WinWay Technology

6515.TW | Bottleneck / high-performance test interfaces

AI sockets / MEMS probing / thermal and optical test

WinWay is an established AI test-interface supplier with real revenue momentum, scarce qualification expertise and a growing high-power socket/MEMS opportunity. The model prices capacity, selective premiums and learning gains before confirmation, while preserving the 2028 factory timing and the cost of externally sourced probe technology.

ACTIVE CEILING	BASE SCORE	OP MULTIPLE	ACTIVE WINDOW
TWD 6,269 / share	78 / 100	20x	Q4 2027 - Q3 2028

20x forward-four-quarter consolidated operating profit / maximum modeled diluted shares in the same four-quarter window; no net-cash addition or net-debt deduction.

Status: Active research model. Model inputs, probabilities and scoring are analyst estimates. Financial units: NT$ billions; share counts: millions.

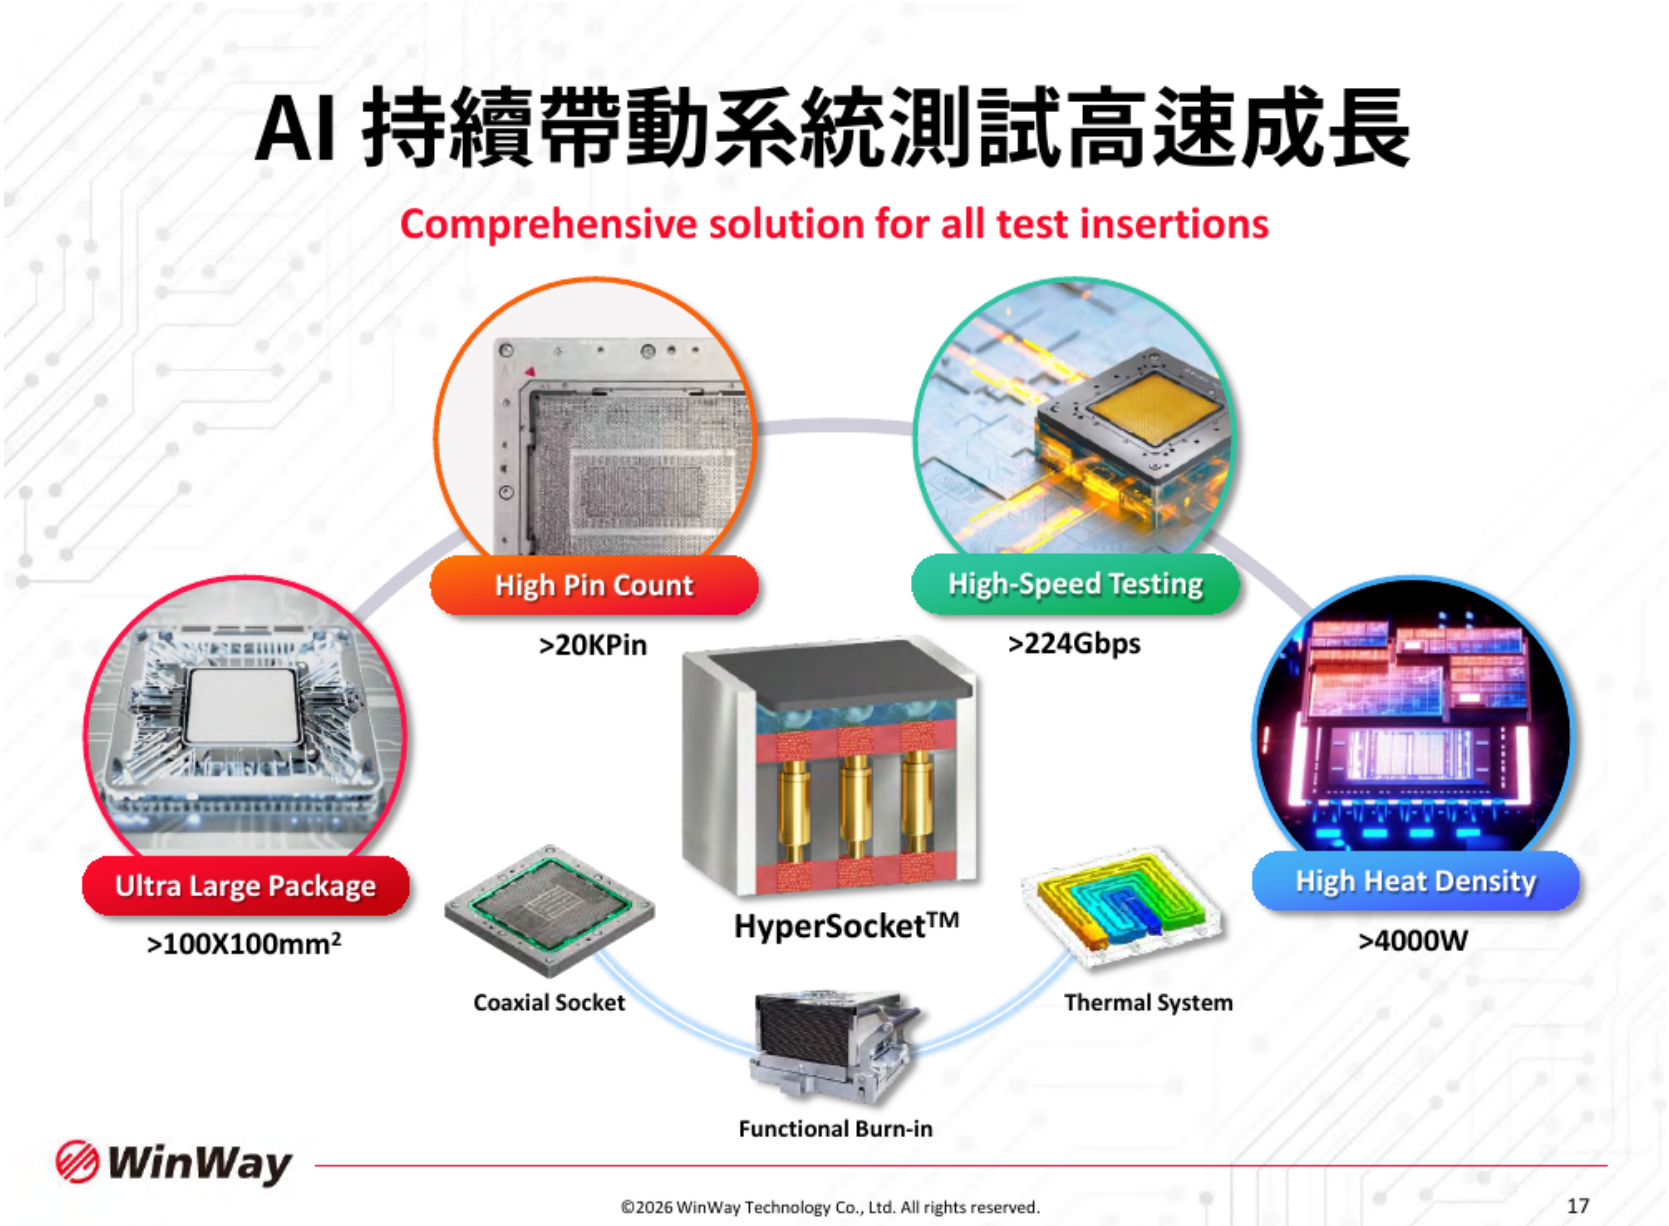

Production artifact snapshot as of 2026-10-12: G:/My Drive/1amInvesting/Artifacts/6515TW_WinWayTechnology_DeepDive.pdf

