Q4 2027 model ceiling: TWD 2,608.60

Analytical Base 43/60 = 72 | Watch

20x forward-four-quarter IFRS operating profit per diluted end-window share

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	12,949.3	20x	99.281	2,608.60

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Thesis

MPI (□□□□; Taipei Exchange 6223) sells the physical interfaces and measurement equipment needed to determine whether semiconductor devices work before they move into more expensive manufacturing stages. Its strongest established business is wafer probe cards. Photonics automation is a credible additional opportunity, supported by actual products, but remains a much smaller and less disclosed part of the company.

The investment question is whether MPI can convert more difficult AI-chip testing into durable gross profit while expanding qualified production. AI spending is useful context; it does not determine MPI's revenue. Customers must order specific cards or equipment, qualify them, accept delivery and pay. More pins, higher current, tighter pitch and optical coupling can increase the value of that work, but can also increase MPI's own engineering, calibration and manufacturing costs.

The analytical Base is 72, or 43 out of 60 framework points. The active Q4 2027 ceiling is approximately NT$2,609 per diluted share, calculated at 20x operating profit for Q4 2027 through Q3 2028. This is a conditional model output, not company guidance. The model uses IFRS operating profit, includes development and employee expenses, and carries a conservative convertible-share reserve. It does not capitalize an analyst target or add a separate valuation for photonics.

What MPI sells

A probe card is the customized interface between automated test equipment and electrical contacts on a wafer. The tester supplies the instruments and test program; MPI provides the precisely positioned electrical path into the chip. An unsuitable contact interface can produce unstable measurements, damage pads, fail to deliver current or lengthen test time. Its economic importance therefore exceeds its share of the finished accelerator's selling price. It is still one supplier's interface invoice, not a claim on the entire accelerator or test-system bill.

MPI offers cantilever, vertical and MEMS probe-card architectures, substrates, probe heads and supporting engineering. The annual report records 2025 probe-card revenue of NT$9,657.136 million, or 72.22% of group sales. Semiconductor equipment contributed NT$3,490.967 million, with NT$223.078 million of other revenue. In Q2 2026, the reported mix moved to 74.7% probe cards, 23.3% equipment and 2.0% other. [P3, P7]

Equipment includes engineering wafer-probing systems, RF and high-power measurement, photonic-device probing and sorting, and thermal test systems. These serve different customer workflows. A new wafer prober does not imply a new probe-card sale of equal value, and photonics revenue cannot be added to reported equipment sales as if it were an unreported fourth segment.

Original issuer exhibit | Original probe-card product family: vertical, MEMS and cantilever architectures are interfaces between a tester and the wafer, not the tester itself. Product photographs are not evidence of customer-specific design wins.

Engineering value and competitive limits

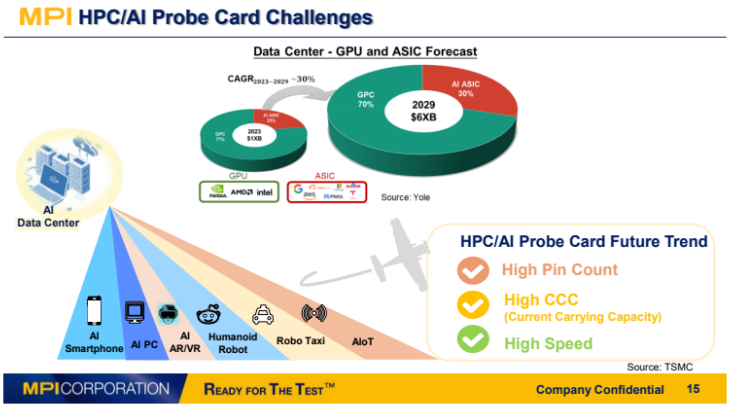

AI processors make electrical test harder in several connected ways. Increasing pin count raises alignment and routing demands. Fine pitch narrows the mechanical tolerance available at each contact. High current creates voltage-drop and thermal problems. Faster links require controlled signal integrity. Larger chips and multiple chiplets can also increase the cost of allowing defective die to reach advanced packaging.

