Jentech

3653.TW | Taiwan Stock Exchange | 2026-10-07

Q4 2027 model ceiling: TWD 3,133.76

Analytical Base 46/60 = 77 | Strong

20x forward-four-quarter IFRS operating profit after a legacy-business minority reserve, less gross lease and pension claims, divided by end-window diluted common shares. No cash or investment-income credit.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: TWD 6,805.00 per share (2026-10-07); 147.204 million common shares (2026-10-07); estimated equity capitalization TWD 1,001,722.4 million. TWSE October 7 quote and capital profile. The August 12 restricted-share issuance is included. No treasury balance is reported; modeled unissued awards and employee-compensation dilution are excluded from market capitalization. This dated common-share snapshot is separate from forecast diluted shares.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	23,122.8	20x	147.534	3,133.76

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Group operating profit after fully expensed depreciation, cash compensation and share payments, less the modeled outside claim on legacy-component earnings.. 20x forward-four-quarter IFRS operating profit after a legacy-business minority reserve, less gross lease and pension claims, divided by end-window diluted common shares. No cash or investment-income credit.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use TWD m unless a different unit is stated.

Thesis

Research date: October 7, 2026. Taiwan Stock Exchange: 3653. Financial amounts are TWD millions unless stated otherwise. The active Q4 2027 ceiling is approximately TWD3,134 per share, using 20x forward-four-quarter owner-attributable IFRS operating profit, after gross financial claims and forecast dilution. Analytical Base is 77/100, or 46/60 before conversion.

What Jentech sells

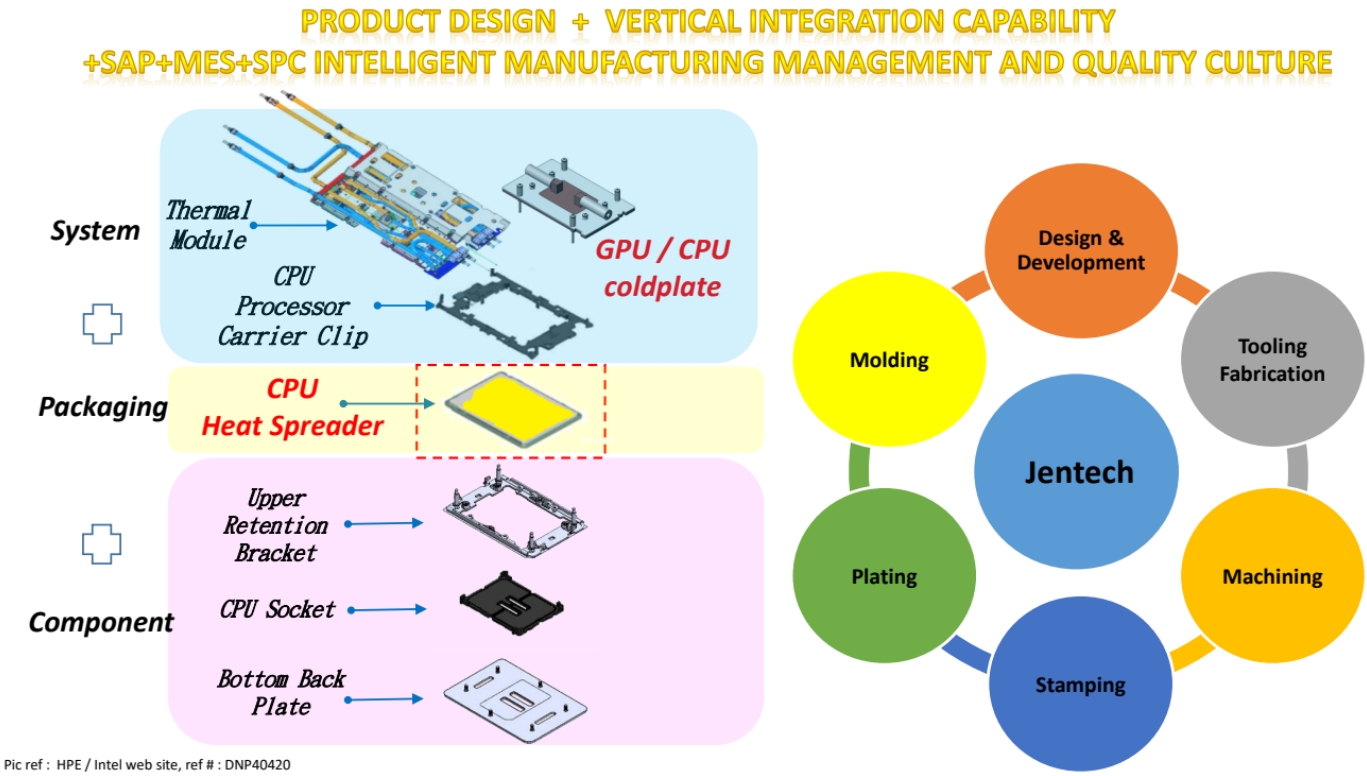

Jentech is a precision manufacturer whose most attractive opportunity sits where a high-value semiconductor package meets its mechanical retention and thermal system. A more powerful processor can need a larger, flatter, more carefully plated lid, a more demanding cold plate and better control of the mechanical forces holding everything together. These are paid manufactured parts with measurable yield and reliability requirements. The thesis does not require attributing the value of the chip, rack or cooling plant to Jentech.

The company combines tooling, stamping, CNC machining, metal bonding, plating, molding, assembly and inspection. Keeping these processes connected can shorten the feedback loop between a customer design, a prototype and repeatable production. Its annual report describes heat spreaders for advanced packaging and power electronics, liquid thermal modules for AI servers and electric vehicles, semiconductor leadframes, CPU socket mechanics and communications connectors. These businesses have different growth and margin profiles. [Sources: 2025 annual report, business and manufacturing sections; November 28, 2025 investor presentation.]

