8046.TW | Taiwan Stock Exchange | updated 2026-10-12

Q4 2027 model ceiling: TWD 897.40

Analytical Base 44/60 = 73 | Watchlist

20x Q+next 3 modeled IFRS operating profit, less matched net financial and pension claims, divided by common diluted shares at the end of the same forward window.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

Snapshot: TWD 1,480.00 on 2026-10-07 close. Model diluted shares at Q3 2026: 646.176m. Indicative diluted capitalization: TWD 956,340.5m. Quote and share dates/bases may differ; legal shares are reconciled in the analysis.

All operating values are in TWD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP TWD M	Multiple	Matched claims TWD M	Shares M	Ceiling TWD
Q4 2027	Q4 2027 throughQ3 2028	30,291.164173	20x	25,942.661110	646.176	897.403528

The model adds probability-weighted operating deltas to reference profit. Full conditional cash paths separately determine borrowing reserves above the matched reference, with a zero floor and no surplus cash credit. Common-share value equals 20x forward-four-quarter operating profit less matched financial and pension claims, divided by end-window diluted shares. The earlier isolated October 7 sales overlay retains its frozen claims treatment.

October 12 update: ABF scarcity, with product scope and overlap retained

The Q4 2027 ceiling rises from TWD 875.8869238251028 to TWD 897.4035283769781, a +2.456550493745202% revision. The earnings window remains Q4 2027 through Q3 2028. Excel Base 73, artifact analytical Base 73, the 20x operating-profit method and 646.176M diluted shares are unchanged. The TWD 1,480 October 7 quote is a historical snapshot: this model ceiling remains below that quote, not positive upside from a fresh market price.

The full original TrendForce Weekly Radar 005 chart, published October 12, retains the earlier October 5 ABF forecast: very tight 48-56 week lead times versus 12 weeks balanced, and 10-15% sequential price increases from Q3 2026 through Q4 2027. The chart is an industry forecast, not Nan Ya PCB contract guidance. The

October 12 repetition is the same underlying pricing event, not another independent demand shock. The delivered X image was a crop; the full publisher chart below was retrieved and inspected independently. [NY-TF-ABF]

The model already contains substantial reference growth, a 13% cumulative content/ASP proxy and a 35% pricing branch on 35% of reference networking plus AI/HPC sales. That application pool is not disclosed ABF revenue. The revised branch preserves its probability and eligible application share, adds only a 60% ABF-exposure proxy inside that share, and captures 50% of the residual industry price level after the old conditional premium. The 60% scope and 50% overlap reserve have different denominators. Neither applies to all company sales, fixed-price backlog, conventional products or new-factory branch output.

For 2027, use the lower 10% industry step, anchored at the original Q3 2026 index: the industry levels are 21%,33.1%,46.41% and 61.051% above that index. Existing conditional premiums of 4%,6%,8% and 10% are subtracted before the extra scope/residual capture. The new blended premiums on the eligible cohort are 9.1%,14.13%,19.523% and 25.3153%. This is a numerical 35% joint pricing-realization case, not certainty about undisclosed invoices. No new physical area, units or demand multiplier is added.

Q4 2026 receives zero extra ABF increment. Its prior 2% premium and the already applied 15-19% sequential sales overlay remain. The small residual price case would overlap that same quarter's sales outcome. For 2028, the old 12% premium remains and only the residual extension fades by 87.5%,75%,62.5% and 50%; that fade is model judgment because the source forecast stops at Q4 2027. The resulting blended premiums are 24.8758875%,23.036475%,21.1970625% and 19.35765%. All 2029-2030 operating premiums, quantities and other branches are unchanged.

The retained cost bridge consumes 35% of extra price revenue in manufacturing/input costs and 3% in selling, administration and support. Thus 62% reaches operating profit; production depreciation remains in reference margins. The revised pricing path is also run through 25% cash tax, the retained dividend policy,90% working-capital funding on positive sequential sales, the full TWD 46.8B factory programme plus maintenance investment, customer-advance depletion, leases and 3.5% debt interest. A revenue premium is not a free cash-value credit.

SemiAnalysis's October 12 thread explains that Japanese substrate data use value per square meter while Taiwanese data use value per piece. Bigger substrates can lift invoice ASP without equal like-for-like price growth; complexity, layers and yields can also absorb the selling-price benefit. Its saved text was read; the mapped source charts were still missing at this preparation checkpoint, so their numerical curves are not treated as independently validated. This supports the 60% product-scope proxy and 50% residual reserve, rather than a second area or yield shock. [NY-SA-DENOMINATOR]

The active four-quarter increment is TWD 695.1756731456262 M of operating profit. Active matched financial/pension claims stay TWD 25,942.661110390298M. The full conditional pricing path needs less peak borrowing, from TWD 24,161.070563644003 M to TWD 23,484.113222014414M, but it does not release a valuation credit below the reference borrowing reserve. Missing inputs remain actual ABF mix, renewal eligibility, customer timing, like-for-like pricing, qualified throughput and retained margin. Revisit those inputs rather than adding a second scarcity multiplier.

Item	Status	Current Lead Time	Balanced Lead Time	Quick Take
CPU	Tight	25–30W	16–20W	Despite the continued expansion of server CPU supply across both mainstream and new platforms, customer orders remain difficult to fulfill.
GPU	Balanced	30-40W	30-40W	NVIDIA and AMD are expected to be shipping mainly Blackwell and MI350, respectively, while their next-generation Rubin and MI450 AI server systems still need time for tuning.
DRAM	Very Tight	20W	8W	PC OEMs' limited ability to absorb the 4Q26 contract price increases is prompting DRAM suppliers to reallocate bit supply from PC DRAM toward server DRAM, primarily to meet demand from US CSPs.
NAND (eSSD)	Tight	16W	8W	As with HDDs, CSPs are looking to secure eSSD supply through 2027. Lead times for eSSDs remain elevated.
HDD	Very Tight	50W	16W	CSPs remain eager to lock in supply with HDD vendors. Lead times show no signs of shortening through 2027.
ABF	Very Tight	48–56W	12W	Capacity additions for ABF substrates are lagging well behind fast-growing demand, which leaves little room for the shortage to ease in the near term. We expect sequential price increases of 10–15% per quarter from 3Q26 through 4Q27.
MLCC	Tight	35W	12W	Smartphone and notebook ODMs are slowing their MLCC inventory build. Consumer-grade MLCC demand is diverging: weak for low-capacitance products, strong for high-capacitance ones.

