Q4 2027 model ceiling: TWD 4,955.92

Analytical Base 45/60 = 75 | High conviction

20x forward-four-quarter owner-attributable IFRS operating-profit equivalent per diluted end-window share

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	99,669.6	20x	402.225	4,955.92

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

AVC core plus 16.87% Fositek economic interest; reported consolidated revenue is shown separately. 20x forward-four-quarter owner-attributable IFRS operating-profit equivalent per diluted end-window share

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use TWD m unless a different unit is stated.

The investment question

AVC is already a large, profitable supplier to the AI infrastructure buildout. The central question is whether its ability to design, manufacture and qualify an integrated cooling system can retain attractive profit as accelerator power increases. A larger cold plate is not automatically a better business: it consumes more copper, machining time, testing and working capital. The value accrues when AVC can deliver a qualified assembly on schedule and retain more of the selling-price increase than the additional cost.

The present model starts from an unusually strong reported base. First-half 2026 revenue was NT$98.16 billion and operating profit was NT$25.50 billion. September monthly revenue brings preliminary Q3 sales to NT$59.09 billion. The company is therefore not being valued on a hypothetical entry into liquid cooling. The annual report describes 2025 as its first year of large-scale liquid-cooling production and identifies AI servers and ASIC customers as growth priorities. That statement is management's description, while the realized revenue and margin expansion are independently observable in the financial statements. [A3, A4, A6]

The analytical Base is 75, or 45 points out of 60. The score credits demonstrated manufacturing scale, integration and financial capacity. It deducts for customer concentration, uncertain qualified output, geographical exposure and the interim review limitation. It does not assume a monopoly, an exclusive NVIDIA relationship or an awarded share of a future accelerator platform.

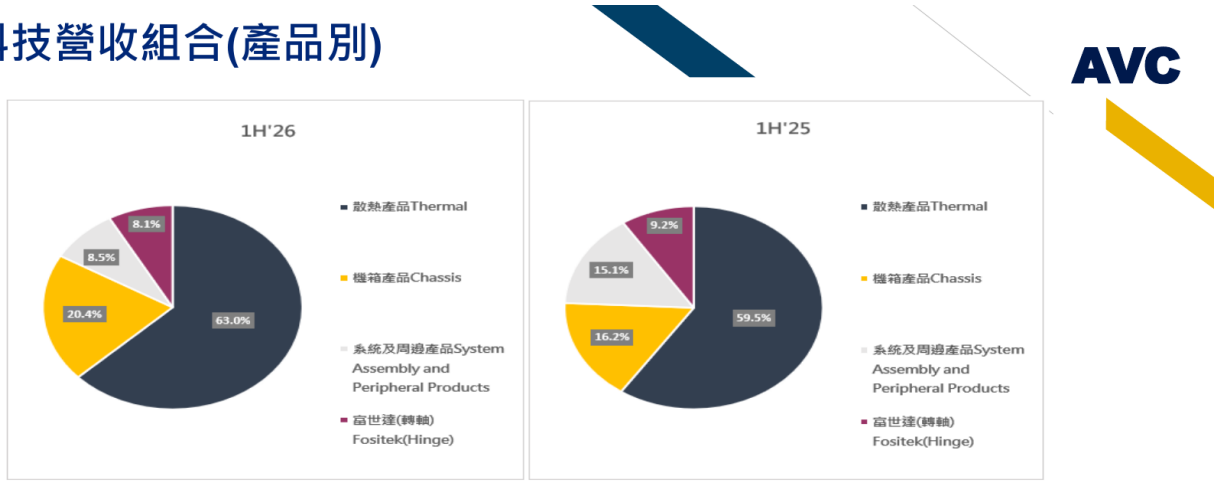

Four businesses, one cooling qualification process

The original Q2 presentation separates four product groups. Thermal revenue was NT$30.63 billion, chassis and mechanical enclosures NT$10.15 billion, system assembly NT$4.60 billion and Fositek NT$3.74 billion. Thermal represented approximately 63% of first-half sales, but includes air cooling as well as liquid cooling. Treating that percentage as a liquid-cooling share would materially overstate the disclosed exposure. The Fositek category is sometimes labeled with its legacy hinge business; Fositek's own first-half disclosure shows that server products were already 55.7% of its revenue. [A1]

AVC supplies fans, heat sinks, heat pipes, vapor chambers, cold plates, manifolds, chassis and integrated systems. Those products solve different parts of the same thermal problem. The cold plate transfers heat from the chip into coolant; the manifold distributes that coolant; connectors permit assembly and servicing; the chassis holds the physical system and routes the interfaces. A complete design must satisfy flow, pressure drop, mechanical tolerances, corrosion compatibility, leakage and service requirements. Good thermal performance on a laboratory sample does not establish repeatable production yield.

