Machvision

3563.TW | TWSE | 2026-10-07

Q4 2027 model ceiling: TWD 798.31

Analytical Base 43/60 = 72 | Qualified inspection bottleneck / watchlist

20x rolling forward-four-quarter IFRS operating profit attributable to common equity using a 2% minority-OP reserve, divided by modeled window-end shares. No excess-cash bonus or debt claim.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	2,567.4	20x	64.321	798.31

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Thesis

Research date: October 7, 2026. TWSE 3563; all financial amounts are TWD million unless stated otherwise. Analytical Base: **72/100**. The Q4 2027 ceiling is **TWD798.31**, using **20 times Q4 2027 through Q3 2028 common-attributable operating profit** and 64.3212 million modeled shares at the end of that window. The reference without probability-weighted increments is TWD750.75. These are modeled ceilings, not company guidance or an analyst target.

Machvision is an engineering exposure to the cost of making increasingly difficult circuit boards and packages. Its tools must find defects while preserving throughput and avoiding unnecessary rejection of good product. The near-term opportunity is stronger than a generic AI-capex story: actual monthly sales have accelerated, management describes semiconductor tools completing qualification, and new facilities are scheduled for early 2027. The valuation nevertheless already requires a considerable earnings ramp. A qualified bottleneck is not an unlimited pricing franchise.

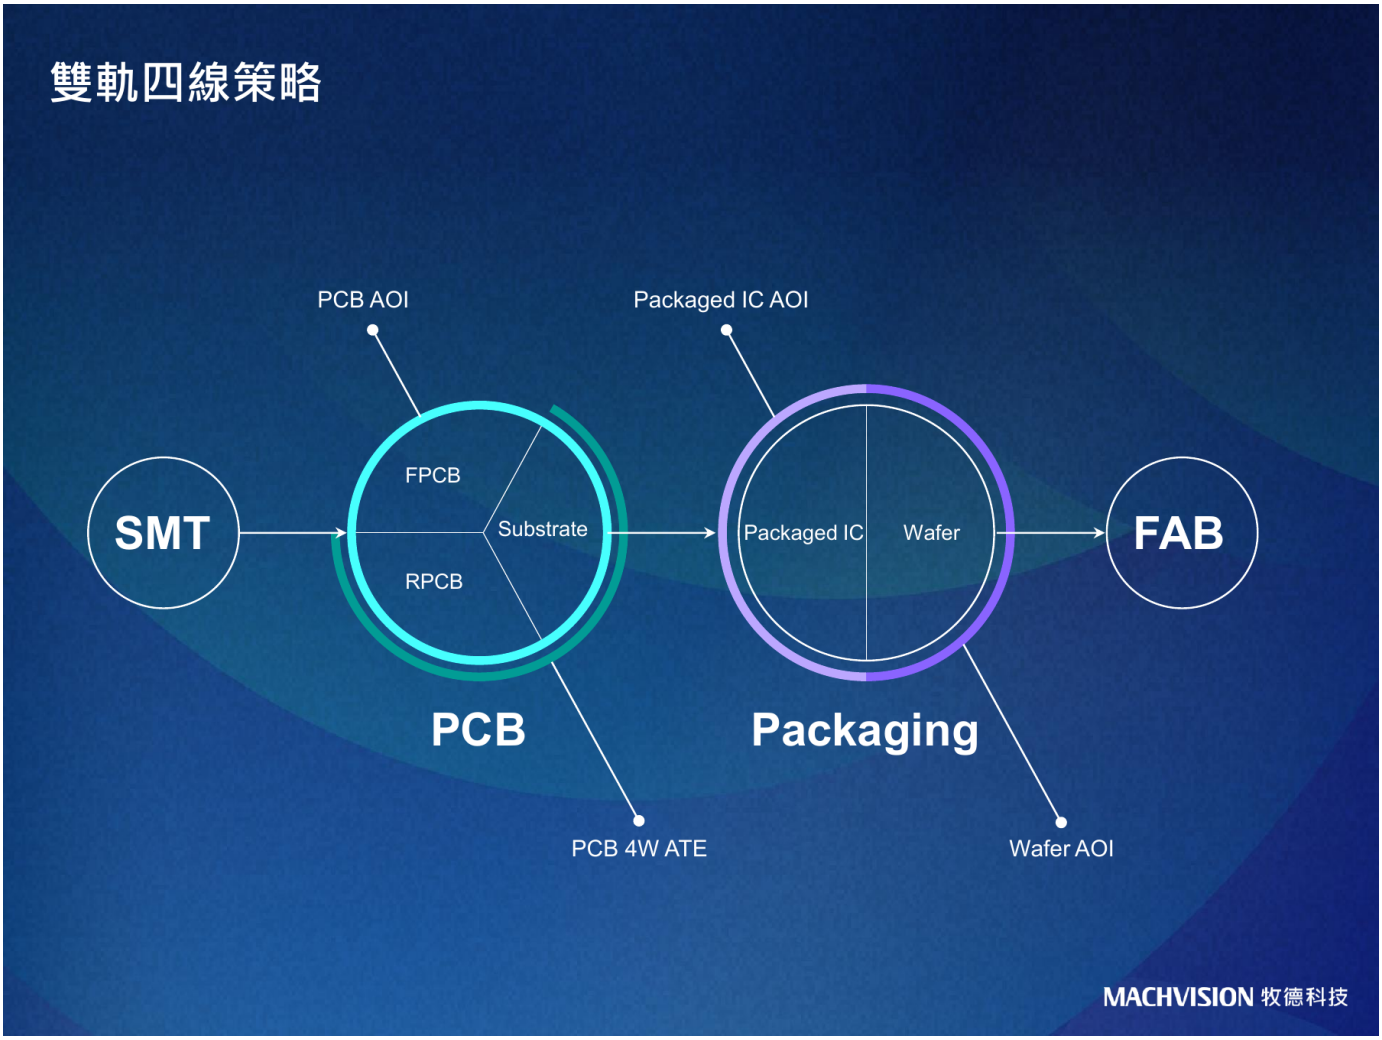

Products and engineering

Machvision integrates optics, illumination, precision motion, mechanical handling and image-analysis software. PCB automatic optical inspection finds visible circuit and surface defects. Automatic visual inspection checks finished appearance and dimensional features. Three-dimensional measurement addresses items such as bump height and warpage. Four-wire electrical testing measures resistance and connectivity; it solves a different problem from a camera finding a visible defect. Counting both functions is appropriate only when a customer installs both kinds of systems, not because the same board has more vias.