Status key

Very Tight = severe shortage **Tight** = constrained supply **Tightening** = conditions worsening

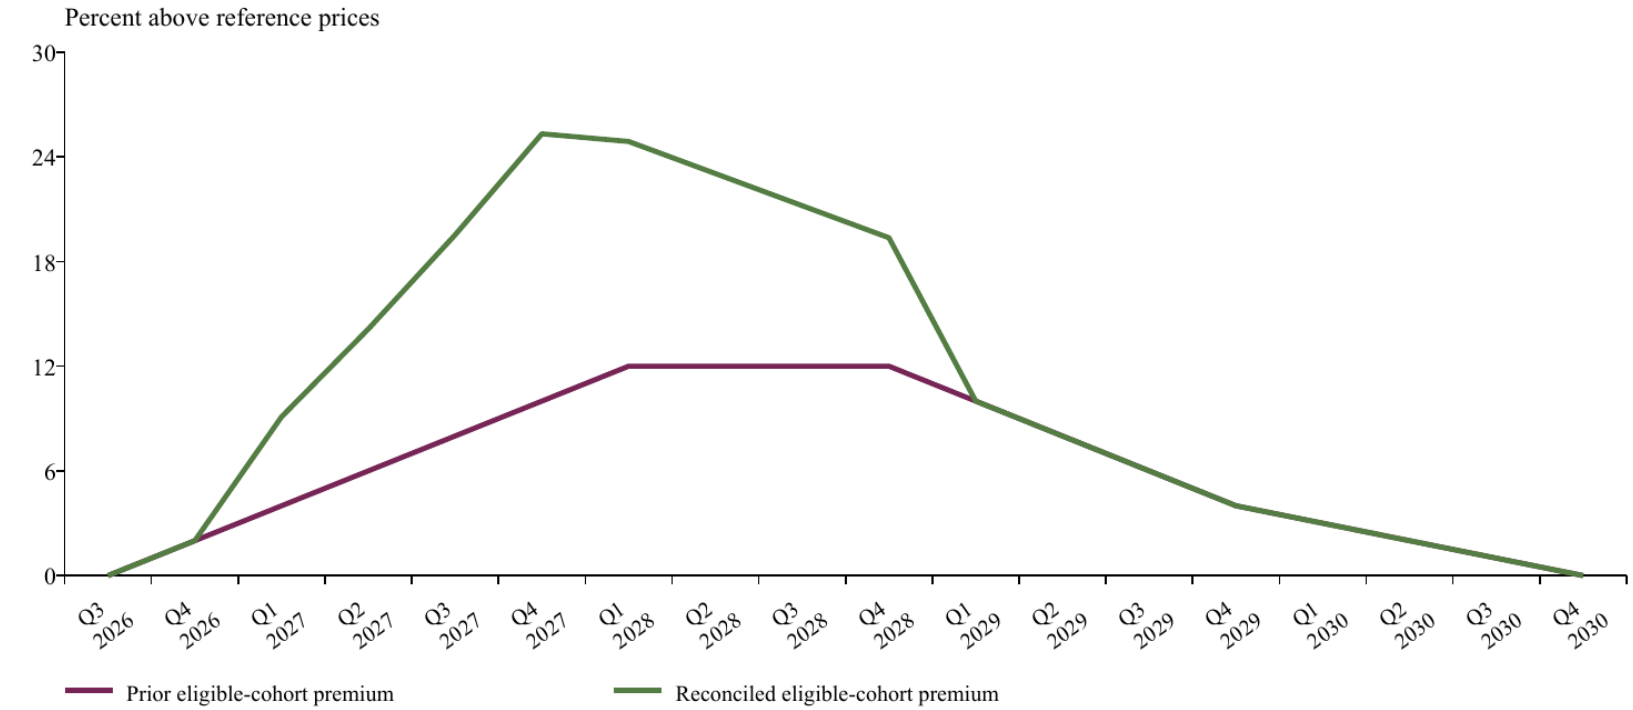

Balanced = supply-demand balance **Easing** = conditions improving

October 7 historical update: a bounded Q4 sell-through improvement

At the October 7 checkpoint, the Q4 2027 ceiling remained TWD 875.886924; analytical Base 73 and protected Excel Base 73 were unchanged. The later October 12 ABF price reconciliation is the current model, described above. The new evidence changes only Q4 2026 sales and the two forward windows containing that quarter. The 20x operating-profit method, share schedule and financial/pension claims are retained.

An October 6 digest relays an attributed 15-19% sequential Q4 sales forecast. Public reporting corroborates improving demand and near-full Kunshan utilization, but does not independently establish that exact range. September revenue and the Q3 total were already incorporated in the full deep dive. This revision therefore evaluates the forward forecast against the saved active Q4 sales, not against a stale pre-September base. [NY-OCT6-CHANNEL; NY-OCT6-CORROBORATION; U166]

The selected conditional outcome is 17% growth on reported Q3 sales, weighted at 40% realization because product/customer coverage, qualification and the quoted range remain unresolved. Existing active Q4 growth was approximately 9.75%. The conditional incremental sales are TWD 19,162.57239m minus TWD 17,975.36m, or TWD 1,187.21239m. Applying 40% once adds TWD 474.884956m and raises active Q4 revenue to TWD 18,450.244956m. This is a residual improvement after the existing pricing and execution branches; no separate ASP, AMD market-share or margin uplift is added.

The existing Q4 gross-profit rate of 31.0791% and total operating-expense rate of 3.2319% apply to those sales. The resulting TWD 147.590073m of added gross profit less TWD 15.347679m of added operating expense yields TWD 132.242395m of operating profit. Higher shipments receive their associated costs, rather than free operating leverage. Existing financial claims remain reserved and no additional cash or financing benefit is credited.

Item	Prior saved model	October 7 active model	Change
Q4 2026 revenue, TWD m	17,975.360000	18,450.244956	474.884956
Q4 2026 gross profit, TWD m	5,586.584000	5,734.174073	147.590073
Q4 2026 operating expense, TWD m	580.940800	596.288479	15.347679
Q4 2026 operating profit, TWD m	5,005.643200	5,137.885595	132.242395
Q3 2026 ceiling, TWD/share	628.746259	632.839336	4.093077
Q4 2026 ceiling, TWD/share	686.523727	690.616804	4.093077
Q4 2027 ceiling, TWD/share	875.886924	875.886924	0.000000

The zero Q4 2027 increment is a timing and overlap decision: that window starts three quarters after the only changed sales quarter. A one-quarter channel forecast does not establish another permanent output level, qualified new capacity or renewed pricing beyond the already rising 2027 path. Revisit October and November sales, mix and customer acceptance before extending this bridge. At that October 7 checkpoint the 60% factory-output, 35% pricing and 25% execution branches were retained. The October 12 update retains all three probabilities and separately refines only the bounded pricing magnitude.

Economic scope and matching claims

Full consolidated wholly owned operating subsidiaries; equity-method earnings excluded. No parent holding-company ownership discount. 20x Q+next 3 modeled IFRS operating profit, less matched net financial and pension claims, divided by common diluted shares at the end of the same forward window.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use TWD m unless a different unit is stated.

Thesis

8046.TW | Taiwan Stock Exchange | TWD | updated 12 October 2026

Q4 2027 model ceiling: TWD 897.40. Analytical Base: 73/100, Watchlist. The valuation uses 20 times modeled operating profit over Q4 2027 through Q3 2028, less matched financial and pension claims, divided by 646.176 million diluted shares. This is an operating-profit valuation, not a P/E ratio.

