DISCO

6146.T | TSE Prime | 2026-10-07

Q4 2027 model ceiling: JPY 55,193.72

Analytical Base 46/60 = 77 | Precision semiconductor processing equipment and consumables

20 x current quarter plus next three quarters of fully costed operating profit, including an idle-facility cost reserve, divided by modeled diluted shares; no net-cash addition

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

Snapshot: JPY 65,500.00 on 2026-10-06. Model diluted shares at Q3 2026: 108.700m. Indicative diluted capitalization: JPY 7,119,850.0m. Quote and share dates/bases may differ; legal shares are reconciled in the analysis.

All operating values are in JPY m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	300,253.8	20x	108.800	55,193.72

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Thesis

October 7, 2026. TSE Prime: 6146. Currency: JPY. Analytical Base: 77/100. Q4 2027 model ceiling: ¥55,194 per share, using 20x forward-four-quarter recurring operating profit and 108.8 million modeled diluted shares. The earnings window is Q4 2027 through Q3 2028. The model includes recurring stock compensation, research and development, depreciation, qualification expenses and an additional reserve for idle-facility depreciation recorded below operating profit. This is a company earnings model, not a semiconductor-market-share shortcut.

DISCO earns money by making expensive wafers and packages thin enough, clean enough and accurately separated enough to work. It sells precision equipment, the tools that wear during processing, and maintenance parts. More valuable devices raise the cost of breaking a wafer, damaging a die or contaminating a bonding surface. That strengthens the value of a qualified process, although it does not guarantee an unlimited equipment budget or an automatic price increase.

The latest evidence is unusually strong. The October 6 preliminary release reports July-September parent-only sales of ¥118.5 billion and shipments of ¥123.9 billion, with shipments up 60% year over year. Equipment and consumables both remained strong, principally for generative AI. These are **parent-only preliminary figures**. Consolidated revenue and profit for that quarter are due October 22; neither has been reported yet. The model gives the observed parent sales beat an explicit consolidated earnings bridge, then limits further increments to opportunities not already represented in the reference forecast.

What is already real

DISCO's fiscal year runs from April through March. Its fiscal Q1 ended June 30, 2026 is calendar Q2 2026. Consolidated revenue was ¥114.308 billion, gross profit ¥81.543 billion, selling and administrative expense ¥32.509 billion, and operating profit ¥49.033 billion. Small differences between subtracting rounded line items and the stated operating result are rounding, not a separate adjustment. Gross margin was 71.3%; operating margin was 42.9%. Consolidated shipments were ¥135.906 billion.

The reported accepted-sales mix was approximately 59% precision equipment, 24% processing tools or consumables, 12% maintenance parts and 5% other. These percentages are rounded. The issuer provides one consolidated segment; the product gross margins used later in our model are assumptions, not disclosed segment profitability. The equipment subcategories also contain rounding and should not be summed as though each were an exact audited revenue value.

For the year ended March 31, 2026, revenue was ¥436.889 billion and operating profit ¥184.989 billion. Consolidated shipments were ¥442.822 billion. The business had achieved six consecutive record earnings years. Management attributed the high gross margin to valuable products, but also identified rising personnel and R&D costs. That combination supports a profitable franchise and argues against valuing every additional yen of sales as a yen of operating profit. Sources: April 22 and July 23 financial statements and issuer briefing notes.

Earnings Forecast 2Q FY2026

Billions of Yen — Forecast

	FY25 1Q	2Q	3Q	4Q	FY26 1Q	2Q

Original issuer exhibit | Prior consolidated quarterly guidance and FX exposure

Shipments tell one story; acceptance determines the accounts

Since fiscal 2019, equipment sales are recorded after customer inspection and acceptance. A machine leaving the factory is therefore not automatically revenue for that quarter. Processing tools and consumables are recorded much closer to shipment. The October 6 release explicitly repeats this distinction.

Parent-only first-half sales of ¥213.6 billion exceeded the July forecast of ¥201.1 billion by ¥12.5 billion. Parent-only first-half shipments were ¥240.5 billion. The small difference between adding rounded quarterly numbers and the published first-half total is issuer rounding. The parent figures must not be added to consolidated shipment figures; the parent is already included in the group.

The July consolidated first-half guidance was ¥242.8 billion of revenue and ¥104.9 billion of operating profit. Subtracting the reported June quarter gives July-September guidance of **¥128.492 billion revenue and ¥55.867 billion operating profit**. Our reference keeps those figures rather than silently substituting a consolidated result. A 75% probability branch adds a conditional ¥14 billion of consolidated revenue: approximately the ¥12.5 billion parent beat multiplied by a 1.12 consolidation factor. That factor is an explicit assumption about subsidiary activity and eliminations, not an observed accounting ratio. The conditional range is ¥10-16 billion.

At 65% incremental gross profit and 10% incremental compensation, applications and support costs, that branch adds ¥10.5 billion of expected revenue and ¥5.775 billion of expected operating profit. The actual consolidated results will replace this branch on October 22. The benefit is not repeated indefinitely: later reference quarters already assume that high shipment activity continues.

DISCO CORPORATION

October 6, 2026

Preliminary Report on Non-Consolidated Sales Figures and Shipment Figures (Second Quarter of Fiscal Year 2026)

DISCO CORPORATION hereby releases the preliminary report of the non-consolidated sales figures and shipment figures for the indicated term.

Non-Consolidated Sales Figures for Fiscal Year 2026 (Quarterly Trend)

(Billions of yen)

	1Q	2Q	1H	3Q	4Q	2H	Full year
Net Sales	95.0	118.5	213.6	-	-	-	-
YoY % Change	26.0%	38.9%	32.8%	-	-	-	-
QoQ % Change	-9.4%	24.7%		-	-		
Reference: Fiscal Year 2025	75.4	85.3	160.8	88.0	104.9	192.9	353.8

Non-consolidated net sales for the first half (April-September) were 213.6 B yen, achieving 106.2% of the most recent non-consolidated business forecast (net sales of 201.1 B yen).

Sales for equipment products, including for precision processing equipment, are recorded when the equipment is inspected/accepted by the customer. Since net sales tend to deviate from market trends, net shipments, which more closely reflect market trends, are disclosed below for reference.

