TAESUNG

323280.KQ | KOSDAQ | Full deep dive | Framework 8.0 | Updated: October 6, 2026 | Financial anchor: Q2 2026

Scarce delivery slots. A larger equipment opportunity.

ACTIVE CEILING: Q4 2027	ANALYTICAL BASE	VALUATION
KRW 44,420 / share	73 / 100 - Watchlist	20x forward-4Q operating profit

The ceiling uses KRW 70.046 bn of operating profit in Q4 2027 through Q3 2028 and 31.537980 m projected diluted shares. This is one probability-weighted operating case. The price-sensitive ranking lives in the master workbook.

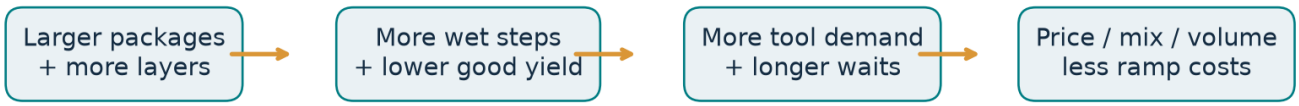

Figure 1. User-supplied discovery image: equipment shortages, AT&S supply and SEMCO investment. The headlines initiate research; they are not a Taesung revenue allocation. [S11]

Thesis: AI packaging expands substrate area, layers and process intensity. Taesung can capture more equipment orders, richer tool mix and a scarcity premium before new supply arrives. Delivery capacity, cash conversion and external customer qualification constrain that opportunity.

Header snapshot only: October 1 KRX close KRW 61,100; issued shares 30.537980 m; implied common market capitalization KRW 1,865.87 bn. Price is a dated market-data snapshot [S12], not a valuation input inside the ceiling calculation. Portfolio Base 73 remains protected.

01 | What the bottleneck actually is

Illustrative transmission map. It does not assert Taesung unit content or realized pricing.

Figure 2. How substrate complexity transmits into equipment economics. Analytical mechanism, not a company production forecast.

A wet-processing line cleans, develops, etches, strips or plates panels. More layers create more process passes. A larger package consumes more panel area; tighter patterns and complex handling can reduce good yield. Delivering the same number of good substrates can therefore require more equipment even before AI unit demand grows.

Illustrative physics	Calculation	Implication
Area: 80mm to100mm square	$100^2 / 80^2 = 1.5625$x	56.25% more area per package
Layers: 16 to24	24 /16 =1.50x	More repeated build-up/process work
Combined area x layers	1.5625 x1.50 =2.34375x	Workload proxy before yield/recipe effects
Yield: 90% to 80%	90% /80% =1.125x input	More input for equal good output

These examples explain direction; they do not establish Taesung equipment content, unit demand or a 2.34x revenue multiplier. Some processes batch, some steps do not repeat, and process innovation can offset burden. The company model therefore uses orders and specific customer equipment wallets rather than multiplying broad substrate TAM by an assumed market share.

Pricing implication: a late tool can delay an entire expensive factory. That strengthens a qualified vendor’s negotiating position on new orders, upgrades and priority delivery. A longer queue can also come from internal execution problems. B6 carries 45% economic probability from Q4 2026, charges associated ramp costs and excludes fixed-price backlog from repricing. The Q3 2026 operating snapshot retains 35%. The separately attributed, undated BofA exhibit is embedded beside the B6 inference below. [S4, S11, S15; model B6]

02 | Products, customers and the economic unit

Figure 3. Issuer product overview: established wet-processing machinery supports adjacent glass and foil engineering. Historical IR archive; customer/product status must be dated separately. [S7, PDF p5]

Vector	Economic unit / model treatment	Evidence confidence
Core PCB and services	External tool, installation/service and ordinary renewals; group revenue proxy	MEDIUM demand / LOW detailed mix
Incremental Via Fill	Additional plating content, beyond ordinary wet tools	LOW; Simmtech LOI
Glass equipment	Wet cleaning/etching and later plating lines	LOW ramp; pilot revenue exists
Composite-foil equipment	External machine sales; no internal transfers/material sales	LOW; commercialization unresolved

Taesung supplies customized production equipment rather than ABF film, glass cloth or finished substrates. Its potential advantage is qualified process know-how, handling capability, customization and customer service. It does not own every scarce input. Glass TGV laser formation, wet processing, metallization chemistry and inspection have different vendors and economics.

AT&S Malaysia supply is company-attributed and concrete, but unpriced. Simmtech's LOI is a distinct conversion opportunity. An old deck's AMD, Intel, battery-maker and substrate-company logos are not all confirmed customer wins. [S4, S6, S7]

03 | Latest actuals anchor the model

K-IFRS consolidated. FY and quarterly columns cover different durations. Q3 2026 has not been reported in the reviewed filing set.

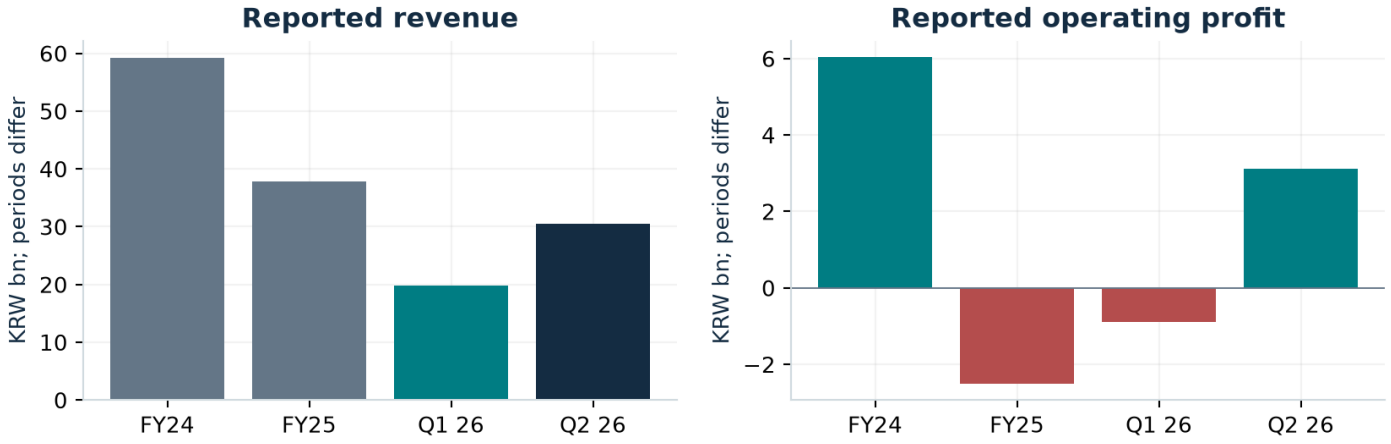

Figure 4. FY2025 contraction followed by a Q2 2026 operating recovery. Annual bars must not be compared with quarterly bars as growth rates. [S1-S3]

Period / status	Revenue	Gross profit	SG&A	OP	OP margin
FY2024 A	59.212	14.559	8.522	6.038	10.2%
FY2025 A	37.859	7.640	10.146	-2.506	-6.6%
Q1 2026 A	19.868	2.543	3.426	-0.883	-4.4%
Q2 2026 A	30.518	6.844	3.726	3.118	10.2%

H1 2026 revenue was KRW 50.386 bn and OP KRW 2.235 bn. Q2 revenue was KRW 30.518 bn, gross profit KRW 6.844 bn and OP KRW 3.118 bn. The Q2 gross margin was 22.42% and operating margin 10.22%. These exact filed amounts supersede rounded media summaries. [S1, S2]

The October research report provides no numeric FY2026 revenue or OP guidance. The CEO’s potential KRW 300 bn annual orders is an aspiration conditional on the pace continuing, not recognized revenue guidance. The model’s FY2026 total is KRW 129.170 bn revenue and KRW 11.614 bn OP: H1 actual plus H2 estimates. [S4, S5; model]

H1 detailed equipment mix is parent-only: KRW 34.901 bn compared with consolidated KRW 50.386 bn. Surface treatment 13.216 bn, etch 9.977 bn and polishing 6.113 bn are useful process evidence, but their percentages are not represented as filed consolidated segment shares. H1 consolidated China sales were 66.38%. [S1]

04 | Order surge: keep the source beside the inference

Figure 5. Original October 1 research page. It distinguishes order intake, June backlog and prospective capacity. The report discloses an IR-service relationship on p6. [S4, p3]

Translation of the material points: cumulative orders increased from about KRW 43 bn at end-April to KRW 220 bn in early September; lead times extended from 3-4 to7-8 months; recently booked work increasingly contributes in 2027. July relocation added substantial space, with staffing and outsourcing still expanding. [S4]

June's KRW 45.593 bn backlog is from a parent product-order table with its own scope. It cannot be added to September cumulative intake or netted against consolidated sales to manufacture a current backlog. The new capacity graphic is a mix allocation, not accepted revenue.