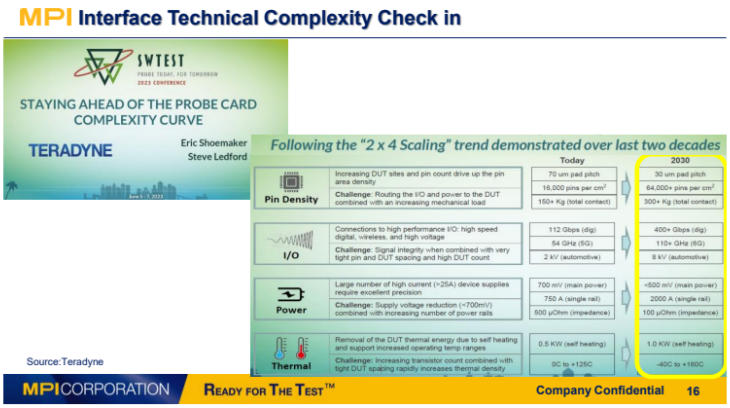

MPI's annual plan addresses high-current, high-speed, fine-pitch, high-pin-count and large-area temperature-controlled interfaces. These are relevant engineering capabilities. They do not establish that every accelerator platform uses MPI, that MPI is the sole qualified supplier, or that a roadmap's highest parameter can be achieved simultaneously with every other parameter. The September presentation reproduces an industry complexity roadmap; those figures remain conditional roadmap requirements, rather than guaranteed MPI specifications. [P3, P7]

Customer qualification and service are meaningful barriers. A replacement interface must reproduce measurements reliably, maintain contact quality and operate with the customer's test flow. This gives an incumbent an advantage and may support urgency premiums. It does not eliminate competition: MPI's annual

report names FormFactor, Technoprobe, JEM and Nidec's SV Probe in cards, and several competitors in equipment. Qualification can also support dual sourcing once the customer has paid the engineering cost. [P3]

Cards are not consumed in a fixed ratio to wafer starts. Device redesigns, test parallelism, card life, repair and customer inventory affect purchases. Higher semiconductor output can increase wear and demand, while higher parallelism or longer card life can reduce the number required per wafer. The model therefore uses a delivered revenue-content index, rather than pretending that a disclosed physical card count or universal ASP exists.

Original issuer exhibit | High pin count, current delivery, speed and thermal load raise interface difficulty. The lower slide reproduces an industry roadmap with specified conditions; it is not a universal specification or an MPI capacity forecast.

Photonics: established products and the new option

The annual report says MPI has launched silicon-photonics die-level measurement equipment for known-good-die testing after PIC or combined electronic/photonic wafer dicing. It also describes engineering probing with optical interfaces configurable on both sides. This is more substantial evidence than a generic claim that optical networks will grow. Testing an optical die before costly assembly can prevent value being added to defective parts. [P3]

MPI's existing photonics automation catalogue includes wafer probers, die and packaged-device probers, sorters and the STARGAZER test platform. Its VEGA range addresses VCSELs, edge-emitting lasers and optical modules. Relevant measurements include light-current-voltage sweeps, optical spectra, near- and far-field

behavior, and temperature-dependent performance. The mechanical handling and measurement environment matter because a repeatable laboratory result is not enough for reliable unattended production. [P11-P13]

The August 2025 Lightium and Axiomatic_AI agreement adds an option around AI-assisted measurement. Lightium develops thin-film lithium-niobate photonics; Axiomatic_AI supplies measurement automation software; MPI provides probing platforms and integration. The partner's 2026 material describes demonstrations that translate design coordinates and measurement objectives into instrument workflows. This can reduce application-engineering effort and improve repeatability. [P9, P10]

The agreement and demonstration do not disclose a purchase order, production-tool count, revenue-sharing agreement or contracted software subscription. TFLN is also one photonic platform, not a synonym for every silicon-photonics manufacturing flow. MPI already sells optical equipment, so a new demonstration should not cause the whole existing business to be valued again.

The active optical branch assigns a 45% probability to 10, 25, 40 and 50 additional tool-equivalent deployments in 2027-2030 at an assumed NT$20 million per equivalent. These are bounded planning assumptions, not disclosed bookings or an issuer ASP. A 50% overlap deduction leaves conditional residual revenue of NT$100 million, NT$250 million, NT$400 million and NT$500 million annually. At 45% GP and 20% additional application, qualification and service expense, the branch captures 25% operating profit before probability. There is no additional software-revenue assumption.