The competitive advantage is the relationship between these steps. Customer design work can lead into tooling, pilot qualification and mass production, while an integrated supplier can resolve mechanical and thermal interfaces before the rack is assembled. Annual-report disclosure supports long-standing thermal expertise, in-house critical parts, dedicated customer development teams and a diversified manufacturing footprint. These are meaningful advantages, but buyers can qualify alternative suppliers and standardized interfaces can shift value away from proprietary components. Eaton's own cold-plate description, including production leak and flow testing, illustrates that the engineering barrier attracts capable competitors rather than creating an exclusive franchise. [A4, A8, A9]

The application chart is a second view of the same sales. Server products were NT$64.92 billion in the first half, or roughly 66% of consolidated revenue. That figure must not be added to thermal revenue or chassis revenue. Likewise, internal sales from Fositek to AVC are already reflected in consolidated accounting; adding a connector wallet on top of the complete module invoice would count the same economic activity twice. [A1, A3]

AVC Confidential 10

Original issuer exhibit | Original product mix. Thermal includes both air and liquid cooling; the Fositek category is not all hinges. This product view must not be added to the application view.

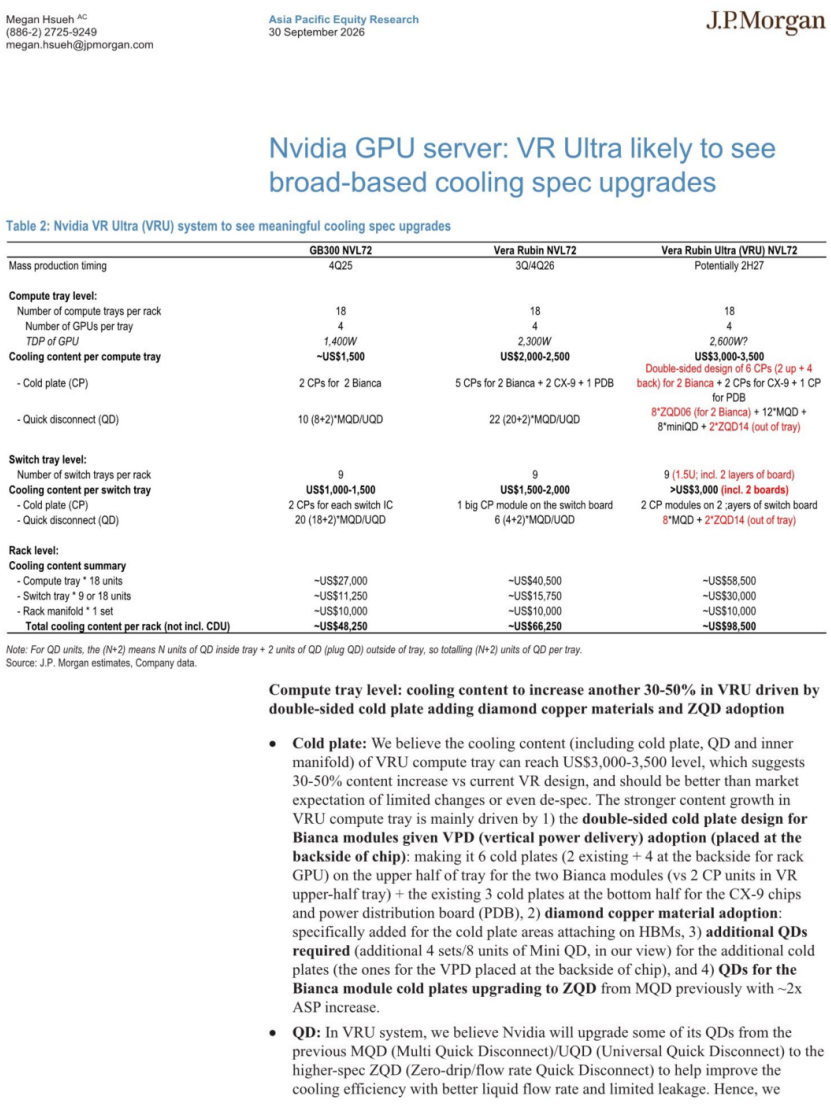

Why power density changes the invoice

Higher heat flux creates a difficult optimization problem. A plate with finer channels or more aggressive geometry may remove heat more effectively, but can require greater pumping pressure, tighter machining tolerances and more intensive cleanliness controls. Larger plates, double-sided cooling and advanced thermal-interface materials can raise the saleable content per tray while reducing throughput per machine. The relevant capacity measure is qualified good assemblies, not the number of machines or the floor area of a new factory.