Non-Consolidated Shipment Figures for Fiscal Year 2026 (Quarterly Trend)

(Billions of yen)

	1Q	2Q	1H	3Q	4Q	2H	Full year
Shipment Amount	116.5	123.9	240.5	-	-	-	-
YoY % Change	25.3%	60.0%	41.1%	-	-	-	-
QoQ % Change	18.7%	6.4%		-	-		
Reference: Fiscal Year 2025	93.0	77.4	170.5	90.1	98.1	188.2	358.8

Non-consolidated net shipments for the second quarter (July-September) were 123.9 B yen, a year-on-year increase of 60.0% and a quarter-on-quarter increase of 6.4%.
Shipments of both precision processing equipment and precision processing tools remained at high levels, mainly for generative AI applications, and quarterly shipments reached a record high.

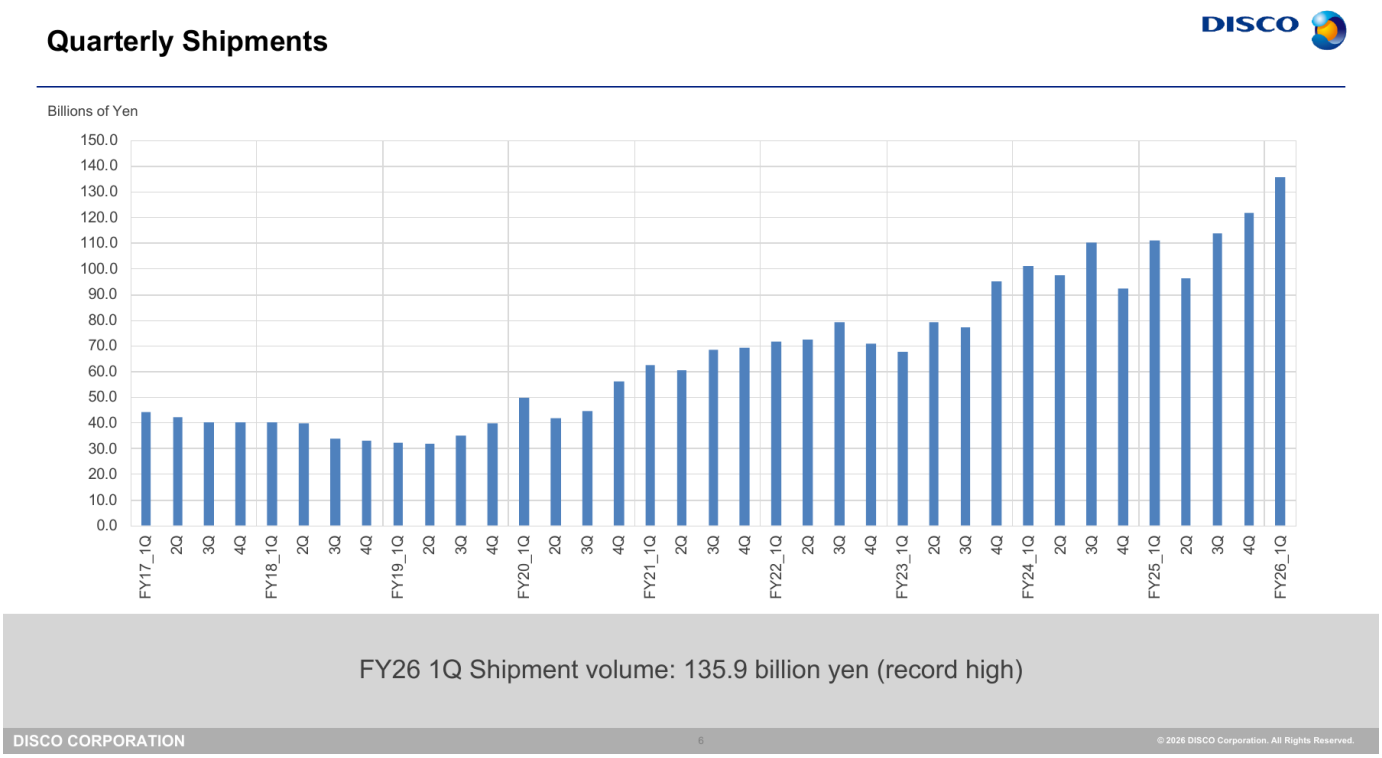

The official financial results for the second quarter of fiscal year 2026 will be announced on October 22, 2026.

Purpose of the Preliminary Report

DISCO CORPORATION's (the Company's) preliminary report is a voluntary disclosure on non-consolidated sales and shipment figures that is made each quarter, as soon as those figures are tabulated, in order to deliver real-time information on the Company's financial results to investors. The report above was created before the completion of an audit and is based on information available to the Company at the time of release. The actual operating results may differ from the preliminary report as a result of findings made after a detailed audit by an auditing firm.

Original issuer exhibit | Consolidated shipments; do not add to accepted equipment revenue