Original issuer exhibit | The AST portfolio includes silicon-photonics measurement, RF and power-device test. This commercial portfolio predates the AI-assisted TFLN development agreement. The issuer's market-leader language does not establish exclusivity.

testing during wafer mass production.

B. In response to the demand for advanced packaging, micro-pitch solutions have been introduced.

C. In response to the demand for high-performance AI computing, high pin-count solutions have been introduced.

D. With the continuous increase in demand for driver assistance technologies in automobiles, demand for automotive ICs continues to grow. To meet customer needs, the Company has developed large-coverage, high-throughput, and high/low-temperature probe cards to accommodate automotive IC customers' product requirements for increased production capacity.

E. In response to testing applications, mixed probe solutions for probe cards are developed.

2. Advanced semiconductor testing equipment:

A. The Company has launched silicon photonics die-level measurement equipment, which can be applied to KGD (Known Good Die) process testing after PIC and EIC+PIC wafer dicing, including measurement of relevant optoelectronic conversion characteristics, as well as bandwidth and noise testing of high-frequency components.

B. In silicon photonics engineering wafer testing equipment, to accommodate customers' different electro-optical input and output positions, the Company has successfully introduced a bidirectional point probing inspection system with optical testing interfaces configurable on both the upper and lower sides, in order to meet customers' diverse design layouts.

C. The Company continues to develop optoelectronic characteristic measurement equipment for optical communication components such as VCSEL, EEL, and DFB.

3. Semi-conductor component temperature testing series:

We continued to develop various models that correspond to different testing temperature ranges and traffic to match customers' needs. These models will be integrated with customized systems for customers, providing the most suitable solutions for mass production and engineering.

II. Summary of the 2026 business plan

(I) Business policy

Technology is the core foundation for maintaining competitiveness; in view of the development of the microelectronics industry and future technological demands, the Company upholds its core philosophy of assisting customers in enhancing competitiveness and undertakes the following strategic planning and efforts, with the aim of growing together with customers:

1. In response to the rapid development of AI applications, the Company continues to develop high current-withstanding probes and high current-withstanding probe card architectures.
2. In response to AI demand, the Company is developing higher-speed wafer probe cards to meet next-generation requirements for faster transmission.
3. To meet the needs of advanced IC process scaling and advanced packaging, the Company continues to develop new fine-pitch technologies.
4. In response to customer demand for high temperature and high parallel test counts, the Company continues to develop large-area high-temperature probe card technology.
5. In response to high-performance computing demands driven by artificial intelligence, the Company continues to develop high pin-count probe card solutions.
6. In semiconductor mass production testing solutions, application fields cover key technology platforms such as silicon photonics, radio frequency, and compound semiconductors (including LED, GaN, SiC, etc.), providing highly integrated automated wafer and die mass production test equipment incorporating optical, mechanical, electrical, and software systems. System design is centered on high stability, high repeatability, and high throughput to meet the stringent testing requirements of advanced processes in mass production environments.
7. In semiconductor engineering testing application fields, the Company enhances various product functions and operational convenience, improves higher-frequency and more precise measurement capabilities, and enables more automated engineering measurements, allowing customers to obtain more accurate measurement results and more efficient engineering experimental processes, thereby accelerating validation and product development timelines.

(II) Important production and sales policies

2

Original issuer exhibit | The annual report explicitly describes launched silicon-photonics die testing and bidirectional optical interfaces. Known-good-die testing has economic value before expensive packaging; shipped tool counts and photonics revenue are not disclosed.

Actual results and forecast calibration

Q2 2026 revenue was NT$5,233.387 million, gross profit NT$3,054.851 million and operating profit NT$1,801.851 million. Gross margin was 58.4% and operating margin 34.4%. Q1 revenue had been NT$3,933.067 million and OP NT$1,273.010 million. H1 OP totaled NT$3,074.861 million. These reviewed statements, rather than a bank forecast, anchor the model. [P1, P2, P5, P6]