AVC's annual report discusses two-phase cold plates, jet impingement and advanced thermal-interface materials. Its claimed comparison for a two-phase design is a 15% reduction in thermal resistance and one-third of the flow requirement relative to a single-phase design. The report does not provide the complete operating conditions needed to apply that result universally. It establishes an engineering direction, not a guarantee that every customer will adopt the design or pay an equivalent premium. [A4]

The supplied JPMorgan September 30 exhibit estimates a substantial increase in rack cooling content across GB300, Rubin and Rubin Ultra. Its wallet excludes the CDU and combines products that may be sold by different suppliers. There is also a rounding or scope inconsistency in the Rubin Ultra switch subtotal: nine trays at the displayed approximately US$3,000 per tray do not equal the US$30,000 subtotal. The exhibit is therefore useful for identifying more complex plates and richer interfaces, but it is not an exact bill of materials or an AVC order book. No analyst earnings forecast or target price is imported. [A7]

The reference forecast already includes rising liquid-cooling penetration, customer demand and a 10% specification-mix allowance after 2026. The additional engineering branch is deliberately narrower. A 45% probability applies a residual content increase to 30% of reference thermal revenue: zero through Q2 2027, 10% in H2 2027, 20% in 2028, 10% in 2029 and 5% in 2030. Incremental gross profit is 35% of added revenue, while qualification, engineering and selling expense consumes another 4%. The resulting operating-profit capture is 31%, not the entire content increase. Fositek connectors and system assembly are excluded from this eligible pool.

Cooling content per switch tray	**US$1,000-1,500**	**US$1,500-2,000**	**>US$3,000 (incl. 2 boards)**
- Cold plate (CP)	2 CPs for each switch IC	1 big CP module on the switch board	2 CP modules on 2 ;ayers of switch board
- Quick disconnect (QD)	20 (18+2)*MQD/UQD	6 (4+2)*MQD/UQD	8*MQD + 2*ZQD14 (out of tray)
Rack level:			
Cooling content summary			
- Compute tray * 18 units	~US$27,000	~US$40,500	~US$58,500
- Switch tray * 9 or 18 units	~US$11,250	~US$15,750	~US$30,000
- Rack manifold * 1 set	~US$10,000	~US$10,000	~US$10,000
Total cooling content per rack (not incl. CDU)	**~US$48,250**	**~US$66,250**	**~US$98,500**

Note: For QD units, the (N+2) means N units of QD inside tray + 2 units of QD (plug QD) outside of tray, so totalling (N+2) units of QD per tray.
Source: J.P. Morgan estimates, Company data.

Compute tray level: cooling content to increase another 30-50% in VRU driven by double-sided cold plate adding diamond copper materials and ZQD adoption

- **Cold plate:** We believe the cooling content (including cold plate, QD and inner manifold) of VRU compute tray can reach US$3,000-3,500 level, which suggests 30-50% content increase vs current VR design, and should be better than market expectation of limited changes or even de-spec. The stronger content growth in VRU compute tray is mainly driven by 1) the **double-sided cold plate design for Bianca modules given VPD (vertical power delivery) adoption (placed at the backside of chip)**: making it 6 cold plates (2 existing + 4 at the backside for rack GPU) on the upper half of tray for the two Bianca modules (vs 2 CP units in VR upper-half tray) + the existing 3 cold plates at the bottom half for the CX-9 chips and power distribution board (PDB), 2) **diamond copper material adoption**: specifically added for the cold plate areas attaching on HBMs, 3) **additional QDs required** (additional 4 sets/8 units of Mini QD, in our view) for the additional cold plates (the ones for the VPD placed at the backside of chip), and 4) **QDs for the Bianca module cold plates upgrading to ZQD** from MQD previously with ~2x ASP increase.
- **QD:** In VRU system, we believe Nvidia will upgrade some of its QDs from the previous MQD (Multi Quick Disconnect)/UQD (Universal Quick Disconnect) to the higher-spec ZQD (Zero-drip/flow rate Quick Disconnect) to help improve the cooling efficiency with better liquid flow rate and limited leakage. Hence, we

Original issuer exhibit | JPMorgan September 30 rack cooling-content estimates, US dollars, excluding CDU. Larger plates and more complex materials can increase supplier content, but total rack wallets are not AVC revenue. The VRU switch subtotal uses US$30,000 against a rounded US$3,000 per tray and nine trays; do not treat its total as an exact unit-price specification.