05 | B1: translate orders without counting them twice

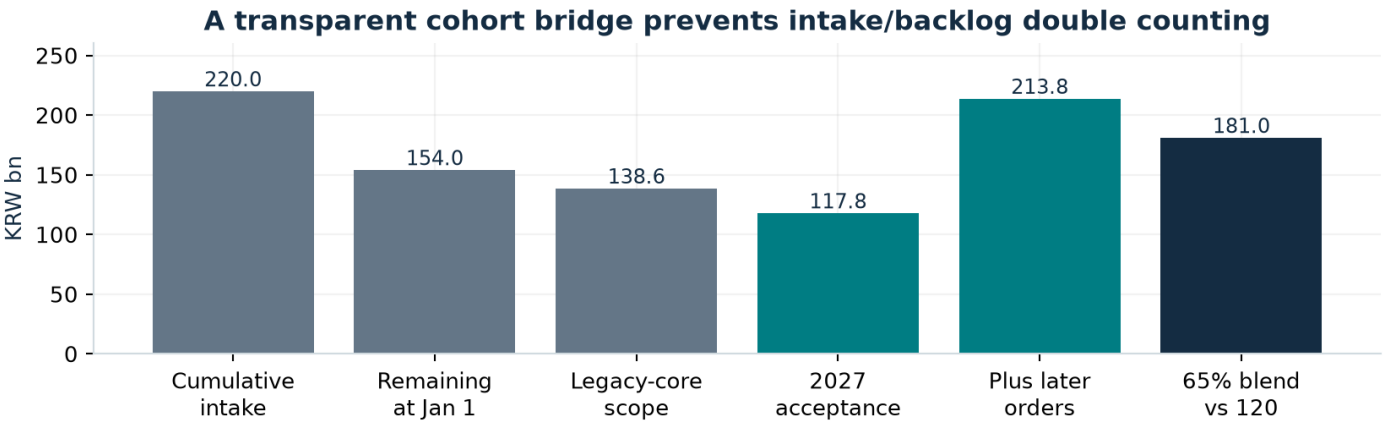

Figure 6. Model allocation of the September intake cohort. Only the first amount is a reported claim; the remaining fractions, repeat orders and probability are explicit assumptions.

Step	Assumption / calculation	KRW bn
Reported cumulative intake	Early September, all reported scope	220
Remaining at January 1	220 x 70%; carve out 2026 delivery/cancellation	154
External legacy-core share	154 x 90%; reserve 10% for other scope	138.6
Accepted during 2027	138.6 x 85%	117.81
Later/repeat deliveries	96; excludes the same intake cohort	96
Conditional 2027 core	117.81 +96	213.81
Active B1 core	120 +65% x(213.81 -120)	180.9765

The KRW 120 bn reference approximates Q2 consolidated annualized revenue of KRW 122.074 bn within 1.7%; it is a continuity anchor, not proof of a constant product mix. The KRW 96 bn later-order assumption represents 80% of that reference run rate. It explicitly excludes the legacy intake cohort, incremental Sejong, incremental Via Fill, glass and foil.

The 65% weight reflects material company-attributed intake and longer lead times, tempered by missing contract-level scope and acceptance schedules. Growth Research, the issuer-reposted article and the X post are one correlated claim group. The later conditional core path is213.81 x1.20 in 2028, x1.08 in 2029, x1.04 in 2030; growth slows as the backlog burst matures. This is a LOW-confidence extrapolation.

06 | B2: SEMCO capex is a customer wallet

Official September 29 project	Investment	Production target	Model treatment
Sejong, Korea	KRW 4.27 trn	September 2028	Equipment before startup; modeled 2027-29
Vietnam	KRW 2.51 trn	June 2030	No separate contribution in active Q4 2027 window

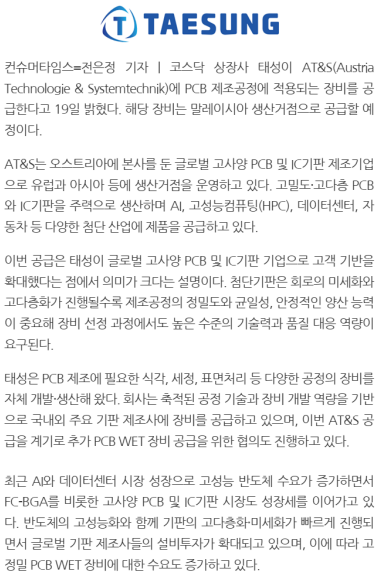

The official release states customer funding and medium/long-term volume commitments. This is stronger demand evidence than an unsupported industry TAM increase. It still does not name Taesung's equipment allocation. Timing matters: the Vietnam portion must not be pulled into 2028 just because both projects appear in the same headline. [S8]

Sejong demand bridge	Input	Status
Total project	KRW 4,270 bn	Reported customer investment
Equipment share	55%	Model proxy; civil/building costs excluded
Wet-process wallet	10% of equipment	Model proxy, process scope
Taesung capture	20% of wet wallet	Model proxy, competitive award
Conditional lifetime sales	4,270 x 55% x 10% x 20% =46.970 bn	Not a disclosed Taesung contract
Outcome probability	65%	Specific funded project + supplier fit
Recognition 2027 /2028 /2029	45% /50% /5%	Before/around production startup

Probability-weighted Sejong revenue is KRW 13.739 bn in 2027,15.265 bn in 2028 and 1.527 bn in 2029. This is a new project cohort after the September intake cutoff. If later order reporting includes these awards, replace the proxy with those orders; do not add both.

AH-12 calibration limit: historical sales by named customer and equipment wallet are unavailable. The full-company reference calibrates to reported Q2 revenue, but the Sejong percentages are not a historically calibrated capture rate. Confidence remains LOW. Other research-listed customer investment totals are context, not additional automatic model revenue. [S4, S8]

07 | Customer conversion: AT&S and Simmtech

TAESUNG

컨슈머타임스=전은정 기자 | 코스닥 상장사 태성이 AT&S(Austria Technologie & Systemtechnik)에 PCB 제조공정에 적용되는 장비를 공급한다고 19일 밝혔다. 해당 장비는 말레이시아 생산거점으로 공급할 예정이다.

AT&S는 오스트리아에 본사를 둔 글로벌 고사양 PCB 및 IC기판 제조기업으로 유럽과 아시아 등에 생산거점을 운영하고 있다. 고밀도·고다층 PCB와 IC기판을 주력으로 생산하며 AI, 고성능컴퓨팅(HPC), 데이터센터, 자동차 등 다양한 첨단 산업에 제품을 공급하고 있다.

이번 공급은 태성이 글로벌 고사양 PCB 및 IC기판 기업으로 고객 기반을 확대했다는 점에서 의미가 크다는 설명이다. 첨단기판은 회로의 미세화와 고다층화가 진행될수록 제조공정의 정밀도와 균일성, 안정적인 양산 능력이 중요해 장비 선정 과정에서도 높은 수준의 기술력과 품질 대응 역량이 요구된다.

태성은 PCB 제조에 필요한 식각, 세정, 표면처리 등 다양한 공정의 장비를 자체 개발·생산해 왔다. 회사는 축적된 공정 기술과 장비 개발 역량을 기반으로 국내외 주요 기판 제조사에 장비를 공급하고 있으며, 이번 AT&S 공급을 계기로 추가 PCB WET 장비 공급을 위한 협의도 진행하고 있다.

최근 AI와 데이터센터 시장 성장으로 고성능 반도체 수요가 증가하면서 FC-BGA를 비롯한 고사양 PCB 및 IC기판 시장도 성장세를 이어가고 있다. 반도체의 고성능화와 함께 기판의 고다층화·미세화가 빠르게 진행되면서 글로벌 기판 제조사들의 설비투자가 확대되고 있으며, 이에 따라 고정밀 PCB WET 장비에 대한 수요도 증가하고 있다.