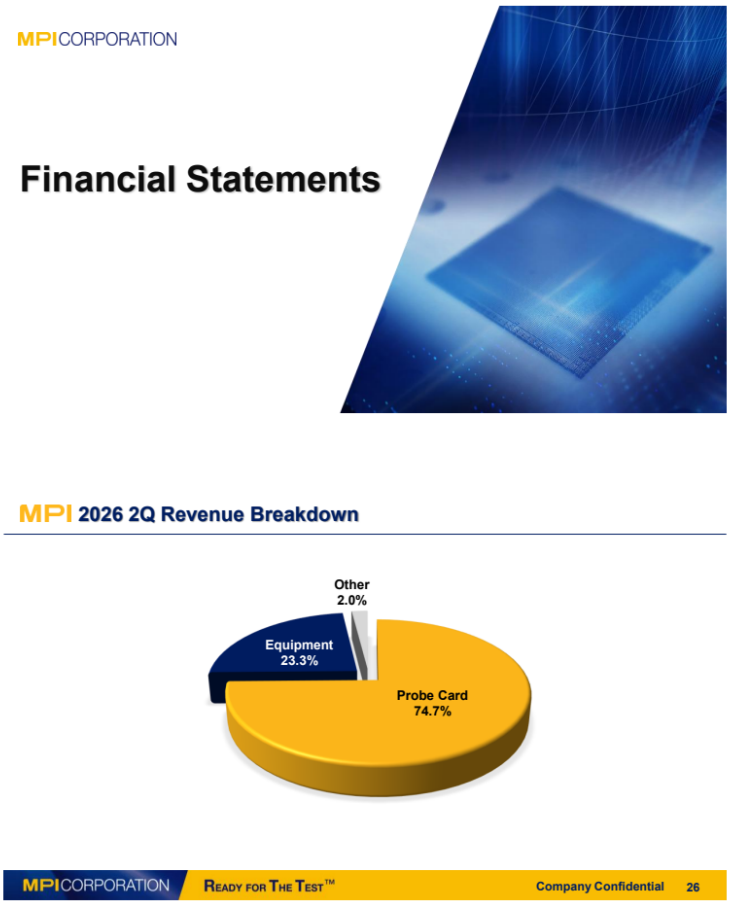

The latest issuer monthly table retrieved records July revenue of NT$1,805.362 million and August revenue of NT$2,048.171 million. September was blank. The modeled Q3 sales total is NT$5,900 million, implying September sales of about NT$2,046 million. Q3 profit remains a forecast. Monthly sales can be revised and contain none of the gross-margin or expense detail required to describe a quarter's earnings as reported. [P8]

The reference product model starts Q3 with NT$4,425 million of probe revenue, NT$1,355 million of equipment revenue and NT$120 million of other sales. Assumed margins of 61.5%, 49% and 35% reconcile to a group gross margin close to the recent actual mix. These product margins are analytical allocations; MPI does not disclose

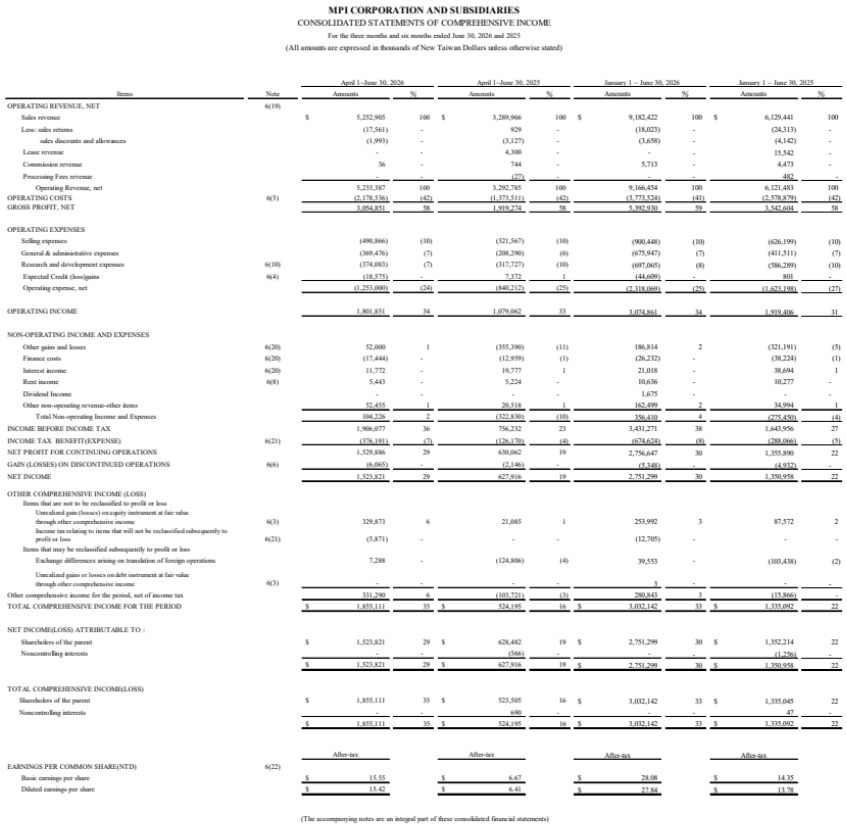

those margins separately. R&D includes a fixed development base and a sales-linked component; selling and field support vary with revenue; administration grows separately; expected credit loss remains an expense.