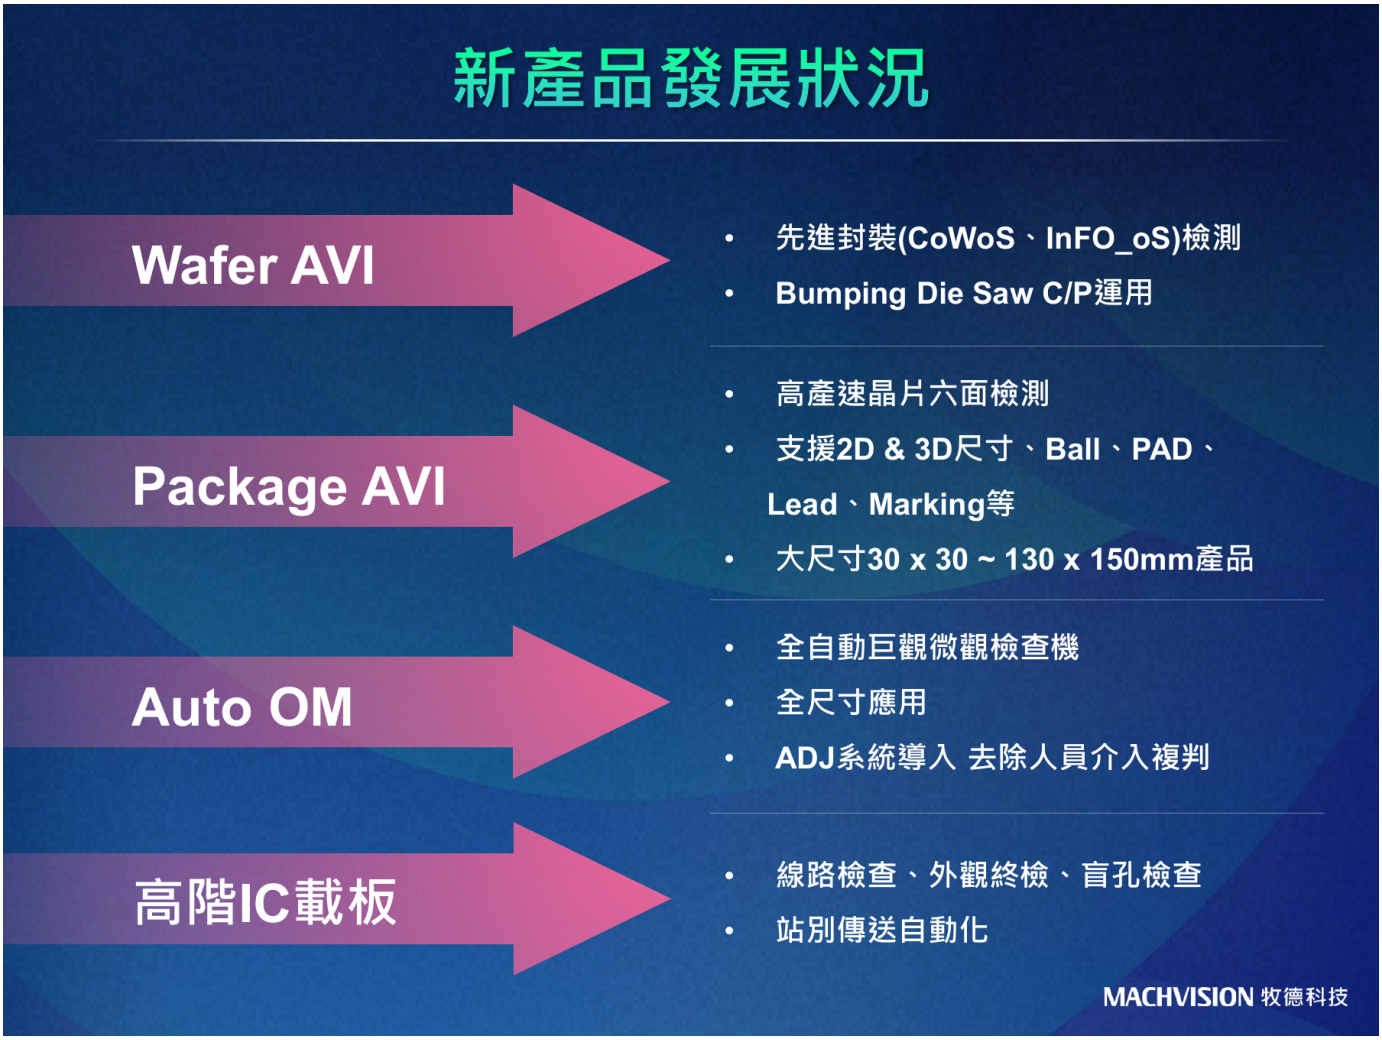

As boards become larger and denser, a fixed inspection recipe can require more pixels, scanning time or review effort. A better inspection system can recover factory throughput or reduce escaped defects. That creates a meaningful cost of waiting for a qualified machine. It does not establish that every increase in layer count produces an equal increase in Machvision revenue. Recipes, sampling rates, parallelism, machine speed and yield all matter.

The September presentation describes four lines: PCB AOI, PCB four-wire testing, packaged-IC AOI and wafer AOI. The June deck shows wafer inspection for advanced packaging, package inspection of multiple faces, and automated macro/micro inspection. The stated package-size range extends from 30 by 30 mm to 130 by 150 mm. Product-specific qualification and throughput are more useful evidence than an undifferentiated semiconductor inspection TAM. [June presentation, PDF pages 9-10; September presentation, pages 5-7.]