The actual business mix

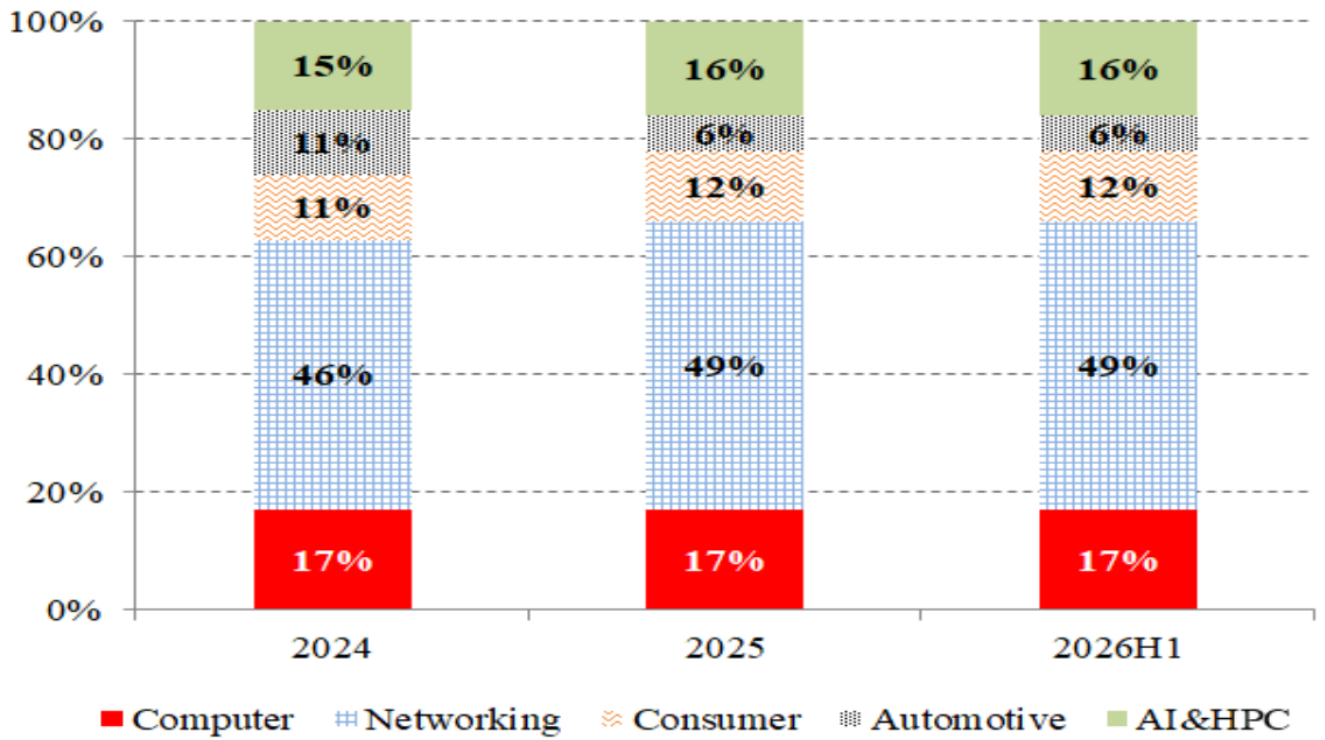

Nan Ya Printed Circuit Board is the listed substrate and PCB manufacturer, ticker 8046. It should not be confused with its parent, Nan Ya Plastics, or with the separate DRAM manufacturer Nanya Technology. The investment case is the conversion of increasingly difficult package and board designs into qualified output and retained manufacturing profit.

The company's August presentation reports H1 application mix of 49% networking, 16% AI/HPC, 17% computer, 12% consumer and 6% automotive. Networking and AI/HPC are separate classifications. They provide a useful way to organize the model, but they are not a disclosure of ABF versus BT production or product-level margins. Nor does every networking sale necessarily serve AI. [NY-DECK, slide 7]

The attractive exposure is broader than a single accelerator. Switches, server processors, custom ASICs and power-related packages can each require sophisticated interconnects. That diversification helps only if the company is qualified on the actual design and can deliver it profitably. Customer semiconductor sales and data-center capital budgets are demand context, not Nan Ya PCB revenue.

Financial Status

Revenue Structure(By Applications)

- Impacted by component shortages, sales growth for PCs and consumer electronics was constrained. Consequently, our revenue contribution from related applications in 26H1 was on par with 2025.
- The ongoing high-end switch upgrade trend in data centers kept our networking revenue contribution elevated through 26H1.

7

Original issuer exhibit | H1 2026 application mix: networking 49%, AI/HPC 16%, computer 17%, consumer 12%, automotive 6%. Networking and AI/HPC are separate categories; neither percentage is a margin or direct ABF product split.