Reference growth is already substantial before probability branches. It assumes successful qualification of installed equipment and continued demand, not a static business with all growth assigned to a small probability. Active annual revenue reaches about NT$29.53 billion in 2027, NT$35.76 billion in 2028, NT$40.80 billion in 2029 and NT$44.00 billion in 2030. Active OP is approximately NT$10.86 billion, NT$13.61 billion, NT$15.44 billion and NT$16.19 billion. The declining growth rate and later margin moderation reflect competition and capacity response. These are demanding assumptions, especially against 2025 revenue of NT$13.37 billion.

There is a presentation inconsistency worth preserving. The September balance-sheet slide labels NT$3,431 million as H1 EBITDA, while that figure matches reported pretax income. Reviewed OP plus reported depreciation and amortization totals NT$3,616.208 million. The model uses IFRS OP; it does not adopt the mislabeled metric. [P2, P7]

Original issuer exhibit | Q2 2026 sales mix: probe cards 74.7%, equipment 23.3%, other 2.0%. Photonics is inside equipment, not a separate disclosed segment to add again.

6

Original issuer exhibit | Original reviewed income statement in NT$ thousands: Q2 revenue NT$5,233.387m, gross profit NT$3,054.851m and operating profit NT$1,801.851m. Net income includes non-operating and discontinued items.

Probability branches and overlap

The new-design branch assigns 55% probability to additional revenue content on 35% of reference probe sales: 5% in Q4 2026, 10% in 2027, 12% in 2028, then 8% and 4%. This is the residual above already modeled growth. Conditional additional sales retain 60% GP and incur 8% engineering and field-support expense, producing 52% OP capture.

A separate repeat-design pool, 25% of reference probe sales, receives a 35% probability of 5% pricing in 2027, 8% in 2028 and 4% in 2029, fading to zero in 2030. The pool excludes new-design content and fixed terms. Of each incremental revenue dollar, 30% is reserved for materials, overtime and expedited production, with another 5% for commercial and engineering support. Absence of an announced same-SKU increase is not a reason for zero probability, but the evidence does not justify pricing the entire book.

The downside branch assigns 25% probability to losing or delaying 10% of reference probe revenue, with two percentage points of rework cost on retained sales in 2027-28. It halves thereafter. Fixed operating expenses remain. This is one combined execution shock: a second utilization penalty is not stacked onto the same delayed cards. The model’s probability-weighted Q4 2027 ceiling is slightly below its reference ceiling because this downside offsets the positive branches.

As a separate sensitivity, a 10% shortfall in all reference revenue at unchanged product margins and fixed operating expense reduces the Q4 2027 reference ceiling from approximately NT$2,627 to NT$2,220. A

one-percentage-point group gross-margin change across that forward window moves the ceiling by approximately NT$69. Neither sensitivity is an extra active shock.

Funding, claims and dilution

June cash was NT$9,879.943 million, but it already included NT$5,019.197 million of net CB6 proceeds. Bank loans totaled NT$3,570.168 million; CB6 had NT$5 billion face and NT$4,561.473 million carrying value; lease liabilities were NT$518.557 million. Equipment payables were NT$1,743.223 million, in addition to NT$2,332.247 million of signed, unrecognized PPE purchase commitments. H1 CFO of NT$2,646.835 million was below PPE cash purchases of NT$3,132.042 million, before NT$848.918 million of acquisition spending. [P1, P2]

The funding model includes NT$4.4 billion of H2 2026 cash capex, covering the two equipment obligations above plus a modest additional reserve. These amounts are not deducted twice. Annual cash capex then runs at NT$4.8 billion, NT$4.0 billion and NT$3.6 billion in each of 2029 and 2030. Marginal working capital consumes 65% of incremental quarterly revenue; employee expense, taxes, leases, dividends and remaining thermal-chuck technology payments are retained. The modeled cash minimum is approximately NT$6.53 billion, conditional on operating delivery and collection.