The 2025 annual report identifies KLA, CIMS and SCREEN among circuit-inspection competitors and Shirai and Utech in appearance inspection. Machvision describes broad penetration among major PCB manufacturers, but penetration of a customer list is not market share. Customer process recipes, installed software, field service and demonstrated false-positive/escape performance raise switching costs. Competing tools, internal process improvements and faster inspection algorithms can still reduce the number of machines needed. [Annual report, PDF pages 93-106.]

https://mopsov.twse.com.tw/nas/STR/356320260930M001.pdf | Original issuer exhibit: Sep2026_deck, PDF page 5. Figures retain issuer units; the surrounding text translates them to TWD million.

https://mopsov.twse.com.tw/nas/STR/356320260630M001.pdf | Original issuer exhibit: Jun2026_deck, PDF page 9. Figures retain issuer units; the surrounding text translates them to TWD million.

Current results and issuer outlook

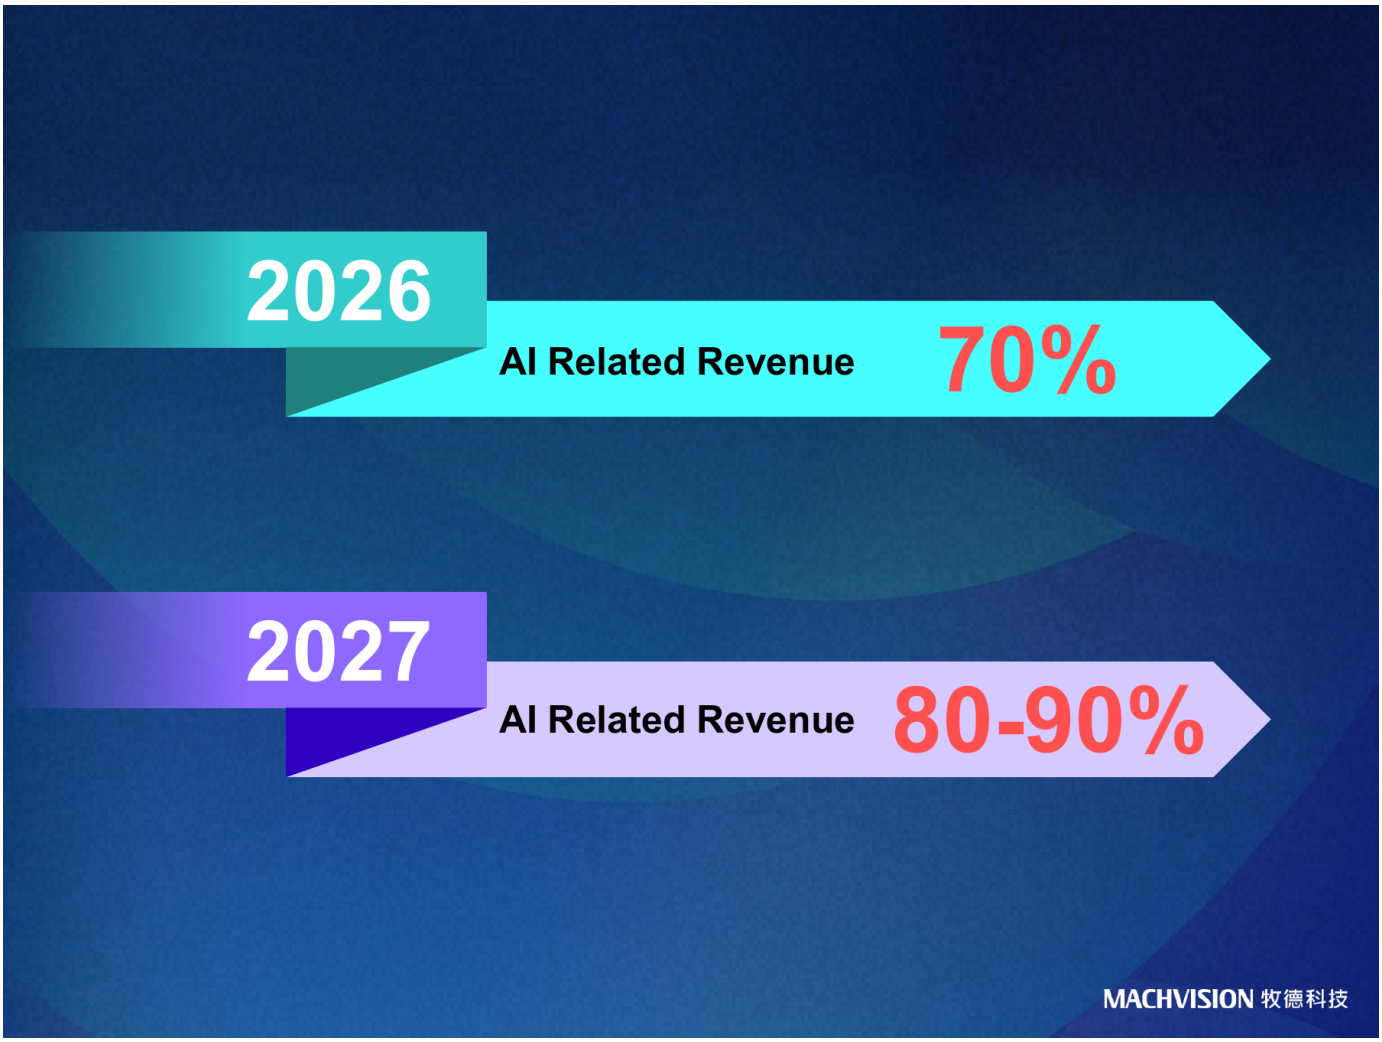

Q2 2026 revenue was **1,047.196**, gross profit **632.619** and reported operating profit **408.919**. The reported 39.05% operating margin included a **19.988 expected-credit-loss reversal**. Without that benefit, operating profit was **388.931**, or approximately **37.14%** of revenue. H1 reported operating profit of **742.904** similarly contained **37.503** of credit reversals. The forward model does not repeat those benefits. Recurring R&D, selling costs, depreciation and compensation remain expenses. [Q2 statements, PDF page 6.]