A parent-company claim, not all subsidiary earnings

AVC consolidates Fositek even though its direct economic ownership is only 16.87%. The interim statements explain the control relationship, including AVC's position as the largest shareholder and influence over management. IFRS consolidation therefore brings in 100% of Fositek's revenue and expenses, with other investors' profit removed through non-controlling interests. Consolidated operating profit alone is not the full economic claim available to AVC shareholders. [A3]

The valuation uses an owner-attributable operating-profit equivalent. Core thermal, chassis and system-assembly economics are modeled at the parent group's economic scope, while Fositek revenue, gross profit, operating expense and every probability branch are included at 16.87%. Reported consolidated sales are shown separately for reconciliation. This approach prevents a change in the connector probability from increasing earnings without increasing the corresponding minority claim.

The calibration is close to the reported attribution. In Q2, 83.13% of Fositek's NT$849.14 million net income equals NT$705.89 million, versus AVC's reported NT$710.58 million non-controlling net income. The NT$4.69 million residual is small but is not silently declared zero: tax, consolidation and minor attribution differences remain. A modest recurring reserve is included in the cost model. Because full product gross-profit and elimination matrices are not disclosed, the owner-equivalent line is explicitly a modeling construct rather than a renamed IFRS subtotal. [A3]

Reported earnings and model calibration

Q2 consolidated revenue of NT$49.12 billion generated NT$16.00 billion of gross profit and NT$13.48 billion of operating profit. Parent net income was NT$9.57 billion. The improvement is not solely a function of revenue growth: higher thermal mix and favorable conversion economics have lifted the consolidated gross margin above 32%. [A1, A3]

For calibration, the model assigns a 39% gross margin to thermal products, 22% to chassis, 12% to system assembly and uses Fositek's separately reported gross profit. These assumptions reproduce Q2 gross profit within 0.04%. They are inferred product economics, not disclosed segment margins. They can be wrong in offsetting directions, which is why the aggregate fit is necessary but does not prove each product assumption.

Q2 operating expense included a NT$153.88 million credit-impairment gain. Carrying that gain into every future quarter would overstate sustainable earnings. The normalized cost model combines a fixed research and administration base with revenue-linked engineering and selling costs, plus Fositek's proportionate expenses. Its Q2 backcast is within 0.2% of reported expense after adding back the credit gain. Stock compensation remains an expense; the model also reserves future dilution.

Preliminary Q3 consolidated sales of NT$59.09 billion exactly reconcile to the monthly announcements. The allocation across thermal, chassis, assembly and Fositek remains an assumption because Q3 product profit has not been reported. The active full-year 2026 sales path is NT$221.10 billion, versus NT$139.64 billion in 2025. Subsequent active consolidated sales are approximately NT$308.20 billion in 2027, NT$398.33 billion in 2028, NT$464.24 billion in 2029 and NT$512.05 billion in 2030. These are model forecasts, not management guidance. [A4, A6]

Reference thermal gross margin remains 39% through 2027, then fades to 38%, 36.5% and 35% in 2028-30. That fade recognizes capacity response, customer bargaining and competition. It avoids assuming that today's scarcity margins persist indefinitely while sales continue to compound.

Original issuer exhibit | Original quarterly product revenue, NT$ millions. The four management categories reconcile to consolidated sales; internal connector sales must not be added again.

Scarcity pricing and execution risk

The second positive branch addresses commercial terms rather than specification content. A 35% probability applies a 3% price premium in 2027, 5% in 2028 and 2% in 2029 to only 20% of original thermal reference revenue. Fixed-price backlog and all revenue created by the specification branch are excluded. After incremental materials, testing and overtime, 65% reaches gross profit and another 5% is spent on operating expenses. The branch therefore retains 60% of conditional extra revenue as operating profit.