The company had 97,981,309 outstanding ordinary shares and no treasury shares at June; the October 6 exchange record shows the same issued count. The old fifth convertible was already fully converted or redeemed during 2025 and must not be added again. CB6 initially converted at NT$6,223, and public bond tables indicate an adjusted NT$6,201.8; the original adjustment notice remains a precise retrieval gap. A rounded one-million-share reserve exceeds either full-conversion count. Future employee dilution is reserved at 0.15 million shares a year from 2027, despite no outstanding employee options at June. [P2, P14]

CB6 holders have a NT$5 billion cash put in June 2029. Funding stresses repayment then even though valuation reserves all conversion shares. This is a nonconversion liquidity stress, not a simultaneous debt-and-dilution subtraction from value. The ceiling adds no cash and applies no separate bank-debt deduction; it is a fully diluted operating-profit convention. If cash conversion or capex spending deteriorates enough to make refinancing necessary, both financing terms and dilution must be revisited.

Cash and cash equivalents at end of the period	$ 9,886,784	$ 5,645,434
Reconciliation of cash and cash equivalents at end of the period		
Cash and cash equivalents stated in the consolidated balance sheets	$ 9,879,943	$ 5,637,373
Cash and cash equivalents classified to non-current assets (or disposal group) held for sale	6,841	8,061
Cash and cash equivalents at end of the period	$ 9,886,784	$ 5,645,434

(The accompanying notes are an integral part of the parent company only financial statements)

9

Original issuer exhibit | H1 cash flow: NT$3,132.042m PPE purchases, NT$848.918m acquisition spending and NT$5,019.197m net convertible proceeds. The cash balance is already post-financing; proceeds are not added again.

What would change the assessment

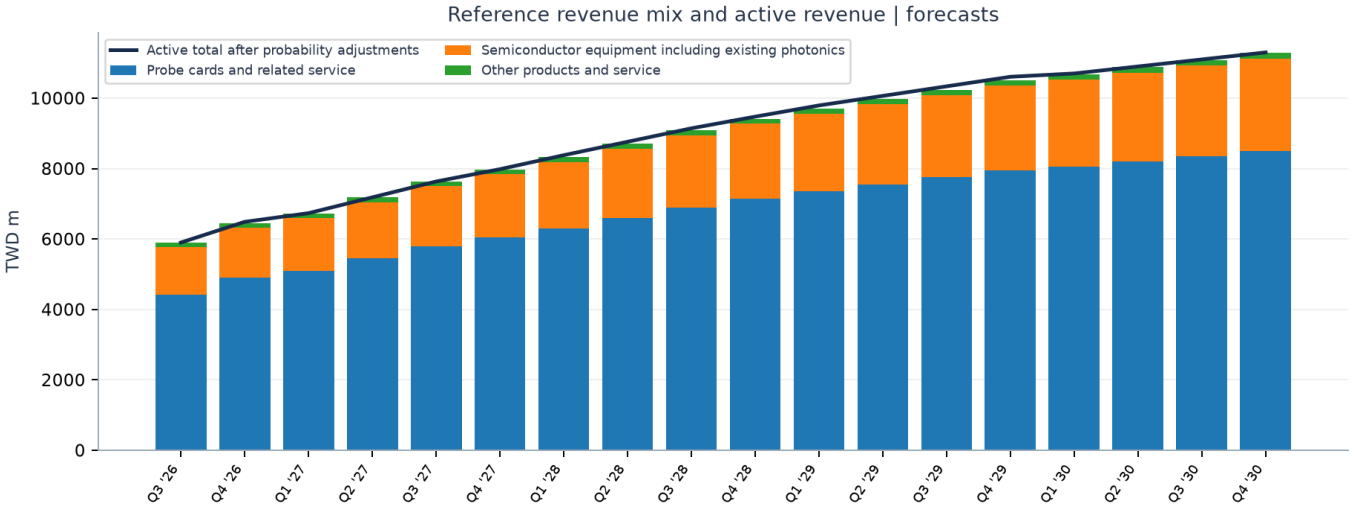

The most useful next evidence is measured qualified card output, customer design wins, price resets on a defined repeat-design pool, and cash collection against the expansion. For photonics, paid orders and production acceptance are more decisive than another laboratory demonstration. Those facts would replace tool-equivalent assumptions with contracted units, actual ASPs and support costs.