The issuer's monthly table reports September sales of **372.810**, up 63.20% year over year. July through September sum to **1,093.627**, which anchors the Q3 revenue estimate. Q3 profit has not yet been released. There is a small reconciliation issue: the January-June monthly figures sum to **1,911.044**, versus **1,910.611** in the financial statements. The **0.433** difference is retained as an open monthly-to-quarterly reconciliation, not silently treated as extra Q3 revenue. [Issuer monthly-revenue table, accessed October 7.]

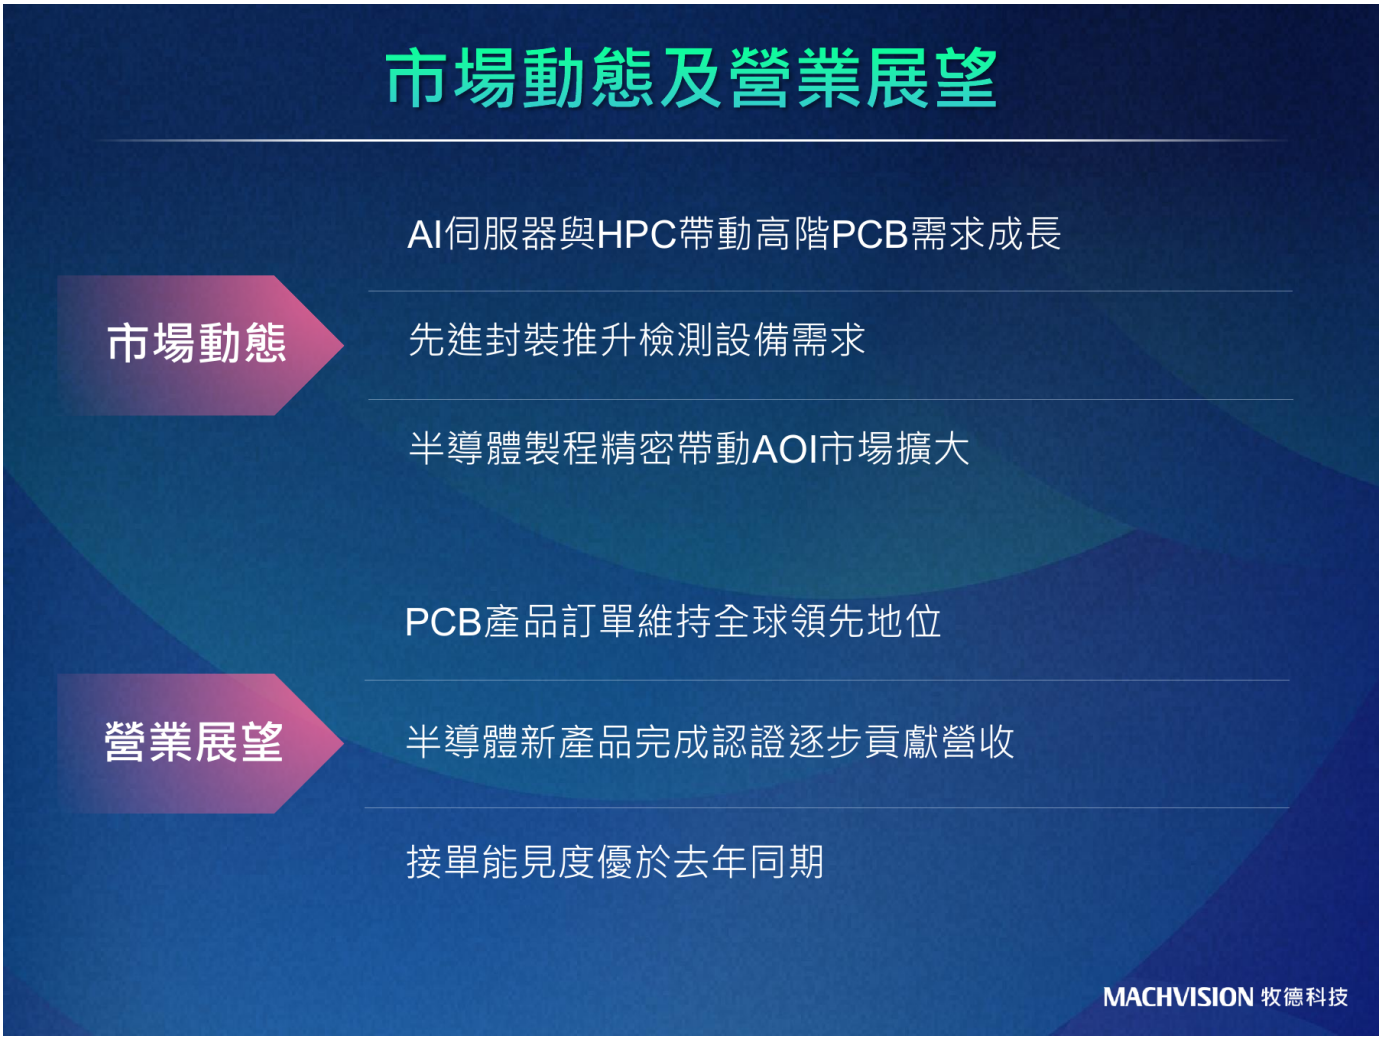

September management describes AI-related revenue at 70% for 2026 and 80-90% for 2027. These are management's classification and outlook; they are not separately additive sales. The deck's historical growth-stage illustrations are not a formal 2027 sales or profit forecast. The June presentation says new semiconductor products have completed qualification and are gradually contributing to sales, with better order

visibility than the prior year. No verified tool-by-tool bookings schedule or customer award amount was disclosed in the reviewed originals.

Both the June 30 and September 30 management presentations were reviewed in full. An official verbatim Q&A transcript was not retrieved. Secondary claims of particular backlog amounts, six-month lead times or 80-90% market share are not used as verified model inputs.

Capacity, qualified output and pricing

The September 30 deck places a **January 1, 2027** planned opening beside the headquarters/second Hsinchu plant and mainland operating/production headquarters. It describes capacity prepared for a **TWD10 billion scale**. This supports a multiyear growth path, but it is not a TWD10 billion revenue promise, a saleable-unit count or evidence that all sites reach full qualification on opening day. [September presentation, PDF page 17.]