The investment case: the small interface that must survive a harder test

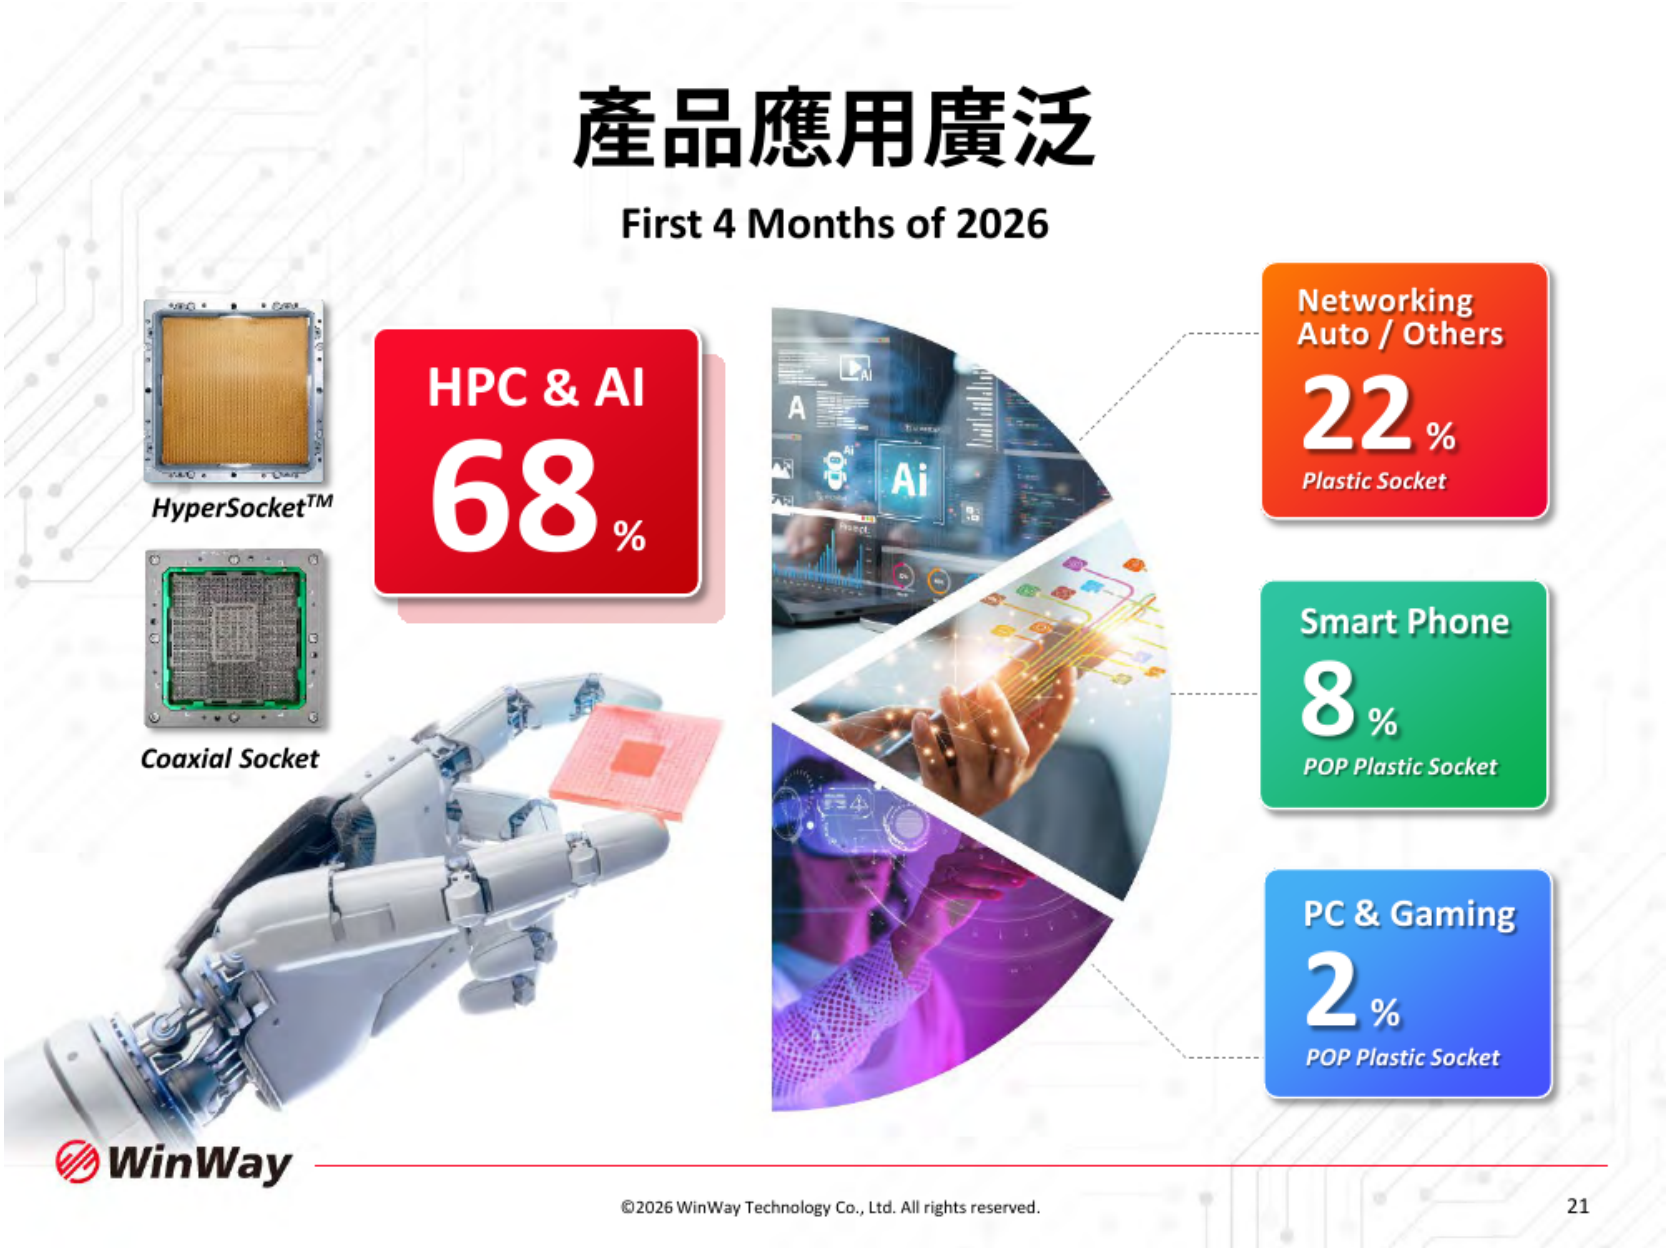

WinWay supplies sockets, contact elements, probe cards and thermal/interface solutions connecting valuable chips to test systems. It does not manufacture the main ATE platform. As packages become larger, currents rise and test duration increases, signal integrity, cooling, contact reliability and repeatable alignment become economically important.

January-April 2026 issuer mix was 68% HPC/AI, up from 48% for FY2025. Advanced-node exposure was 89% on the issuer’s definition. This supports a real AI testing ramp. The customer-origin geography of 81% North America is not the same as the financial statement’s US billing share.

Framework DB10 AI/ASIC complexity and DB1 optical testing are relevant. Phase one is high-end sockets already shipping; phase two adds MEMS and thermal content; phase three is optical-specific interface programs. Qualification, IP and manufacturing know-how support bottleneck status, but neither socket market rank nor optical capability proves an irreplaceable global monopoly.

W1 | Issuer next-generation package/test requirements, May 26 deck PDF p 18 IR_MAY. Higher power and pin counts increase difficulty; the diagram is not a forecast of interface sales.

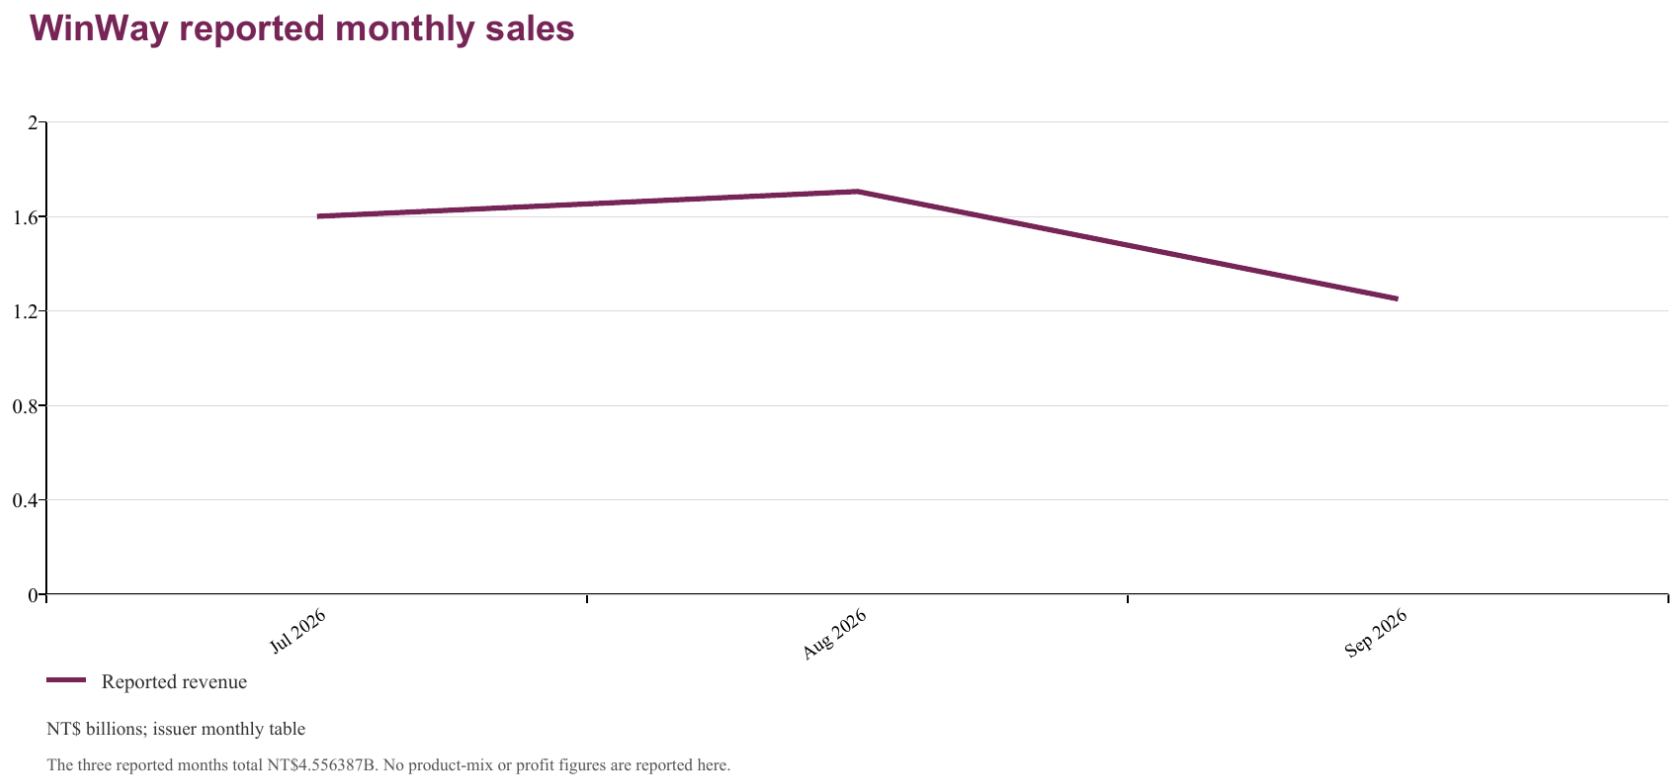

W2 | January-April 2026 end-market mix, issuer PDF p 22. HPC/AI share is a dated disclosed mix, not a permanent margin or sales growth rate.

Latest activity is accelerating, but margins are not yet following

Q2 revenue was NT$ 3.523235 bn, gross profit NT$ 1.350430 bn and operating profit NT$ 0.825157 bn. Gross margin fell to 38.33% from Q1's 43.01% as product mix, high-end socket capacity and MEMS investment created costs. Revenue momentum does not justify skipping this production-cost bridge.

July, August and September reported sales are NT$1.600351B, NT$1.705663B and NT$1.250373B. Their exact sum establishes Q3 consolidated revenue of NT$4.556387B. Q3 product mix, gross margins, operating profit and cash flow remain model estimates pending the full quarterly filing. The model allocates this reported total proportionally across its retained product mix and charges the existing product costs, fixed expense and 8% variable expense. All Q4 2026 onward operating assumptions remain separately modeled.