Figure 7. Issuer-hosted August 19 AT&S supply article. Wet etch/clean/surface-treatment supply is attributed to the company; further orders are discussions, with no disclosed contract value. [S6]

태성 (323280)

GROWTH RESEARCH

리스크 및 체크 포인트

동도금장비 계약 추진으로 사업영역 확대

동도금장비 진입은 고객사 증설당 수주 규모를 확대할 수 있는 요인이다. 동사는 심텍의 SoCAMM 증설 프로젝트에 습식 장비와 Via Fill 동도금장비를 함께 공급하기 위한 구매의향서(LOI)를 수령하고 본계약을 추진 중이다. Via Fill 장비는 기존 습식 장비보다 대당 가격이 수 배 이상 높아, 동일 고객사의 투자에서 확보할 수 있는 수주액이 커진다. 특히 첫 양산용 도금장비 공급을 추진하는 대상이 **일반 메모리 모듈 기판보다 미세 비아 충진과 도금 균일도 관리가 비교적 까다로운 SoCAMM 기판이라는 점에서 기술적 의미도 있다.**

심텍과 추가 공급도 논의 중이며, **본계약 체결과 양산 성능 검증이 이뤄지면 후속 증설 및 타 PCB 고객사로의 공급 확대를 기대할 수 있다.** 이번 공급은 **식각·세정 중심의 장비 영역을 도금까지 넓히는 계획이 구체화되는 사례로서 유의미하다.** PCB 양산라인에서 확보할 도금 기술과 운영 경험은 **향후 유리기판에서도 식각에 이어 도금장비로 공급 범위를 확**

Figure 8. October 1 research excerpt describing the Simmtech LOI and Via Fill opportunity. Original top portion, clipped for readability; full image embedded in MD. [S4, p5]

B3, probability 50%: the 2027 conditional incremental plating allocation is KRW 8 bn. A bounded proxy is the report's KRW 274.2 bn Simmtech investment x 55% equipment x 10% wet wallet x 53% capture, approximately KRW 8 bn. The rounded operating input is not a reported LOI value. Weighted revenue is KRW 4 bn; ordinary wet-tool deliveries remain in core.

Later conditional Via Fill sales of KRW 16/24/30 bn in 2028/29/30 assume repeat and additional-customer wins, weighted at 50%. The source's several-times ASP comparison motivates richer process content; it is not multiplied again on top of the estimated equipment wallet. Definitive orders, acceptance and cost-to-build determine whether probability should rise.

08 | B4: glass expands wet-process content

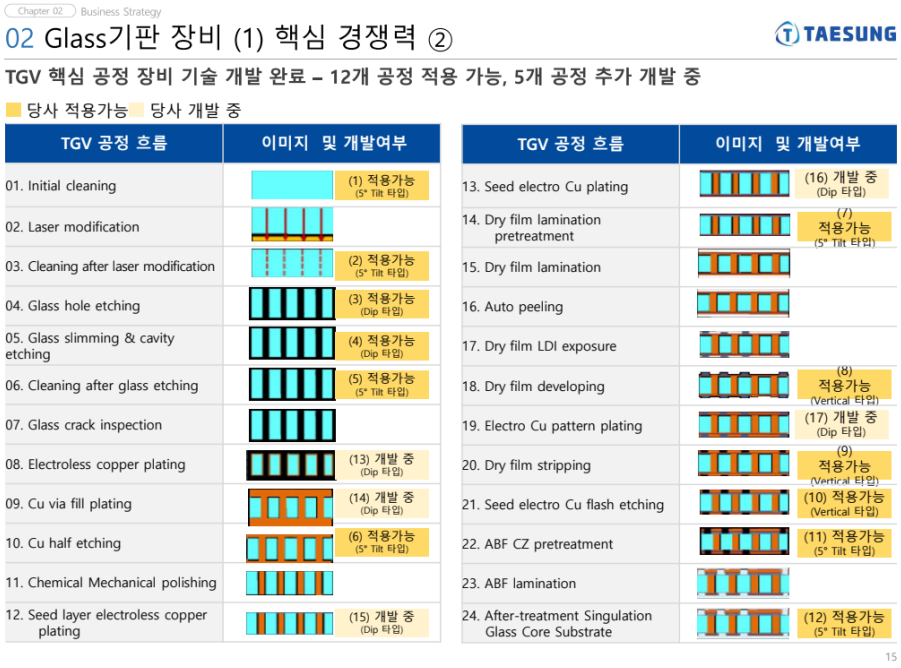

Figure 9. Issuer process map: 12 applicable processes and 5 in development across a24-step glass flow. Laser, inspection, polishing and lamination are distinct steps. [S7, PDF p16]

Taesung's opportunity includes TGV cleaning/etching, thin-glass handling and potential copper-plating extensions. Its wet-process capabilities can complement laser drilling rather than displace it. Existing parent glass revenue of KRW 0.468 bn in H1 demonstrates some sales, while the size and timing of a new commercial line remain uncertain. [S1, S7]

Year	Pilot reference	Conditional glass total	35% weighted total
2027	2.0	40.0	15.3
2028	4.0	100.0	37.6
2029	6.0	150.0	56.4
2030	8.0	180.0	68.2

The conditional path 40/100/150/180 bn is13/33/50/60% of the issuer's aspirational KRW 300 bn glass-space allocation. It is a capacity-utilization proxy, not a market-share forecast. Only the increment above the pilot reference is weighted at 35%. Source claims about a first new order conflict in scope with historical glass etch sales; this is treated as a new commercial/plating ramp, not proof that all glass sales are new. [S4, S5, S7]

09 | B5: foil equipment is a separate option

Chapter 02 Business Strategy

9

Figure 10. Historical issuer specifications: approximate USD 4 m per composite-foil tool and up to4 tools/month. Performance/yield claims are issuer claims, not independent customer acceptance. [S7, PDF p10]

Year	Conditional external sales	Tools at KRW 5.4 bn each	25% weighted sales
2027	60.0	11.1	15.0
2028	100.0	18.5	25.0
2029	160.0	29.6	40.0
2030	200.0	37.0	50.0

The unit bridge uses the historical USD 4 m indication and a modeling translation of KRW 1,350/USD, not a current exchange-rate quote: KRW 5.4 bn/tool. Conditional annual sales 60/100/160/200 bn require roughly 11/19/30/37 machines, below the old 48-machine annual illustration. Actual realized prices and usable capacity are unverified. Probability 25% recognizes engineering progress while retaining qualification and commercialization risk.

The model excludes revenue from the company’s own foil-material roadmap and internal equipment transfers. It does not count a machine sold to a consolidated subsidiary as external sales. Material operations would require a separate area, qualification, customer, margin and working-capital bridge. The old 1 GWh/5 GWh plans do not establish paid shipments. [S7]

10 | Three-phase TAM and competitive position

Phase	Opportunity / economic mechanism	Weight and treatment
1: current AI packaging	Larger FC-BGA and high-layer PCB production require wet-process capacity; replacement/service recurring	100% relevance to TAM thesis; individual sales still probability-weighted
2: adjacent production 2026-30	Glass-core processing and composite-foil equipment; physical AI expands substrate and battery production	50% framework phase weight for scoring; use B4/B5 probabilities in sales, no second haircut
3: new applications 2027-35	More demanding heterogeneous packages, edge/defense/space electronics	20% thematic relevance; no separate numerical revenue without company capture bridge

The expansion score is8/10 because the engineering capabilities address more than one production process. This is not permission to assign the entire packaging, AI, EV or battery TAM to Taesung. The operative addressable markets are the wet-equipment wallet and qualified external foil-machine demand. The framework's substrate-market estimates are industry context, not Taesung tool revenue.

Participant	Role	Implication for Taesung
MKS / Atotech	Established chemistry + equipment + service; extensive installed base	A real competitive alternative; no global sole-source premium
LPKF	Laser-induced TGV formation	Potential complementary process, different wallet
SCHMID	Wet lines / integrated glass process development	Adjacent integration and competitive process exposure
AT&S / SEMCO / Simmtech	Substrate/PCB customer capital investment	Demand catalysts; purchasing power can limit equipment margin

Atotech's own product catalogue lists advanced-substrate wet processing and more than 1,050 copper platers supplied since 1987. Taesung's local customization and service may win share; an issuer claim of domestic uniqueness does not prove a worldwide monopoly. Comparative uptime, qualified yield and lifetime cost remain diligence gaps. [S9]

11 | One active case, explicit probabilities

ID / event	p	2027 increment (KRW bn)	Transmission / confidence
B1 order conversion	65%	60.977	Above 120 bn core reference; LOW cohort allocation
B2 Sejong tools	65%	13.739	New customer project; LOW capture
B3 Via Fill	50%	4.000	Incremental plating; LOW LOI conversion
B4 glass ramp	35%	13.300	Beyond 2 bn pilot reference; LOW
B5 external foil	25%	15.000	External machines only; LOW
B6 scarcity price	45%	6.326	12% conditional premium on eligible core; LOW

The probabilities are subjective outcome weights, not statistical confidence intervals. They apply to economic increments after subtracting what is already modeled. For B1,65% expresses persistence and conversion after explicit scope/timing haircuts; it is not an additional independent factual confirmation of the KRW 220 bn headline.

