ABB Ltd

ABBN | SIX Swiss Exchange | 2026-10-07

Q4 2027 model ceiling: CHF 82.49

Analytical Base 44/60 = 73 | Watchlist: delivery and transaction execution

20x forward-four-quarter fully expensed normalized US-GAAP operating profit, 98% common attribution, less matched net claims; USD equity converted to CHF at0.9309/1.1177, divided by end-window economic shares. Quarter plus next three.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD millions and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: CHF 79.88 per share (2026-10-07 close); 1,815.154 million common shares (2026-06-30 approximate issued less rounded treasury); estimated equity capitalization CHF 144,994.5 million. SIX quotation; legal issued1823.154373m less approximately8m treasury. Not an exact October7 count and not the diluted forecast. This dated common-share snapshot is separate from forecast diluted shares.

Decision in the model

Operating profit and claims are in USD millions. Equity value is translated once at 0.8328710745280486 CHF per USD; the denominator is Swiss ordinary shares.

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	9,374.0	20x	1,825.954	82.49

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated operations including SBC, D&A, acquired amortization and ordinary restructuring. Transactions match earnings/cash claims at identical probabilities; existing excess cash only after USD2bn operating reserve, no future FCF or portfolio credit.. 20x forward-four-quarter fully expensed normalized US-GAAP operating profit, 98% common attribution, less matched net claims; USD equity converted to CHF at0.9309/1.1177, divided by end-window economic shares. Quarter plus next three.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD millions unless a different unit is stated.

Investment view and valuation scope

ABB is a broad electrical and industrial automation supplier with an unusually useful position as data centers move more power-conversion equipment out of the rack. Its case rests on qualified equipment, installed-base service and delivery capacity. The case does not require every facility to adopt solid-state transformers, nor does ABB own all of the power equipment budget. Conventional switchgear, motors, controls and uninterruptible power systems continue to earn revenue while the next architecture qualifies.

The active Q4 2027 ceiling is CHF82.49. It values Q4 2027 through Q3 2028 operating profit of USD9,565.35m at 20 times, reserves 2% for noncontrolling economic interests, deducts USD6,642m of matched net claims and divides by 1,825.954m end-window economic shares. USD equity converts to CHF at 0.9309/1.1177, the October 7 Banque de France cross rate. This is a forecast of operating economics, not management guidance, net-income P/E or an imported deal multiple. The reference ceiling is CHF82.50. Positive architecture and selective-price effects are substantially offset by delivery risk, qualification costs and the cost of acquiring Rotork. The close agreement between reference and active values is an arithmetic outcome, not a reason to omit those risks.

The security is ABB Ltd on SIX Swiss Exchange, ticker ABBN, quoted in CHF. ABB reports under US GAAP in USD. This distinction matters: an ADR, a Swedish quote and a Swiss share cannot be mixed without checking currency and entitlement. Financial tables below use USD millions unless explicitly labeled CHF. The company is covered; ownership is not assumed.

What earns the money

Electrification supplies protection, switching, distribution, installation, control and power-conversion equipment. Motion sells motors, drives and related services. Automation supplies process control, measurement, marine systems and services. These products benefit from electrification, energy efficiency and industrial capital expenditure as well as data centers. A weak chemical plant or residential building cycle still matters even when AI spending is strong.

Second-quarter external revenue was USD5,111m for Electrification, USD2,065m for Motion, USD2,186m for Automation and USD113m for Corporate and Other. Their sum is the reported USD9,475m. Segment presentations instead show USD5,200m, USD2,217m and USD2,193m because they include intersegment sales. The model uses external revenue, avoiding an extra USD248m of internal transactions. Product and service gross-profit allocations in the forecast are assumptions, not reported segment GAAP gross margins. Original financial information, pages 28-30.

Original ABB July 16, 2026 financial disclosure, PDF page 29. Product and market forecasts remain issuer estimates.

Service is economically different from a greenfield equipment order. ABB has installed equipment, trained technicians, application knowledge and replacement requirements. In Q2, group services and other sales were USD1,491m, with Automation accounting for USD818m. These are recurring customer needs rather than a guarantee of subscription-like revenue. Field labor, response time, replacement inventory and regional approvals consume real cost.