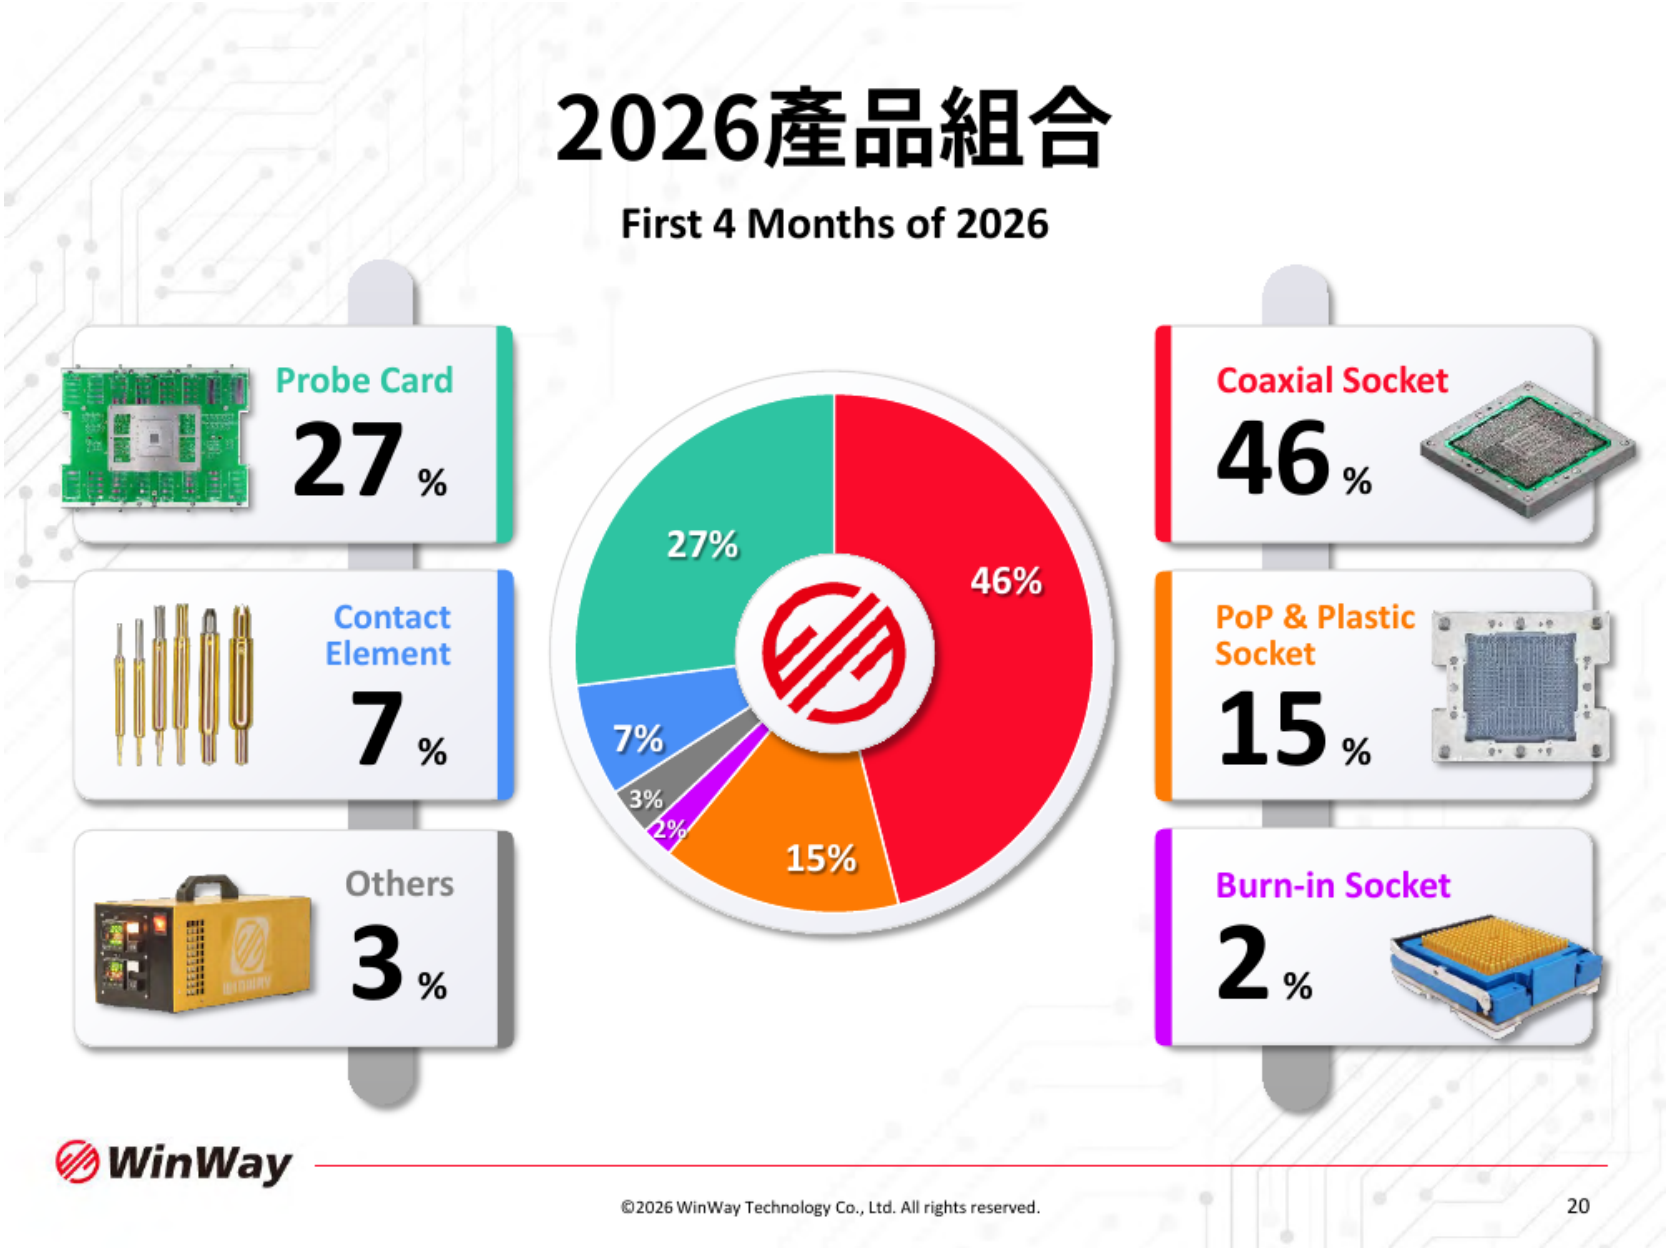

M1 | WinWay issuer monthly sales, accessed12 October2026. NTD thousands converted to NT$ billions; product mix and profits are not disclosed by this table.

Reported month	Revenue NT$ billions
July2026	1.600351

Reported month	Revenue NT$ billions
August2026	1.705663
September2026	1.250373
Q3 consolidated total	4.556387

Q2 socket revenue was NT$ 2.241447 bn and probe-card revenue NT$ 0.997107 bn. Product revenues are disclosed but product gross margins are not. The model calibrates a separate socket/contact/card/other margin allocation to reported Q2 GP, then explicitly costs the ramp. It does not assume every new MEMS dollar carries proprietary fabrication margins.

W3 | Issuer product mix, May 26 deck PDF p 21. Current quarterly financial product categories, rather than this older four-month mix alone, calibrate the model.

Consolidated result	Q1 2026 NT$ bn	Q2 2026 NT$ bn
Revenue	2.98	3.52
Gross profit	1.28	1.35
Operating expense	0.51	0.53
Operating profit	0.78	0.83
Net income	0.70	0.67

Capacity is measured in usable interfaces, with the factory date resolved

The May 26 roadmap showed spring-pin capacity of 6 m/month in H1 2026, 9 m in H2 and a 14 m target in H1 2027. Socket capacity was 3,300, 4,200 and 7,200 equivalent 5,000-pin sets/month respectively. These are management targets, not reported shipments or guaranteed good-unit yield.

The May 29 issuer groundbreaking announcement gives late-2027 completion and 2028 production for the new greenfield site. That later statement controls over the ambiguous Q2 2027 timing on the May 26 slide. Existing and leased facilities can still expand in 2027; the model does not credit the greenfield with full output a year early.

The reference socket capacity rises gradually to 6,600/month by Q4 2027, with a 60%-weighted increment toward 7,200. New-site capacity appears during 2028. Utilization, ASP per equivalent set and contribution costs are separate inputs. The forward ASP-equivalent remains an explicit calibration assumption with separate capacity and utilization drivers. Q3 product allocations use reported consolidated sales, without attributing the monthly difference to ASP or physical output.

Internal pin output is a constraint and a cost/quality lever. Adding its full manufacturing value to socket revenue would count the same product twice. Similarly, longer testing, more testers and capacity expansion describe related demand, not three independent volume multipliers.

W4 | Pin capacity roadmap, issuer May 26 PDF p 28. Targets require actual hiring, production yield and qualification.

W5 | Socket capacity roadmap, issuer May 26 PDF p 29. IMPORTANT: its greenfield timing is superseded by the May 29 announcement: completion late 2027, production in 2028. The capacity targets remain forward hypotheses, not achieved output.

MEMS and thermal content: a larger wallet, with supplier economics attached

Issuer FY2025 figures show MEMS rising from negligible probe-card mix early in the year to 90% in Q4, with 21% for the full year. That transition, plus Q2 2026 card growth, supports a further 55%-probability growth increment beyond the reference. It does not mean all MEMS IP belongs to WinWay.

Technoprobe's December 9, 2025 agreement is decisive: WinWay receives assembly, installation, maintenance, repair, selling and distribution rights for five years, while Technoprobe retains development/manufacturing and IP. The roughly USD60 m minimum is a supplier purchase commitment through MS SUN, not customer backlog. Product costs already include purchased content; the commitment is not subtracted a second time as capex.

Liquid-cooling sockets, thermal-control systems and higher-performance contacts can lift content per test configuration. A selective 6% premium at 35% probability applies only to eligible reference sockets/contact sales from 2027, with 35% incremental production/support costs and ordinary SG&A charged. There is no verified across-the-board hike.

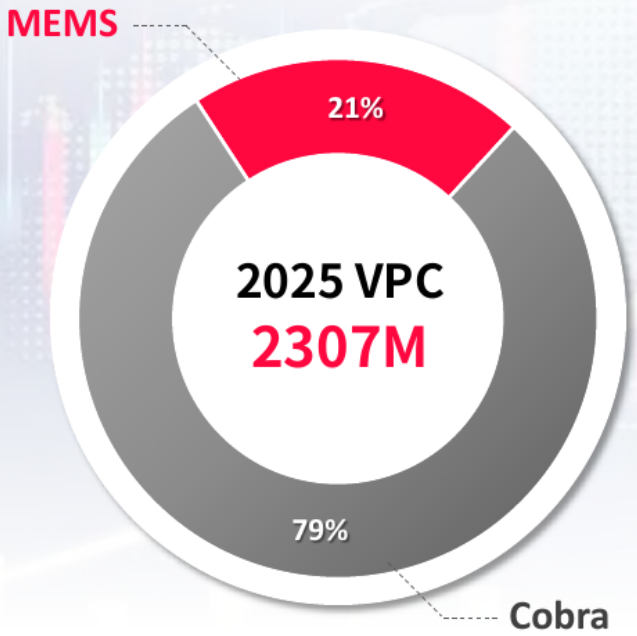

A separate 50%-probability learning outcome adds two GP points on reference sockets and three on reference cards after the reference's own recovery. It captures improved manufacturing yield/cost, not a duplicate price increase. The recent margin decline keeps the initial weight bounded.

W7 | Issuer product roadmap and capabilities. Technical specifications do not establish a universal design win or realized premium.

CPO/NPO is a paid-program option, not the entire optical TAM

WinWay's optical test coverage spans wafer/die, optical engine, double-sided package and module interfaces. Historical customer validation in June 2024 and the detailed May 2026 architecture are credible breadcrumbs. The August 2026 issuer discussion also highlights optical-engine fragmentation as an obstacle to volume production.