The dominant driver is customer AI packaging investment. Order growth, the Sejong award, Via Fill and pricing can fail together. The model therefore does not multiply all event probabilities as independent chances or claim six independent confirmations. Pricing is conditional on the delivered, already-weighted core vector. Joint downside is shown in sensitivity rather than hidden by favorable correlation assumptions.

Do not double count	Implementation
Orders + customer capex	New Sejong cohort separate; later confirmed awards replace proxy
Existing mix + pricing	Contribution-margin improvement excludes B6 scarcity premium
Via Fill tool content	Wallet proxy once; no extra several-times ASP multiplier
Glass + foil internal transfers	Separate external customers; no own-factory tool revenue
Source repetition	S4/S5/S11 treated as one order/lead-time claim group

Confidence can increase before a final filing if credible new customer, pricing, acceptance or hiring evidence improves the bridge. Official confirmation is not a prerequisite for this model. Conversely, an unnamed exciting headline without a defensible amount cannot be assigned an arbitrary sales number. [S13, Rule 16b]

B6 | Source evidence and probability

S15 | Supplied October 6, 2026; original report publication date unknown. The source is the image, not a newly verified BofA report.

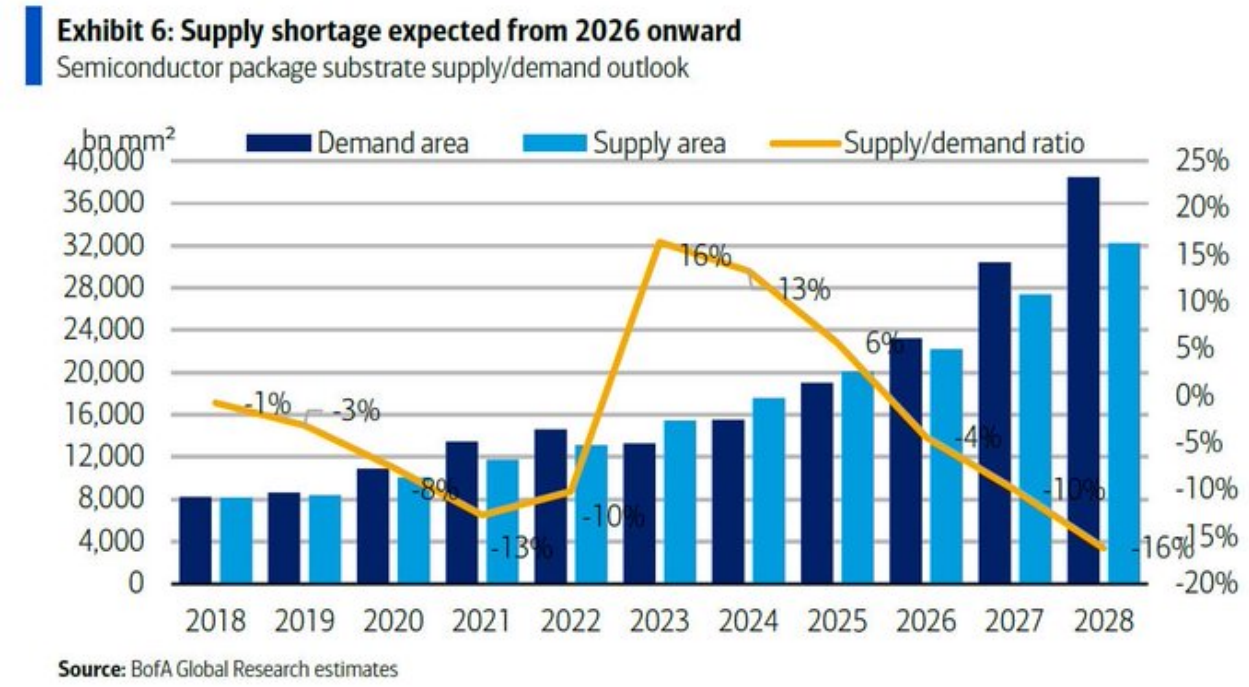

Figure 11. User-supplied BofA Global Research Exhibit 6, as attributed in the image. Broad semiconductor package-substrate area, bn mm2; S/D ratio in percent. Full crop retained; exact market definition and ratio denominator unavailable. [S15]

Year	Printed S/D ratio	Reading and scope
2026	-4%	Labeled chart value; package substrates
2027	-10%	Labeled chart value; package substrates
2028	-16%	Labeled chart value; package substrates

The exhibit supports persistent industry scarcity alongside Taesung's existing order and lead-time evidence. It does not measure wet-tool prices or establish a 12% Taesung premium. The repost's -6% to -10% wording does not match the displayed 2026-28 labels. No area deficit is converted directly into equipment revenue.

B6 judgment:45% economic probability applies from Q4 2026 to the existing 12% premium on eligible, already-weighted core deliveries. This is a modest judgment for persistence, with LOW confidence in realized pricing. Original report date and scope are missing, so the two source groups are not treated as independent confirmations of the same pricing outcome.

The same demand theme already supports core volume, Sejong and Via Fill. Their probabilities, capture, timing and costs remain unchanged; only B6 changes. Fixed-price backlog, glass and foil are excluded. Actual mix-adjusted ASPs, priority deposits and retained margin raise confidence; flat prices, shorter queues or cost absorption reduce it.

Supplied-file ID: codex-clipboard-218a631c-f743-44e1-a9fb-cad 88b7ee387.png. Source URL and publication date unavailable.

12 | B6: monetize the delivery queue

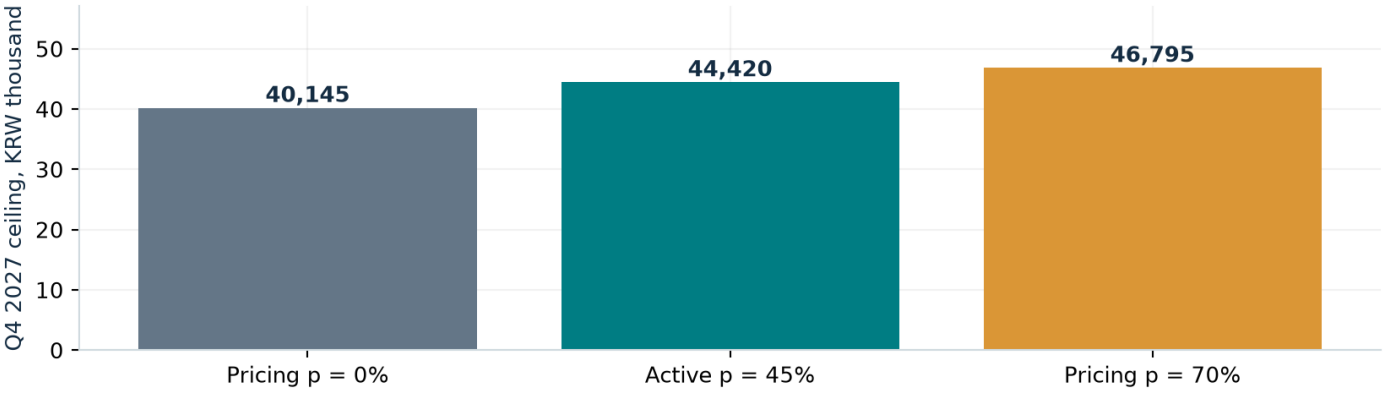

Figure 12. A pricing-only sensitivity holds all other operating drivers, dilution and 20x valuation constant. The premium is already included in the active case.

Pricing case	p on 12% premium	Q4 2027 ceiling (KRW/share)
Pricing p = 0%	0%	40,145
Active p = 45%	45%	44,420
Pricing p = 70%	70%	46,795

The active pricing contribution adds KRW 4,275/share versus a price-neutral control, or 10.6%. This control is a diagnostic, not a second active company forecast. No actual 12% Taesung price increase has been reported in the sources reviewed.

Calculation	Model rule
Eligible core fraction	Q3/Q4 2026: 5%/15%;2027: 35%/50%/65%/75%;2028+: 80%
Conditional premium	12% on eligible new/repriceable deliveries
Probability	45% from Q4 2026, conditional on weighted core; Q3 2026 snapshot 35%
Incremental production cost	30% of extra price revenue for overtime/materials/expediting
Additional operating expense	3.5% of extra revenue; full existing opex retained

2027 pricing revenue is KRW 6.326 bn; incremental production cost KRW 1.898 bn; incremental variable SG&A KRW 0.221 bn. The resulting price-only OP increment is KRW 4.207 bn. Customers with fixed-price contracts are not repriced retroactively. Larger-tool mix and ordinary utilization benefits are modeled separately.

