. Subsidiary-specific earnings and debt/cash ownership are not fully allocated; subtracting full consolidated financial claims against common OP is conservative.

- Malaysia final court/closing documents were not retrieved. June issuer proposal is the controlling economics; September approval coverage is corroborative, not a completion claim.

- Gifu full construction cost is undisclosed. The model includes an illustrative JPY20bn 2028-30 reserve inside total capex and no factory output before 2032.

- Base funding rolls JPY140bn commercial paper. The combined no-rollover stress is unfunded without refinancing, facilities, lower investment or lower returns; none is guaranteed.

- Latest management evidence consists of May 7 full prepared script, June 30 full strategy deck and August 6 full quarterly management deck. No current verbatim Q&A transcript was located; no claim that audio-only Q&A was transcribed.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