The active model assigns 35% probability to a bounded incremental program wallet: 20 paid programs at NT$ 10 m in 2027, 50 at NT$ 15 m in 2028, 100 at NT$ 20 m in 2029 and 150 at NT$ 25 m in 2030. These are explicit low-confidence unit-economics proxies, not company-reported customers or orders. A program is a distinct paid design/interface with deliveries; one customer can have multiple programs.

The 2027 contribution begins in H2. GP is 45%, with an extra 10% of revenue spent on optical qualification/R&D plus normal variable SG&A. Existing cards and sockets remain in the reference. This avoids adding all module revenue or the same generic AI growth again.

CPO pipeline and acceptance evidence

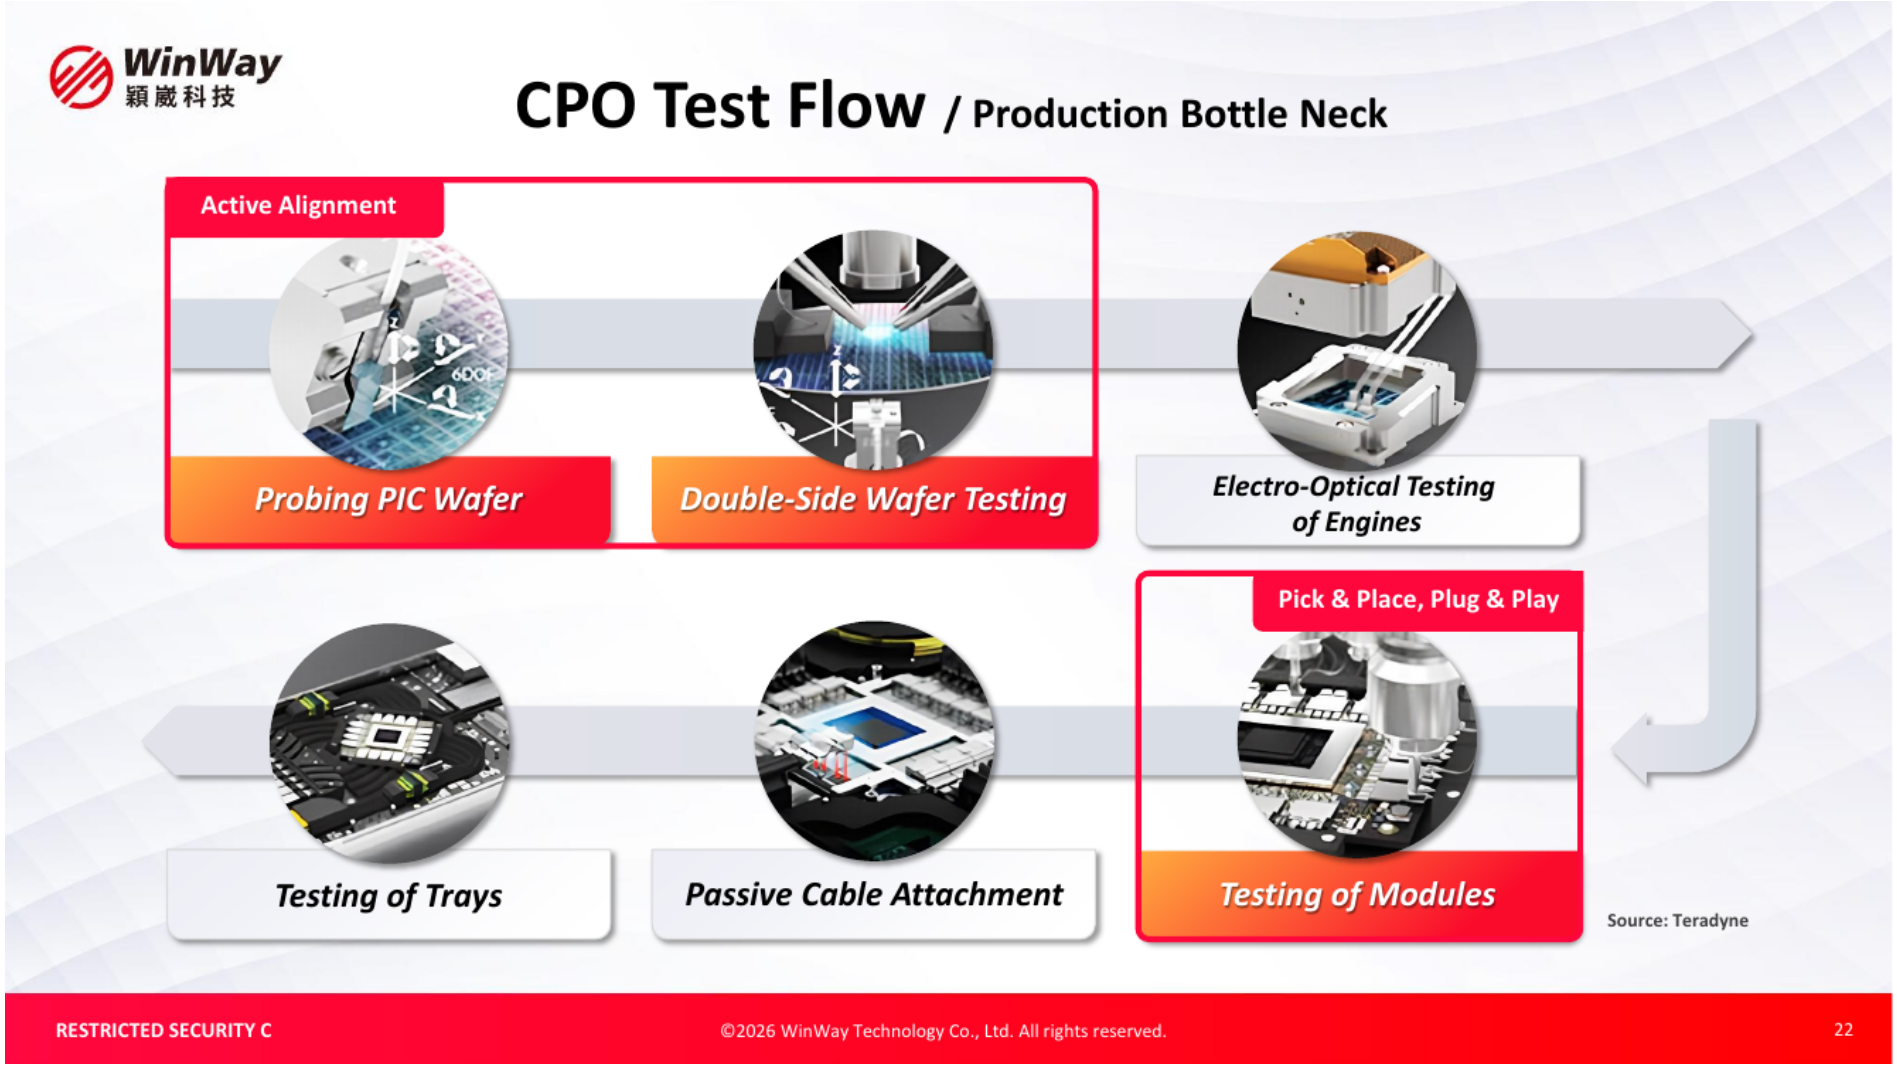

The September 2 direct management interview reports 10+ CPO projects in progress, with socket work at Insertions 3-4 and probe-card collaboration at Insertion 2. Management describes automation as the production bottleneck, with earliest initial small volumes in H2 2027 and possible larger volumes in 2028 or later. The October 12 report repeats ten projects and MSS trials. These are pipeline and qualification observations, not ten new paid programs or accepted invoices. [CPO_PIPE]

The same interview attributes a rise in standard lead time from 8 weeks to 13-14 weeks to larger AI packages, longer tests and more difficult production. It supports the existing 35%-probability selective-pricing case on new or repriceable configurations. Purchased content, qualification costs and fixed-price orders limit profit capture. This dated observation does not establish an independent new price increase.