This is a bounded economic inference. The company has not announced an equivalent blanket price increase. Copper and aluminum procurement uses LME-referenced formulas, while steel and plastics use annual or market-based purchasing arrangements. A nominal selling-price increase may simply recover input inflation. The pricing branch is separated from that pass-through and fades to zero by 2030. [A4]

The downside branch has a 25% probability. During 2027-28, it removes 5% of reference thermal sales, reduces gross margin on the remaining 95% by two percentage points and adds engineering expense equal to 1% of original thermal revenue. Half of these effects remain in 2029-30. This is one bundled qualification and execution scenario; separate plant-delay and utilization shocks are not stacked on top. It does not revise already reported Q3 revenue.

Fositek's separate content, pricing and execution branches are included only at AVC's 16.87% ownership. The branch arithmetic always applies to the original relevant revenue pool. It does not assume that every favorable event happens simultaneously, and the probabilities are not a portfolio of fully independent macroeconomic states. Correlated customer or platform delays would make the downside distribution wider than the simple expected-value table suggests.

The balance sheet can fund expansion, but not unlimited output

At June 30, consolidated cash was NT$77.71 billion, bank debt NT$26.74 billion and lease liabilities NT$2.37 billion. The detailed debt notes matter: the presentation's short-term amount incorporates current long-term maturities, so adding it to the full long-term debt schedule would double count borrowings. The owner-equivalent funding bridge also removes the 83.13% non-controlling share of Fositek's cash, debt and leases. That leaves approximately NT$69.78 billion of starting cash and NT$28.64 billion of debt plus lease claims. Excess cash is not added to the operating-profit valuation. [A3]

H1 operating cash flow was NT$26.29 billion, but included working-capital movements and a NT$1.22 billion release in other operating assets. Total investing outflow was NT$11.64 billion, materially above the NT$7.11 billion spent on PPE because advances and other non-current assets also consumed cash. The forecast therefore budgets cash investment rather than treating the PPE line as the whole expansion bill.

The model funds NT$22 billion of owner-equivalent capex and equipment advances in 2027, rising to NT$26 billion, NT$27 billion and NT$28 billion in 2028-30. It also charges 40% of incremental quarterly sales to working capital, a 27% tax proxy, interest, lease payments and dividends equal to 35% of after-tax operating profit. The resulting cash balance remains above NT$67 billion in both the reference and active paths. No new equity financing is required in this model, but that conclusion is conditional on the modeled margins and capital intensity; it is not a claim that any expansion program can be self-funded.

Vietnam expansion and larger engineering headcount support the direction of capacity growth. They do not verify a total qualified-unit ceiling. By late 2030, reference thermal sales require approximately 2.21 times the modeled Q3 2026 good-output index after the 10% specification allowance. That is one of the most important unverified inputs. Quarterly delivered output, acceptance, yield and capex should be checked before extending the forecast further. [A4]

Original issuer exhibit | H1 cash flow, NT$ millions. Total investing cash outflow is larger than PPE purchases because equipment advances and other non-current assets also absorb cash.

Shares, valuation and what would change the assessment

The exchange fact sheet shows 392.670 million issued shares. June financial statements disclose 7.244 million options outstanding. The starting valuation denominator is conservatively 400.221 million shares: issued shares, all outstanding options and a 0.307 million compensation reserve, without credit for option proceeds. It then grows 0.25% annually for prospective awards. Fositek employees' AVC options are already part of the parent claim and are not added a second time. [A3, A5]