Thermal products represented TWD5,425.433m of Q2 2026 sales, or 74.6%. Leadframes generated TWD626.681m; electronic components TWD418.097m; communications connectors TWD64.537m; other products TWD739.768m. The filing does not divide thermal revenue between lids, cold plates and other thermal modules. The forecast makes that split explicitly as an assumption, rather than presenting it as an issuer segment disclosure.

Competitive Advantage

Pic ref : HPE / Intel web site, ref # : DNP40420

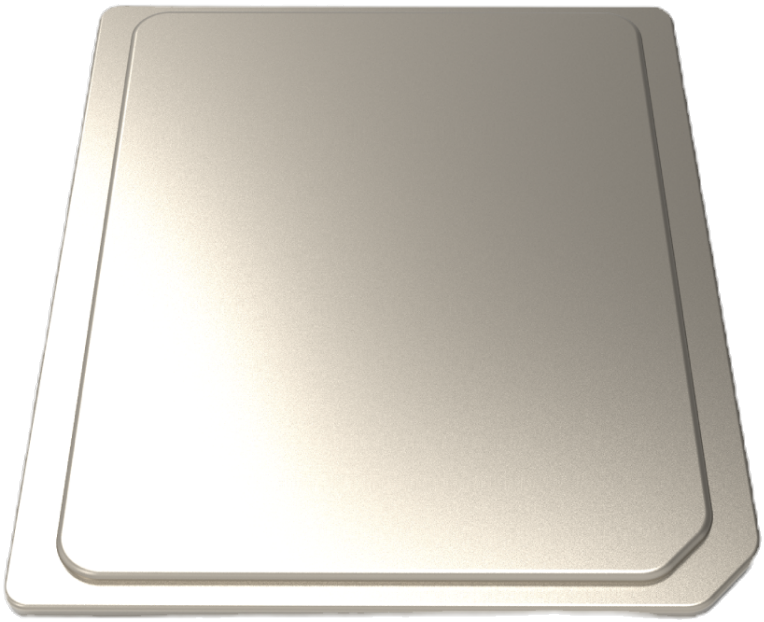

Original issuer exhibit | The issuer separates package heat spreaders, socket mechanics and system cold plates. Each has a different invoice boundary; the full server and cooling plant are outside Jentech revenue.

Package lids are precision thermal interfaces

A package lid spreads heat and creates a controlled surface for the next thermal interface. The economic challenge is more than obtaining copper. Flatness, material compatibility, bonding, surface treatment, thermal cycling and package stress must remain consistent across large production runs. A defective low-cost component can impair a much more expensive processor, which gives a qualified supplier an opportunity to earn a premium for dependable output.

The issuer's process description runs from raw material through forming, machining, bonding and several alternative surface treatments before assembly and inspection. This explains why the bottleneck can be a qualified production step or good-unit yield even when raw metal is available. A larger component or additional processing can increase invoice value while consuming more machine time. Neither nominal square metres nor metal tonnage alone measures saleable capacity.

This advantage has limits. Customers can qualify another supplier, redesign the thermal interface or reduce an expensive plating step. Jentech's annual report itself discusses alternative materials, automation and negotiating metal-price changes with customers. Higher metal content can raise revenue without creating the same increase in retained profit. The model therefore treats a potential price reset as a revenue change with associated costs, rather than a pure-margin windfall.

Original issuer exhibit | Issuer heat-spreader product image. Flatness, plating and mechanical reliability are relevant; this photo does not prove a specific customer award or universal thermal rating.

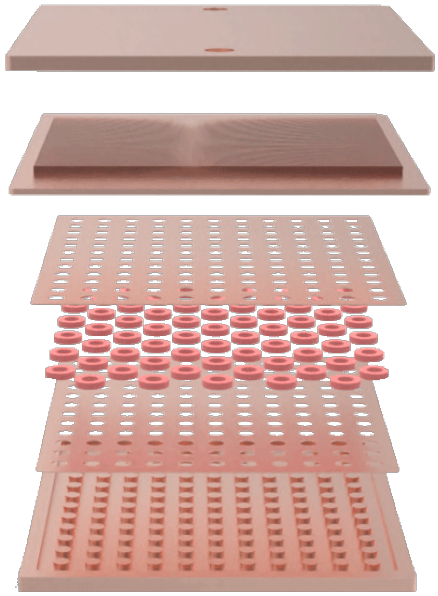

Integration changes the revenue boundary

Jentech publicly offers microchannel lids, cold plates, liquid-cooling modules and quick-disconnect products. A microchannel structure can bring coolant closer to the heat source and reduce part of the thermal path. The exact benefit depends on flow, pressure loss, coolant, interfaces, package mechanics and operating conditions. The product drawings establish an offered design; they do not establish a universal performance advantage or an exclusive customer award.