The product is a process that survives production

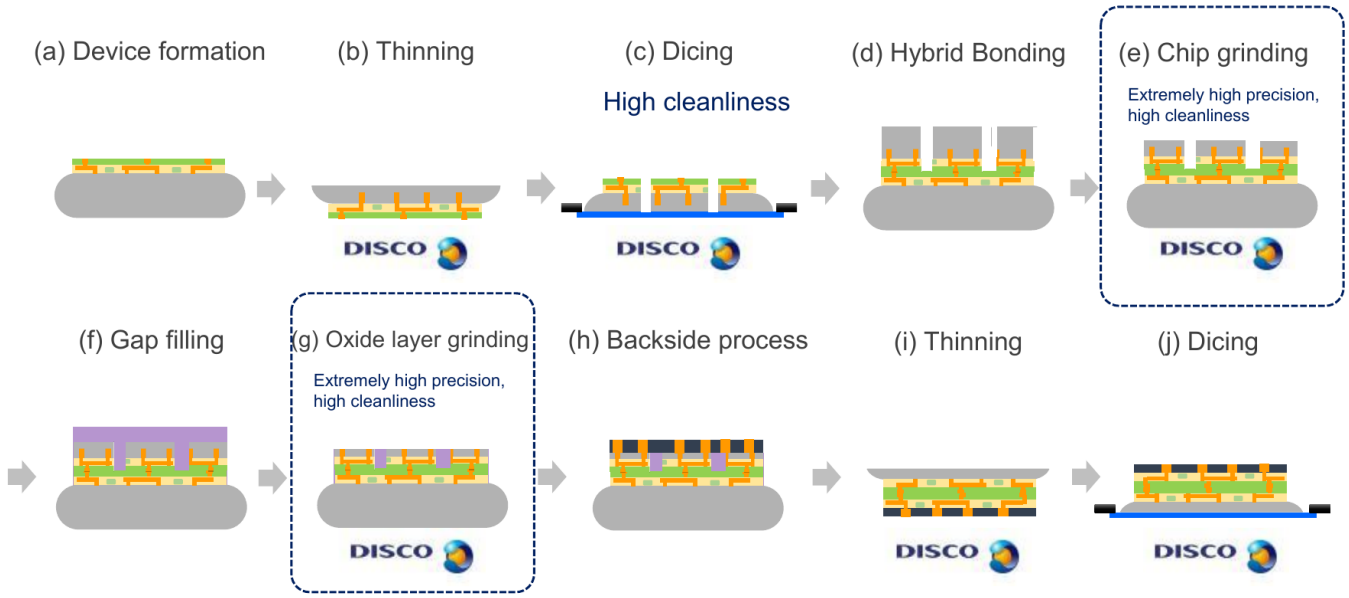

Grinding removes material. Polishing changes surface quality and removes damage. The distinction matters because an acceptable ground surface may not need polishing at all. Coarser abrasives can remove material quickly but leave more damage; finer abrasives reduce damage while changing wear and processing time. The number of grinding axes depends on the application and removal requirement. It does not increase mechanically with every additional memory layer.

DISCO combines machines, blades and wheels, process development, cleaning and applications knowledge. That combination helps a customer qualify the complete operation. A low-priced alternative tool is not an economic substitute if it increases breakage, consumes more wafer value, reduces throughput or requires a prolonged requalification. Our Core score rewards that specific qualification advantage. It does not assume a disclosed monopoly or an invented exact market share.

The December 2025 technology briefing shows why advanced packaging can increase the wallet. A die-to-wafer hybrid-bonding example includes thinning and dicing before bonding, chip grinding and oxide-layer grinding after bonding, and later thinning and singulation. These are distinct processing opportunities. The high-precision and high-cleanliness grinder includes wafer-shape correction and chemical cleaning. But the numerical thickness charts on the next slide are expressly **reference measurements on bare silicon wafers**. They are not published yields from a customer's production HBM line.

Wafer-to-wafer bonding is productive when complete wafers can be joined, but bad dies can compound yield losses. Die-to-wafer assembly allows known-good dies to be selected, at the cost of more individual handling. Which architecture wins determines the number, difficulty and timing of paid processing steps. The model counts residual company revenue from qualifying those steps; it does not multiply wafer growth, die count, stack height and machine demand as independent shocks. Source: December 2025 technology briefing, pages 8-16.

Original issuer exhibit | Bare-silicon reference precision, not proven customer HBM yield