The main counter-case is straightforward: expensive interfaces may be technically necessary while competition captures much of the economic benefit for customers. Qualification delays, card-yield problems or improved card lifetime could weaken revenue growth, while inventory and depreciation remain. MPI’s existing profitability makes it more than a speculative optical-testing concept, but it does not remove the need to prove each additional unit of capacity and retained margin.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	See the scoring evidence and distinct risk classes in the analysis.
Cycle	8	See the scoring evidence and distinct risk classes in the analysis.
TAM	8	See the scoring evidence and distinct risk classes in the analysis.
Catalysts	4	See the scoring evidence and distinct risk classes in the analysis.
Macro	7	See the scoring evidence and distinct risk classes in the analysis.
Alpha	4	See the scoring evidence and distinct risk classes in the analysis.
Risk classes	-4	See the scoring evidence and distinct risk classes in the analysis.
Total	43/60	Rounded Base 72. Both artifact and new workbook row use this score; this is not a manual override.

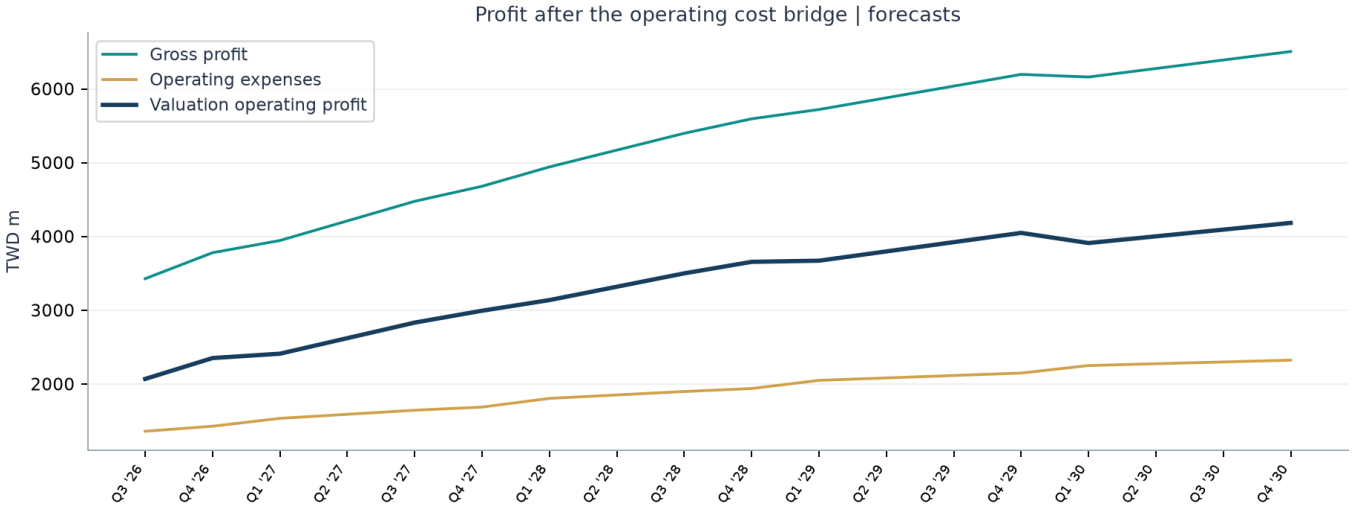

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	5,900.0	0.0	5,900.0
Q4 2026	6,440.0	47.2	6,487.2

Q4 2030	720.3	1,071.9	469.4	45.1

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Claim decisions, overlap and triggers

MPI-CONTENT

p: 0.55

signal: Actual probe-card growth, higher-current and finer-pitch development, and substantial capacity investment.

Conditional: A further 5%/10%/12%/8%/4% revenue-content gain in Q4 2026/2027/2028/2029/2030 on 35% of reference probe-card sales.

scope: Only new qualified high-complexity designs above the already growing reference. No wafer-volume multiplier or chip-value TAM allocation; zero in Q3 2026.

bridge: 60% incremental gross profit after probes, substrates, assembly and calibration; 8% incremental design/field-support expense, leaving 52% OP capture.

timing: After customer qualification and delivery. The revenue-content measure combines ASP and paid interface complexity, not physical card units.

counter: FormFactor, Technoprobe, JEM and Nidec compete; customer dual sourcing, pin density yield and card lifetime may limit wallet capture.