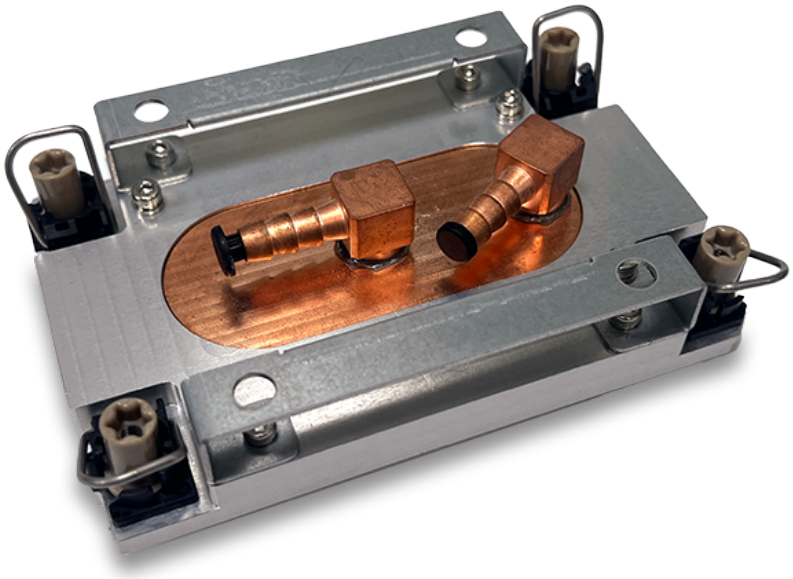

Integration can also remove a separate part. If a future package combines functions previously performed by a lid and cold plate, revenue cannot be calculated by retaining both old invoices and adding the entire integrated invoice. The positive microchannel branch therefore removes 50% of its potential sales for overlap with existing thermal revenue and component substitution. Quick-disconnects inside a module are not counted again as a second complete cooling system.

The main uncertainty is commercial qualification. Public material does not disclose the new products' customer identities, accepted order quantities, exact prices, yields or program-level margins. That prevents treating the whole opportunity as contracted. It does not justify assigning no value to a credible engineering path. The active

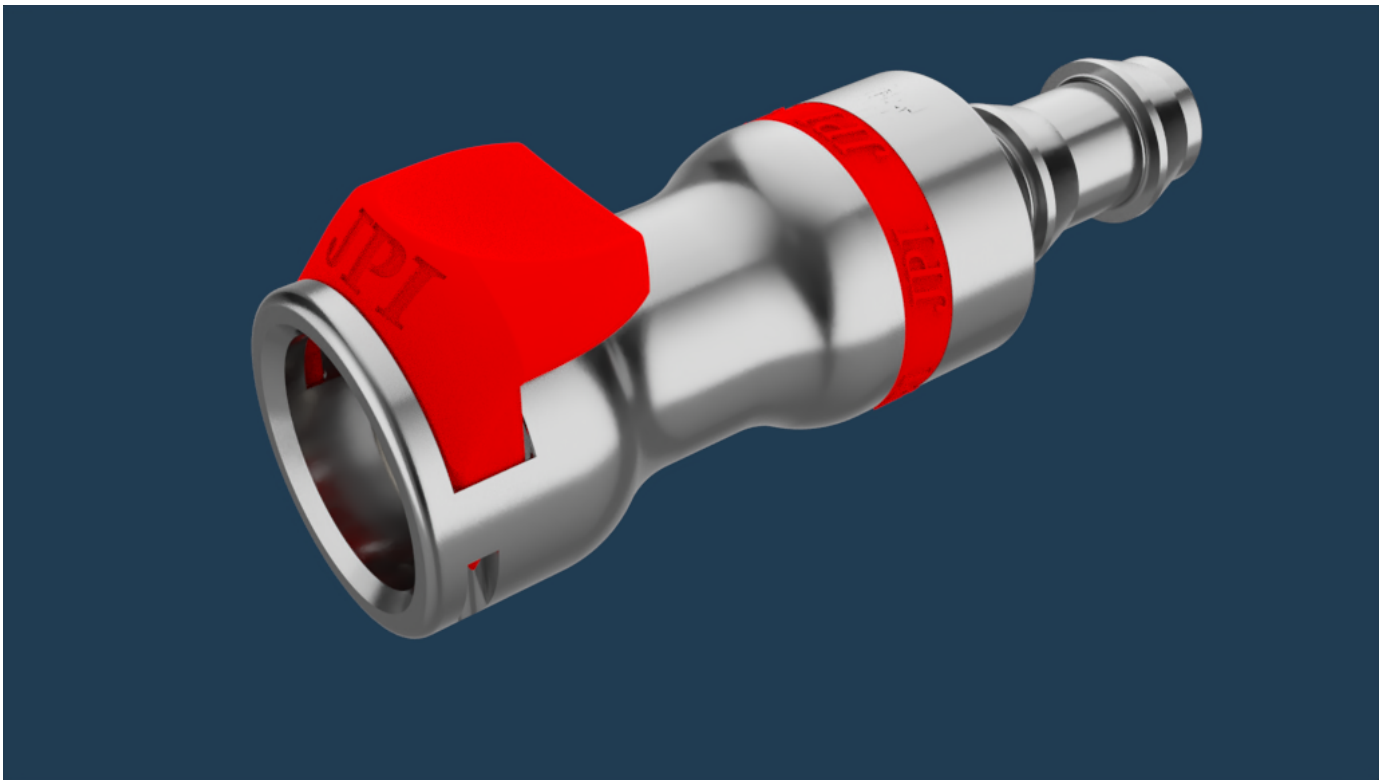

model includes a bounded 45% probability branch, with development expense, capital spending and an initially negative incremental operating contribution.

Original issuer exhibit | Issuer microchannel-lid design. Integrating heat spreading and fluid channels can raise content while displacing a separate component; the model deducts 50% overlap from its incremental wallet.

Original issuer exhibit | Issuer liquid-cooling module. Cold plates and connected plumbing are a product bundle; the model does not add full bundle revenue again for every coupling.

Original issuer exhibit | Issuer quick-disconnect product. Seal integrity, flow restriction and compatibility matter. No standalone CDU revenue or unverified share is assigned.