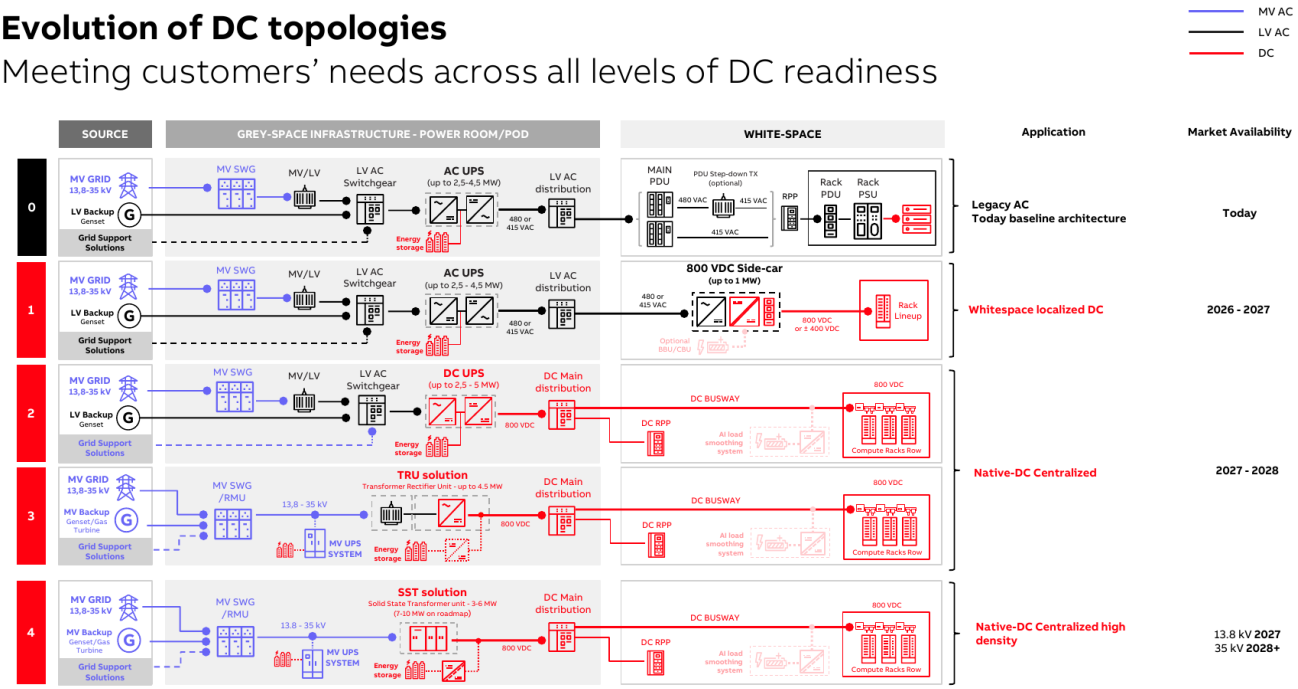

The electrical constraint, from first principles

Higher rack power raises current rapidly if voltage stays fixed. For a given load, moving distribution to a higher voltage reduces required current; conductor losses scale with current squared when resistance is unchanged. Real systems must also satisfy insulation, protection, fault isolation, redundancy and safety standards. Reduced copper and conversion losses do not remove those requirements.

ABB's September 24 presentation describes current 48-54V rack distribution and 415/480V AC supply reaching practical limits around 400kW per rack. The proposed response is to move AC/DC conversion out of the IT rack and supply 800V DC. Its native-DC system combines medium-voltage protection, conversion, distribution, fast DC protection and cooling-related control. ABB's cooling exposure includes motors and drives; it should not be mistaken for complete ownership of the chiller or liquid-cooling system. Original September 24 presentation.

Evolution of DC topologies

Meeting customers' needs across all levels of DC readiness

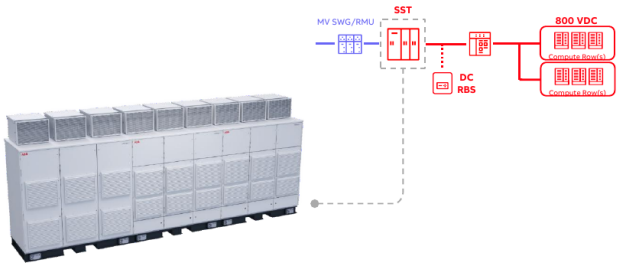

Original ABB September 24, 2026 DC portfolio, PDF page 16. Product and market forecasts remain issuer estimates.

The roadmap is staged. Existing AC infrastructure and local DC sidecars arrive before native-DC centralized architectures. The slide gives 13.8kV solid-state-transformer availability in 2027, with 35kV in 2028 or later; the management Q&A clarified second-half 2027 commercial availability for the initial offering. Commercial availability is an orderable product milestone. It is not evidence that all planned MW will be qualified, accepted and recognized as revenue in that period. Early public transcripts contain garbled units and an inconsistent early date; the original diagrams and later clarification control this analysis.