MPI-PRICE

p: 0.35

signal: Higher complexity and qualified-capacity requirements increase the customer cost of waiting, while MPI expands equipment and staffing.

Conditional: A 5% premium in 2027, 8% in 2028, 4% in 2029 and zero in 2026/2030 on 25% of reference probe-card sales.

scope: A separate repriceable repeat-design pool; excludes the 35% new-design content pool, fixed-price deliveries and photonics tools. No announced same-SKU price increase is assumed as fact.

bridge: 70% incremental GP after overtime, material and expedited output costs; 5% commercial/engineering expense, leaving 65% OP capture.

timing: Only newly negotiated or reset contracts as delivered; fade reflects competing capacity and customer bargaining.

counter: Larger orders may command discounts; customer qualification can protect the incumbent without granting unlimited price increases.

MPI-PHOTONICS

p: 0.45

signal: Commercial silicon-photonics KGD equipment and optical automation products plus the August 2025 Lightium/Axiomatic_AI joint development and 2026 demonstration.

Conditional: 10/25/40/50 incremental tool-equivalent deployments in 2027/2028/2029/2030 at modeled NT$20m each, reduced by 50% overlap with reference equipment growth.

scope: NT$100m/250m/400m/500m residual annual revenue, before probability. These are bounded planning units, not booked orders or a disclosed MPI ASP. No separate software subscription wallet.

bridge: 45% incremental GP, 20% incremental application engineering, qualification and support expense; 25% OP capture.

timing: No residual sales before 2027. Acceptance and repeatability precede recognition; a laboratory demonstration does not establish factory throughput.

counter: Tool ASP, paid deployments, production qualification, partners' commercial allocation and photonics installed base are undisclosed. TFLN is one platform, not all photonics.

MPI-EXECUTION

p: 0.25

signal: Inventory, capex and new product complexity create cost and qualification risk during rapid growth.

Conditional: 10% lost or delayed reference probe-card revenue plus 2 percentage points of rework cost on retained probe sales in 2027-28; half of that shock in 2029-30.

scope: One combined capacity/yield/customer-delay state; fixed R&D/admin are retained. No additional utilization penalty for the same missing sales, and no speculative reversal of observed 2026 monthly sales.

bridge: Lost sales lose reference GP; retained sales incur the specified two-point cost. No opex release is credited.

timing: 2027-30, with recovery as equipment and staff qualify.

counter: Existing production qualifications, diversified suppliers and operating margins above 30% support execution, but no measured total good-unit capacity was disclosed.

Remaining bounded uncertainties

- The primary issuer deck does not give company-level numerical revenue guidance, total qualified probe-card capacity, shipped cards, ASP or photonics revenue. All forward rows are model assumptions.

- September 2026 monthly sales and Q3 earnings were not available in the retrieved issuer table. Monthly releases may be revised; Q3 is not a reported result.

- The latest two results presentations and September roadshow were obtained; full management Q&A transcripts were not available. The September 3 and September 22 decks repeat the same economic evidence.

- CB6 initial primary conversion price is NT$6,223; current public bond tables indicate NT$6,201.8 after adjustment, but the primary adjustment notice was not retrieved. A rounded 1m-share reserve exceeds both conversion counts; it is not a claim of 1m legally issuable shares.

- Photonics installed base, paid orders, acceptance terms, software licensing and the Lightium partnership revenue split are undisclosed. Existing equipment sales already include photonics.

- The September presentation labels NT$3,431m as H1 EBITDA although it matches pretax income. Reviewed OP plus reported D&A is NT$3,616.208m. The model uses reviewed IFRS OP and does not use the mislabeled metric.

- Cash and capacity forecasts require actual collection, equipment acceptance and retention of margins. New factory good-output capacity and capex completion dates are not disclosed; funding includes the full June signed commitments and equipment payables within H2 cash capex.

- A 10% reference sales shortfall at fixed product margins and fixed operating expense is a separate diagnostic, not an additional active branch. Prospective employee dilution of 0.15m shares annually is a model reserve; no outstanding employee options were disclosed at June.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