Financial calibration

The latest reviewed quarter is Q2 2026. Revenue was TWD7,274.516m, gross profit TWD3,404.889m and operating expenses TWD655.704m, producing TWD2,749.185m operating profit. Gross margin was 46.8% and operating margin 37.8%. First-half revenue was TWD12,579.732m and operating profit TWD4,445.751m. This is an established profitable business, not a pre-revenue product thesis. [Source: Q2 reviewed Chinese financial statements, pages 8 and 36-42.]

July, August and September monthly sales sum to TWD9,493.226m. September was below August, so the record quarter should not be described as uninterrupted sequential acceleration. These disclosures establish Q3 revenue only. Its gross margin, product mix, operating expenses and new share-payment expense remain estimates until the quarterly filing appears.

The reference model allocates 77% of Q3 revenue to thermal products. Within thermal sales, 26% is assigned to liquid cooling. Assumed gross margins of 56.5% for lids, 47% for liquid modules and 25% for legacy products reproduce Q2's reported group margin to within approximately 0.15 percentage point using a 25% liquid share of thermal revenue. That is a calibration, not independent evidence of those product margins. Q3 modeled gross margin remains close to the reported Q2 level.

Research, sales and administration remain fully expensed. Production depreciation is inside product cost; engineering depreciation remains in operating expenses. Interest income, foreign-exchange effects, investment gains and the small equity-accounted investment do not enter the operating-profit valuation. The new restricted-share award is a separate cost, discussed below.

其他	-	418,879	418,879
	$ 4,372,250	$ 809,154	$ 5,181,404

Original issuer exhibit | Original Q2 product revenue note. Thermal products total TWD5,425.433m; the internal split between lids and liquid cooling is not disclosed.

Capacity and qualification

The two latest distinct conference decks located on the issuer's site are November 28, 2025 and December 4, 2024. Both were read in full. No complete official Q&A transcript was located, and qualitative icons in the outlook slides have not been translated into numerical guidance.

The November 2025 deck planned 15,653 square metres at Dayuan Plant 1 for Q1 2026 and 37,488-plus square metres in the first phase of Dayuan Plant 3 for Q1 2027. The earlier deck had placed Dayuan 3 Phase 1 in Q4 2027. That is a meaningful acceleration in management's plan. It is not proof that all equipment is installed or qualified as of this research date. The combined 53,141 square metres of new Taiwan floor space must be interpreted alongside process mix, equipment, staffing and yield.

The reference sales path is already ambitious: TWD49.2bn in 2027, TWD62.0bn in 2028, TWD71.2bn in 2029 and TWD75.7bn in 2030. This includes substantial expansion before any positive probability branch. The model incorporates a 12% reference content/ASP increase by Q4 2027 relative to Q3 2026, with a smaller further increase in 2028. Thus sales growth is not equated one-for-one with physical unit growth. Later capacity and

automation requirements are funded explicitly, but remain assumptions rather than verified total qualified throughput.

For auditability, Q4 2027 reference lid sales of TWD7,808m correspond to 3.87m invoice equivalents at TWD2,016 each. Liquid-module sales of TWD3,508m correspond to 0.63m equivalents at TWD5,600. These are revenue-normalization proxies, not observed prices or shipments. They show the production burden implied by the forecast. The reference thermal output index reaches 1.38 times Q3 2026 after the content adjustment; the successful additional-ramp outcome reaches 1.52 times. Machine productivity and qualification must support that result. It is not guaranteed by the floor-area plan.

The issuer's August 26 clarification did not endorse the media forecast of roughly TWD60bn revenue in 2027. That figure is not imported. The model uses product economics and a funding path; the absence of company guidance does not convert a media forecast into either a fact or a disproof of the growth opportunity.

Original issuer exhibit | November 2025 heat-spreader slide. The 2026 outlook uses qualitative icons, not a numerical revenue forecast.

Dayuan Plant 3 Taoyuan Aerotropolis Expansion Plan

Taoyuan Aerotropolis Plant

Land size : 30,876 m^2

Factory size : 37,488+ m^2

(The area of the Phase 1 plant is expected to be completed by Q1 2027.)

The current factory size in Taiwan is 46,413 m^2 , in China is 53,223 m^2 (Total: 99,636 m^2).

The total newly constructed factory size in Taiwan for 2026-2027 is 53,141m^2 (Dayuan Plant 1: 15,653m^2 + Dayuan Plant 3: 37,488m^2).

Original issuer exhibit | November 2025 deck: Dayuan 3 Phase 1 planned for Q1 2027, with 37,488+ square metres. The combined new Taiwan area is 53,141 square metres; qualified output need not increase proportionately.

Dayuan Plant 3 Taoyuan Aerotropolis Expansion Plan

Taoyuan Aerotropolis Plant
Land size : 30,876 m^2
Factory size : 37,488+ m^2
(The area of the Phase 1 plant is expected to be completed by Q4 2027.

The current factory size in Taiwan is 42,942 m^2 , in Wuxi is 53,223 m^2 (Totaling 96,165 m^2).

Confidential –Do not duplicate, distribute or edit without Jentech permission

Original issuer exhibit | Earlier December 2024 deck put Dayuan 3 Phase 1 at Q4 2027. The timing revision is real but does not prove completion or customer qualification.

How the model treats the breadcrumbs

The five branches make the uncertainty visible. A 55% qualified-ramp outcome adds thermal sales above the growing reference, reaching a conditional 10% increment during 2028. It is mutually exclusive with a 25% delay outcome; the remaining 20% retains reference execution. Incremental ramp sales retain 50% gross profit before 10% additional operating expenses. Delayed sales lose gross profit and incur idle/rework and support costs. Both outcomes fade as supply adjusts.

A separate 55% pricing/content outcome applies only to 35% of reference thermal sales. Its conditional uplift reaches 8% in 2027-2028 and then fades to 4% and 2%. Only 65% of the incremental revenue remains as gross profit after materials and processing; another 10% goes to operating support. It excludes fixed legacy orders, extra ramp units and the separately modeled microchannel opportunity. This prevents compounding the same capacity, mix and price benefit several times.