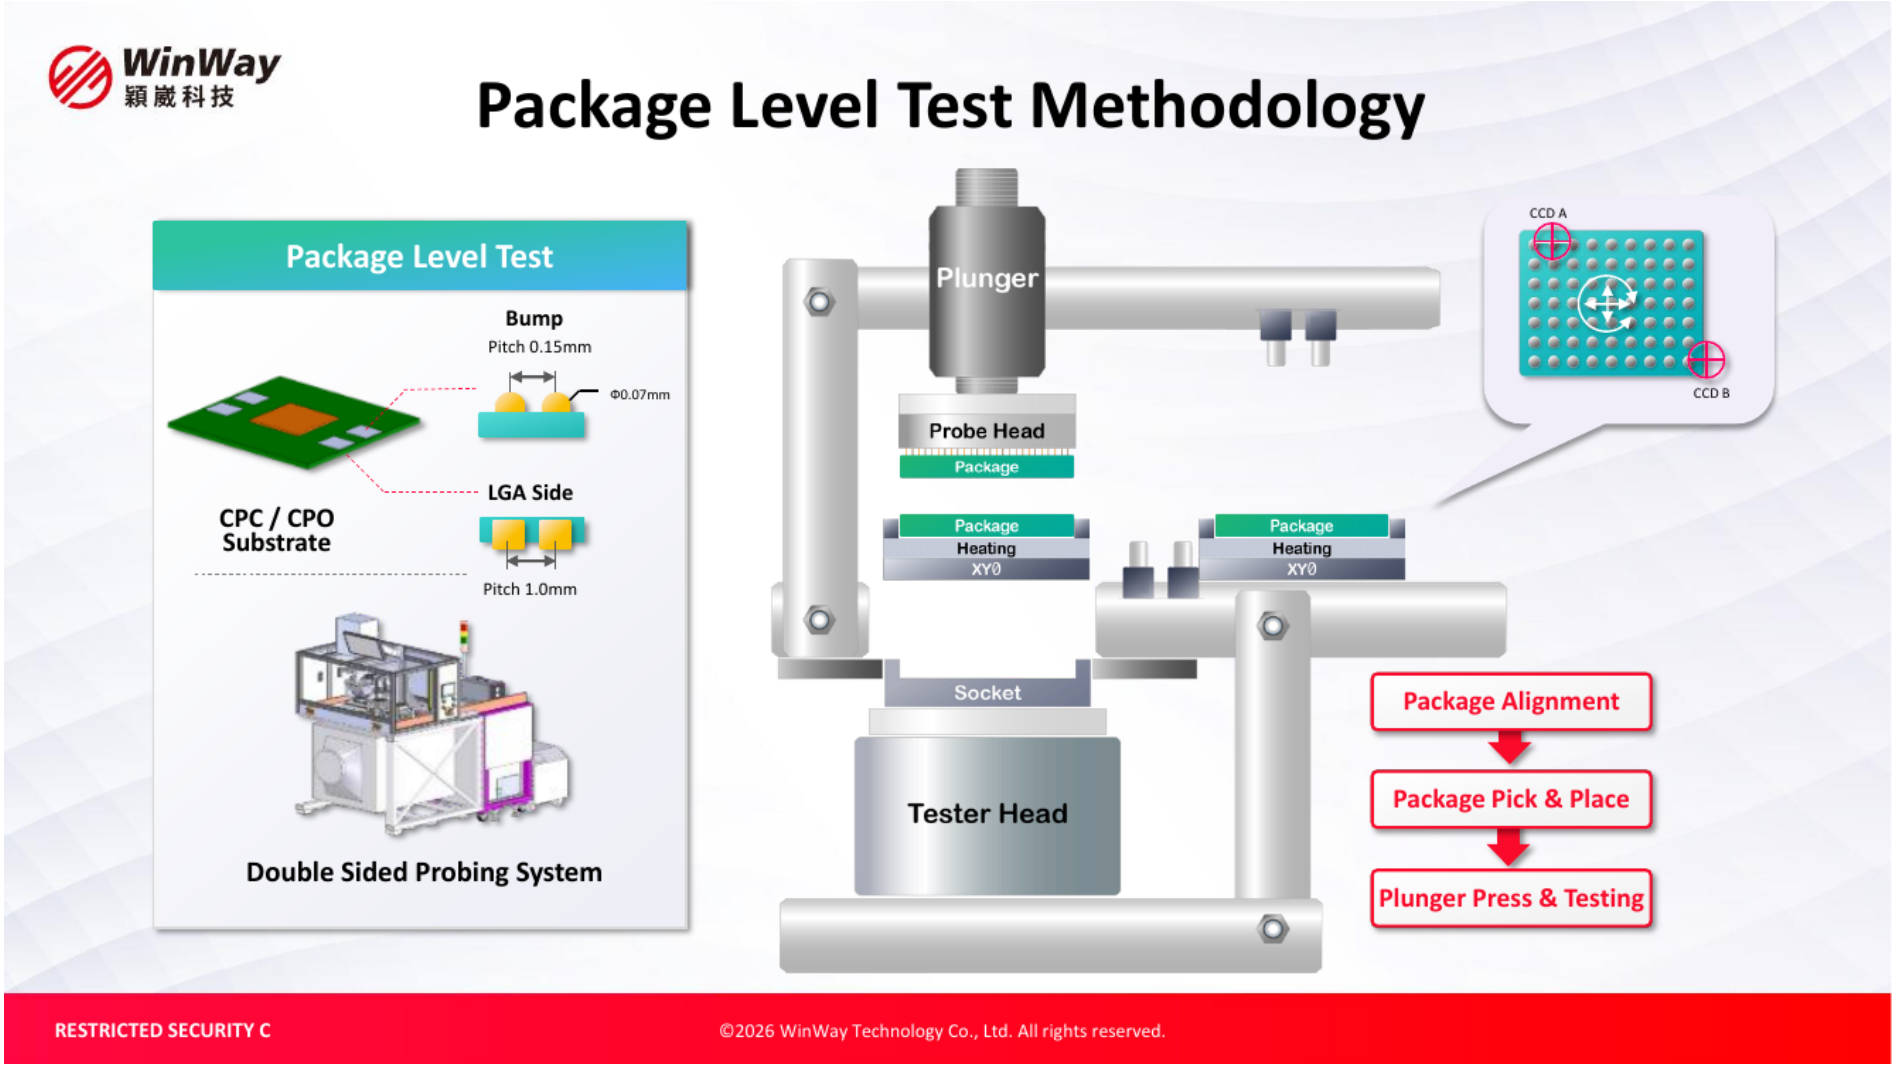

The optical branch remains at 35% probability: 20 paid programs x NT$10M in 2027 and 50 x NT$15M in 2028, phased into acceptance, with 45% GP less 10% dedicated qualification/R&D and 8% variable SG&A. Its expected 2027 sales are NT$70M and operating contribution NT$18.9M. A bounded probe of 0-10 additional 2027 programs would imply NT$0-100M conditional sales and NT$0-27M conditional OP before weighting. The observed ten projects occupy the same pipeline category and fit within the existing 20-program conditional build. No separately paid scope or acceleration is identified above that path. This source adds zero further revenue or OP while retaining the existing 35% realization outcome. Paid program scope, accepted deliveries and incremental interface content would reopen that decision.

A forward stress applying the 9.084583862847% current-quarter allocation shortfall to future product sales is a diagnostic only. It cannot identify lost customers, delayed deliveries, product mix or the 2027 acceptance cohort. The active capacity, pricing, CPO and yield branches keep their existing quarterly paths. Obtain product mix, paid orders, delivery and acceptance timing, and Q3 margin evidence before selecting a forward effect.

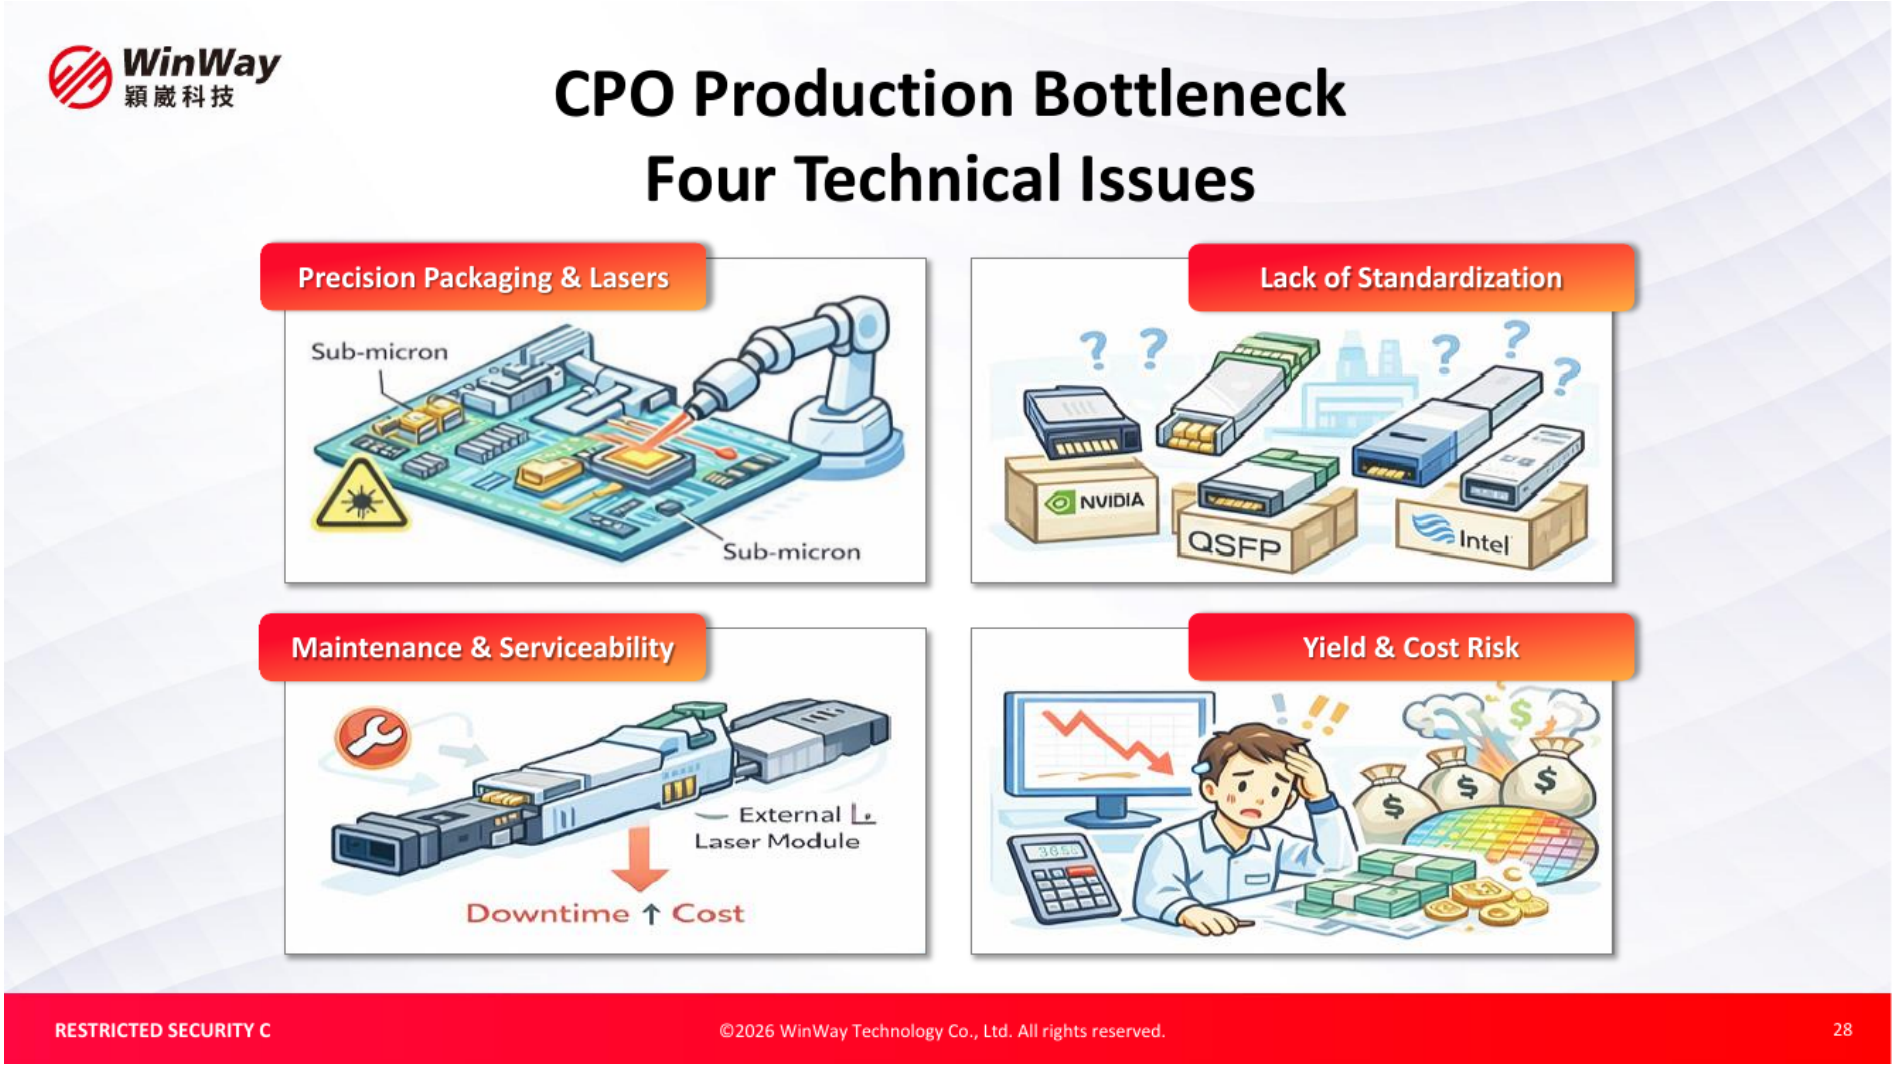

Lumentum's supplied 2027 laser-fulfillment comment supports the urgency of qualification and test but can also delay optical assemblies. It supplies no WinWay award or program count. It is treated jointly with the CPO timing/realization uncertainty, not as a second additive TAM shock.