The proposed solid-state transformer uses existing traction and medium-voltage-drive components, suppliers and manufacturing experience. This improves its starting position relative to a entirely new technology chain. A data center still has a different load profile, uptime requirement and qualification process. Fast fault protection is particularly important in DC because current does not naturally pass through zero as in AC. The new 250A and 500A solid-state-breaker frames address this problem, but the original product pages explicitly label development specifications as subject to change.

02 SOURCES & POWER QUALITY

ABB Infinitus Solid State Transformer (SST)

Application

Native 800 V DC datacenter high power and superior efficiency applications to power GW campus, target high-density AI workloads from MV AC Source

Benefits

- Emerging technology that converts medium-voltage AC from source grid input into **stable 800V DC output**
- Optional Energy Storage Systems (ESS) coupled block & row DC feed output protection providing a **fully-integrated MV to DC** packaged solution
- **Superior efficiency** in compact footprint
- Optimized for quick-deploy (Skid & eHouse integration)
- MV/LV low-frequency transformer-less solution

Did you know?

The SST comprises of existing and proven reliable and robust ABB components and platforms, including existing factories and production know-how as well as our qualified suppliers from Traction and MV Drives businesses.

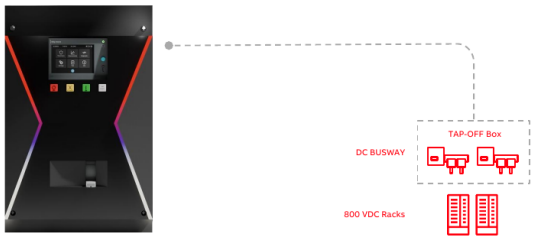

Specifications for products marked as "Under Development" may change without notice.

Original ABB September 24, 2026 DC portfolio, PDF page 19. Product and market forecasts remain issuer estimates.

04 POWER PROTECTION

ABB Infinitus Solid State Circuit Breaker (SSCB)

Application

- Infinitus SSCB with two new frames of 250 A and 500 A developed specifically for critical loads in DC applications
- Infinitus SSCB provides unparallel rack protection eliminating needs for OR-ing diodes and hold-up capacitors in the IT rack
- Available on UL489I and IEC 60947-10

Benefits

- Power electronic section that provides **ultra-fast short-circuit detection** and interruption. Electromechanical switch that provides galvanic isolation and can **switch load currents**
- Compact design with air cooling
- Settable tripping thresholds
- Both poles protected → full handling of IT-grounded systems
- Ultra-fast detection mechanism enables high di/dt handling and fast response protection for first Native DC racks

Did you know?

Originally developed to comply with ODCA and Current/OS standard the circuit breaker offers full short-circuit protection and isolation in both poles, making it the ideal solution for IT LVDC systems.

Original ABB September 24, 2026 DC portfolio, PDF page 20. Product and market forecasts remain issuer estimates.

HiPerGuard medium-voltage UPS is a more established commercial platform. ABB describes parallel configurations up to 50MW and claims footprint and copper benefits. These are configuration-dependent vendor claims; they are not proof that every customer saves the same amount. Qualification history, protection coordination, service coverage and a customer's cost of downtime can sustain pricing even when competing hardware is available.

A larger wallet can replace an existing wallet

ABB estimates that electrical power-infrastructure spending shifts from roughly 55% grey space and 45% white space toward as much as 75% grey space and 25% white space. The chart excludes generators, cooling and IT equipment. It is a mix shift inside a defined equipment budget, not a 20-point increase in the entire data center's capex. Some AC distribution, transformers and rack power supplies disappear as DC conversion, protection and distribution gain content. ABB participates on both sides.

Original ABB September 24, 2026 DC portfolio, PDF page 13. Product and market forecasts remain issuer estimates.