The manufacturing bottleneck

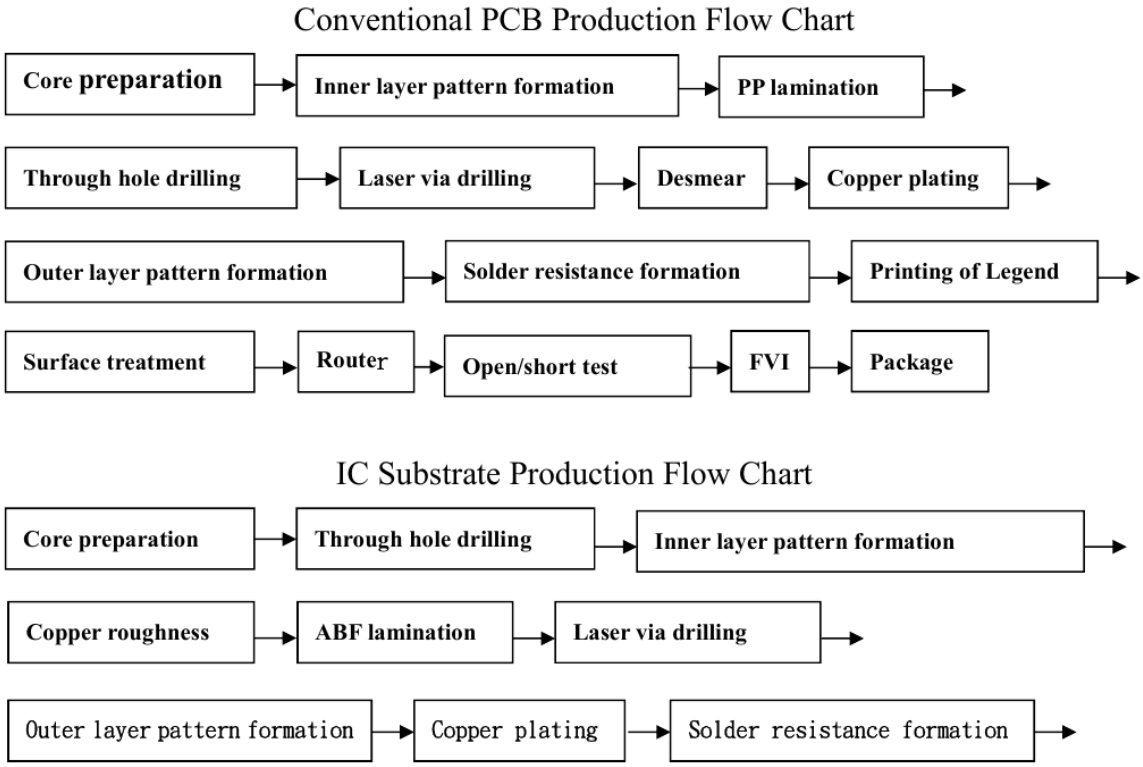

A package substrate distributes power and signals between the semiconductor package and the circuit board. A PCB connects components within the larger electronic system. Nan Ya PCB receives invoices for these manufactured products. It does not receive the value of the processor, optical engine, memory stack or finished server.

The physical bottleneck is the sequence of fabrication steps needed to produce a saleable component. More package area reduces the number of units obtainable from a panel. Higher layer counts require repeated processing, while finer routing and tighter alignment increase defect sensitivity. Warpage, via integrity, electrical testing and customer qualification determine whether nominal factory capacity becomes accepted shipments. A larger selling price can be accompanied by higher material consumption, longer processing time and lower yield.

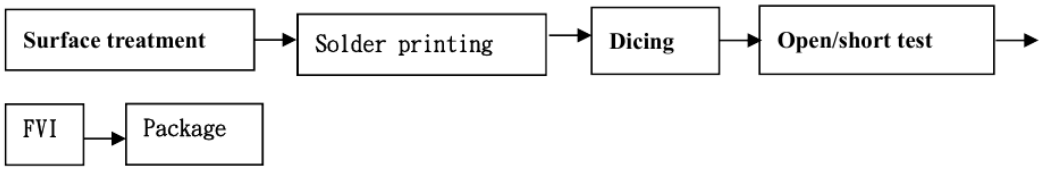

The issuer's ABF roadmap provides a concrete engineering direction: larger package bodies, more layers, finer lines and closer bump pitch. Its published development schedule progresses toward more than 150 mm body size, line width/space of 6/7 micrometers and 80-micrometer bump pitch in H1 2027. These are separate roadmap targets, not proof that every feature is simultaneously qualified at profitable volume. [NY-ABF]

This distinction prevents a common modeling error. Area growth, extra layers, tighter design rules and lower yield should not each become a separate demand multiplier. They are related drivers of processing work and effective output. The model uses one revenue path and one correlated execution downside for the existing production base.

4.2.2.2 Production processes of major products

Original issuer exhibit | Original production flows distinguish finished PCB and IC-substrate manufacture. Copper foil, glass cloth, CCL and ABF film are inputs; their suppliers do not receive the same invoice. Original exhibit, panel 1 of 2; read from top to bottom.

4.2.3 Supply of Primary Raw Materials

4.2.3.1 Raw Material Supply:

The Company's most important raw materials are copper clad laminates (CCL), base material (additive film), copper foil, drill bits, dry film, inks, etc., all of which are long-term co-operation vendors, and are the leading manufacturers of the industry. Most of the materials have at least 2 qualified suppliers, therefore the supply is stable.

4.2.3.2 Procurement mechanism:

The Company has conducted procurement operations through the online e-platform to ensure the fairness and integrity of the procurement process, and to prevent procurement frauds. The procurement cases can be publicly queried on the Internet. The supplier is able to provide quotation after confirming its identity with the electronic signature, in order to ensure the safety and fairness of the overall operation and shorten the procurement process that achieves a win-win situation between the Company and its suppliers. At present, this e-platform has more than 10,000 online quotation vendors.

Original issuer exhibit | Original production flows distinguish finished PCB and IC-substrate manufacture. Copper foil, glass cloth, CCL and ABF film are inputs; their suppliers do not receive the same invoice. Original exhibit, panel 2 of 2; read from top to bottom.

Evidence that the product mix is changing

There is direct financial evidence that advanced products are improving the business. Q2 revenue was TWD 13.575 billion, gross profit TWD 3.360 billion and operating profit TWD 2.899 billion. Operating margin reached 21.36%, versus 12.10% in Q1. The August 27 presentation specifically connects the sequential improvement to mass production of substrates for 1.6T switch applications. [NY-Q2; NY-DECK, slide 6]

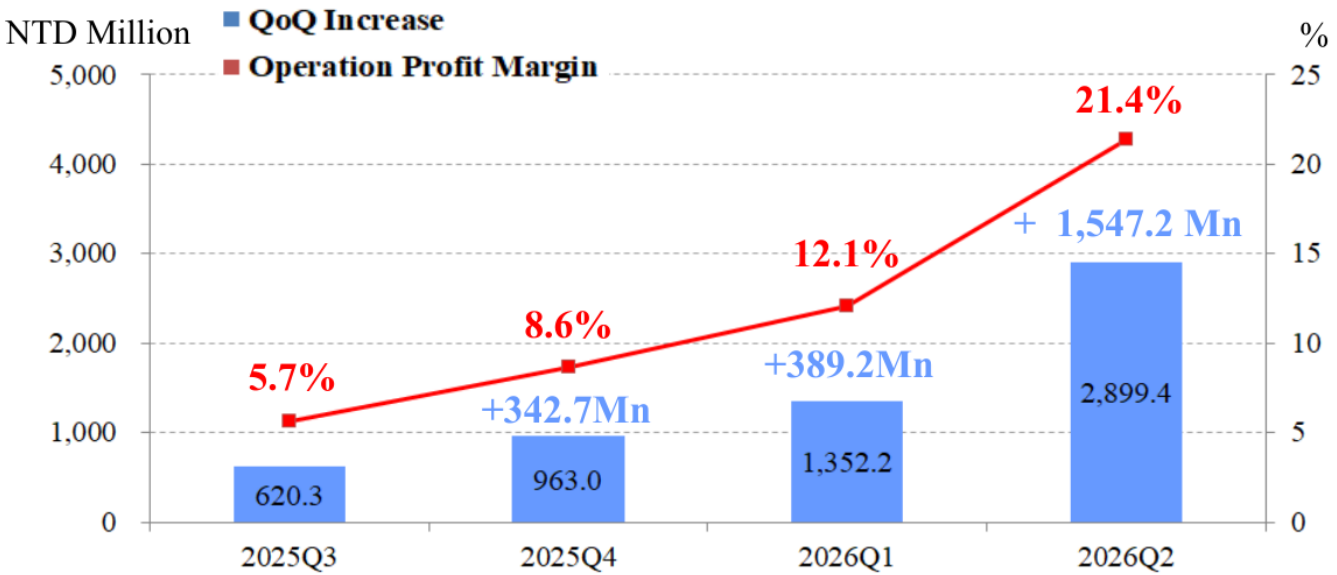

September revenue subsequently reached TWD 5.586 billion. The reported nine-month total less reviewed first-half sales gives Q3 revenue of TWD 16.378 billion. That figure is held fixed in the model. Its product allocation and profit remain estimates until the quarterly statement is available. [NY-SEPT]

An October 2 exchange disclosure supplies a further calibration point: August self-assessed pretax profit of TWD 1.486 billion on rounded revenue of TWD 5.353 billion. This supports a stronger current run rate, but it is not the same as operating profit, an audited quarter or a promise that the margin will persist. The model does not multiply that one month by twelve. [NY-AUG]

The first-half application mix also remained broadly stable. Rising profits therefore cannot be explained simply by assigning a much larger percentage of the business to the AI category. Better products within networking, pricing, utilization, process performance and operating cost absorption can matter even when top-level mix percentages barely move.