W8 | Technical test flow spanning multiple optical production stages, issuer CPO forum May 14 PDF p 23. Slide credits underlying industry architecture; no exclusive WinWay capture follows.

W9 | Double-sided electro-optical probing, issuer PDF p 34. Technical capability is relevant to program qualification; production volumes remain modeled.

W10 | Issuer's own CPO manufacturing constraints, PDF p 29. Fragmentation, serviceability, yield and standards can defer revenue even when end-market demand is large.

Demand calibration and financing must agree with the capacity story

The direct demand bridge is available at product level: all four FY2025 categories sum exactly to NT$ 7.857179 bn, and Q2 2026 categories sum to NT$ 3.523235 bn. A customer-by-customer capex bridge is not publicly observable: the largest FY2025 customer is unnamed and represented 32.15% of revenue; the three disclosed large customers accounted for 54.32%. No hyperscaler name is assigned to those anonymized customers.

The forward capacity, utilization, ASP and probe-growth paths retain their dated calibration assumptions. Reported Q3 consolidated sales are applied to the current-quarter product allocation only. A single aggregate quarter does not identify product mix, paid acceptance, shipment deferral or the qualified 2027 customer cohort. The 2027 reference already incorporates fast AI expansion, so ledger increments are residuals rather than whole-market additions.

H1 cash plus unrestricted deposits was NT$ 6.883929 bn, supported in part by convertible financing. The NT$ 1.787462 bn dividend was paid August 18. H1 CFO of NT$ 1.024552 bn minus cash capex/prepayments of NT$ 0.653526 bn left NT$ 0.371026 bn. Strong accounting profit does not eliminate funding needs for inventory, receivables and the new facility.

The forecast uses an all-converted denominator of 36.887831480 m shares before a modeled annual 1% reserve. The remaining June bond face divided by the adjusted conversion price is added to the latest register; subsequent conversions could overlap that proxy. Already-issued restricted stock is not added again. No convertible debt deduction is made alongside the converted share count.

The announced NT$ 3.49 bn industrial-park investment covers a joint development with other participants; it is not automatically all WinWay capex. The cash model uses explicit reserves, ordinary operating working capital and dividends. Minimum supplier purchases remain in cost of goods, rather than being treated as customer cash deposits.

What can invalidate the thesis - and what to monitor next

Risk point 1: customer concentration and program transitions. A lost large design can matter more than the number of smaller accounts. The named Credo supplier award confirms a relationship, not a quantified future revenue allocation.

Risk point 2: execution and working capital. Qualified good output may lag nominal capacity; greenfield timing, hiring, collections and yield must be observed together. Reference utilization is not a reported utilization rate.

Risk point 3: supplier dependence, competition and margin capture. Technoprobe retains key technology, while Cohu, Smiths Interconnect and MPI cover relevant competing interfaces/probes. Growth can accrue to an upstream partner or to customer efficiency rather than entirely to WinWay.

Risk point 4: unresolved IP/trade-secret litigation with MPI. The filing describes claims including NT$ 158.91 m, NT$ 200 m and NT$ 38.25 m. They are not summed into an assumed final liability or dismissed as zero; resolution and any operational injunction risk would change the model.

Cross-book: Chroma and other ATE suppliers can signal tester investment; AI chip makers and assembly/test companies signal complexity and qualifications. Technoprobe merits a separate supplier-economics screen, but this request creates only the three named positions. Next tests: Q3 product mix, reported GP/OP and cash, delivery-versus-acceptance timing, H1 2027 pin/socket targets, and 2028 factory qualification.

Reported calibration and model bridge

All four disclosed product revenues reconcile. Product GMs are unreported: use contact 45%, cards 30%, other 40%; socket residual 41.386432514% exactly reproduces Q2 GP. The retained forward socket ASP-equivalent is 281,162.17NT$/5000-pin set, with capacity and utilization modeled independently. Q3 allocation uses a consolidated-sales realization factor of0.909154161372. This factor matches aggregate reported sales without claiming a known price, volume, yield or acceptance cause. FY25 product sales 4.401474+.816958+2.306741+.332006 = 7.857179 bn.

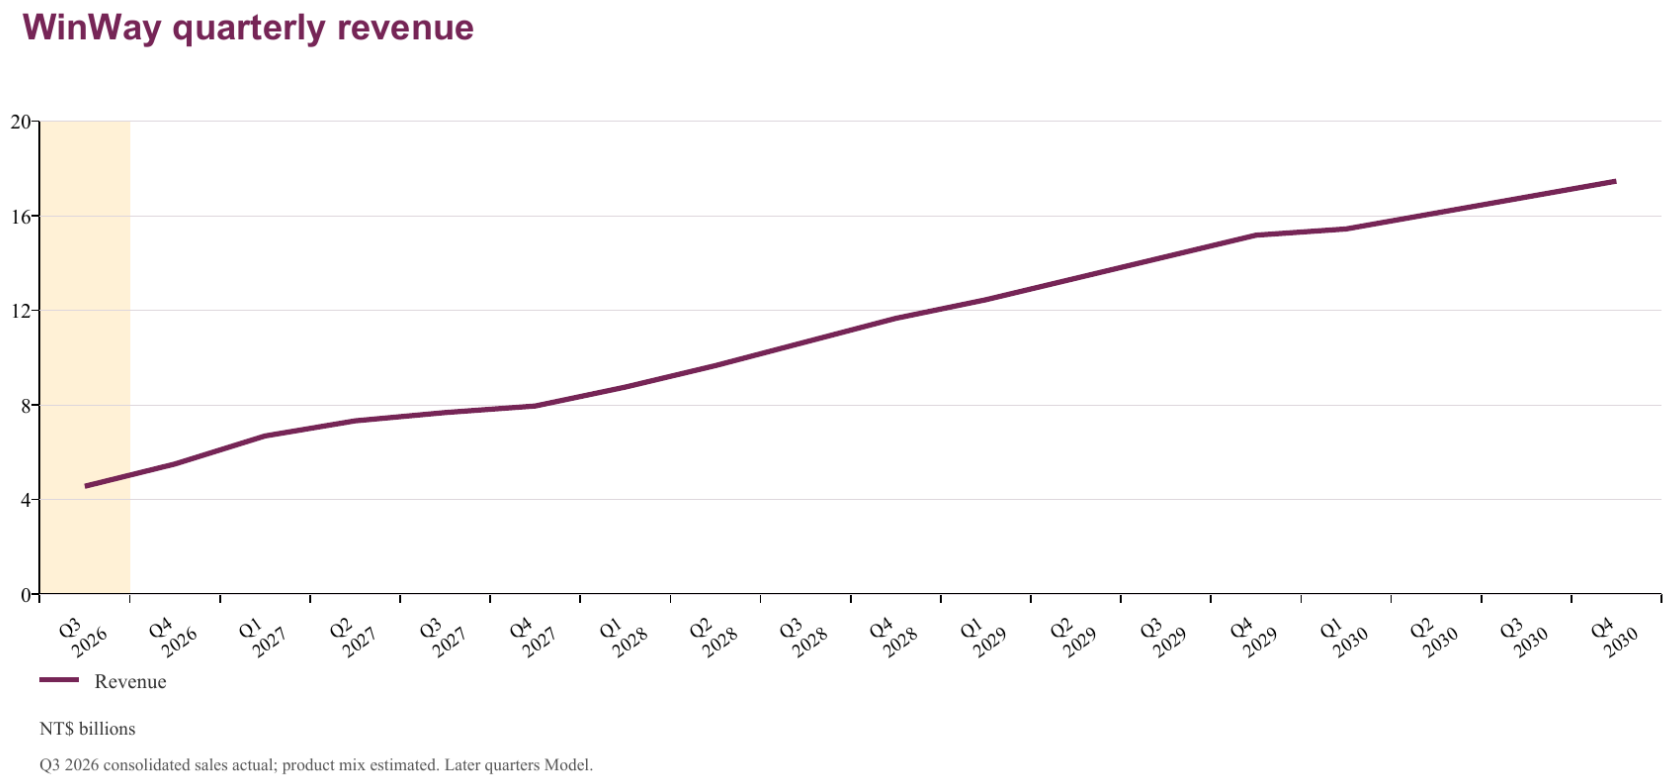

Metric	Reported	Reconstructed	Period
REVENUE	3.52	3.52	Q2 2026
GP	1.35	1.35	Q2 2026

Reported period	Revenue	Gross profit	SG&A / opex	Operating profit	Net income
2025 Q3	1.80	0.76	0.35	0.41	0.37
2025 Q4	2.23	0.93	0.46	0.47	0.48
2026 Q1	2.98	1.28	0.51	0.78	0.70
2026 Q2	3.52	1.35	0.53	0.83	0.67

Reported calibration is distinct from the forward probability-weighted model. Units: NT$ billions.

Quarterly product revenue: 18-quarter model

Status: Q3 2026 consolidated revenue is Actual from issuer monthly sales; its product mix, GP, OP and cash are Model. Every Q4 2026 onward row is Model. No monthly revenue disclosure establishes a quarterly reported margin.

Source: analyst operating model, research cut 2026-10-12. NT$ billions.