Equipment sourcing, assembly, calibration, customer acceptance and after-sales support are the relevant constraints. A new building expands the opportunity to produce systems; it does not eliminate precision-component lead times, field staffing or customer qualification. The June statements disclose a mainland building contract of **118.251**, with **95.830** paid by June. H1 cash investment therefore includes that equipment/building prepayment, not just the much smaller **3.657** cash PPE line. [Q2 statements, PDF pages 8 and 31.]

The model assigns a **60%** probability to additional accepted PCB equipment sales above a reference that already grows strongly. Conditional incremental sales are **300/450/500/400** in 2027/28/29/30. A TWD10 million equivalent system price translates this to 30/45/50/40 systems. The price is an auditable calibration proxy, bounded at

TWD7-15 million, not a claim about actual units or ASP. Incremental gross profit is 56% of sales; launch, sales and application engineering absorb another 12%, leaving 44% operating profit before minority attribution.

Pricing receives a separate **50%** weight: a 4% gross premium on 40% of reference equipment sold under eligible new or renewed terms. The bounded range is 2-6% on 25-60% of eligible orders. The premium phases through 2027, is fully available in 2028, then fades as capacity responds. Components, labor, expediting and warranty consume 40% of the price increment, and selling/qualification costs another 5%. No scarcity premium is applied to the separate incremental-volume branches. No new general gross-margin uplift is layered on top. This treatment recognizes customers' cost of waiting while acknowledging that actual contract terms and lead times remain undisclosed.

The new-semiconductor-win branch has a **45%** probability and conditional sales of **60/120/180/240** through 2027-30. It represents only systems beyond the other-testing reference. At a TWD20 million equivalent-system price, this is 3/6/9/12 additional systems; a TWD10-30 million range illustrates the uncertain mix. Gross profit of 56% less 15% application engineering/service costs leaves 41% operating profit. ASE's ownership is a relationship, not evidence of a guaranteed order.

A **25%** residual downside allows qualification and warranty costs equal to 1% of reference equipment sales in 2027-28, fading to 0.5% in 2029. This is an overrun beyond normal modeled launch costs, not a second utilization haircut. The model probabilities are investment judgments, not statistically estimated frequencies. The ledger states what evidence would increase or reduce them.

https://mopsov.twse.com.tw/nas/STR/356320260930M001.pdf | Original issuer exhibit: Sep2026_deck, PDF page 17. Figures retain issuer units; the surrounding text translates them to TWD million.

Revenue vectors and economics

The annual report's four disclosed 2025 categories were appearance inspection **793.051**, circuit inspection **1,044.825**, other testing **1,104.304**, and service **249.281**. Those product categories organize the model; they do not identify end-market TAM or customer geography. [Annual report, PDF page 93.]

The CY2027 reference is **5,800** of revenue: 1,700 appearance, 1,950 circuit, 1,700 other testing and 450 service. CY2028 reference is **7,150**, then **8,450** in 2029 and **9,250** in 2030. These are assumptions, not issued guidance. They already incorporate the major announced demand/capacity opportunity. Product gross-margin assumptions range from 58% to 68% in 2027 and aggregate near the currently reported level. Selling, administration and R&D total 25.5% of reference sales in 2027, easing to 24.5% by 2029. R&D still rises in absolute money; operating leverage is not created by deleting engineering costs.

After probability-weighted increments and minority attribution, CY2027 revenue/OP are **6,034.820 / 2,108.172**; CY2028 **7,526.800 / 2,719.137**; CY2029 **8,877.800 / 3,246.201**; CY2030 **9,631.800 / 3,503.226**. The 2030 weighted revenue remains below the order of magnitude of the announced TWD10 billion capacity preparation. Timing and tool mix matter more than treating that number as a hard capacity ceiling or an automatic forecast.

The Q4 2027 valuation window covers **Q4 2027, Q1 2028, Q2 2028 and Q3 2028**. It contains **2,567.403** of common-attributable operating profit. At 20 times and 64.3212 million end-window shares, the ceiling is **798.31**.

The same window without the incremental branches is **750.75**. Thus this is an explicit operating bridge, not a higher valuation multiple dressed up as business improvement. A one-percentage-point change in common attribution changes the ceiling by approximately TWD8.15, before any other changes.

The full model supplies every quarter from Q3 2026 through Q4 2030, with 15 rolling ceilings through Q1 2030. Confidence is materially lower after 2028. Quarterly delivery allocation and product margins are disclosed model allocations rather than issuer guidance. New reported results should replace these assumptions instead of being added as another growth overlay.

IV. Operational Highlights

4.1 Business Activities

4.1.1 Business Scope

(1) Main contents of business

CB01010 Mechanical equipment manufacturing

CE01010 General Instrument manufacturing

CE01030 Optical instrument manufacturing

I301010 Information software service

F401010 International trade

Research, develop, manufacture and market following products:

(a) Non-contact mechanical vision inspection system equipment (detection accuracy below 10μm)

a. BGA, CSP substrate inspection system equipment

b. LCD PANEL detection system equipment.

c. PCB high-speed hole measurement equipment

(b) Smart vision module

(c) Wire width detector

(d) Drill needle detector

(e) Arrow targe

(f) analysis software

(g) Concurrently engage in import and export trade related to the above products

(2) Business share of major products

Product value / Item	2025	
	Revenue (NTD$ thousand)	Operating proportion (%)
Appearance inspection series	793,051	25%
Circuit inspection series	1,044,825	33%
Other testing series	1,104,304	34%
Service	249,281	8%
合　　計	3,191,461	100%

(3) Company's current commodity (service) projects

The company’s expertise is divided into three major technologies: (1) appearance inspection (commonly called AVI); (2) 2-D/3-D measurement; and (3) circuit-inspection (commonly called line AOI). The three technologies are applicable to various industries. For example, AVI can be used for final appearance inspection of PCBs and COFs, appearance inspection of IC substrates,

Treasury, working capital and shares

June cash equivalents were **1,419.437**, with current amortized-cost financial assets **2,919.908** and noncurrent financial assets **256.611**. The latter include bonds and must not all be described as bank deposits. No bank or bond borrowings appear in the reviewed balance sheet; leases total **70.819**. Dividends payable of **767.531** mean headline cash is not entirely uncommitted. The valuation gives no excess-cash bonus and has no net financial-debt deduction. [Q2 statements, PDF pages 5 and 12-13.]