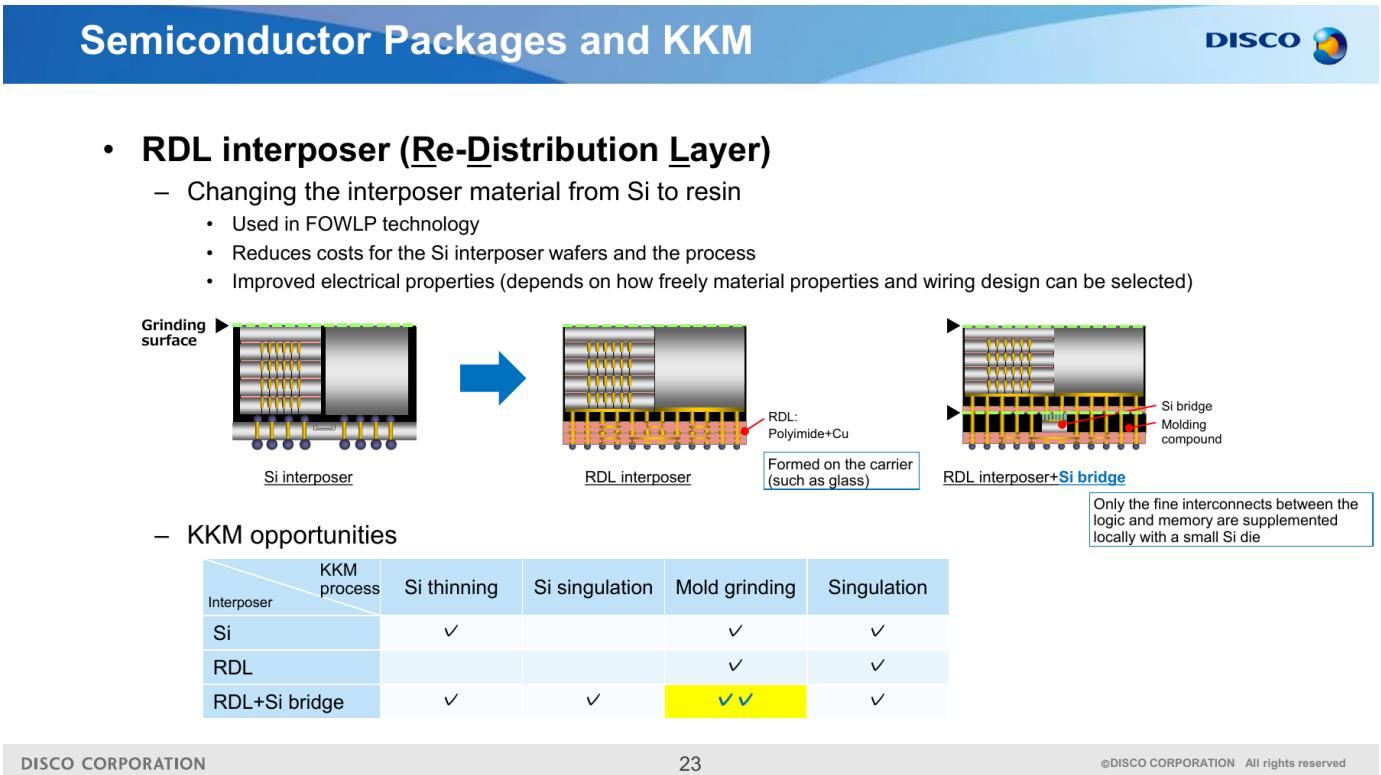

Package changes also remove revenue opportunities

The same issuer presentation provides important counter-evidence. Replacing a silicon interposer with a redistribution-layer structure can remove silicon-specific thinning or singulation work while preserving mold grinding and final singulation. An RDL structure with silicon bridges can add different local processing content. There is no general rule that every new package design requires more DISCO equipment.

Panel processing is another qualified opportunity. Larger rectangular workpieces can improve area utilization and accommodate packages that fit poorly on a 300 mm wafer. DISCO identifies developed or delivered panel-processing products and continuing demonstrations. It also identifies warpage, process-quality difficulties, immature supply chains and the cost of new equipment and materials. A larger panel is not automatically more saleable output or lower total cost.

These tradeoffs are built into the residual process-insertion branch. The gross company-wallet proxy is ¥20 billion in 2027, ¥36 billion in 2028, ¥50 billion in 2029 and ¥52 billion in 2030. Half is removed as overlap with the reference model's existing memory, logic and advanced-packaging growth. The remaining conditional increments are ¥10 billion, ¥18 billion, ¥25 billion and ¥26 billion. A 45% probability reflects demonstrated products but incomplete evidence about commercial production scale.

For scale, the 2027 gross proxy can be described as 100 configured equipment packages at ¥150 million each plus ¥5 billion of related tooling and service. **Those are scenario units and prices, not disclosed orders or a production-capacity claim.** Residual 2028 revenue is bounded at ¥0-25 billion. A 65% incremental gross margin less 12% incremental qualification, applications and service cost leaves 53% incremental operating profit. Expected 2027 contribution is therefore ¥4.5 billion revenue and ¥2.385 billion operating profit. Production acceptance, repeat tool demand and customer-specific throughput would improve this estimate. Sources: technology briefing pages 13-16 and 20-27.

Semiconductor Packages and KKM

- Challenges of PLP
  - It is difficult to achieve the same process quality as WLP
    - Difference between round and square workpieces
    - Warpage

    Need to develop new equipment and materials → Higher cost
- History of PLP
  - During the 2010s, FOWLP and 2.5D package first made an appearance
    - Most customers preferred WLP to PLP
      ➡ PLP supply chain remained immature
  - During the 2020s, 2.5D package using WLP reached its limits
    - Most customers started PLP development
      ➡ Full-scale start of establishing high quality for the PLP process

    Recognized as having value exceeding simply the cost aspect for high value-added devices

PLP trend comparison

	2010s	2020s
Concept	More die acquired per workpiece→Lower costs	
	High-volume production of small packages	Large interposer
Image		
Target products	Low end	High end
User	OSAT	IDM, foundry
Supply chain	Immature Market preferred WLP	Full-scale start

Original issuer exhibit | Panel area efficiency versus warpage, cost and qualification

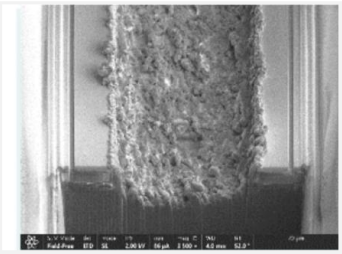

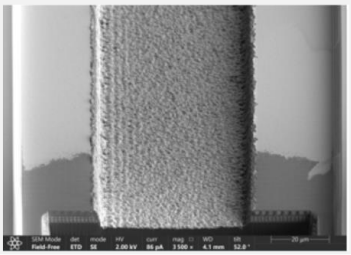

Laser precision has a cost

Laser ablation, internal modification or stealth dicing, LEAF and KABRA address different problems. They are not interchangeable labels for one unbounded AI laser market. In the December presentation, a femtosecond pulse reduces thermal damage relative to a nanosecond pulse, but has shallower processing depth, a more expensive head and a shorter head life. For an application that can tolerate more thermal impact, the less expensive nanosecond approach may remain better economically.

DISCO reported 4,000 cumulative laser-saw shipments by February 2026. The December 2025 presentation separately cited nearly 100 femtosecond installations or units in its track record. The first number is cumulative across the larger laser-saw category; the second is a subset, not an annual run rate. The technology has substantial development and customer-qualification history, but no separate extra laser revenue pool is added on top of the equipment and process-insertion rows. Those rows already capture the economic opportunity. Sources: March 2, 2026 announcement; December briefing pages 30-34.

Comparison of the Influence of Pulse Width

- It is necessary to select the optimal laser head based on processing requirements

Pulse width	Nanosecond ←	→ Femtosecond
Example of processing results		
Processing depth of one pulse	Deep	Shallow
Thermal damage	Large	Small
Laser head price	Reasonable	High
Laser head lifespan	Long	Short

DISCO CORPORATION 33 ©DISCO CORPORATION All rights reserved

Original issuer exhibit | Femtosecond quality improvement has cost, depth and head-life tradeoffs

Scarcity can improve terms, but existing backlog is not freely repriced

Management's July presentation described plants operating at high capacity. Record consumable shipments were supported by customers' equipment utilization. A customer facing expensive wafer scrap or a delayed high-value product has a reason to pay for reliable, qualified capacity.

We therefore model a 35% probability of a 3% premium, bounded at 0-5%, on 30% of reference equipment revenue and 20% of reference consumable revenue from 2027. This is a narrow pool of new or repriceable business. Fixed-price backlog, all maintenance revenue, and the separate process-insertion branch are excluded. No disclosed company-wide price increase is claimed.