13 | Cost bridge: revenue is not operating profit

Q2 2026 calibration	KRW bn	Nature
Reported revenue	30.518470	Consolidated actual
Variable production proxy: 72% of revenue	21.973299	Model cost classification
Residual factory cash overhead	1.325947	Backsolved after D&A to exact COGS
Production D&A proxy	0.375665	Cash-flow D&A minus reported SG&A D&A
Total COGS	23.674910	Exact filed amount; model reconciles
Gross profit	6.843560	Exact filed amount
SG&A fixed anchor	2.657355	SG&A minus 3.5% of revenue
Variable SG&A: 3.5%	1.068146	Model classification
Operating profit	3.118059	Exact filed result

The filing reports costs by nature, not a fixed/variable production split. Q2 materials, product/inventory changes, consumables and outsourcing total about 63.18% of revenue; adding non-SG&A fees takes the grouping to about 68.01%. A 72% variable-production proxy leaves a calibrated residual for fixed factory costs. The allocation is an assumption, while total COGS and SG&A are exact. [S1]

Core variable production cost is 72%/71% in H2 2026,69/68/67/66% in 2027 and 66/67/68% in 2028/29/30. The improvement assumes procurement scale and higher-content mix; later normalization gives some benefit back. Shared factory cash costs grow 8% annually from the calibrated anchor. Glass/foil contribution margins 32%/28% in 2027 are independent assumptions. All shared factory costs and production D&A are subtracted once after summing product contributions.

Plant commissioning is charged explicitly: production D&A0.9/1.3 bn in H2 2026 and 6/7/8/9 bn annually in 2027-30. June net construction in progress was about 69.729 bn. The modeled annual 6 bn production charge corresponds roughly to existing production D&A plus this balance over 15.5 years; actual asset lives and commissioning mix could differ. Administrative D&A remains inside SG&A; it is not deducted twice. [S1; model]

14 | Capacity: flexible space is not staffed output

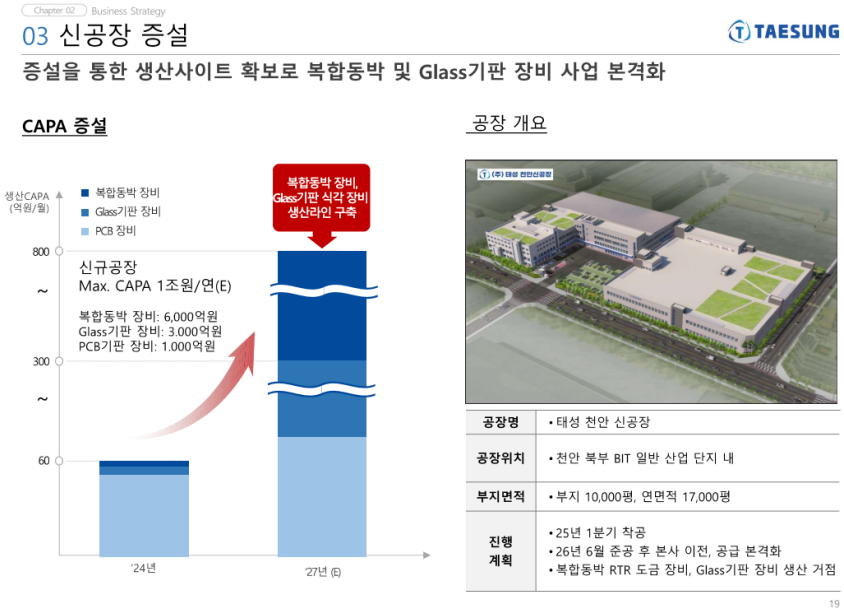

Figure 13. Historical new-site capacity illustration. The KRW 1 trn split is PCB 100 bn, glass 300 bn and foil 600 bn; it is an aspirational allocation, not current usable revenue capacity. [S7, PDF p20]

The newer October report says the July move expands space and manufacturing capability six to seven times, with labor and outsourcing being added. It does not reconcile that flexibility with the older PCB 100 bn allocation. The active case assumes space can be reallocated to the core order surge and outsourced assembly can supplement internal bottlenecks. This is a material assumption, not a resolved fact. [S4, S7]

2027 model / test	KRW bn or ceiling	Interpretation
Core revenue before scarcity price	198.715	Requires flexible allocation beyond old 100 bn plan
Glass revenue	15.300	Far below old 300 bn aspiration
Foil revenue	15.000	Low weighted commercialization
If100 bn PCB is a hard cap	16,204 KRW/share	Q4 2027 ceiling falls materially

The six-to-seven-times statement is not multiplied by the KRW 1 trn maximum, and the model never treats a factory building as booked sales. The most useful new evidence is staffed tool throughput, acceptance and outsourcing cost per shipped line. A capacity model that cannot deliver the orders deserves a lower probability even if the customer shortage remains real.

15 | Revenue and mix: quarterly path

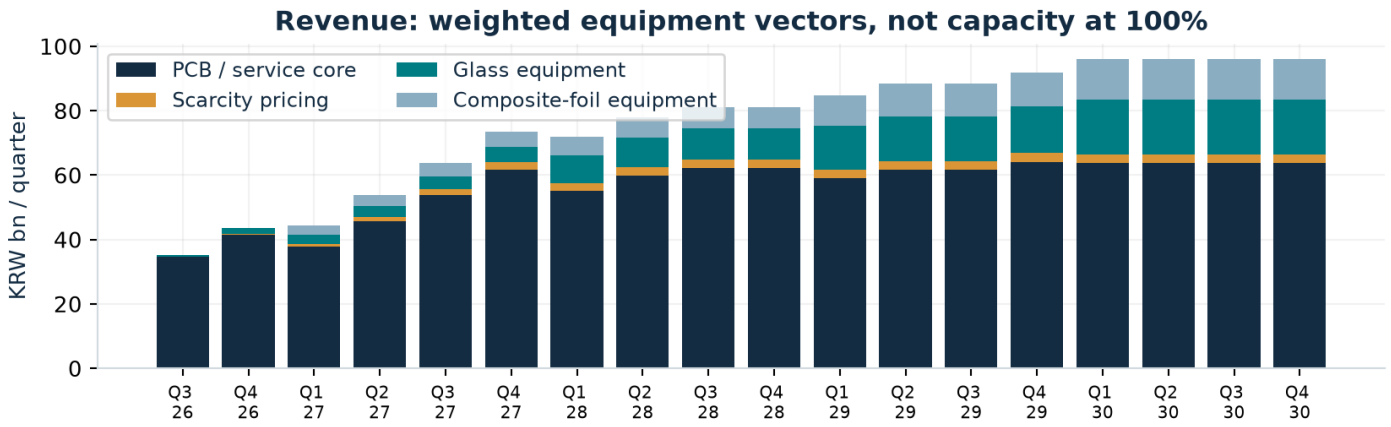

Figure 14. Quarterly modeled group revenue by economic vector. Detailed actual group product segments are undisclosed; these are analytical allocations. Numerical continuation immediately follows.

Core contains ordinary PCB machinery, services and the weighted B1/B2/B3 contributions. Pricing is separately visible. Glass and external foil machinery retain their own contribution margins. No customer count, tool shipment total or consolidated historical product split has been fabricated to fill a template.

Year	Core	Pricing	Glass	Foil	Total revenue
2026 H2	76.00	0.41	2.38	0.00	78.78
2027	198.72	6.33	15.30	15.00	235.34
2028	239.04	10.33	37.60	25.00	311.96
2029	246.14	10.63	56.40	40.00	353.17
2030	254.82	11.01	68.20	50.00	384.03

2027 quarter weights are 19/23/27/31%, reflecting longer lead times and a ramp through the year.2028 uses 23/25/26/26%, 2029 uses 24/25/25/26%, and 2030 is evenly allocated. These are model seasonality/recognition assumptions. The newest actual remains Q2 2026; every later row is labeled Model.

16 | Quarterly revenue audit

Continuation of Figure revenue/mix. All amounts KRW bn; each row is Model. Values may differ by0.01 from displayed sums because formulas use full precision.