Financial Status

Quarterly Operation Profits in a Year

- **Operation profits in 25Q4 were increasing NTD 342.7 Mn from 25Q3:**
  With an rising demand for high-end servers and switches, operating profit in the fourth quarter increased compared with the third quarter.
- **Operation profits in 26Q1 were increasing NTD 389.2 Mn from 25Q4:**
  Driven by steady demand in server and switch IC substrates, 26Q1 operating profit saw quarterly growth.
- **Operation profits in 26Q2 were increasing NTD 1,547.2 Mn from 26Q1:**
  Mass production of IC substrates for 1.6T switches optimized the product mix, increasing Q2 operating income compared to Q1.

6

Original issuer exhibit | Issuer Q2 operating profit rose to TWD2.899bn with a 21.4% operating margin. The slide attributes the improvement to 1.6T switch-substrate mass production. The 1.6T label is the issuer application description, not substrate data throughput.

What can expand next

The August 6 board decision approved TWD 46.8 billion for a smart factory aimed at large-size, high-layer, advanced substrates. It identified internal funds, bank borrowing or other fundraising as possible sources of capital. It did not disclose a definitive payment schedule, installed good-unit capacity or customer-acceptance timetable. [NY-CAPEX]

The technology roadmap and existing product success make future expansion credible. They do not justify assuming that the factory produces full revenue immediately. The model's new-factory output begins in Q1 2028, with a 60% probability applied to a bounded conditional ramp. The timing is an analytical assumption. No new-factory revenue is assigned to calendar 2027.

The reference business already grows substantially before this branch. Quarterly revenue increases from TWD 16.378 billion in Q3 2026 to TWD 23.150 billion in Q4 2027. This assumes existing-plant debottlenecking, qualified process upgrades and richer product content. A 13% cumulative content/ASP proxy would still require about 25% more constant-mix saleable output. That is a meaningful operating requirement, not a claim that spare floor area makes the growth automatic.

The framework probability applies to output above this reference, not to the entire company's forecast. A 60% expansion probability must not disguise an aggressive reference as a low-risk outcome. If customer acceptance or throughput evidence disappoints, the reference path must also be cut.

Future Product Development

Continue to Expand High Value Products

- **ABF Substrate**
  As CSPs increased their data center capital expenditures, the Company collaborated with customers to develop large-area, high-layer-count substrates for next-generation AI server ASICs, CPUs, and high-speed switch chips. Additionally, optimistic about the growth of inference AI, the Company will mass-produce substrate chips for high-end AI PCs, thereby increasing the proportion of high-value-added products.

- **BT Substrate**
  On top of developing substrates for next-gen mobile SiP mainboards, smart glasses, 5G base stations, and automotive signal switches, we've also partnered with customers to work on substrates for next-gen servers and power IC chips. This comes as AI chips demand power management modules with higher power conversion efficiency, and it's going to help drive our overall profitability.

- **Conventional PCB**
  Driven by demand for high-end PCBs from data center servers and switches, the Company will develop and mass-produce products to capture related business opportunities, such as server mainboards, server secondary boards, and high-layer switch boards. Additionally, targeting opportunities across various edge AI applications, the Company will mass-produce high-end PC and LED circuit boards to further diversify its product portfolio.

9

Original issuer exhibit | August 27 roadmap identifies large-area and higher-layer substrates, power-related BT products and server PCBs. It names development areas, not customer awards, market shares or accepted factory output.

From sales to operating profit

The operating model uses five application vectors: networking, AI/HPC, computer, consumer and automotive. Q3's allocation is a proxy informed by the disclosed H1 mix and subsequent networking strength. Product margins are also analytical allocations; the company does not publish each application's gross profit.

Reference networking sales reach TWD 12.5 billion a quarter by Q4 2027 and AI/HPC reaches TWD 5.0 billion. Their gross margins are 38% and 40% at that point. Computer, consumer and automotive sales carry substantially lower margins. The resulting reference revenue and profit are reconciled to a single consolidated total rather than added to an independent market-share forecast.

The cost structure keeps production labor, process development, material usage and depreciation inside gross profit. Selling, administration and cash employee compensation are separately deducted. There is no additional blanket R&D charge that would count manufacturing development costs twice. The operating-profit denominator excludes interest income, currency gains, associate income and tax.

New-factory fixed costs matter even when output is delayed. Reference margins soften in 2028 as the model absorbs expansion depreciation and qualification overhead. The conditional output branch then contributes 35% gross profit on extra revenue, with another 4% spent on operating costs. This contribution is after incremental manufacturing costs; the fixed depreciation has already been charged in the reference.

The active annual model produces revenue of TWD 83.790 billion and operating profit of TWD 25.286 billion in 2027, rising to TWD 109.550 billion and TWD 31.750 billion in 2028. The later model reaches TWD 155.210 billion of revenue and TWD 43.850 billion of operating profit in 2030. These are substantial growth assumptions, not company guidance. Competitive normalization prevents the peak pricing overlay from continuing indefinitely.

Original issuer exhibit | Reviewed Q2 2026 statement, in TWD thousands. Operating profit is TWD2.899bn; pretax profit TWD2.976bn and net profit TWD2.262bn are different measures. The model uses operating profit. Original exhibit, panel 2 of 2; read from top to bottom.

Three structural probabilities and the narrow quarterly overlay

The October 7 sell-through branch described above applies 40% only to its residual Q4 2026 outcome. The qualified-output and execution branches retain their inputs. The pricing probability remains 35%; its conditional magnitude now follows the October 12 bounded ABF reconciliation.

The 60% qualified-output branch starts with conditional additional sales of TWD 0.5 billion in Q1 2028. It reaches TWD 4.5 billion in Q4 2028, TWD 7.5 billion in Q4 2029 and TWD 9.5 billion in Q4 2030. It represents incremental accepted output above the expanding reference. The model does not add another utilization or market-share multiplier to those sales.