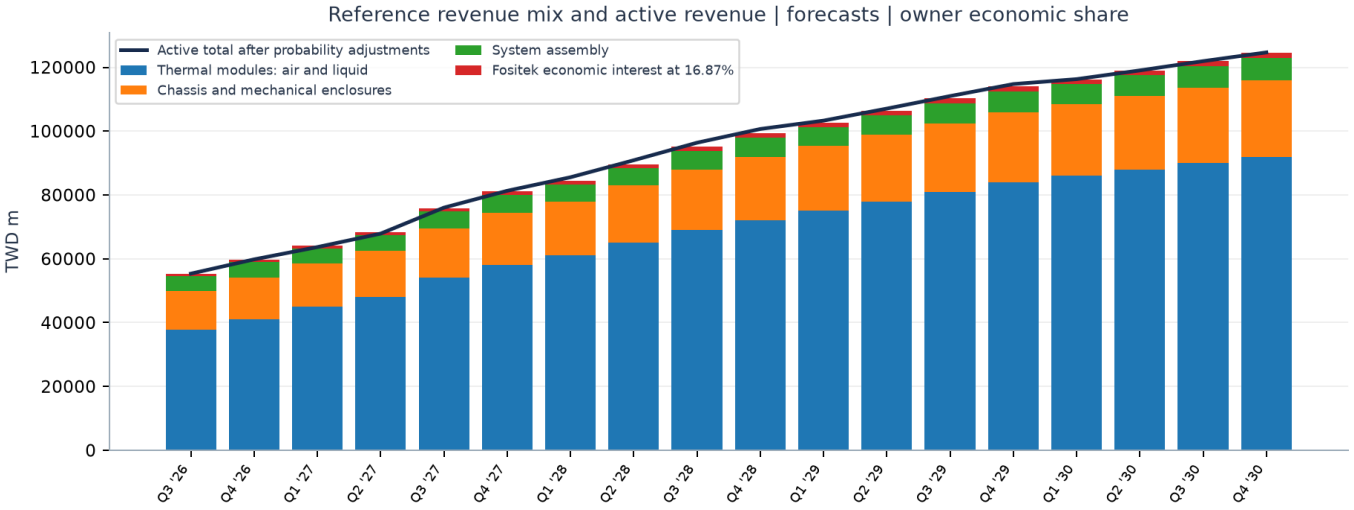

The ceiling convention is 20 times the next four quarters of owner-attributable operating-profit equivalent, including the stated quarter, divided by diluted shares at the end of that window. It is an operating-profit multiple, not a net-income P/E. No analyst target is used, and no separate market value of Fositek is added because its earnings are already included proportionately.

The most useful next evidence is the Q3 product and margin bridge, accepted output from expanded facilities, a specific platform's qualified cold-plate or manifold scope, and realized terms on new orders. Those facts would distinguish a durable systems supplier from a temporarily scarce fabrication vendor. Negative evidence would include gross-margin deterioration despite richer mix, materially higher capex or advances without delivered output, customer insourcing, failed qualifications, or a shift to architectures that reduce the merchant plate and manifold invoice.

Total	45/60	Rounded Base 75. Both artifact and new workbook row use this score; this is not a manual override.