Quarter	Core	Pricing	Glass	Foil	Total	Confidence
Q3 2026	34.50	0.07	0.68	0.00	35.25	MED/LOW
Q4 2026	41.50	0.34	1.70	0.00	43.54	MED/LOW
Q1 2027	37.76	0.71	2.91	2.85	44.23	MED/LOW
Q2 2027	45.70	1.23	3.52	3.45	53.91	MED/LOW
Q3 2027	53.65	1.88	4.13	4.05	63.72	MED/LOW
Q4 2027	61.60	2.49	4.74	4.65	73.49	MED/LOW
Q1 2028	54.98	2.38	8.65	5.75	71.75	MED/LOW
Q2 2028	59.76	2.58	9.40	6.25	77.99	MED/LOW
Q3 2028	62.15	2.68	9.78	6.50	81.11	MED/LOW
Q4 2028	62.15	2.68	9.78	6.50	81.11	MED/LOW
Q1 2029	59.07	2.55	13.54	9.60	84.76	MED/LOW
Q2 2029	61.54	2.66	14.10	10.00	88.29	MED/LOW
Q3 2029	61.54	2.66	14.10	10.00	88.29	MED/LOW
Q4 2029	64.00	2.76	14.66	10.40	91.83	MED/LOW
Q1 2030	63.70	2.75	17.05	12.50	96.01	MED/LOW
Q2 2030	63.70	2.75	17.05	12.50	96.01	MED/LOW
Q3 2030	63.70	2.75	17.05	12.50	96.01	MED/LOW
Q4 2030	63.70	2.75	17.05	12.50	96.01	MED/LOW

FY2026 combines H1 actual 50.386 bn and this table’s H2 model 78.784 bn to produce 129.170 bn revenue. The 2027 active group revenue is235.341 bn, 2028 is311.963 bn. The full outer-year path supports rolling windows; the strongest evidence horizon remains the next 12-16 months. Precision is arithmetic traceability, not predictive certainty.

17 | Margins and operating profit

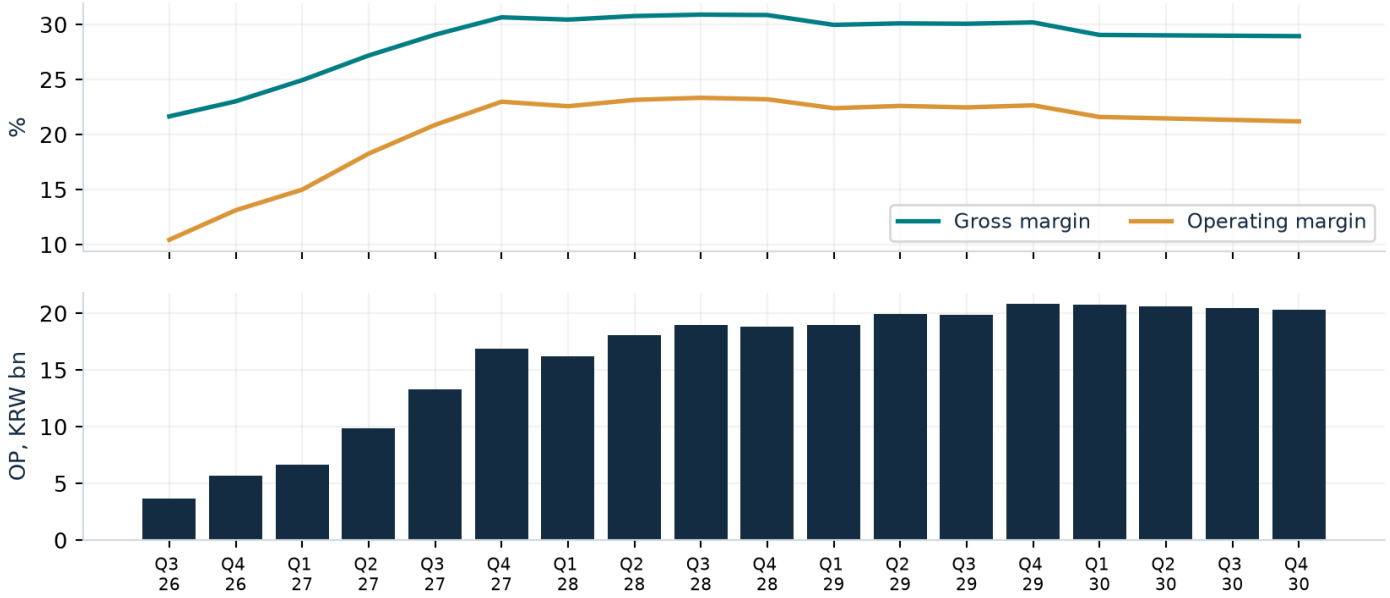

Figure 15. Consolidated margins after shared factory costs, commissioning D&A and full operating expense; OP in KRW bn. Numerical continuation immediately follows.

Year	Revenue	Gross profit	Full opex	OP	OP margin
2026 H2	78.78	17.65	8.27	9.38	11.9%
2027	235.34	66.72	20.07	46.65	19.8%
2028	311.96	95.91	23.94	71.97	23.1%
2029	353.17	106.23	26.68	79.54	22.5%
2030	384.03	111.33	29.20	82.13	21.4%

Operating leverage is earned through contribution dollars spreading across a rising, fully charged cost base. It is not modeled as an automatic jump to an arbitrary consolidated margin. Fixed SG&A grows 10% annually; variable SG&A remains 3.5% of total revenue. Expensed development, warranty costs and administrative depreciation remain included. No EBITDA substitution or stock-compensation addback is used.

18 | Quarterly profit audit

KRW bn. Product contributions less shared production overhead and D&A = consolidated GP; GP less full SG&A = operating profit.

Quarter	Core contrib.	Glass contrib.	Foil contrib.	Factory + DA	GP	SG&A	OP	OPM
Q3 2026	9.71	0.17	0.00	2.25	7.63	3.96	3.67	10.4%
Q4 2026	12.27	0.42	0.00	2.68	10.02	4.31	5.71	13.1%
Q1 2027	12.20	0.93	0.80	2.90	11.03	4.40	6.63	15.0%
Q2 2027	15.49	1.13	0.97	2.93	14.65	4.81	9.84	18.3%
Q3 2027	19.02	1.32	1.13	2.96	18.52	5.22	13.30	20.9%
Q4 2027	22.69	1.52	1.30	2.99	22.52	5.64	16.88	23.0%
Q1 2028	20.36	3.03	1.72	3.27	21.84	5.65	16.19	22.6%
Q2 2028	22.13	3.29	1.88	3.30	23.99	5.95	18.05	23.1%
Q3 2028	23.01	3.42	1.95	3.33	25.06	6.13	18.92	23.3%
Q4 2028	23.01	3.42	1.95	3.36	25.02	6.21	18.81	23.2%
Q1 2029	21.28	4.87	2.88	3.64	25.40	6.42	18.97	22.4%
Q2 2029	22.17	5.08	3.00	3.67	26.57	6.63	19.95	22.6%
Q3 2029	22.17	5.08	3.00	3.70	26.54	6.71	19.83	22.5%
Q4 2029	23.05	5.28	3.12	3.74	27.72	6.92	20.79	22.6%
Q1 2030	22.31	5.97	3.62	4.02	27.88	7.16	20.73	21.6%
Q2 2030	22.31	5.97	3.62	4.05	27.85	7.25	20.60	21.5%
Q3 2030	22.31	5.97	3.62	4.09	27.82	7.34	20.47	21.3%
Q4 2030	22.31	5.97	3.62	4.12	27.78	7.44	20.34	21.2%

Core contribution includes probability-weighted scarcity revenue less its 30% incremental production costs. Product contribution margins exclude shared factory overhead and production depreciation, which appear in a separate column and are deducted exactly once. Thus the displayed product contribution is not a reported segment gross profit.

The negative test is explicit: if all three product contribution margins are 3 percentage points lower with costs otherwise unchanged, the Q4 2027 ceiling is KRW 38,823/share. This captures sourcing, labor, warranty and manufacturing cost pressure that could offset pricing.