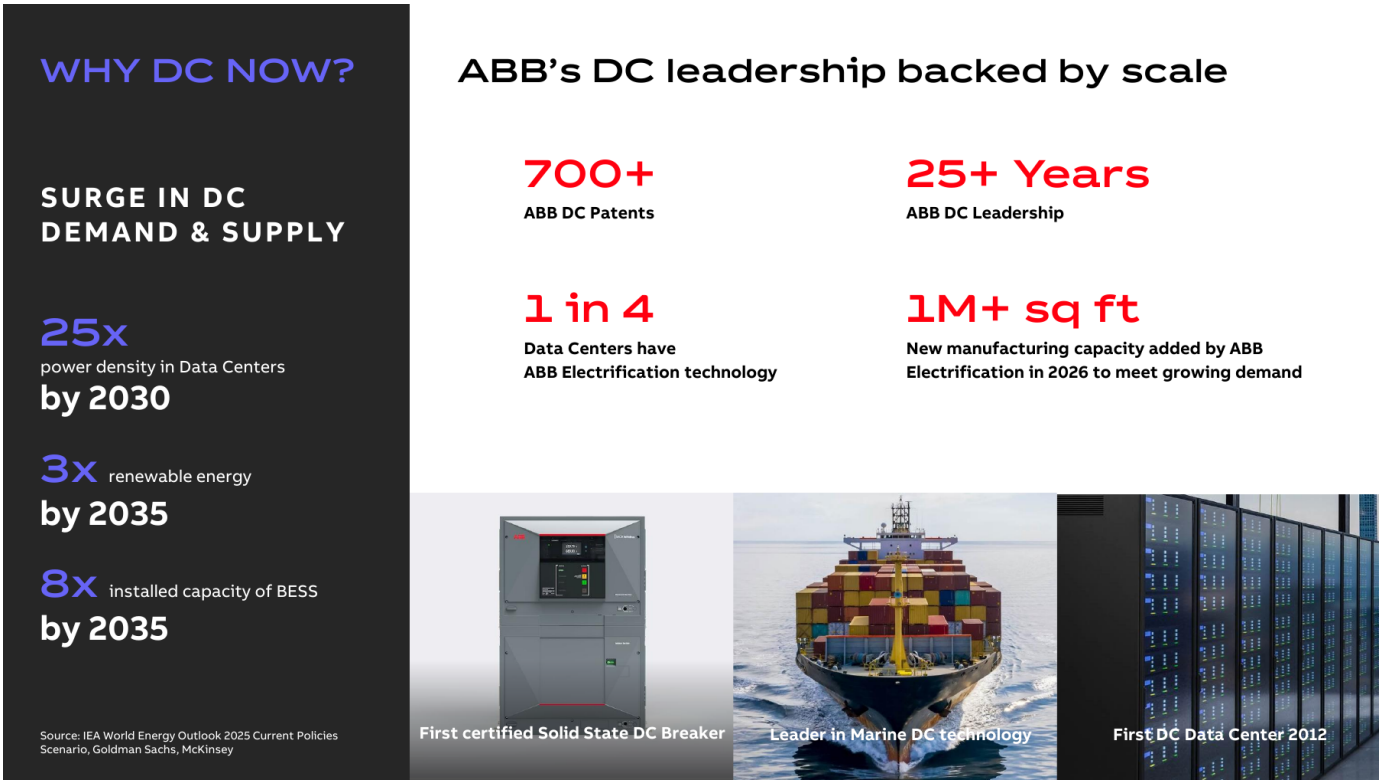

Management discussed approximately USD2m or more of present addressable power-equipment content per MW. That is neither ABB's realized ASP nor its captured revenue on every MW built. The model uses a much smaller incremental-content proxy, USD0.5m per qualified MW after displaced legacy equipment, and then removes 25% overlap with core growth. A 55% probability applies to both the resulting profit and the associated qualification expense. Selected additional project equivalents are 100MW late in 2027, 600MW in 2028, 1,000MW in 2029 and 1,500MW in 2030. The ranges are deliberately bounded in the claim ledger.

At the selected assumptions, the 2027 branch generates USD37.5m conditional revenue, USD14.25m GP and USD23.75m application/qualification expense. It therefore reduces 2027 conditional OP by USD9.5m, or USD5.225m after probability weighting. In 2028, conditional revenue rises to USD225m and conditional OP to USD33m after USD30m of qualification cost; the weighted OP increment is USD18.15m. This is how a credible long-term architecture can cost money before it becomes a material profit contributor.

ABB's 250GW industry capacity illustration is external market context. The 25-40% DC share discussed for capacity installed in 2030 is not applied to today's installed base. Neither figure is multiplied directly into ABB revenue. A slow, central and fast company-level execution test uses 0.25/0.50/0.75m incremental dollars per eligible MW. Customer dual sourcing, lower hardware requirements, migration delays and price competition can offset a larger total market.

Capacity, lead times and who captures the economics

ABB says Electrification adds more than one million square feet of manufacturing capacity in 2026. Floor area alone is not delivered equipment. Qualified labor, components, protection testing, production flow and customer acceptance determine good output. The latest calls describe shorter local supply chains and productivity work rather than a universal inability to deliver. July lead times were stable; management did not describe the same acute constraint as large gas turbines or some power transformers.