The 45% microchannel outcome begins with a TWD100m gross potential wallet in Q4 2026, then TWD1.2bn in 2027, TWD2.9bn in 2028, TWD4.8bn in 2029 and TWD5.8bn in 2030. Half is removed for overlap before probability weighting. Conditional incremental gross margin is 46%; variable development/support consumes 15% of sales and launch expense is TWD30m each quarter. Cash capital expenditure consumes another 20% of the net incremental sales. These are bounded analytical assumptions, not announced orders.

A 25% architecture-reset outcome reduces the invoice price on 30% of reference lid sales by 15% in 2027-2028 and 10% thereafter. Only 40% of the lost sales value becomes lost gross profit because cheaper metal or processing also lowers costs. This is a product-design risk, not a claim that a named customer's future design has been verified. It is kept separate from total demand and qualification timing.

After weighting these branches, annual sales are approximately TWD50.2bn, TWD64.6bn, TWD73.9bn and TWD77.4bn in 2027-2030. Owner operating profit is approximately TWD18.9bn, TWD24.2bn, TWD26.9bn and TWD27.5bn. Growth slows and margins compress in the outer years. No bank target or assumed share of a broad cooling TAM generates these numbers.

Customers and competition

The 2025 annual report identifies two anonymous customers accounting for 22.82% and 13.56% of revenue. They are not assigned guessed names. The largest coded supplier represented 24.93% of purchases. Customer concentration matters because a program redesign, price negotiation or qualification delay can affect a meaningful portion of revenue even if overall AI investment remains healthy.

The competitive set differs by product. The annual report names heat-spreader competitors and separately lists companies active in liquid thermal modules, including Asia Vital Components and Auras. A competitor's presence in a category does not establish interchangeable performance on every program, but it does disprove a blanket monopoly assumption. The report's old listing annotations are not used as current security-identification evidence.

Jentech can gain from engineering depth and production integration while still facing customer bargaining power. The strongest future evidence would be sustained accepted shipments, product-level profitability, verified qualified capacity and favorable new-order terms. More social posts describing a difficult cooling problem would add little if those economic channels remain unchanged.

4.2.4.2 Information on Major Customers in the Most Recent Two Years

Unit: NT$1,000

Year	2024				2025			
Item	Customer	Net revenue	Percentage of Annual Net Sales (%)	Relations with the Company	Customer	Net revenue	Percentage of Annual Net Sales (%)	Relations with the Company
1	ClientA	1,359,995	9.52	None	ClientA	4,627,203	22.82	None
2	ClientB	2,372,712	16.62	None	ClientB	2,749,930	13.56	None
	Other	10,545,480	73.86	-	Other	12,898,444	63.62	-
	Total	14,278,187	100.00	-	Total	20,275,577	100.00	-

Explanation of Changes in Increase/Decrease:

The Company's products are primarily exported, with Asia and North America being the main sales regions. In the most recent two years, major customers were all located in Asia and North America, with no significant changes.

4.3 Employees' average years in service, age, and educational background distribution

Item		2024	2025	As of March 31, 2026
Number of Employees	Management staff	246	330	334
	General staff	932	895	920
	Production line workers	2,161	2,128	2,161
	Total	3,339	3,353	3,415
Average Age		36.56	36.94	37.00
Average Years of Service		5.60	5.64	5.70
Education (%)	PhD	0.06	0.06	0.06
	Masters	3.06	3.88	4.16
	Bachelor's Degree	27.62	32.93	32.45
	Senior High School	56.66	49.00	48.99
	Below Senior High	12.60	14.14	14.35
	Total	100.00	100.00	100.00

4.4 Data on our environmental protection expense

In the most recent fiscal year and up to the date of printing this annual report, the company has incurred losses due to environmental pollution. These losses include compensation payments and penalties resulting from violations of environmental regulations. The report should provide details such as the date and reference number of the penalties, the specific provisions violated, the nature of the violations, and the content of the penalties imposed. Furthermore, the report should disclose the estimated amounts of current and future potential losses and outline the corresponding measures taken. If it is not possible to reasonably estimate the losses, the report should explain the circumstances that prevent a reasonable estimation: In fiscal year 2025 and up to the date of publication of this annual report, there have been no violations of environmental protection regulations resulting in penalties imposed by the competent authorities.

Original issuer exhibit | Issuer annual report: two coded customers account for 22.82% and 13.56% of 2025 sales. These identities are not guessed. Only the customer table is used; unrelated template text below is not evidence of an environmental event.

Compensation, dilution and claims

The April 2026 plan authorized up to 500,000 restricted shares. The August 12 issue covered 471,075 shares, bringing the current ordinary count to 147.203878m. Those issued shares are already included once. The remaining 28,925 are reserved as possible future grants, not described as existing issued stock. A separate 226,000-share employee-compensation reserve follows the H1 diluted-EPS note. Both convertible issues raised in 2025 were fully converted; their shares are already in the ordinary count and their former principal is not carried as debt.

The actual accounting value of the August grant has not yet been reported. An analytical proxy uses its issue-date closing price and yields TWD2,105.705m for the issued shares. The April illustrative expense profile allocates 56%, 16%, 16% and 12% to 2026-2029; that profile is applied provisionally, with the 2026 amount split between Q3 and Q4. No 2026 share-payment movement appears in the reviewed H1 equity rollforward, so an already recognized charge is not deducted again. The unused plan capacity has a separate TWD129.295m forecast cost spread across 2027-2029. Neither estimate is labeled a reported IFRS grant value.