19 | The complete quarterly ceiling path

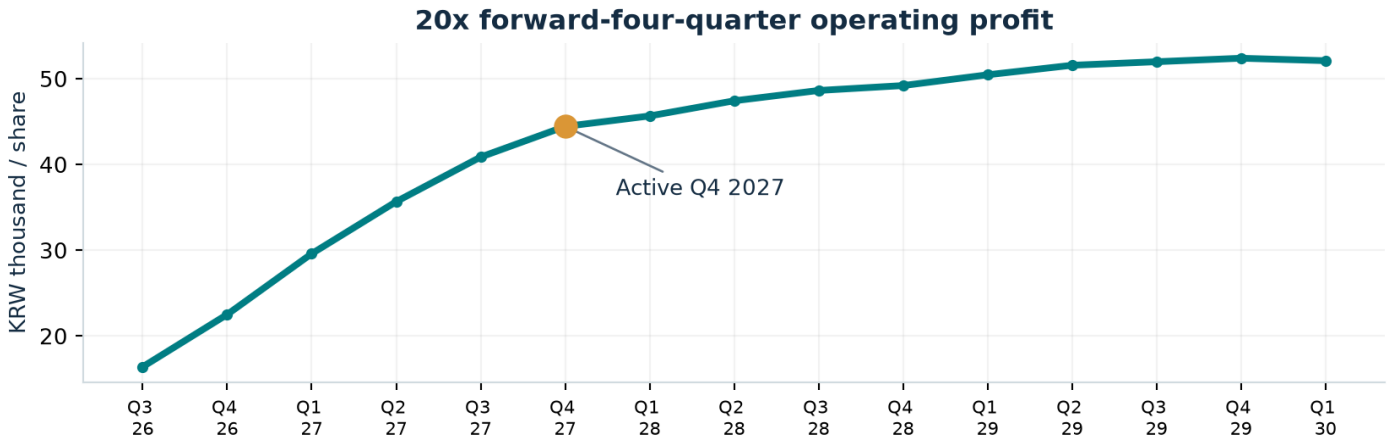

Figure 16. Rolling start-quarter convention; the active Q4 2027 window is October 2027-September 2028. All ceilings use 20x OP. Numerical continuation immediately follows.

Active derivation: OP for Q4 2027 through Q3 2028 = 16.884653 + 16.188940 + 18.048605 + 18.923449 = KRW 70.045648 bn. Multiply by20, convert KRW bn/sharesm with x1,000, then divide by31.537980 m shares = KRW 44,419.87/share. Displayed ceiling rounds to KRW 44,420.

Valuation term	Definition
Metric	Consolidated operating profit after full production D&A and SG&A
Multiple	20x, existing sanctioned company method
Exact window	Ceiling quarter plus next 3 quarters; Q4 2027-Q3 2028 active
Dilution	Maximum modeled shares within the 4-quarter window
Currency / scale	KRW; bn OP x1,000 / million shares
Cash/debt	No net-cash addition or debt deduction under this operating-profit convention; financing affects dilution and thesis risk

No bank price target is imported. No revenue-multiple handoff is assumed. The active portfolio selection remains Q4 2027 through December 31, 2026, then rolls to Q1 2028 on January 1, 2027. A calendar roll selects the existing path; it is not an economic forecast upgrade. [S13]

20 | Ceiling derivation audit

All amounts KRW bn except shares in millions, multiple and ceiling in KRW/share. Formula: F4Q OP x20 x1,000 / max projected F4Q shares.

Ceiling quarter	Exact OP window	F4Q OP	Shares m	Multiple	Ceiling KRW
Q3 2026	Q3 2026 - Q2 2027	25.844	31.537980	20x	16,389
Q4 2026	Q4 2026 - Q3 2027	35.467	31.537980	20x	22,492
Q1 2027	Q1 2027 - Q4 2027	46.645	31.537980	20x	29,580
Q2 2027	Q2 2027 - Q1 2028	56.209	31.537980	20x	35,645
Q3 2027	Q3 2027 - Q2 2028	64.418	31.537980	20x	40,851
Q4 2027	Q4 2027 - Q3 2028	70.046	31.537980	20x	44,420
Q1 2028	Q1 2028 - Q4 2028	71.974	31.537980	20x	45,643
Q2 2028	Q2 2028 - Q1 2029	74.760	31.537980	20x	47,410
Q3 2028	Q3 2028 - Q2 2029	76.658	31.537980	20x	48,613
Q4 2028	Q4 2028 - Q3 2029	77.562	31.537980	20x	49,187
Q1 2029	Q1 2029 - Q4 2029	79.543	31.537980	20x	50,442
Q2 2029	Q2 2029 - Q1 2030	81.293	31.537980	20x	51,553
Q3 2029	Q3 2029 - Q2 2030	81.947	31.537980	20x	51,967
Q4 2029	Q4 2029 - Q3 2030	82.590	31.537980	20x	52,375
Q1 2030	Q1 2030 - Q4 2030	82.135	31.537980	20x	52,086

The assumed Q2 2027 equity reserve affects even the earlier rolling windows that include that quarter. Those windows therefore use 31.537980 m projected shares, rather than retaining today’s30.537980 m denominator while valuing later profit. The financing itself is a labeled model assumption, not an announced issuance.

The Q3 2026 operating row retains its 35% pricing probability and all operating amounts. Its rolling forward-four-quarter ceiling includes Q4 2026-Q2 2027, so it reflects the 45% probability in those future quarters. This is a forward-valuation calculation, not a revision of the Q3 operating snapshot.

21 | Cash conversion and financing

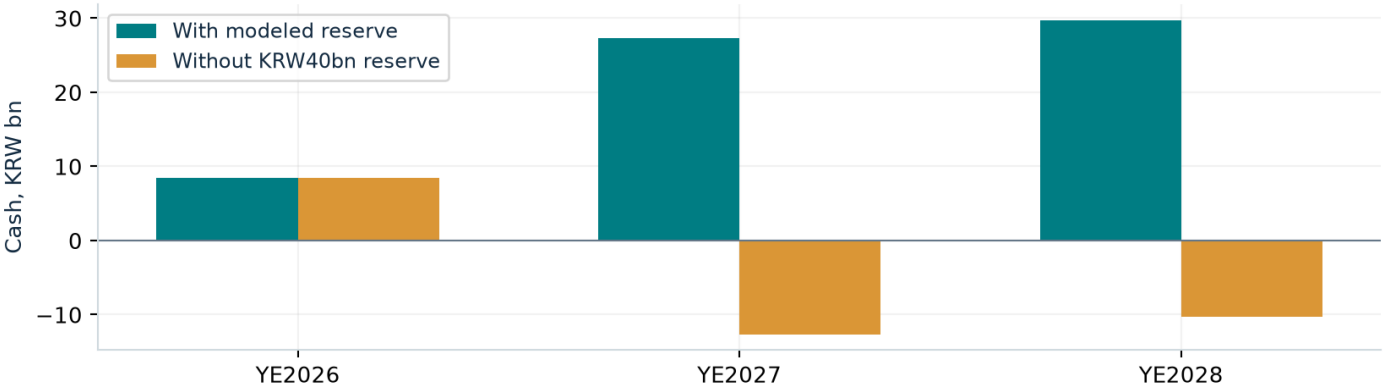

Figure 17. Funding stress bridge. The active case includes a hypothetical KRW 40 bn equity reserve. Removing it leaves cash negative by year-end 2027 under these cash-cost assumptions.

Cash bridge, KRW bn	H2 2026	FY2027	FY2028
Opening cash	28.02	8.48	27.36
OP	9.38	46.65	71.97
All-company D&A addback	2.44	6.52	7.57
Cash interest	1.20	3.00	3.00
Cash tax	2.04	10.91	17.24
Working-capital increase	8.12	30.37	21.92
Operating cash flow	0.45	8.88	37.39
Net capital spending	20.00	30.00	35.00
Hypothetical equity	0.00	40.00	0.00
Ending cash	8.48	27.36	29.75

June actual cash was 28.022 bn against 47.518 bn borrowings, plus approximately 0.165 bn leases. H1 operating cash flow was-15.827 bn; gross PPE purchases 37.915 bn and intangibles 1.450 bn were partly offset by9.095 bn grants. FY2025 equity cash inflow was 89.483 bn; funding already raised does not make new factory working capital free. [S1, S3]

This is a funding stress proxy, not cash guidance. Operating working capital is scaled at28.604% of annual revenue, calibrated to June receivables+inventory-payables over annualizedH 1 sales. Model net capex 20/30/35 bn and cash tax 25% of positive OP less interest are assumptions. Customer prepayments and asset sales are not assumed; scheduled borrowing repayment is excluded, so refinancing remains a separate risk. D&A is added back here only, never in valuation.