The price premium contributes 80% incremental gross profit after expedited manufacturing and materials, less 10% incremental commercial and applications support, leaving 70% operating profit. Ordinary high-value mix and normal utilization already contribute to reference margins. The branch covers only additional commercial terms after those effects; that is why it is neither a blanket uplift to all sales nor a second operating-leverage benefit.

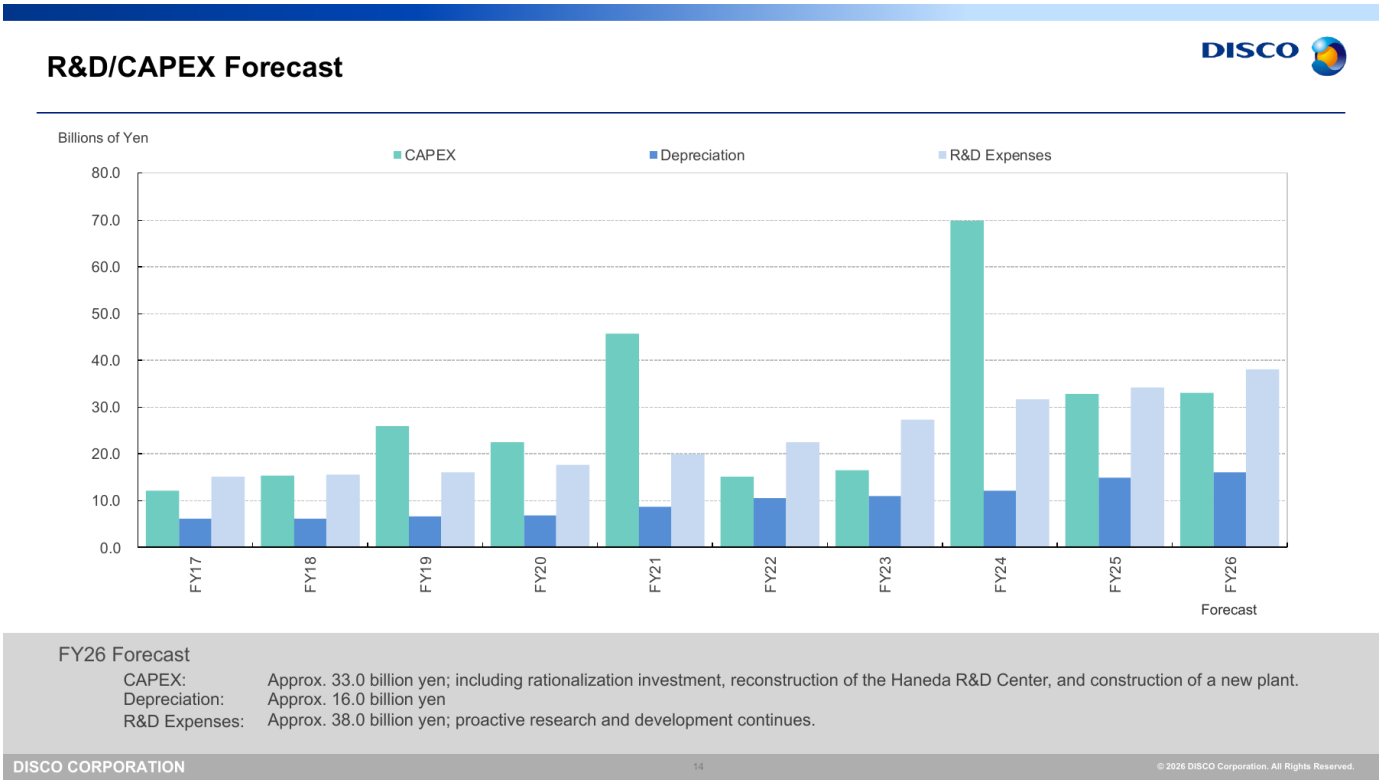

Capacity arrives with people, qualification and depreciation

The announced Gohara plant concerns precision processing tools and consumables. Phase-one construction was scheduled to start in February 2026 and finish in April 2028. The plan specified approximately ¥33 billion of building investment and 133,570 square metres of floor area. Some functions transfer from the existing Kure and Kuwabata facilities. Thus the entire floor area is not incremental production capacity, and completion is not proof of qualified good-unit output.

The model carries a 20% probability of migration or qualification disruption: 3% of reference consumable revenue lost during 2028 and 1.5% during 2029, at 65% lost contribution, plus ¥800 million and ¥400 million respectively of

conditional duplicated or qualification expenses. These costs are in addition to normal depreciation and R&D already included in the reference. We do not apply a machine-shipment haircut simply because this is a consumables factory.

Haneda's new R&D building was planned for March 2027 completion, with approximately ¥12.8 billion of investment and 22,300 square metres. That is development infrastructure, not a disclosed equipment-output guarantee. The July plan retained approximately ¥33 billion fiscal-year capital expenditure and raised depreciation to ¥16 billion and R&D to ¥38 billion. Management expects annual capital expenditure to remain above ¥30 billion. Research staff and applications expertise remain necessary even when demand is strong. Sources: April 18, 2025 Gohara announcement; October 19, 2023 Haneda announcement; July 23 presentation pages 14-15.

Original issuer exhibit | R&D, depreciation and capex must remain funded

The operating model and what it assumes

The reference uses four revenue vectors: precision equipment, processing tools and consumables, maintenance parts, and other. July-September begins with the latest reported rounded mix; subsequent quarters assume 62%, 23%, 11% and 4% respectively. These allocations are model assumptions, not official segment forecasts. Equipment growth is a proxy for accepted qualified capacity and richer configurations; consumables follow installed-tool use and wear; maintenance follows the installed base. No tool-unit disclosure exists that would justify presenting the inferred units as facts.

Reference calendar-year revenue is ¥603 billion in 2027, ¥671 billion in 2028, ¥730 billion in 2029 and ¥782 billion in 2030. The starting point is the current consolidated guidance plus the separately modeled parent sales beat, not an arbitrary percentage of global AI expenditure. Reference growth moderates as the model extends. The issuer itself guides only one upcoming quarter because customer investment and acceptance timing are volatile. Our later years are lower-confidence operating scenarios.