Receivables including long-term balances reached **2,042.627**, versus about **1,571.811** at December. H1 operating cash flow was **453.464**, below reported earnings, with receivables and inventory absorbing cash. Contract liabilities of **202.581** are deposits and deferred revenue, not the full order backlog. Growing reported revenue without timely collections would undermine the thesis even if accounting margins remain high.

The current issued common-share basis is **63.960858 million**, already including the **10% stock dividend in November 2025**. The earlier private placement to ASE is also already included. It is not added again. A **0.25% annual dilution reserve** produces 64.3212 million at the Q3 2028 window end; no future buyback is assumed. [Annual report, PDF pages 87-92; June statements, capital/EPS notes.]

Minority interests exist in the consolidated subsidiaries. The model reserves **2% of consolidated operating profit**, including probability-weighted increments, for minority attribution. This is an imperfect proxy informed by subsidiary operating earnings and recent minority net income, with a 1-3% sensitivity range. The **134.676** balance-sheet minority book value is not subtracted from the valuation. Applying both a perpetual OP attribution and a fixed book deduction would confuse two different economic measures.

The quarterly review qualification concerns certain small subsidiaries whose interim accounts were not separately reviewed. Their disclosed scale is about 6% of assets and 5% of liabilities; it is not a going-concern or fraud opinion. It remains a proportional reporting-quality watch item. [Q2 statements, auditor report, PDF pages 3-4.]

Growth-funding cross-check

Opening cash plus current financial assets of **4,339.345**, less all **767.531** of June dividends payable, leaves **3,571.814**. Noncurrent bonds receive no liquidity credit. The **7.162** of pledged deposits are separately reported in other noncurrent assets and are already outside this pool. The remaining signed mainland property commitment is **22.421**. July's **81.580** subsidiary capital injection is a transfer within the consolidated group, not a second external expense. [June statements, PDF pages 5, 13 and 31.]

An explicit quarterly liquidity check links the adopted revenue/margin path to receivables, inventories, payables and deposits. The reference uses 190 receivable days, 110 inventory days and 90 payable days; a stress uses **240/150/60 days**, while contract deposits equal 5% of annualized sales. Both use 25% cash tax on consolidated operating profit, only 1% of revenue as a D&A addback, and dividends equal to 50% of the resulting after-tax operating-profit proxy. Capex reserves are 4% and **5.5% of sales**, respectively, plus the remaining signed property payment once. Those future capex/dividend allocations are assumptions, not company guidance. H1 property prepayments already paid are not deducted again.

Minimum post-dividend liquidity is **2,872.523** in the reference (Q4 2027) and **711.431** in the stress (Q4 2029). Combining the stress with a 50% haircut to current financial assets for transfer/access uncertainty creates a **748.523** funding deficit if future modeled dividends continue. Suspending prospective dividends, while fully reserving the June dividends already payable, leaves minimum liquidity of **813.197** without new equity or borrowing. Funding flexibility therefore depends on curtailing distributions in that harsher combined case. This bounded check does not establish that all deposits are freely transferable or that cash conversion cannot deteriorate further. No funding benefit is added to the valuation.

(請詳閱後附合併財務報告附註)

https://doc.twse.com.tw/server-java/t57sb01?step=9&kind=A&co_id=3563&filename=202602_3563_AI1.pdf | Original issuer exhibit: Q2_2026_financials, PDF page 5. Figures retain issuer units; the surrounding text translates them to TWD million.

Risks, catalysts and score

Q2 geographical revenue attributed to China was **906.876**, about **86.6%** of the total. H1 was approximately **81.4%**. This is a substantial concentration and cannot be neutralized merely by calling the end-use AI. Customer capex delays, local competitors, export rules and collection risk can all affect timing. [Q2 statements, PDF pages 22-24.]

The next decisive observations are monthly sales and collections, Q3 expense quality, January 2027 site readiness, customer acceptance of new systems, and whether realized price/mix actually covers new costs. A failure to qualify systems, persistent competitive discounts, rapidly aging receivables or a wider gap between cash flow and profit would justify lowering volume/pricing probabilities. Successful acceptance and service revenue from new semiconductor products could justify raising the currently bounded capture branch.

The framework score is **43/60 = 72/100**: core thesis 15, cycle 8, TAM expansion 8, catalysts 4, macro 9, alpha 4, and five risk deductions. Precision inspection and qualification support the score; competitive alternatives and concentrated customers prevent treating it as a monopoly. The score is analytical quality and timing, not a guaranteed return and not an automatic manual portfolio override.