Historical employee and director profit sharing is already included in reported expenses. Deducting its 10% and 2% accrual rates again would double count compensation. Later recurring awards reserve TWD100m per quarter from 2028 and 25,000 additional shares per quarter. The precise grant valuation, vesting allocation and forfeitures are near-term reconciliation items.

Jiaxing Jinli is 66.6% owned, whereas Nantong is effectively wholly owned through two intermediate companies. A minority-profit reserve of 0.625% of legacy-component revenue approximates the small outside claim, calibrated to H1 noncontrolling profit. The thermal branches do not receive an arbitrary 33.4% haircut. This allocation must be replaced if subsidiary operating disclosures show a material shift.

1. 本公司依章程規定係按當年度扣除分派員工及董事酬勞前之稅前利益分別以不低於 5%提撥員工酬勞(其中 15～35%為分派基層員工之酬勞)及不高於 2%提撥董事酬勞。

2. 本公司民國 115 年及 114 年 4 月 1 日至 6 月 30 日暨民國 115 年及 114 年 1 月 1 日至 6 月 30 日員工酬勞估列金額分別為$308,169、$149,084、$502,739 及$340,448；董事酬勞估列金額分別為$61,633、$29,817、$100,547 及$68,089，前述金額帳列薪資費用科目。

民國 115 年及 114 年 1 月 1 日至 6 月 30 日係依截至當期止之獲利情況，按下列比例估列：

	115年1月1日至6月30日	114年1月1日至6月30日
員工酬勞	10%	10%
董事酬勞	2%	2%

經董事會決議之民國 114 年度員工酬勞及董事酬勞金額分別為$730,557 及$146,111，與民國 114 年度合併財務報告認列之金額一致。

本公司董事會通過之員工及董事酬勞相關資訊可至公開資訊觀測站查詢。

(二十)所得稅

Original issuer exhibit | Original Q2 note: employee and director profit sharing is already expensed. The new restricted-share award is a separate expense provision; subtracting the historical 10% and 2% again would double count.

Funding and valuation discipline

June cash was TWD11.390bn. No bank loans or bond principal were outstanding; gross leases were TWD75.510m and the pension provision TWD44.665m. The valuation deducts their combined TWD120.175m and gives no surplus-cash credit. Gross claim scope is conservative relative to the small minority adjustment.

Cash is not all freely distributable. The bridge pays the full TWD3.187bn June dividend payable, TWD950.655m opening tax liability and TWD1.302bn employee/director compensation payable in Q3. It funds working capital

equal to 80% of positive sequential sales growth, cash taxes at 22% of owner operating profit and future cash dividends at 60% of modeled after-tax prior-year profit. Capital spending is TWD2.5bn in the second half of 2026, then TWD3.8bn, TWD3.6bn, TWD3.0bn and TWD2.5bn, plus branch-specific investment. These future budgets are assumptions; equipment prepayments are included rather than omitted from capex.

All 24 combinations of execution, pricing, microchannel and architecture assumptions remain above a TWD3bn cash floor. The minimum is approximately TWD6.05bn. An additional stress with 20% lower sales and 25% higher capex also remains above that floor. Cash conversion could still disappoint, but no undisclosed customer financing or automatic equity raise is needed to balance this modeled path.

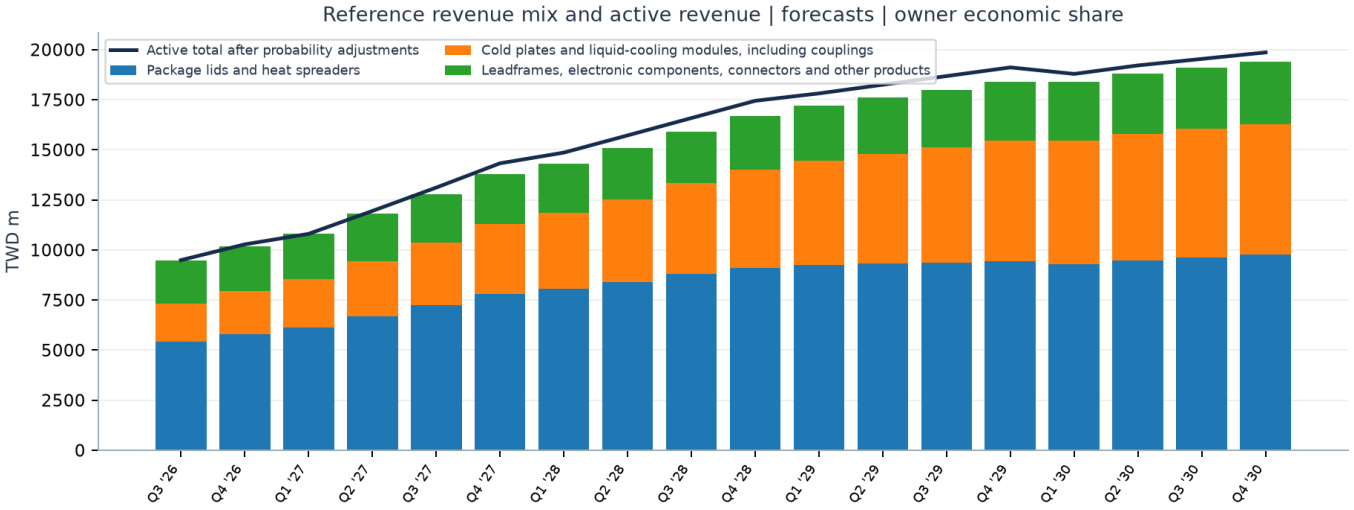

At Q4 2027, turning off all probability branches yields about TWD3,036 per share. A one-percentage-point higher gross margin raises the active ceiling to about TWD3,217. A 10% sales shortfall at fixed product margins and fixed operating costs lowers it to about TWD2,728; 10% extra ordinary shares lowers it to about TWD2,849. Each ceiling uses its quarter plus the next three quarters and the diluted shares at the end of that window. The 20x multiple remains unchanged across the path.