Assumed product gross margins begin around 70% for equipment, 80% for consumables, 72% for maintenance and 45% for other; they are chosen to reconcile the consolidated gross margin, not asserted as reported segment

margins. Equipment margin gradually fades as competition and customer cost pressure increase. Separate R&D and other selling/administrative expenses include recurring stock compensation, corporate costs, support and operating depreciation. Future expenses rise in absolute yen; they are not held flat while sales grow.

The latest accounts also show ¥243 million of depreciation in non-operating expenses. To avoid overstating economic profit from facilities, the model adds a ¥250 million quarterly idle-facility reserve, rising to ¥350-400 million as the asset base grows. This is separate from the operating depreciation already included in product costs and SG&A. It is not a second deduction of the full depreciation number. As a result, the first-quarter reference economic OP is ¥55.617 billion rather than the statutory guidance's ¥55.867 billion before the observed-sales branch.

Calendar year	Reference revenue, ¥bn	Active revenue, ¥bn	Active recurring OP, ¥bn	Active OP margin
2027	603.0	601.0	273.9	45.6%
2028	671.0	670.9	308.4	46.0%
2029	730.0	732.9	337.1	46.0%
2030	782.0	785.3	359.4	45.8%

The net active increment is small because identified upside is offset by currency and ramp risks. That is deliberate. A large part of AI-related demand is already included in a strong reference business; the probability ledger should not give it a second name and add it again.

Currency, cash and the share denominator

The July quarter used ¥160.4 per US dollar, compared with ¥144.1 a year earlier. The next-quarter guidance assumed ¥159, and the presentation showed annualized currency sensitivity of approximately ¥1.9 billion for the dollar and ¥0.1 billion for the euro. Overseas sales represented 90.8% of revenue. Some recent growth and profitability therefore reflect exchange rates as well as physical demand.

The reference holds ¥159 per dollar. A 30% adverse branch assumes ten-yen appreciation, 70% of revenue linked to the dollar, and a 35% natural cost offset. For 2027 that means conditional revenue loss of approximately ¥26.55 billion and OP loss of ¥17.26 billion; the weighted OP effect is approximately ¥5.18 billion. The assumed currency exposure and natural hedge are not disclosed company percentages. The result is a bounded company-specific check against the issuer's sensitivity, not an additional hedge loss added to an already currency-reduced margin.

At June 30, cash and deposits were ¥283.892 billion, inventories ¥152.952 billion, and contract liabilities ¥72.970 billion. Cash is substantial, but customer advances, planned investments and distributions matter. No net-cash premium is added to the operating-profit valuation. The condensed balance sheet does not show a separate borrowing line; that is not a claim that every lease or financing liability is zero.

The last full-year operating cash flow was ¥133.543 billion. Capital purchases were ¥35.143 billion for property and equipment and ¥84 million for intangibles. The large negative investing cash flow also included ¥100 billion transferred into time deposits. That transfer reduces reported cash equivalents but is not a ¥100 billion deterioration in operating free cash generation. There is no newly published Q1 cash-flow statement in the reviewed materials.

Issued shares at June 30 were 108,483,729; treasury shares were 16,004, leaving 108,467,725 outstanding. The model starts at 108.7 million diluted shares in Q3 2026 and adds 0.02 million a quarter for potential option and award dilution. This is a modeled reserve, not a disclosed issuance schedule. No speculative buyback benefit is assumed. The April 1, 2023 three-for-one split is already incorporated in these accounts and must not be applied again. Valuation and decision points

The valuation uses 20x Q-plus-next-three-quarter recurring operating profit divided by the valuation quarter's modeled diluted shares. There is no EBITDA substitution, cash add-on or reliance on an analyst target. The Q4 2027 window contains ¥300.254 billion of operating profit and 108.8 million shares, giving **¥55,193.72**.

Valuation quarter	Ceiling, JPY/share
Q3 2026	47,113
Q4 2026	48,640
Q1 2027	50,382
Q2 2027	51,508
Q3 2027	53,642
Q4 2027	55,194
Q1 2028	56,683

Valuation quarter	Ceiling, JPY/share
Q2 2028	58,144
Q3 2028	59,601
Q4 2028	60,819
Q1 2029	61,904
Q2 2029	63,061
Q3 2029	64,085
Q4 2029	65,086
Q1 2030	65,955

The Base score is **77**, from 46/60: Core 18/20, Cycle 8/10, TAM 8/10, Catalysts 4/5, Macro 8/10, Alpha 3/5 and Risks -3. The differentiation is supported by actual profitability, integrated process expertise and consumable demand. The deductions reflect semiconductor cyclicality, acceptance timing, currency exposure, process substitution and migration execution. The score is an analytical initiation; no existing protected portfolio override has been changed by this research.

The most important near-term test is the October 22 consolidated release: actual acceptance, gross margin, expenses and the next shipment guide. Later tests are paid production qualification for hybrid and panel processing, like-for-like new-order terms, customer utilization, Haneda commissioning and Gohara's saleable output after qualification. Evidence of fewer paid process steps, slowing utilization or new capacity without corresponding returns would reduce the model. More factory area, more stack layers or a better laboratory surface alone would not justify raising it.