Primary source register

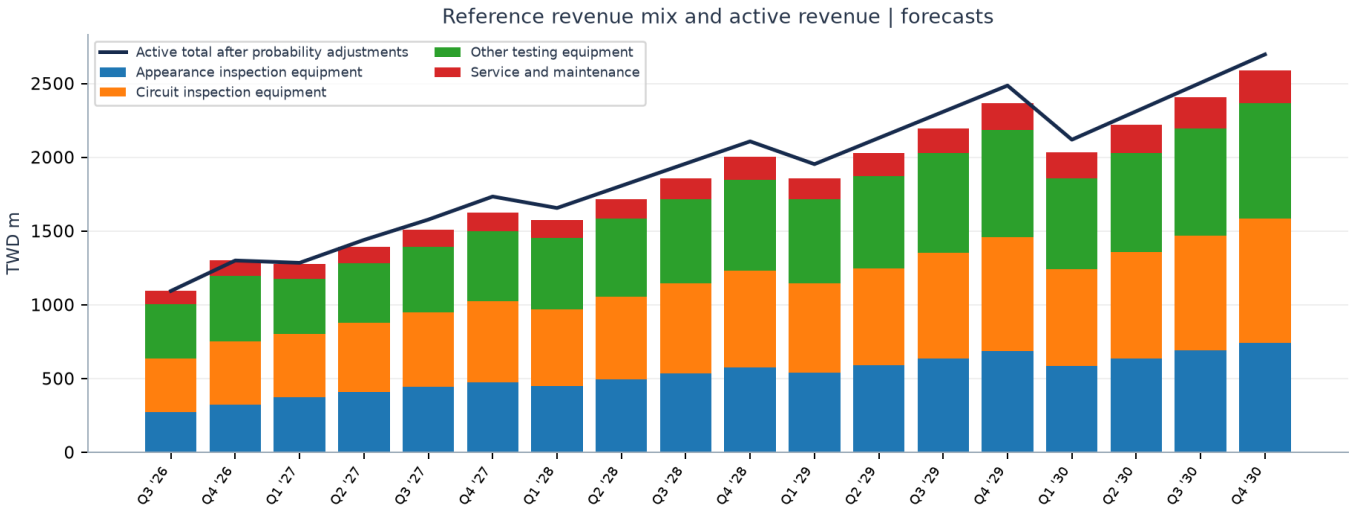

- September 30, 2026 management presentation: all 18 pages reviewed; original product map, AI mix and capacity exhibits retained. - June 30, 2026 management presentation: all 12 pages reviewed; product scope and outlook retained. - Q2 2026 consolidated financial statements, original exchange document: all relevant statements, capital, subsidiary, geography and commitment notes reviewed; original 35-page PDF archived. - 2025 annual report, issuer document archived by filing repository: business/product mix, competition, R&D, ownership and subsidiary earnings. - Issuer consolidated monthly revenue: accessed October 7, 2026; original table uses TWD thousand.

The source manifest preserves document hashes, dates, pages and the eight original exhibits. The model's numerical forecasts and probabilities are explicitly separate from source facts.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	15	Precision optical/electrical inspection is a qualified yield bottleneck, but strong incumbent competition prevents monopoly scoring.
Cycle	8	Accepted sales are accelerating before new 2027 capacity; cyclical PCB investment remains material.
TAM	8	Four product lines expand from PCB inspection into advanced packages and wafer inspection; revenue capture remains bounded.
Catalysts	4	Monthly revenue, third-quarter financials, planned January 2027 facilities and semiconductor product acceptance.
Macro	9	AI board and advanced packaging complexity support inspection demand; geographic concentration is a constraint.
Alpha	4	Local-language equipment disclosures and recurring versus credit-reversal profit reconciliation improve the economic bridge.
Risk classes	-5	Five classes: customer/geographic concentration and export policy; competition/qualification; capacity and field quality; receivables/cash conversion; valuation/cyclicality and minority ownership.
Total	43/60	Rounded Base 72. Both artifact and new workbook row use this score; this is not a manual override.

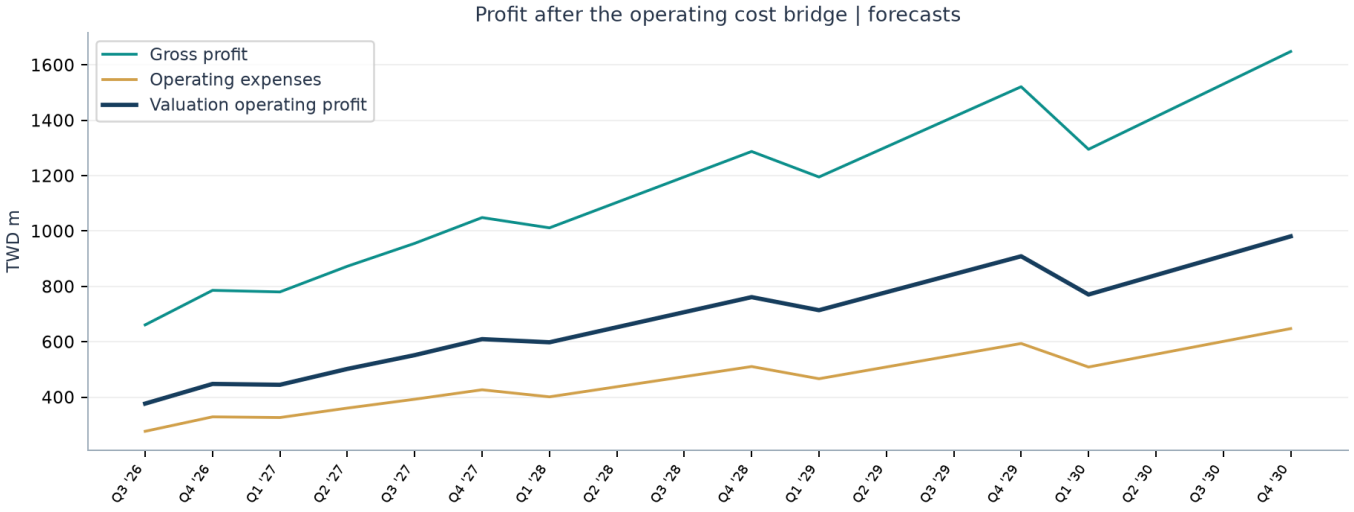

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	1,093.6	0.0	1,093.6

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Four-quarter earnings window	F4Q OP	Multiple	Shares	Ceiling
Q3 2026	Q3 2026 to Q2 2027	1,771.3	20x	64.121	552.47

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Reference equipment equivalent systems at TWD10m average; mix proxy, not issuer shipment count	Status
Q3 2026	100.614	Preliminary monthly sales sum; expenses forecast
Q4 2026	119.600	Model assumption

Q3 2030	219.700	Model assumption
Q4 2030	236.600	Model assumption

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Appearance inspection equipment	273.4	61.0%	166.8
Q3 2026	Circuit inspection equipment	360.9	62.0%	223.8

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Weighted OP below is after the stated minority operating-profit attribution. Conditional gross profit and expenses remain consolidated figures.

Consolidated profit to the common shareholder claim

Minority attribution is an earnings allocation, not operating expense or a fixed book-value deduction. Its rate is a disclosed model proxy and moves with reference profit and each probability-weighted change.

Quarter	Consolidated OP	Minority rate	Minority allocation	Owner OP
Q3 2026	384.4	2.0%	7.7	376.7

Claim decisions, overlap and triggers

MACH-ACCEPTED-OUTPUT

p: 0.6

date: 2026-09-30

source ids: Sep2026_deck Monthly_revenue

hypothesis: New facilities and qualified supply-chain output convert some additional PCB inspection orders above the reference.

reference: Reference sales already grow from about TWD4.30bn in CY2026 to TWD5.8bn in 2027 and TWD9.25bn in 2030. Most AI demand and the announced facilities support that path.