A separate 35% pricing branch applies the conditional premium path above to only 35% of reference networking and AI/HPC sales. This is a proxy for new or repriceable orders. It excludes fixed contract terms, consumer and conventional products, and revenue already in the new-factory branch. The retained 2% premium begins in Q4 2026. The reconciled conditional path peaks at 25.3153% in Q4 2027 and fades through 2028; the original 2029-2030 path reaches zero in Q4 2030. Of each incremental revenue dollar, 35 cents is consumed by materials and processing, and three cents by operating costs; 62 cents reaches operating profit.

This pricing probability gives credible scarcity evidence an active contribution without pretending a premium contract has been disclosed. Customer willingness to avoid an expensive project delay can support price realization. Against that, input suppliers can absorb much of the benefit through higher prices for film, glass, copper and other materials. The scarcity of an input is not automatically the substrate manufacturer's margin.

The 25% execution downside removes 8% of reference networking and AI/HPC sales at a 55% lost contribution margin and adds a direct cost charge equal to 1% of that revenue pool. It combines related process, material and acceptance risks in one branch. Q3 reported sales are not reduced; only its unsettled cost outcome remains exposed. This branch concerns the existing reference production base, while the 60% branch separately gates new, unqualified factory output.

Paying for the factory

The June balance sheet had TWD 10.383 billion of cash and no bank borrowing, but that does not make the expansion free. The model preserves TWD 5 billion as operating liquidity. It pays the entire TWD 46.8 billion programme through 2029: TWD 4.8 billion in H2 2026, TWD 18 billion in 2027, TWD 20 billion in 2028 and TWD 4 billion in 2029. Maintenance investment is additional. The payment schedule is a model assumption because the board notice did not provide one.

The cash bridge deducts taxes, dividends, working-capital growth, lease payments and interest. It assumes 25% cash tax and a 50% payout of post-tax operating profit from 2027. It also pays the already declared TWD 1.292 billion dividend once in H2 2026. Working-capital funding equals 90% of a positive quarterly sales increase, recognizing that growing receivables and inventory can consume cash well before earnings are collected.

Existing customer advances need particular care. The June balance of TWD 4.406 billion represents cash received previously against future deliveries. The model consumes it as revenue is recognized and assumes no fresh advance receipts. Counting it again as new expansion financing would spend the same cash twice. Likewise, a related-party loan, associate investments and equity securities are not treated as immediately available cash. [NY-Q2]

Reference peak borrowing reaches approximately TWD 24.535 billion during 2028. Each valuation quarter reserves the peak cash requirement through its entire four-quarter earnings window. Lease liabilities and a pension reserve are then added. Each of the three structural probability branches carries any additional conditional peak funding need caused by its operating path; setting all structural probabilities to zero restores both reference earnings and reference claims. The earlier isolated Q4 sell-through overlay retains its explicitly frozen financial reserve, so it does not become a fourth conditional funding claim or a retroactive cash credit. No separate future cash windfall is credited from the same earnings stream.

For Q4 2027, reference claims are TWD 24.265 billion and active claims TWD 25.943 billion. The additional working capital required by the conditional factory ramp is part of that difference. The model's higher operating profit cannot arrive with an unpaid inventory bill.

Original issuer exhibit | June contract liabilities of TWD4.406bn are cash received earlier against future deliveries. Revenue recognition consumes these advances; they are not another source of new expansion cash. Original exhibit, panel 2 of 2; read from top to bottom.

The common shareholder and the valuation

The company has 646.165487 million issued common shares. The valuation uses 646.176 million to retain the small potential employee-share dilution visible in the interim EPS calculation. It does not assume a large recurring stock-compensation programme when the disclosed policy favors cash compensation. Nor does it assume a future equity issue merely because the investment announcement allows other fundraising. A 53.835-million-share, no-proceeds sensitivity shows the remaining authorized-capital exposure separately. [NY-IDENTITY; NY-Q2; NY-AR]

All operating subsidiaries included in the June consolidation are wholly owned. The parent's stake in Nan Ya PCB does not reduce the earnings belonging to each listed 8046 share. Conversely, associate income sits outside operating profit and is not quietly added to the earnings multiple. The parent and subsidiary are separate potential investments, not interchangeable exposure.

At the active horizon, modeled forward operating profit is TWD 30.291164173146 billion. Multiplying by 20, subtracting TWD 25.942661110390 billion of matched claims and dividing by 646.176 million shares gives TWD 897.4035283769781. The all-zero probability reference is TWD 860.91. A one-percentage-point change in reference gross margin across the same window changes the isolated ceiling by about TWD 30.60. A 10% reference sales shortfall at fixed product margins and operating costs lowers it by about TWD 100.09 before additional financing effects. A 25% overrun on the factory programme alone subtracts about TWD 18.11 per share.

Twenty times operating profit is a deliberate manufacturing valuation choice. It recognizes difficult qualifications and richer package content while retaining depreciation and a matched financial-claims deduction. It should not be described as twenty times net earnings or copied from a semiconductor designer's multiple. Greater certainty about pricing, yield, funding and customer retention could change the inputs; it does not automatically authorize a higher valuation method.

Competition, failure conditions and the next evidence

AT&S, Kinsus, Unimicron, Ibiden, Shinko and Samsung Electro-Mechanics provide competitive context across different substrate technologies and qualifications. Their announced capacity is not immediately substitutable on every high-end design. Over time, however, qualified additions can reduce pricing power. Lower-end substrates and conventional boards can face price competition while advanced packages remain constrained.

The Formosa group relationship can improve procurement access and coordination, but related materials are still bought at a cost. It does not establish exclusive access to every advanced glass, film or recipe. The issuer's annual report also describes conventional capacity competition and material-cost pressure. Those older observations should be read at their own date and product scope, alongside the newer advanced-product evidence.

The next useful catalysts are the full Q3 financial statement, the next investor briefing, factory construction and equipment orders, and specific customer acceptance or yield disclosures. A higher monthly revenue number is most useful when accompanied by evidence that the additional work carries profit and can be financed. Material warning signs would be revenue growth without cash conversion, unexplained inventory expansion, a deteriorating margin despite higher mix, or repeated commissioning delays.

The analytical score is 44 of 60, rounded to a Base of 73: core 17, cycle 8, TAM 8, catalysts 4, macro 8, alpha 3 and risk adjustment minus 4. Qualified technology and demonstrated profit capture support the score. Missing good-unit capacity, a large financing requirement, concentrated customers and a still-cyclical product base keep it in the Watchlist band.