Source and coverage record

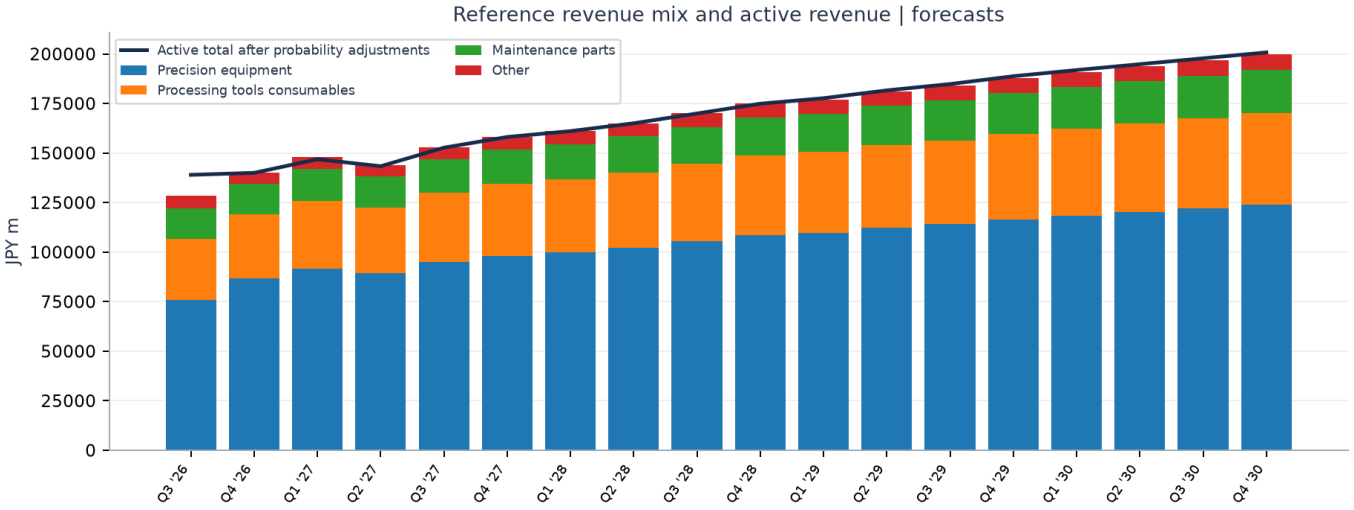

The source archive includes the full April 22 and July 23 issuer financial releases, presentations and page-by-page management commentary; the July financial-information workbook was read without modification. These are the latest two financial briefing records reviewed. A separate live question-and-answer transcript was not obtained. The October 6 preliminary release is newer operating evidence but is not a consolidated earnings release.

The December 2025 technology briefing and the Gohara, Haneda and laser-saw announcements support the engineering and capacity discussion. Original exhibits have been rendered and visually checked for the offline artifact. Each numerical forecast, probability, product margin, unit proxy and future share figure is separately labeled in the model ledger. The current market quote is retained only in portfolio metadata, not used to set the operating forecast or the valuation multiple.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	18	Integrated equipment, consumables and applications knowledge; high actual margins support differentiated process value. No invented exact market share.
Cycle	8	Record shipments/utilization and accepted sales; semiconductor capex and acceptance timing remain cyclical.
TAM	8	More sophisticated memory/logic/packaging creates paid processing opportunities, but process substitution limits simple multiplying.
Catalysts	4	October 22 results, hybrid/panel qualification, Haneda March 2027 and Gohara April 2028 construction milestones.
Macro	8	AI and advanced-packaging tailwinds, partly offset by FX, export and customer-capex sensitivity.
Alpha	3	Separate shipments from accepted sales, process insertions from die count and consumables capacity from equipment factory area.
Risk classes	-3	Acceptance/qualification, yen, customer cyclicality, process substitution and facility migration; competitive differentiation alreadyin Core.
Total	46/60	Rounded Base 77. Both artifact and new workbook row use this score; this is not a manual override.

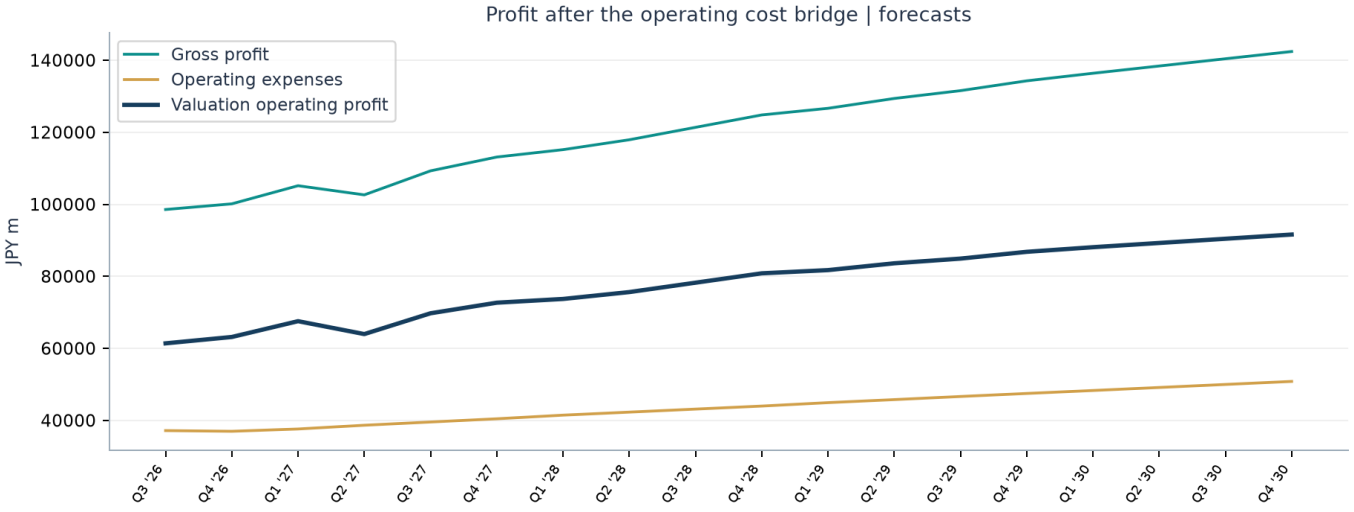

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	128,492.0	10,500.0	138,992.0

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Exact earnings window	F4Q OP	Multiple	Shares	Ceiling
Q3 2026	Q3 2026 + Q4 2026 + Q1 2027 + Q2 2027	256,061.0	20x	108.700	47,113.34

Quarter	Accepted precision-equipment revenue proxy, JPY million	Status
Q4 2029	116,560.000	ASTRA assumptions; materially lower confidence after 2028
Q1 2030	118,420.000	ASTRA assumptions; materially lower confidence after 2028
Q2 2030	120,280.000	ASTRA assumptions; materially lower confidence after 2028
Q3 2030	122,140.000	ASTRA assumptions; materially lower confidence after 2028
Q4 2030	124,000.000	ASTRA assumptions; materially lower confidence after 2028

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Precision equipment	75,810.3	70.0%	53,067.2
Q3 2026	Processing tools consumables	30,838.1	80.0%	24,670.5

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Claim decisions, overlap and triggers

DISCO-OCT6-ACCEPTANCE

probability: 0.75

source date: 2026-10-06

hypothesis: The parent-only acceptance beat translates into consolidated revenue above July guidance.