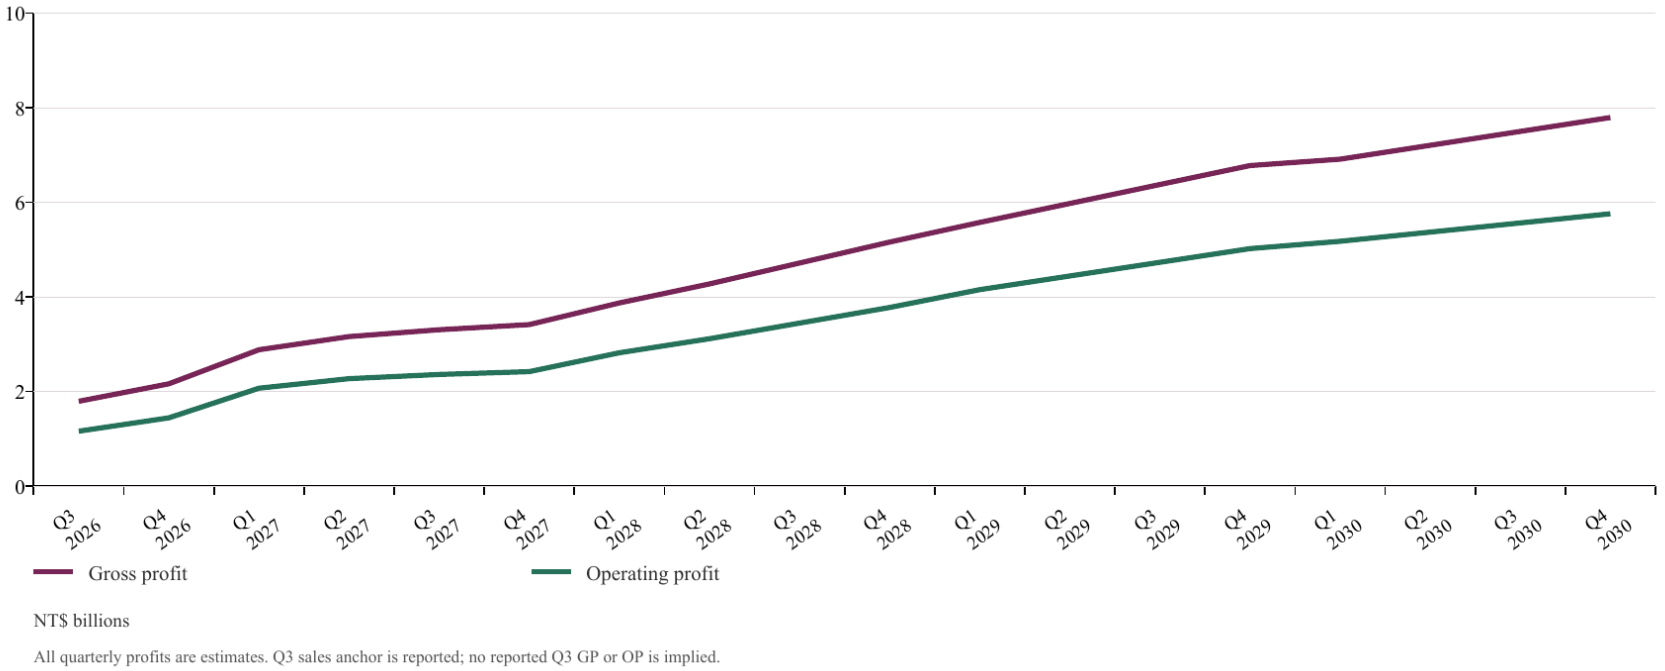

The highlighted quarter is the active valuation start. Revenue equals the reference path plus probability-weighted incremental outcomes. The final three quarters support earlier forward-four-quarter windows.

Per-quarter operating ceiling derivation

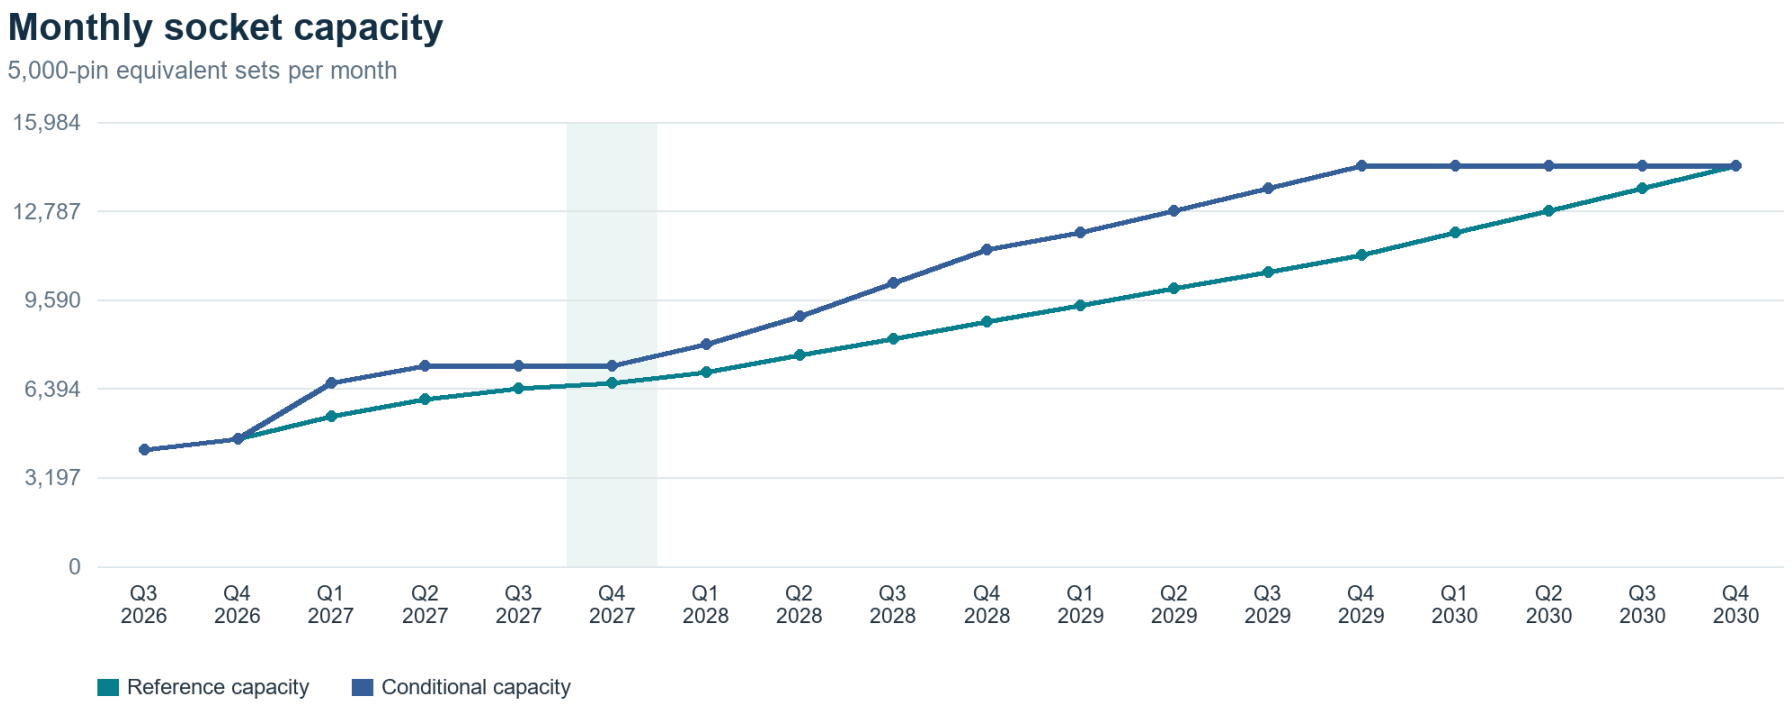

Quarterly OP figures below are model estimates in NT$ billions. The 1000 factor converts billions into millions to match the diluted-share denominator. Every target uses 20x and its own maximum same-window shares.

- Q3 2026: (1.159337240 + 1.441497842 + 2.068494685 + 2.270241377) x20 x1000 / 37.256709795 = TWD3,725.273210. Window: Q3 2026 - Q2 2027.

- Q1 2030: (5.175253271 + 5.369380952 + 5.563508632 + 5.757636313) x20 x1000 / 38.385625359 = TWD11,392.691386. Window: Q1 2030 - Q4 2030.

Latest registered shares 36.444782 m plus all remaining June 30 CB faceNT$ 1,559.8 m / current conversionNT$ 3,520.6 = 0.443049480 m, total 36.887831480 m. This is a conservative all-converted proxy: it can overstate dilution if later conversions are already in the current register. It does not add the already-issued 288k restricted shares again. Add 1% annual award/funding reserve from 2027 (assumption). Use maximum in each forward-four-quarter window. No split evidenced.

Operating drivers: source anchors and model inputs

Source: analyst operating model, research cut 2026-10-12. 5,000-pin equivalent sets per month.

Modeled reference socket revenue = monthly capacity x 3 months x utilization x ASP-equivalent / 1 billion. Q3 2026 alone also uses the consolidated-sales allocation factor shown below. The conditional capacity path is an unweighted outcome; the CAPACITY ledger applies its probability to the incremental revenue. ASP-equivalent is a calibration input, not an issuer quoted selling price.

Modeled quarter	Reference sets/month	Conditional sets/month	Utilization	ASP-equivalent NT$/set	Revenue realization
Q3 2026	4,200	4,200	90.0%	281,162.17	0.909154161

Annual reference assumptions before probability increments

The reference path is the starting scenario, before any probability-weighted ledger increment. These are full annual reference assumptions as supplied by the model; the final fiscal year may only be partly present in the 18-quarter operating schedule.

Reference product revenue - NT$ billions

Product	CY 2027	CY 2028	CY 2029	CY 2030
Test sockets	17.494	23.925	32.540	42.536
Contact elements	1.334	1.574	1.811	2.028
Probe cards	7.659	9.957	12.446	14.935
Other / new optical test	0.584	0.701	0.806	0.903

Reference product gross-margin assumptions

Product	CY 2027	CY 2028	CY 2029	CY 2030
Test sockets	46.0%	47.0%	47.0%	46.5%
Contact elements	45.0%	45.5%	46.0%	46.0%
Probe cards	32.0%	33.5%	34.5%	35.0%
Other / new optical test	40.0%	42.0%	43.0%	44.0%

Reference fixed and variable SG&A assumptions

Reference year	Fixed SG&A (NT$ billions)	Variable SG&A / revenue
CY 2027	1.266	8.0%
CY 2028	1.582	8.0%
CY 2029	1.867	8.0%
CY 2030	2.147	8.0%

Annual product totals and cost structure

Annual totals cover the quarters present in the 18-quarter model. A period marked fewer than four quarters is partial; it is not a full-year forecast.