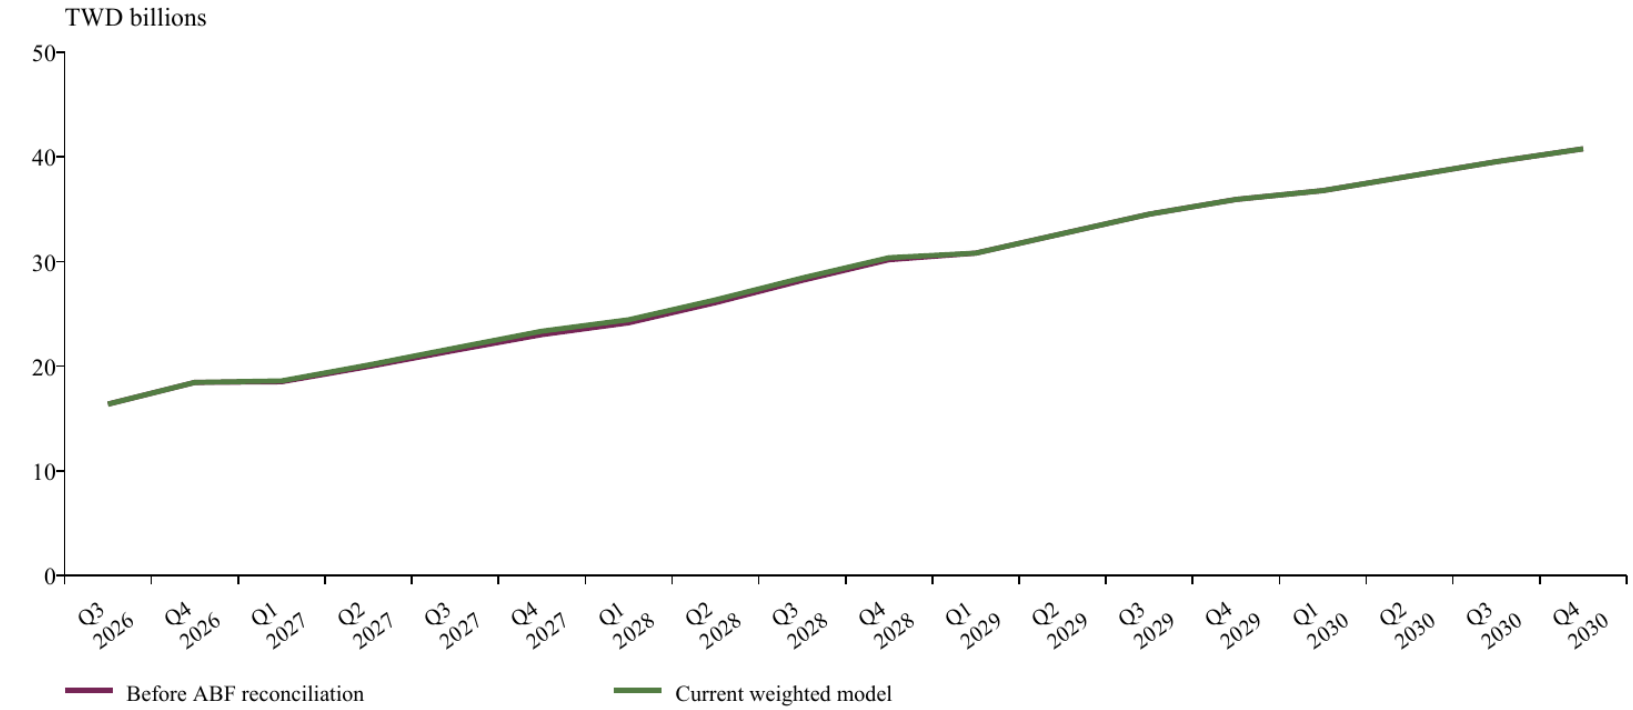

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Demonstrated advanced switch-substrate profit capture and difficult qualification.
Cycle	8	Advanced package demand strengthens; conventional substrates remain cyclical.
TAM	8	More package area and process content across switches, ASICs and servers.
Catalysts	4	Q3 financials, factory equipment orders and customer acceptance.
Macro	8	AI infrastructure supports demand, with capital-budget concentration.
Alpha	3	Detailed process and funding reconciliation; considerable opportunity is already visible.
Risk classes	-4	Four distinct classes: execution, customer concentration, funding and competitive cyclicality.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Nan Ya PCB: scoped ABF pricing and revenue

No added units or substrate area. Q4 2026 and 2029-2030 operating branches are unchanged.

Nan Ya PCB: current sales path after the bounded ABF pricing reconciliation. Both lines contain the previously applied Q4 2026 sales overlay; forecasts are model assumptions, not issuer guidance.

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Networking substrates and PCBs	8,189.1	35.0%	2,866.2
Q3 2026	AI and HPC package substrates	2,948.1	38.0%	1,120.3
Q3 2026	Computer substrates and PCBs	2,620.5	20.0%	524.1
Q3 2026	Consumer substrates and PCBs	1,637.8	17.0%	278.4
Q3 2026	Automotive substrates and PCBs	982.7	20.0%	196.5
Q4 2026	Networking substrates and PCBs	9,400.0	36.0%	3,384.0
Q4 2026	AI and HPC package substrates	3,400.0	39.0%	1,326.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Recomputed cash and conditional funding paths

The following complete paths use the same operating forecasts as the live worksheet. Figures are TWD millions. The reference and full conditional pricing path each pay the entire factory programme, maintenance, liquidity reserve, working capital, tax, dividend, advance depletion and interest. The factory and execution paths are also rebuilt in the self-contained model and worksheet. Peak borrowing is a reserve, not a repayment forecast; later cash does not become a second valuation credit. The earlier Q4 sell-through operating overlay keeps its previously frozen financial treatment.

Lease cash is 70M per quarter; the separate lease/pension valuation claims are 1,108.951 M and 812.694M. Opening available cash is 10,383.363M less the 5,000M liquidity reserve. The reference Q2 sales anchor is 13,575.475M. Advances begin 4,406.130 M and are consumed at no more than 554.536M each quarter, without new assumed receipts. All 18 cash rows for all four paths remain exact in the linked model.

Claim decisions, overlap and triggers

NYPCB-QUALIFIED-OUTPUT

probability: 0.6

signal: August 6 approved TWD 46.8bn large-size, high-layer smart factory and issuer technical roadmap; evidence of current 1.6T substrate mass production.

Conditional outcome: Additional revenue above reference starts at TWD 0.5bn in Q1 2028, TWD 4.5bn in Q4 2028, TWD 7.5bn in Q4 2029 and TWD 9.5bn in Q4 2030.

cost bridge: 65% incremental manufacturing cash/variable costs and 4% selling and administration; reference gross margins already carry full expansion depreciation and qualification overhead. Full factory spending remains in reference financing even if this output fails.

overlap: Reference networking and AI/HPC sales already expand through debottlenecking, existing plants and richer packages. This branch covers only residual qualified output; no additional multiplier for utilization, area, layers or the same customer platform.

timing: Illustrative acceptance from Q1 2028, not issuer guidance. No factory output is added in 2027.

counterevidence: No disclosed production area, good-unit yield, customer allocation or completion timetable. Competitors expand too.

NYPCB-REPRICE

probability: 0.35

signal: Original full TrendForce October 12 chart repeats the October 5 ABF10-15% sequential price forecast through Q4 2027, with 48-56 week lead times. Current margin/mix improvement provides corroboration, but exact ABF contract renewal prices remain unknown.