The Base score reflects strong realized profitability, relevant process capability and demand, while retaining deductions for concentration, changing architectures, factory qualification and uncertain compensation. The next decisive checks are the Q3 filing, actual restricted-share expense, Dayuan's qualified output, customer acceptance and retained margin on higher-content products.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Precision thermal/mechanical manufacturing with integrated tooling and strong realized profitability; exact customer exclusivity is unverified.
Cycle	9	Record monthly revenue and rising thermal mix support near-term demand, with September sequential softness and qualification risk.
TAM	8	Higher power and package complexity expand paid content, but integration can also remove components.
Catalysts	4	Q3 financial disclosure, restricted-share accounting, Dayuan qualification and next-platform product acceptance.
Macro	8	AI and advanced packaging support demand; Taiwan concentration, currency and trade policy remain risks.
Alpha	4	Invoice boundaries, compensated employees, metal-cost offsets and accepted good units matter more than a broad cooling TAM.
Risk classes	-4	Customer concentration, capex execution, architecture substitution and compensation uncertainty.
Total	46/60	Rounded Base 77. Both artifact and new workbook row use this score; this is not a manual override.

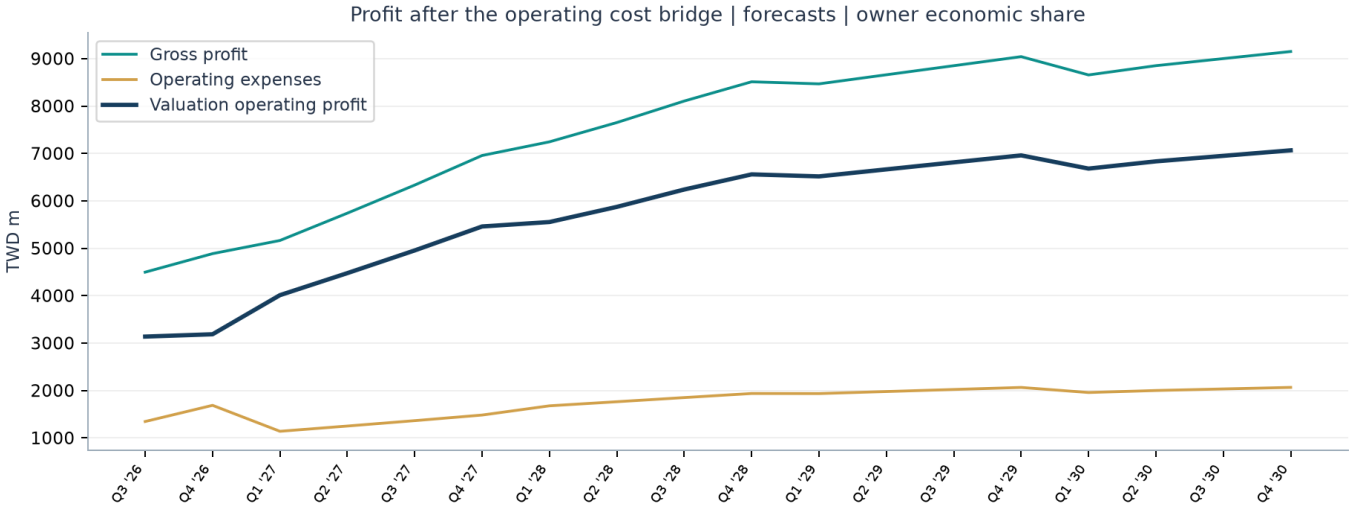

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	9,493.2	0.0	9,493.2

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Package lids and heat spreaders	5,409.2	56.5%	3,056.2
Q3 2026	Cold plates and liquid-cooling modules, including couplings	1,900.5	47.0%	893.3

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Claim decisions, overlap and triggers

QUALIFIED_RAMP

probability: 0.55

classification: Dated factory plans and realized sales support an incremental execution hypothesis

source: November 2025 deck pages 7-8; Q2 filing; September monthly sales

Conditional: Extra thermal-product sales above the already growing reference: 3% in Q4 2026, 4/6/8/10% during 2027, 10% during 2028, 7% in 2029 and 4% in 2030.

overlap: Reference sales already include Dayuan expansion and rise to TWD49.2bn in 2027. This is residual accepted-output headroom, not a second full factory or demand forecast. Mutually exclusive with the 25% delay branch, leaving 20% reference execution.

cost bridge: 50% incremental GP less 10% engineering, staffing and customer support retains 40% OP. Incremental capex consumes 6% of branch revenue in the cash bridge.

timing: Accepted shipped parts after machining, plating, leak and reliability qualification; fade after 2028 as capacity responds.

THERMAL_TERMS

probability: 0.55

classification: Pricing/content inference, not an announced across-the-board increase

source: Issuer thermal designs, integrated processing and factory plans

Conditional: 3% incremental ASP/content in Q4 2026, 4/5/6/8% in 2027 and 8% in 2028, fading to 4% in 2029 and 2% in 2030. Only 35% of reference thermal sales are new or repriceable.

overlap: No increase on fixed legacy orders, added ramp units or the separate microchannel branch. The existing reference product mix and gross margins already capture most rising content.

cost bridge: 65% retained GP after incremental copper, plating and process cost, less 10% additional support expense: 55% OP capture. This is not pure pricing at 100% margin.

timing: Revised purchase terms and accepted higher-specification parts; qualification delay prevents immediate reset of the entire book.