Conditional: Consolidated CYQ3 revenue uplift 14 B, bounded 10-16 B. Parent-only H1 beat is 12.5 B (213.6 actual versus 201.1 guide); apply approximately 1.12 consolidation factor. This is a scope bridge assumption, not consolidated reported revenue.

rationale: Actual parent sales and record shipments strongly support a beat, but subsidiary acceptance and eliminations remain unknown until Oct 22.

overlap: CYQ3 reference remains July consolidatedguide 128.492 B. Add this branch once. Subsequent reference 140 B-158 B quarters already incorporate sustained high shipment conditions, so no perpetual repetition of the one-quarter beat.

earnings bridge: 65% incremental GP minus 10% incremental compensation/application costs=55% OP; p 75 gives 10.5 B revenue and 5.775 B OP.

trigger: October 22 consolidated results replace branch with actuals.

DISCO-PROCESS-INSERTIONS

probability: 0.45

source date: 2025-12

hypothesis: High-precision hybrid-bonding preparation and panel processing gain residual paid equipment, specialized consumables and service content beyond broad AI growth.

Conditional: Gross company-wallet proxy 20 B 2027, 36 B 2028, 50 B 2029, 52 B 2030; remove 50% reference overlap => conditional residual 10 B, 18 B, 25 B, 26 B. 2027 gross proxy equivalently 100 qualified equipment packages at 150 M plus 5 Bassociated tooling/service; units/ASP are assumptions, not orders. Residual 2028 outcome bounded 0-25 B.

rationale: Issuer process maps and developed grinders, delivered panel equipment support nonzero adoption; exact customer ramp, throughput and economics undisclosed. 45% reflects demonstrated products but incomplete production scale and substitution.

overlap: Reference already compounds memory/logic/OSAT adoption. Remove 50% of gross proxy and include RDL substitution/net lost conventional content inside the residual, not a second wafer-volume uplift. No stackingxwaferxtool triple count. No extra CPO wallet without distinct process evidence.

earnings bridge: 65% incremental GP less 12% customer qualification/application/support=53% OP. 2027 expected 4.5 B revenue/2.385 B OP.

trigger: Production-accepted tools, repeat specialized consumables, customer process qualification and actual revenue mix.

DISCO-NEW-ORDER-PRICE

probability: 0.35

source date: 2026-07-23

hypothesis: Qualified high-value capacity and expensive customer delays enable premiums on new/repriceable orders.

Conditional: 3% incremental price, bounded 0-5%, on 30% reference equipment plus 20% reference consumables from 2027. All other sales and fixed-price backlog excluded.

rationale: Plants at high capacity, record shipments, high customer utilization and costly yield failures support pricing value. No disclosed broad price hike; probability 35%, rather than zero, recognizes uncertainty.

overlap: Reference product mix, normal utilization, currency and technical content already drive core margins. Premium applies only reference revenue, excludes process-insertion branch and maintenance; no premium on entire backlog.

earnings bridge: 80% incremental GP after expedited labor/materials, less 10% commercial/application support=70% OP.

trigger: New terms or like-for-like ASP, lead-time, customer cost-of-delay evidence; no improvement means remove branch.

DISCO-GOHARA-RAMP

probability: 0.2

source date: 2025-04-18

hypothesis: Consumable migration and qualification temporarily constrain saleable output.

Conditional: 3% reference consumable sales loss 2028, 1.5%2029; plus 800 M/400 M annual duplicated/qualification expenses. Outcome bound 0-5% lost annual consumables.

rationale: Large new plant starts operations after scheduled April 2028 construction completion; relocation replaces some Kure/Kuwabata functions and involves qualification, not instant net capacity.

overlap: Reference includes ordinary depreciation and R&D; branch adds only disruption and duplicated incremental ramp costs. No arbitrary equipment shipment loss from a consumables factory.

earnings bridge: Lost sales at 65% contribution plus stated extra expense, probability 20%.

trigger: Commissioning milestones, consumables qualification, yield and lead times.

DISCO-YEN-STRESS

probability: 0.3

source date: 2026-07-23

hypothesis: Yen appreciates ten per USD relative to 159 planning anchor.

Conditional: 70% of company revenue assumed USD-linked, 10/159 translation loss, 35% variable/natural-cost offset; outcome bounded 5-15 JPY appreciation. CY2027 conditional revenue-26.547 B andOP-17.256 B, near but not identical to published annualized 1.9 B/JPY currency sensitivity.

rationale: 90.8% reported overseas revenue, large guide FX tailwind and earnings sensitivity; currency path uncertain, 30% adversecase.

overlap: Reference holdsFX159, product margin normalization is cost/mix rather than FX. Branch applies to reference only, no currency shock again on small separate commercial branches. USD exposure share and cost offset are explicit assumptions.

earnings bridge: 65% contribution to currency-driven revenue loss; no new tax/net-income bridge and no extra interest adjustment.

trigger: Actual invoicing-currency mix, hedging and averageFX; recalibrate at results.

Remaining bounded uncertainties

- October 6 numbers are parent-only preliminary; consolidated July-September revenue and OP are due October 22.

- No current equipment-unit counts, ASPs, booked order totals or qualified capacity are disclosed; the model uses explicit revenue and capture proxies.

- No public program-level hybrid or panel tool awards, share, or assured production dates.

- Q1 accepted-sales mix is rounded; future product gross margins are assumed, not issuer segment margins.

- No new Q1 cash-flow statement; current operating cash conversion rests on the last annual statement and balance-sheet indicators.

- No separate borrowings line in the condensed balance sheet; leases and other liabilities are not certified zero.

- June 30 shares are the latest verified; the future option and SBC share path is an assumption.

- Issuer briefing notes were read in full for April 22 and July 23; a separate live Q&A transcript was not obtained.

- 2029-2030 paths are lower-confidence operating scenarios, not management guidance.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