Conditional: Additional equipment sales of TWD300m/450m/500m/400m in CY2027/28/29/30. At a TWD10m equivalent system price, these are 30/45/50/40 incremental systems; price is a disclosed model proxy, not issuer ASP.

bounds: TWD7m-15m per equivalent system; CY2028 conditional sales TWD200m-700m. No claim that all models have identical prices or throughput.

overlap: Only the residual output above the already expanding reference is added. AI revenue classification, larger boards, more layers and new floor space are not independent demand shocks. This branch excludes the separate new semiconductor wins.

cost bridge: Conditional revenue x56% GP, less 12% launch, selling and engineering costs; net 44% consolidated OP before the common-equity attribution reserve.

timing: Begins Q2 2027 at 20%, Q3 at 30%, Q4 at 50% of the annual increment, after the planned January facility opening; subsequent years use a rising quarterly delivery allocation, not asserted business seasonality.

why p: Two current management presentations, rising reported monthly sales and specific facilities support conversion, but customer qualification and accepted output remain unreported.

counter: Reduce to 35% after two quarters of installation/qualification slippage or flat orders; raise toward 75% only after accepted production and cash collections track plan.

MACH-NEW-TERMS

p: 0.5

date: 2026-09-30

source ids: Sep2026_deck Annual2025

hypothesis: Some scarce qualified inspection systems earn a modest premium on new or renewed orders.

reference: Reference product margins include ordinary mix but no general scarcity price premium.

Conditional: 4% gross price premium on 40% of reference equipment revenue, phased at 25/50/75/100% in Q1/Q2/Q3/Q4 2027; 100% in 2028, 75% in 2029 and 50% in 2030.

bounds: 2-6% gross premium on 25-60% eligible new/repriceable orders; no disclosed issuer price list or announced blanket increase.

overlap: No premium is applied to the separate output or semiconductor-win branches. No extra margin uplift is added to the same sales. Facilities and customers cost of waiting support the hypothesis, not a second volume pool.

cost bridge: Only 60% of incremental premium is GP after component, labor, expediting and warranty costs; incremental selling/qualification cost 5%, leaving 55% OP.

timing: Recognition follows delivery/acceptance of new terms in 2027-28, with fade as suppliers add capacity.

why p: Qualified inspection has a high cost of delay at an expensive PCB line and the issuer is adding dedicated capacity. Absence of verified lead-time and contract repricing data limits the weight to 50%.

counter: Cut the increment if costs fully absorb new terms or customer discounts persist; raise only with comparable realized ASP and cost evidence.

MACH-SEMICONDUCTOR-WINS

p: 0.45

date: 2026-06-30

source ids: Jun2026_deck Annual2025

hypothesis: Additional advanced-package and wafer-inspection wins beyond the reference other-testing growth.

reference: The existing reference other-testing vector already rises to TWD1.7bn in 2027 and TWD2.8bn in 2030 and contains current semiconductor revenue.

Conditional: Above-reference TWD60m/120m/180m/240m in CY2027/28/29/30, equivalent to 3/6/9/12 incremental systems at TWD20m each; actual system ASP and mix are not disclosed.

bounds: TWD10m-30m per equivalent high-end system; zero to TWD200m additional sales in 2028.

overlap: Only incremental won systems above the reference are counted; ASE ownership does not imply a named order, and AI/CoWoS end-market TAM is not directly converted to revenue.

cost bridge: 56% GP less 15% application engineering, software, service and sales cost gives 41% OP. Tool gross margin includes production depreciation and warranty costs.

timing: Small 2027 installations, expanding through 2030 after product-specific customer qualification.

why p: June management states new semiconductor products have completed qualification and begin contributing revenue, while scope and customer awards remain undisclosed.

counter: Reduce on lost qualifications or failed throughput/false-positive tests; increase after named commercial installs and recurring support revenue.

MACH-RAMP-COST

p: 0.25

date: 2026-09-30

source ids: Sep2026_deck Q2_2026_financials

hypothesis: New sites and a broader tool mix create a residual qualification/warranty cost overrun.

reference: Reference gross margins and branch costs already include normal ramp costs, while historical expected-credit-loss reversals are not repeated.

Conditional: Additional GP cost equal to 1% of reference equipment revenue in 2027-28, 0.5% in 2029 and zero in 2030.

bounds: 0-2% of equipment revenue; not a revenue haircut or a repeat of modeled engineering expenses.

overlap: This is only a residual cost overrun, separate from the explicit normal branch costs. No simultaneous utilization penalty is added.

cost bridge: The conditional negative GP reduces consolidated OP directly.

timing: 2027-29 site/product ramp.

why p: Two-site expansion and receivables growth make execution risk credible despite a strong cash position.

counter: Remove after sustained acceptable field quality and collection performance; increase if warranty/inspection rework rises materially.

Remaining bounded uncertainties

- Monthly January-June revenue sums to TWD1911.044m versus reported H1 TWD1910.611m, a TWD0.433m discrepancy. Q3 uses the July-September monthly sum TWD1093.627m, not YTD less reported H1. Reconcile when Q3 results arrive.

- No audited 2026 Q3 profit or formal annual revenue/OP guidance is available as of this review. September growth illustrations are not numerical 2027 guidance.

- Product gross margins, system units, average prices, lead times and repricing eligibility are undisclosed; they are explicit bounded model proxies.

- AI-related mix of 80-90% for 2027 is issuer outlook, not a separate incremental revenue pool or confirmed customer award.

- A 2% minority OP attribution proxy uses the order of subsidiary operating earnings and current minority net income; consolidated net-income attribution is not identical to OP attribution. Sensitivity is 1-3%.

- The latest two management presentations were read in full. An official verbatim Q&A transcript was not retrieved; unverified secondary backlog/lead-time claims are excluded.

- Quarterly cost forecasts include recurring R&D, SBC and D&A but do not repeat H1 expected-credit-loss reversals. A new credit loss would reduce the ceiling.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