MICROCHANNEL

probability: 0.45

classification: Verified product capability with unconfirmed program economics

source: Issuer microchannel-lid and liquid-cooling product pages

Conditional: Gross potential revenue is TWD100m in Q4 2026, 1.2bn in 2027, 2.9bn in 2028, 4.8bn in 2029 and 5.8bn in 2030. Only half remains incremental after overlap.

overlap: Deduct 50% for cold plates/lids already in the reference or displaced by integration. Couplings and the complete cold-plate module are not each valued as a separate full system. No CDU or server value is attributed to Jentech.

cost bridge: 46% GP less 15% variable development/support and TWD30m quarterly launch expense. Early negative incremental OP is retained. Cash capex reserve is 20% of net incremental sales.

timing: Small 2026 shipments are an assumption, broader 2027-2030 qualification is conditional. Actual customer, paid units, ASP and yield remain unknown.

DELAY

probability: 0.25

classification: Negative execution branch

source: Factory timing revisions, anonymous customer concentration and working-capital expansion

Conditional: Thermal sales 6% below reference in Q4 2026, 10% below in 2027-2028, 6% below thereafter.

overlap: Same thermal pool as the successful ramp; these two execution states are mutually exclusive. No negative Q3 sales increment is applied to already reported monthly revenue.

cost bridge: Lost GP at 52% of missing revenue plus idle/rework cost of 0.5% of thermal sales and support cost of 0.3%. Base capex remains committed in the cash stress.

timing: Delayed process qualification, machine installation, customer acceptance or inventory digestion.

ARCHITECTURE_RESET

probability: 0.25

classification: Bounded negative product-design hypothesis

source: Issuer offers multiple plating options and microchannel integration; specific future customer design remains unverified

Conditional: A 15% ASP reset on 30% of reference package-lid sales during 2027-2028; 10% thereafter.

overlap: Only the affected lid pool. This is independent of total GPU demand and does not haircut all liquid-cooling revenue. Microchannel growth already loses 50% to substitution.

cost bridge: Only 40% of lost revenue reduces GP, allowing 60% avoided precious-metal/process cost. No additional demand shock or margin collapse is stacked on the same invoice.

timing: Next-platform component redesign and reduced expensive surface treatment, if qualified.

SHARE_PAYMENTS

decision: The 471,075 August-issued shares are already inside actual common shares. Their expense estimate is an analytical grant-value proxy of TWD2,105.70525m, using the August 12 closing price of TWD4,470; actual IFRS grant value and vesting allocations are unreported. The April illustrative 56/16/16/12% schedule is provisionally applied to that issued grant, with 2026 split 40/60 between Q3/Q4. The unissued 28,925 approved-plan shares are a separate future-grant assumption with TWD129.29475m forecast expense over 2027-2029, not existing issued stock or a reported grant. The H1 equity rollforward contains no 2026 share-payment transaction, and the modeled new charge starts after June. The separate 226,000-share employee-compensation reserve is retained. Fully converted 2025 CBs are not added again. Later forecast awards carry TWD100m quarterly expense and 25,000 new shares per quarter from 2028.

NO_EXTRA_NVIDIA_TAM

decision: No separate Nvidia, AMD, ASIC, CPO or entire liquid-cooling TAM revenue is added. These are potential destinations for the same lids/modules. Missing named design awards does not force zero: the bounded positive microchannel and repricing branches recognize engineering evidence while retaining overlap and cost.

OWNER_CLAIMS

decision: Jiaxing Jinli is 66.6% owned; Nantong is effectively 100% through two wholly owned intermediate parents. Minority OP reserve equals 0.625% of legacy-component revenue, calibrated to H1 NCI profit grossed up at an assumed 21% tax rate. Thermal branches are attributed to the wholly owned thermal business. Gross lease and pension claims total TWD120.175m; operating liabilities are funded through cash conversion, not deducted twice.

Remaining bounded uncertainties

- No disclosed unit shipment count, product ASP, thermal subsegment mix or product gross margin. Invoice equivalents are analytical proxies and must not be described as reported shipments.

- Q3 2026 revenue is the sum of unaudited monthly disclosures; its earnings, product mix and restricted-share cost are not yet reported.

- Latest two distinct issuer conference decks located are November 28, 2025 and December 4, 2024. Both were read in full. Official full Q&A transcripts were not located; no secondary wording is presented as a management quotation.

- The November 2025 deck advances Dayuan 3 Phase 1 completion from Q4 2027 to Q1 2027. This is a dated plan, not verified October 2026 readiness. Added floor area is not qualified output.

- The issuer explicitly did not endorse media 2027 revenue forecasts in its August 26 clarification. No numerical company revenue guidance or bank target is imported.

- The April restricted-share expense estimate predates the August issue. Actual grant-date accounting value, A/B allocations, forfeitures and quarterly expense could differ materially. A conservative full-plan proxy is expensed; historical cash profit-sharing is already included in GP/opex and is not deducted a second time.

- The 0.625% legacy-sales minority reserve is a proxy, because Jiaxing-specific operating profit is not disclosed. H1 outside earnings were TWD16.556m; the reserve must move if the subsidiary mix changes.

- Specific microchannel customer wins, qualified manufacturing yields, 2027 purchase terms and exclusive supply claims are unverified. High power and smaller thermal resistance do not establish a monopoly.

- Capex and future cash dividends beyond disclosed obligations are modeled, not issuer commitments. The cash bridge includes opening tax/bonus liabilities and the full June dividend payable. No customer financing or surplus-cash valuation credit is assumed.

- Some English website and annual-report text contains template language or stale competitor listing annotations. Product photos establish offered product classes, not universal performance claims or current competitor exchange status.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