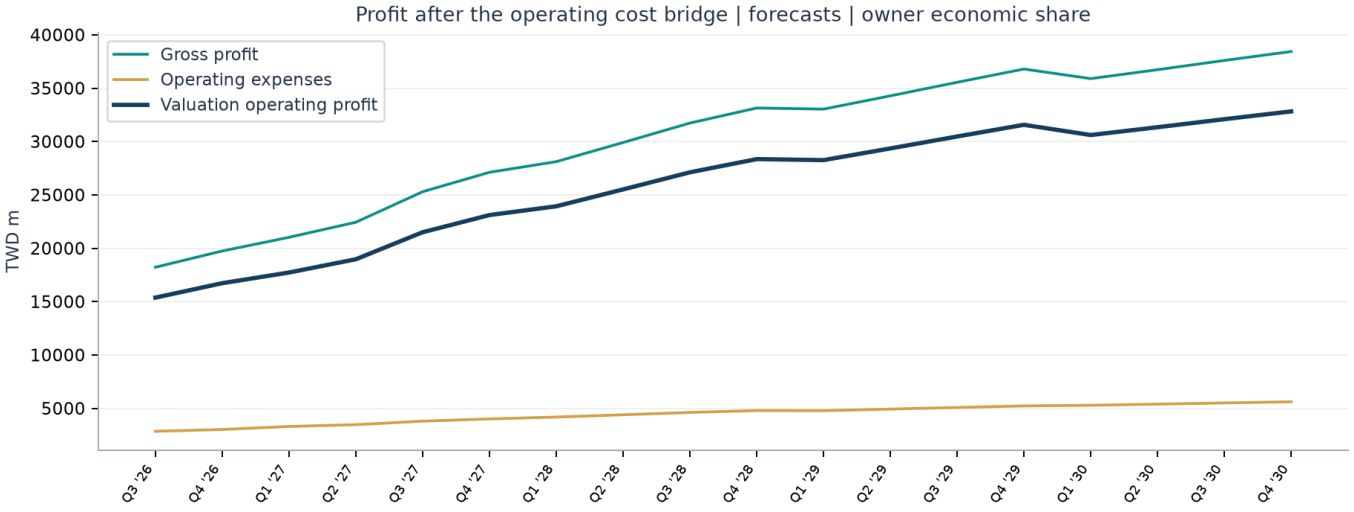

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	55,347.1	0.0	55,347.1

Q4 2030	124,609.4	50.9	124,660.3

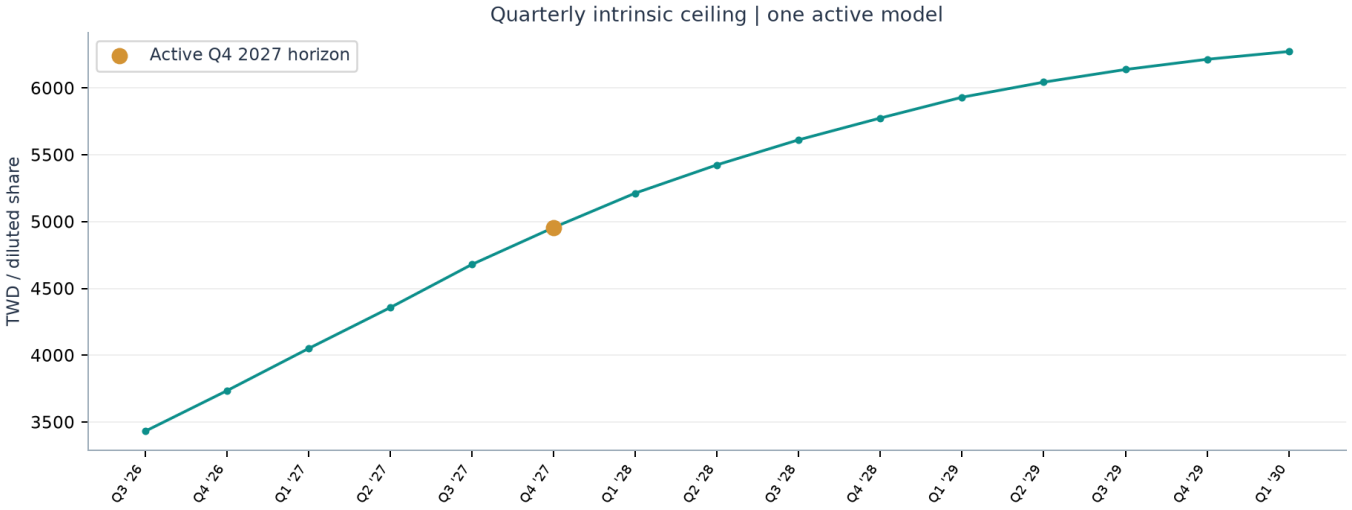

Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter	Revenue	GP	Opex	Valuation OP	OP margin
Q3 2026	55,347.1	18,220.7	2,847.0	15,373.6	27.8%

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Four-quarter earnings window	F4Q OP	Multiple	Shares	Ceiling

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Reference thermal sales index versus Q3 2026; not physical capacity	Status
Q3 2026	1.000	Preliminary reported consolidated revenue; product mix and profit modeled

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Thermal modules: air and liquid	37,800.0	39.0%	14,742.0
Q3 2026	Chassis and mechanical enclosures	12,000.0	22.0%	2,640.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Claim decisions, overlap and triggers

AVC-SPEC

p: 0.45

signal: Higher heat flux, more complex cold plates and manifold requirements; annual technical roadmap plus September rack-content evidence.

Conditional: Residual content gain on 30% of reference thermal sales: zero through Q2 2027, 10% in H2 2027, 20% in 2028, 10% in 2029 and 5% in 2030.

scope: Reference already includes liquid-cooling penetration, normal units and 10% specification mix after 2026. Eligible pool is plates/manifolds, excluding separately modeled Fositek connectors and the system assembly invoice.

bridge: Conditional added sales convert at 35% GP and 4% additional engineering, qualification and selling expense: 31% operating-profit capture.

timing: Recognition after qualified deliveries from H2 2027; not on an announced platform date.

counter: No disclosed platform-specific awarded share or good-unit capacity. Higher materials cost and competition may absorb most of the larger wallet.

AVC-PRICE

p: 0.35

signal: Long qualification and high customer cost of thermal delivery delays create a bounded repricing opportunity.

Conditional: Premium on 20% of original thermal reference sales: 3% in 2027, 5% in 2028, 2% in 2029, zero in 2026 and 2030.

scope: Only new or repriceable business; excludes fixed backlog and all specification-branch revenue. Premium is not applied to chassis, system assembly or Fositek.

bridge: 65% incremental GP after materials, overtime and testing; 5% incremental opex gives 60% OP retention.

timing: New terms recognized when shipped during 2027-29.

counter: Copper/aluminum use LME-referenced procurement, so selling-price inflation can be cost pass-through rather than profit. No announced across-the-board price increase.