Conditional outcome: Preserve 2% in Q4 2026. On the same 35% eligible reference networking/AIHPC pool, use 9.1%,14.13%,19.523%,25.3153% in 2027 and 24.8758875%,23.036475%,21.1970625%,19.35765% in 2028. These add only 60% ABF scope times 50% capture of industry-price residual after the prior premium. The 2029-2030 branch remains unchanged.

cost bridge: 35% of incremental price revenue is consumed by input/process costs, and 3% by operating costs; 62% reaches operating profit.

overlap: Retain 35% new/repriceable application cohort; add 60% ABF scope inside it and 50% residual reserve after the old premium. Reference 13% content/ASP, physical-size mix and possible customer/product overlap are not repeated. Q4 2026 extra is zero because the prior sequential-sales overlay covers the residual. Fixed terms, new-factory revenue and conventional PCBs are excluded.

timing: Customer repricing/acceptance by quarter, not spot-material prices immediately becoming finished-substrate revenue.

counterevidence: Contract terms and ABF application mix are unknown. SemiAnalysis distinguishes per-piece from per-area ASP, so body-size growth is not all like-for-like price. Lower-end PCB capacity competes; resin, cloth, copper and film suppliers can retain some increases. The mapped SemiAnalysis charts remain pending and are not numerically certified.

NYPCB-EXECUTION

probability: 0.25

signal: More area and layers, tighter alignment and scarce qualified materials can reduce good output or delay customer acceptance.

Conditional outcome: 8% shortfall in reference networking plus AI/HPC shipments, plus excess scrap/qualification cost equal to 1% of that revenue pool. Q3 2026 reported sales are fixed; only its cost risk remains.

cost bridge: Lost shipments at 55% contribution with fixed production overhead retained, plus the direct 1% cost charge.

overlap: Single correlated downside for process, materials and delivery; not three independent shortage shocks. Future-factory output probability separately covers that unqualified new capacity.

timing: Recurring platform transitions retain a residual downside throughout the horizon.

counterevidence: Successful alternate-material qualification, process control and spare capacity could eliminate the modeled shortfall.

NYPCB-Q4-SELLTHROUGH

probability: 0.4

signal: October 6 attributed channel forecast of 15-19% sequential Q4 sales growth, versus the existing 9.75% active growth. September and Q3 reported revenue are already in the baseline.

conditional outcome: Select 17% conditional Q4 growth: TWD 19,162.57239m sales. Deduct the existing active TWD 17,975.36m, giving TWD 1,187.21239m conditional incremental sales; 40% realization adds TWD 474.884956m.

cost bridge: Use the existing active Q4 31.0791216% gross-profit rate and 3.2318730% total operating-expense rate. Weighted GP rises TWD 147.590073m and opex TWD 15.347679m, leaving TWD 132.242395m OP. Existing financial and pension claims are retained; no extra cash or financing benefit is credited.

overlap: The conditional result is compared with the entire saved active baseline, including existing qualified-output, pricing and execution branches. Do not apply 17% to that baseline, repeat reported September sales, or add a separate AMD, ASP or margin premium.

timing: This historical October 7 evidence changes only Q4 2026 sales and directly dependent operating profit, with zero contribution in the active Q4 2027 earnings window. The separate October 12 pricing evidence updates 2027-2028; it does not extend this narrow sell-through branch.

counterevidence: Customer and product coverage of the 15-19% range is uncertain. Public corroboration supports the direction of growth and near-full Kunshan utilization, but not the exact quoted range. Qualification, mix and monthly execution remain open.

revisit: October and November monthly sales, actual Q4 mix and margins, package-substrate renewals and qualified debottleneck output.

Remaining bounded uncertainties

- The application split is disclosed, but application gross margins and ABF/BT/PCB product sales are not. Product lines in the model are analytical proxies calibrated to consolidated actuals.
- The TWD 46.8bn programme has no issuer cash-payment, completion or customer-acceptance schedule. The model pays the full programme through 2029 and keeps success-weighted new output separate.
- No absolute qualified area, actual utilization, good-unit yield, customer allocation or contract pricing is published in the reviewed primary documents. Reference growth itself is substantial and should not be read as a verified capacity ceiling.
- New debt interest uses a 3.5% proxy. Exact loan terms, customer financing, government support, private placement or other fundraising are not announced in the reviewed capital notice. No free receipts or certain dilution are assumed.
- The June financial note gives parent ownership of 61.36%, whereas the March annual ownership table gives 66.97%. This discrepancy does not change listed-company shares or operating entitlement; do not apply either percentage to consolidated profits of 8046.
- The historical EPS dilution adds about 10,000 potential employee shares despite a stated cash-compensation policy. Use 646.176m diluted shares versus 646.165487m issued; no large recurring SBC dilution is inferred.

- June financial statements have no subsequent events, while the separate August 6 board notice announces capex. The separate dated notice controls the new plan; the older annual cash outlook is superseded for expansion funding.
- The issuer website August financial link points to a May-named document. The dated August 27 original archived deck was used and saved separately; these are not silently treated as the same revision.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.

The linked workbook and this artifact use the same saved operating model, financial claims and share schedule.

October 7 supplemental sources and synchronization

- NY-OCT6-CHANNEL | 2026-10-06 | October 6 Nan Ya PCB demand and Q4 channel report. Secondary financial news; attributed forecast, not issuer guidance.
- NY-OCT6-CORROBORATION | 2026-10-06 | October 6 public demand and utilization corroboration. Secondary financial news; attributed forecast, not issuer guidance.

The historical October 7 narrow Q4 overlay remains included. Current operating and valuation tables and their dependent charts additionally reflect the bounded October 12 ABF pricing reconciliation. Original issuer exhibits, reference product vectors, factory programme, other operating branches, scores and method are retained. Funding paths and matched claims are recalculated for the current pricing inputs; the isolated prior Q4 sell-through financial treatment remains frozen. The original-named model JSON contains the complete current four-operating-branch calculation and the three structural conditional funding paths.

October 12 pricing sources and recovery record

[NY-TF-ABF] TrendForce Weekly Radar 005, October 12 2026, repeats the October 5 ABF forecast. The original full chart is embedded above:316,170 bytes,2048x 1838 pixels; SHA256 88b46fb02a530f18619c8cd587d090aacace902e8bd85b34f451af383c25d87e. Saved RAML/R0 posts 2109615076571238741 and 2109615077351379437 link the publisher; their image is a crop.

[NY-SA-DENOMINATOR] SemiAnalysis denominator explanation, October 12 2026, within the five-post thread startinghere. Available OHSV/R0 text is counter-evidence; mapped thread charts remain pending and no inaccessible curves are certified. Original text/completeness flags are preserved.

Exact saved calculations compare the same Q4 2027 currency/share basis. Display rounding is presentation only; this is not a horizon roll or a stock market-price move.