22 | Share count, dilution and balance-sheet risk

Item	Count / amount	Treatment
Issued/outstanding common	30,537,980	June report; corroborated September ownership report
Unexercised options	None at June 30	37,250 exercised in January; not incremental now
Current identified convertibles	None outstanding in reviewed filings	Historical converted SPAC instruments excluded
Hypothetical financing	KRW 40 bn at KRW 40,000/share	1,000,000 new shares, modeled from Q2 2027
Valuation share denominator	31,537,980	Maximum projected shares in eachF 4Q window
Extra 10% share stress	34,691,778	Active ceiling 40,382 KRW/share

Current fully diluted shares are inferred from disclosed instruments and subsequent filings, rather than taken from a new October cap table. A September ownership disposal changes who owns shares, not the issuer share count. The Q2 EPS note includes a small weighted option increment despite no ending options; it is preserved as a historical reporting discrepancy, not added as a fictional current instrument. [S1, S10]

The funding reserve is intentionally explicit. A different subscription price, prepayments, additional loans or reduced capital spending would change the dilution outcome. Under the stated cash model,40 bn provides roughly 27.4 bn of year-end 2027 cash, but it is not a promise that financing is available. Dilution probability and issuance terms must be revisited when customer deposits and construction payments become clearer.

A 20x operating-profit convention does not mechanically tax-adjust earnings or deduct debt. That sanctioned convention is preserved; debt still matters to solvency, interest burden, funding capacity and share count. This report does not silently switch to enterprise value, P/E or EBITDA to compensate for a weak balance sheet.

A signed July 7 contract, filed July 8, covers KRW 4.315 bn of PCB automation tools for Vietnam. Payment is 90% within 60 days after shipment and 10% after final acceptance; there is no advance. Final acceptance is scheduled by January 24, 2028. This specific cash-lag evidence is included inside the September intake cohort, not added as a new revenue vector. Its confidential counterparty is not identified as SEMCO or AT&S. [S14]

23 | What moves the result most

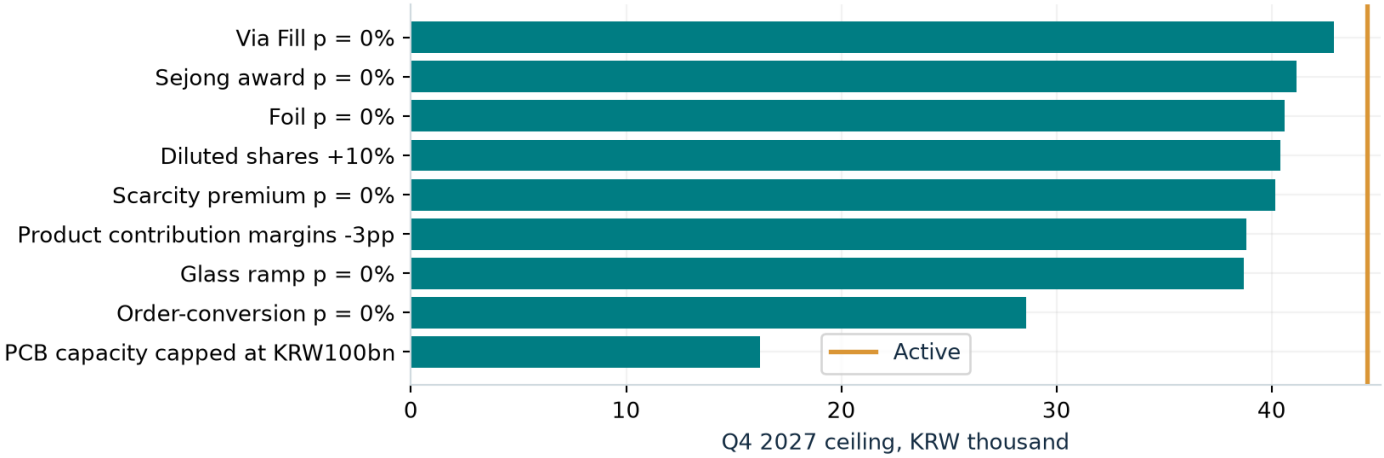

Figure 18. Independent sensitivities, with other inputs held constant. The gold line is the active ceiling. These are diagnostic outcomes, not separate active investment cases.

Change	Q4 2027 ceiling	Delta vs active
Order-conversion p = 0%	28,574	-35.7%
Sejong award p = 0%	41,133	-7.4%
Via Fill p = 0%	42,906	-3.4%
Glass ramp p = 0%	38,708	-12.9%
Foil p = 0%	40,588	-8.6%
Scarcity premium p = 0%	40,145	-9.6%
All incremental probabilities 0%	11,707	-73.6%
Pricing probability 70%	46,795	5.3%
Product contribution margins -3pp	38,823	-12.6%
Diluted shares +10%	40,382	-9.1%
25% of extra order conversion delayed one quarter	44,249	-0.4%
PCB capacity capped at KRW 100 bn	16,204	-63.5%

The largest uncertainties are usable core production capacity, the conversion of the order cohort and incremental product economics. Pricing helps materially, but it cannot repair a factory that cannot ship. The small one-quarter delay sensitivity assumes only 25% of incremental B1 deliveries shift, with later catch-up and the window partly catching that revenue; it is not a severe multi-quarter shutdown case.

24 | Score, risk classes and the reason for Watchlist

Category	Points	Evidence and deduction
Core thesis	14 /20	Qualified wet-process bottleneck; customer relationships and engineering; competitive alternatives remain
Cycle stage	9 /10	Orders and lead times inflect; July relocation and customer capex precede recognition
TAM expansion	8 /10	Advanced substrates, glass wet-process content, external foil machines; phase-weighted
Catalysts	4 /5	Q3/Q4 conversion, 2027 lead-time deliveries, LOI and customer procurement
Macro	9 /10	AI packaging complexity and customer investment; geography/cycle exposure remains
Alpha	4 /5	Local-language order archaeology and cost/recognition bridge; already-promoted theme
Risks	-4	One point per distinct risk class listed below
Total	44 /60	44 /60 x100 =73.33%, lattice-rounded 73 /100

1. Competition and capture (-1): Atotech and other qualified vendors can win tool wallets; logos and domestic marketing claims do not establish worldwide exclusivity.
2. Manufacturing and qualification execution (-1): staffing, outsourcing, yield, acceptance and new-product performance may lag the order queue.
3. Funding and cash conversion (-1): working capital and commissioning consume cash, with additional equity or refinancing possible.
4. Customer/geographic and cycle concentration (-1): China was 66.38% of H1 revenue; customer capex timing, procurement concentration and eventual equipment digestion can move together.

73 is a thesis-quality score and falls in the framework Watchlist band 65-74. It is independent of today’s stock price. Strong industry demand does not erase execution and funding risks, and a promising bottleneck does not automatically earn 85+. Analytical and protected Excel Base both remain 73; this pricing update does not change the score.

25 | Forward triggers and cross-portfolio implications

Driver	Evidence that raises p / confidence	Evidence that reduces it
B1 orders 65%	Q3/Q4 acceptance and collections; scoped order cohort; staffed output	Orders include preliminary/non-core scope; revenue/cash lag; cancellation
B2 Sejong 65%	Vendor selection, procurement, delivery windows	Delayed site/tool acceptance or competitor capture
B3 Via Fill 50%	Definitive Simmtech amount; accepted production; more customers	LOI does not convert; warranty or repeatability issues
B4 glass 35%	Commercial line award; reliable high-volume handling/plating	Cracks, low yield, roadmap delay, repeated samples only
B5 foil 25%	Paid external tool orders and acceptance	Internal use only; cash-intensive material business without customers
B6 pricing 45%	Mix-adjusted ASP increases; deposits for priority slots	Flat new-contract prices; most gains absorbed by costs

Next operational checkpoint: Q3 2026 reporting, then Q4 deliveries and 2027 customer procurement. A specific earnings-call date was not confirmed in reviewed sources. The source priority is actual orders, acceptance, pricing and cash terms; another identical repost does not count as a new event. Review the cost bridge and share schedule alongside every revenue update.

Within the existing framework, this evidence is relevant to SEMCO’s substrate investment, LPKF’s glass-process pathway and MKS/Atotech and SCHMID’s equipment/chemistry positions. It can strengthen sector demand while also increasing competitive capture risk. Taesung’s wet-process order is not proof of an LPKF laser order or a glass production qualification. No other company model changes are made in this deep dive.

The most important remaining source gaps are the September matched backlog, customer/order concentration, cancellations and deposits, staffed tool output, actual new-order pricing, exact Via Fill value, accepted glass/foil programs and segment cost data. Each has a defined model location above. They remain uncertainties inside a working probabilistic case, not a reason to defer all modeling until the opportunity is fully confirmed.

26 | Evidence register and provenance

Read source dates and scopes with each chart. Reported facts, company-attributed claims, contracted research and model assumptions have different status.

S1. Taesung H1 2026 report, filed August 12, 2026

K-IFRS consolidated actuals, notes; separate-company equipment mix and order table explicitly identified.