AVC-EXEC

p: 0.25

signal: Qualification, yields, customer concentration and platform timing can constrain good output even as floor area expands.

Conditional: 5% thermal sales shortfall, a 2 percentage-point GM penalty on remaining 95%, and engineering costs equal to 1% of reference thermal sales in 2027-28; half these effects in 2029-30.

scope: One bundled execution state applied to the same reference pool. No second utilization or plant-delay shock is added; Fositek connector risk is separately limited to its 16.87% economic claim.

bridge: Lost reference GP plus rework/yield pressure; fixed costs remain. Not a percentage reduction in the entire target.

timing: 2027-30; zero against already published Q3 2026 revenue.

counter: Large-scale liquid-cooling shipments and the existing cash balance reduce immediate ramp and solvency risks.

AVC-FOS-SPEC

p: 0.55

signal: Higher-flow and blind-mate connector adoption; JPMorgan VRU architecture plus issuer annual qualification discussion.

Conditional: Additional eligible connector revenue above the reference: 0% through Q2 2027, 15% in H2 2027, 25% in 2028, 15% in 2029 and 5% in 2030.

scope: Only AVC's 16.87% economic interest in Fositek. 60% of server revenue is an analyst connector proxy, not disclosed mix. Reference already contains normal unit growth and 10% specification mix uplift; branch is the residual after that overlap.

bridge: Incremental GP 45% and engineering/qualification opex 5% of conditional incremental revenue; 40% operating-profit capture.

timing: H2 2027 start; recognition only with qualified shipments.

counter: No exclusive ZQD award or verified absolute qualified capacity. Other suppliers can qualify. A larger total connector wallet need not preserve Fositek share.

AVC-FOS-PRICE

p: 0.3

signal: Tight delivery and high customer cost of leak-tested connector delays, supported by attributed August management discussion and September engineering evidence.

Conditional: 5% premium in 2027, 8% in 2028, 4% in 2029, zero in 2030; no premium in 2026.

scope: Only AVC's 16.87% economic interest in Fositek. Only 30% of the 60% connector proxy is new or repriceable. Premium applies to original reference sales only, never to the specification branch.

bridge: 70% incremental GP after materials, expedited processing and testing; 5% incremental opex. This is a 65% OP capture assumption, not announced pricing.

timing: New terms and accepted shipments in 2027-29; fixed-price backlog excluded.

counter: Standardization, buyer bargaining and capacity additions can absorb scarcity value; premium remains a bounded inference.

AVC-FOS-RISK

p: 0.25

signal: Platform transition, qualification failures and customer concentration.

Conditional: 10% of reference server shipments lost or delayed and a 3 percentage-point margin penalty on the remaining 90%, plus 1% of reference server revenue in engineering expense, 2027-28; half in 2029-30.

scope: Only AVC's 16.87% economic interest in Fositek. Single bundled execution state; no separate utilization or capacity-loss shock.

bridge: Lost sales remove their reference GP; remaining shipments bear rework/yield costs. Fixed opex is not reduced.

timing: 2027-30; no unreported Q3 revenue revision.

counter: Already shipped 2026 sales and robust balance sheet support the no-delay state.

Remaining bounded uncertainties

- Thermal product revenue includes air and liquid cooling. The issuer does not disclose cold-plate units, realized ASPs, product-level margins, awarded platform share or qualified good-unit capacity.

- Management product categories reconcile to consolidated revenue, but the issuer does not publish a full product gross-profit/elimination matrix. The economic attribution uses 16.87% of Fositek profit, validated against reported non-controlling net income; residual tax and consolidation differences remain.

- The May and August presentations and annual management discussion were read. Complete verbatim Q&A recordings for both conferences were not retrieved. September conference repeats are not treated as a new earnings event.

- September monthly revenue came from an issuer notice redistributed by E.SUN. Q3 gross profit and operating profit remain forecasts.

- The H1 review is qualified for certain unreviewed smaller subsidiaries and investees. This is a review-scope limitation, not evidence of a restatement.

- Late-2030 reference thermal sales require about 2.21 times the Q3 2026 modeled good-output index after the 10% specification overlap. No disclosed total qualified capacity validates that scale; growth is a material model assumption.

- The bank rack-content exhibit contains rounded/inconsistent tray subtotals. Its total is an industry wallet, excludes CDU, and cannot be multiplied directly by AVC share without a customer/platform invoice bridge.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