Period / quarters	Test sockets	Contact elements	Probe cards	Other / new optical test	Revenue
CY 2026 / 2	6.39	0.56	2.85	0.26	10.05
CY 2027 / 4	19.35	1.35	8.28	0.65	29.63
CY 2028 / 4	27.41	1.59	10.77	0.96	40.73
CY 2029 / 4	38.45	1.83	13.46	1.51	55.24
CY 2030 / 4	45.39	2.05	16.15	2.22	65.81

Period	Revenue	Gross profit	COGS	SG&A / opex	Operating profit	GM	OP margin
CY 2026	10.05	3.95	6.10	1.35	2.60	39.3%	25.9%
CY 2027	29.63	12.76	16.87	3.64	9.12	43.1%	30.8%

Period	Revenue	Gross profit	COGS	SG&A / opex	Operating profit	GM	OP margin
CY 2028	40.73	18.02	22.71	4.87	13.15	44.2%	32.3%
CY 2029	55.24	24.70	30.54	6.36	18.35	44.7%	33.2%
CY 2030	65.81	29.41	36.40	7.54	21.87	44.7%	33.2%

Product assumption provenance

Product	Source / model basis	Confidence
Test sockets	Consolidated revenue note Q2FS pp 24-28; IR_MAY capacities and mix; future utilization/product margins are proxies	HIGH reported / MEDIUM capacity ramp / LOW new-product contribution
Contact elements	Consolidated revenue note Q2FS pp 24-28; IR_MAY capacities and mix; future utilization/product margins are proxies	HIGH reported / MEDIUM capacity ramp / LOW new-product contribution
Probe cards	Consolidated revenue note Q2FS pp 24-28; IR_MAY capacities and mix; future utilization/product margins are proxies	HIGH reported / MEDIUM capacity ramp / LOW new-product contribution
Other / new optical test	Consolidated revenue note Q2FS pp 24-28; IR_MAY capacities and mix; future utilization/product margins are proxies	HIGH reported / MEDIUM capacity ramp / LOW new-product contribution

Probability ledger: conditional outcomes

Each probability applies once to the specified incremental outcome above its reference path. These are analyst judgments, not issuer guidance. Positive and negative interactions remain governed by each stated overlap rule.

ID / outcome	Probability	Active-window incremental revenue	Active-window incremental OP
CAPACITY - Qualified socket capacity reaches more of the roadmap sooner	60.0%	2.257	0.835
MEMS - MEMS probe-card demand outgrows the reference	55.0%	0.759	0.205
PRICE - Urgency and complex new configurations support selective premiums	35.0%	0.293	0.167
LEARNING - In-house pins and manufacturing learning lift existing-product yields	50.0%	0.000	0.360

ID / outcome	Probability	Active-window incremental revenue	Active-window incremental OP
CPO_NPO - Optical-engine test-interface programs become incremental revenue	35.0%	0.231	0.062

Active window: Q4 2027 - Q3 2028. Units: NT$ billions. Incremental OP includes variable operating expense and any dedicated incremental expense.

CAPACITY | Qualified socket capacity reaches more of the roadmap sooner

Assigned probability: 60.0% | 2026-10-02 research cut

Evidence

May 26 targets 4200→7200 sets/month; pins 9 m→14 m/month; actual strong July/Aug revenue. May 29 greenfield release says 2028production.

Reference path

Product references, capacity/utilization and product-specific costs below.

Conditional outcome

Reference capacity 5.4/6.0/6.4/6.6k/month in 2027; conditional 6.6/7.2/7.2/7.2k. In 2028 reference 7.0/7.6/8.2/8.8k versus conditional 8.0/9.0/10.2/11.4k. Same utilization and ASP; later caps in driver table. Incremental GP 45% before 8% variable SG&A.

Probability rationale

60% that more qualified saleable capacity is reached, reflecting actual momentum and specific issuer targets; factory date conflict and hiring/yields prevent higher weight.

Overlap control

Reference already ramps sockets and existing/leased facilities. Greenfield adds capacity only from 2028. Pin supply is an internal socket constraint, not an additional independent finished-product revenue stream.

Revision trigger

Raise to 75% after achieved pin/socket capacity and customer acceptance; reduce to 30% on two-quarter delay or capex/yield issues. No 2027 greenfield attribution.

Probability-weighted quarterly effect

Quarter	Incremental revenue	Incremental GP	Incremental OP
Q3 2026	0.000	0.000	0.000
Q4 2026	0.000	0.000	0.000
Q1 2027	0.516	0.232	0.191
Q2 2027	0.516	0.232	0.191
Q3 2027	0.344	0.155	0.127
Q4 2027	0.258	0.116	0.095
Q1 2028	0.454	0.204	0.168
Q2 2028	0.636	0.286	0.235
Q3 2028	0.909	0.409	0.336
Q4 2028	1.181	0.531	0.437
Q1 2029	1.232	0.554	0.456
Q2 2029	1.327	0.597	0.491

Q4 2030	0.000	0.000	0.000

MEMS | MEMS probe-card demand outgrows the reference

Assigned probability: 55.0% | 2026-10-02 research cut

Evidence

Q2 card sales 0.997107 bn,31% QoQ; FY25 Q4 MEMS90% of cards per issuer; Technoprobe contract enables route.

Reference path

Product references, capacity/utilization and product-specific costs below.

Conditional outcome

Reference 2027 probe revenue grows35% versus the retained annualized calibration base. Conditional55% growth uses20pp extra on that same dated base, then30/25/20% further growth. The current Q3 sales allocation is not fed mechanically into later-quarter capacity or this separate forward cohort. Incremental GP 35% reflecting bought-in technology, plus 8% variable SG&A.

Probability rationale

55% for additional probe growth beyond the already fast reference; demand and technical access are real, purchased content and customer concentration constrain the scale.

Overlap control

Reference already includes MEMS ramp. The$60 m supplier minimum is not customer backlog or incremental sales. Extra share/volume is distinct from socket-capacity signal.

Revision trigger

Raise after repeated design-in/volume evidence; lower to 30% if supplier economics, warranty or customer insourcing erode value capture.

Probability-weighted quarterly effect

Quarter	Incremental revenue	Incremental GP	Incremental OP

PRICE | Urgency and complex new configurations support selective premiums

Assigned probability: 35.0% | 2026-10-02 research cut

Evidence

May 26 management visibility 5-6months; July 2 company pricing comments emphasize design complexity/partnerships.

Reference path

Product references, capacity/utilization and product-specific costs below.

Conditional outcome

One-time 6% premium on 60% of reference sockets and 50% of reference contact revenue, from 2027 only.35% incremental production/support costs plus 8% general SG&A; no annual compounding.

Probability rationale

35% on net realized premium; no public company-wide hike is asserted and booking visibility is not a guaranteed delivery lead time.

Overlap control

Applies only to reference volume, not capacity/MEMS/CPO added revenue. The 2% annual ASP drift from 2028 is ordinary mix; this premium represents negotiated new configurations above that.

Revision trigger

Raise after demonstrated new-order ASP/margin realization; lower to 15% if contracts remain fixed or expedite/thermal costs absorb value.

Probability-weighted quarterly effect

LEARNING | In-house pins and manufacturing learning lift existing-product yields

Assigned probability: 50.0% | 2026-10-02 research cut

Evidence

Issuer describes scaling costs behind Q2 margin decline; specific pin capacity expansion and manufacturing investment.

Reference path

Product references, capacity/utilization and product-specific costs below.

Conditional outcome

Starting 2027, conditional GP improvement on reference sockets 2pp and reference probe cards 3pp;50% weight. No incremental revenue and no benefit applied to other weighted growth.

Probability rationale

50% that manufacturing learning delivers the extra net cost improvement; recent gross-margin compression argues against assuming full realization.

Overlap control

Reference already recovers socketGM to 46% and cardGM 32% in 2027 from Q2-calibrated levels. This is a further bounded good-unit-yield/cost-reduction outcome, not a price increase.

Revision trigger

Raise after two quarters of volume plus GP recovery with stable mix; reduce to 20% if lower-yield MEMS dominates or bought-in costs rise.

Probability-weighted quarterly effect

Quarter	Incremental revenue	Incremental GP	Incremental OP

CPO_NPO | Optical-engine test-interface programs become incremental revenue

Assigned probability: 35.0% | 2026-10-02 research cut

Evidence

2024 customer validation; May 14 technical flow and Aug 19 fragmentation discussion. No quantified 2026 production orders.

Reference path

Product references, capacity/utilization and product-specific costs below.

Conditional outcome

Conditional new annual programs:2027 twenty atNT$ 10 m = 0.2 bn;2028 fifty atNT$ 15 m = 0.75 bn;2029 one hundred atNT$ 20 m = 2 bn;2030 one hundred fifty atNT$ 25 m = 3.75 bn. Program = distinct paid interface/design and related deliveries, not named customer count. GP 45%, extra qualification/R&D 10% plus 8% general SG&A.2027 begins H2.

Probability rationale

35% on this LOW-confidence program-scale proxy; real capability and customer validation support nonzero weight, but architecture standardization and production timing are unresolved.

Overlap control

Existing wafer-test cards and sockets stay in core. Only new optical-specific program wallet is added toOther. Module/engine TAM is not WinWay revenue; source 2024validation is not a 2026newaward.

Revision trigger

Raise on paid optical-program scope and acceptance, lower to 15% if fragmentation delays production or interface content is absorbed by incumbent systems.

Probability-weighted quarterly effect

Planning cash bridge: first ten quarters

June cash plus unrestricted time deposits 6.883929 bn. August dividend 1.787462 bn is deducted once in Q3. No bank loans; CB carrying 1.477475 bn and leases 0.094429 bn. Ceiling uses an all-converted share proxy and makes no debt deduction. Cash model assumes conversion and zero cash coupon (issuer CB coupon 0%); effective accounting interest is not a cash coupon and is below OP. Opening NWC3.902190 bn and future 30% of annualized quarter sales are planning proxies, not reported subtotals. Capex 0.8 bn H2,2.4 bn 2027,2.8 bn 2028 and 2.6 bn thereafter are reserves, not the entire jointly announced 3.49 bn park spend. Supplier purchases are in product COGS; do not subtract the$60 m minimum again as capex.

Quarter	Opening cash	OP	D&A	Interest	Cash tax	NWC change	CFO

Planning identities: CFO = OP + D&A - interest - cash tax - change in operating NWC. Ending cash = opening cash + CFO - capex - dividend. Financing and other items are included only when explicitly described in the supplied model. Units: NT$ billions.

Framework score: complete summing table

Dimension	Awarded	Maximum	Scoring rationale
Core thesis	17	20	High-speed/high-pin-count qualification and thermal IP create real friction; purchased MEMS technology and competitors prevent monopoly status.
Cycle stage	9	10	AI interface demand is already growing fast; new optical test is an earlier extension.
TAM expansion	8	10	Larger packages, longer tests and optical insertions raise content, bounded by capacity and supplier economics.
Catalysts	4	5	Q3 product mix, profit and cash, H1 2027 capacity target and 2028 greenfield acceptance.
Macro	9	10	AI/HPC and advanced packaging demand support test intensity; efficiency/substitution can offset tool count.
Alpha	4	5	Actual capacity timing, supplier-IP terms and dilution matter more than broad CPO labels.
Risks	-4	0	-1 customer concentration; -1 capacity/working-capital execution; -1 supplier dependence/competition and margin capture; -1 unresolved IP/trade-secret litigation.
Total points	47	60	Base = round(total points / 60 x 100)
Base score	78	100	Risk deductions are included in the total.