Original ABB September 24, 2026 DC portfolio, PDF page 7. Product and market forecasts remain issuer estimates.

The base revenue path already incorporates expanded capacity and approximately 2% current pricing discussed by management. A separate 50%-probability premium applies only to 20% of future Electrification invoices that are new or repriceable: an additional 1% price increase, with half removed for overlap. Net conditional extra sales equal 0.10% of segment revenue. Supplier costs absorb 35%, and selling/service absorbs another 10%. This is a small, explicit price/cost bridge rather than a margin increase pasted onto all backlog. Fixed-price contracts and the extra native-DC volumes are excluded from that second premium.

The countercase assigns 25% probability to a 5% delivery shortfall on half of reference Electrification sales. Lost gross profit is 40% of the missing invoices; only 12% of revenue is saved in variable operating cost. Fixed research, factories and support remain. This stress is not added again as a global AI demand collapse.

Actual results and the latest guidance

Q2 2026 revenue was USD9,475m, gross profit USD3,793m and GAAP operating profit USD1,585m. SG&A was USD1,725m, non-order R&D USD371m and other operating expense USD112m. Operational EBITA was USD1,925m, or 20.2%, which is a different measure. The USD340m gap included acquired amortization, restructuring, separation/integration, FX/commodity timing effects, environmental costs and asset-value changes. The model expenses ordinary depreciation, SBC, acquired amortization and recurring restructuring. It does not present operational EBITA as GAAP earnings. Q2 release and reconciliation.

See Notes to the Consolidated Financial Information

8 Q2 2026 FINANCIAL INFORMATION

Original ABB July 16, 2026 financial disclosure, PDF page 8. Product and market forecasts remain issuer estimates.

The first half produced USD18,209m revenue and USD3,365m GAAP OP. A USD377m Q1 real-estate gain is not an annual recurring earnings stream. Q2 Automation also benefited from an approximately USD15m project-settlement release. Both are excluded from future recurring assumptions. The 2025 continuing-company comparison is USD33,220m revenue and USD6,047m OP; that year's other income also included asset gains. Growth in normalized operating performance should not be confused with repeating those gains.

July guidance called for low- to mid-teens comparable Q3 growth and sequential improvement in operational EBITA margin. Full-year comparable growth was raised to low double digits through low teens, with positive book-to-bill and improved margin even excluding Q1's property gain. Capex was approximately USD1bn. The model has USD38,419m full-year core sales, a 15.7% reported increase, with the difference from comparable growth representing an explicit roughly 3-point currency/portfolio bridge. Its Q3 core GAAP OP is USD1,905.57m; adding only the USD125m framework PPA/restructuring/integration diagnostic gives a 20.27% operational margin, close to the stated improvement from 20.2%. This diagnostic is not the valued profit measure.

2026 framework

$ mn unless otherwise stated	Q2 26	Q3 26 framework	2026[1] framework
Corporate and Other Operational EBITA[2]	(109)	~(125)	~(100)
of which stranded costs[4]	(25)	~(25)	~(100)
Non-operating items:			
PPA-related amortization	(51)	~(50)	~(195)
Separation and integration	(23)	~(25)	~(75) From ~(60)
Restructuring and related and Business transformation	(36)	~(50)	~(200)

	2026 framework
Finance net	~150
Effective tax rate[3]	~25%
Capital expenditure	~(1,000)

1. Excludes one project estimated to a total of ~$100 million, that is ongoing in the non-core business. Exact exit timing is difficult to assess due to legal proceedings etc.
2. Excludes Operational EBITA from E-mobility business and includes the real estate gain of $377 million in Q1 2026
3. Excludes the impact of acquisitions or divestments or any significant non-operational items
4. Framework assumes stranded cost for the full year. Closing of Robotics divestment expected in the second half of the year, as earlier announced

© 2026 ABB. All rights reserved. Slide 18

Original ABB July 16, 2026 financial disclosure, PDF page 18. Product and market forecasts remain issuer estimates.

The forecast splits core 2027 revenue into Electrification USD24bn, Motion USD9bn, Automation USD9.5bn and other sales USD0.45bn. Core sales reach USD48.23bn in 2028 and USD57.46bn in 2030. Those are analyst assumptions supported by backlog conversion, not company targets. Electrification slows from a strong 2027 ramp toward 10% modeled growth in 2030; Motion and Automation remain materially less aggressive.

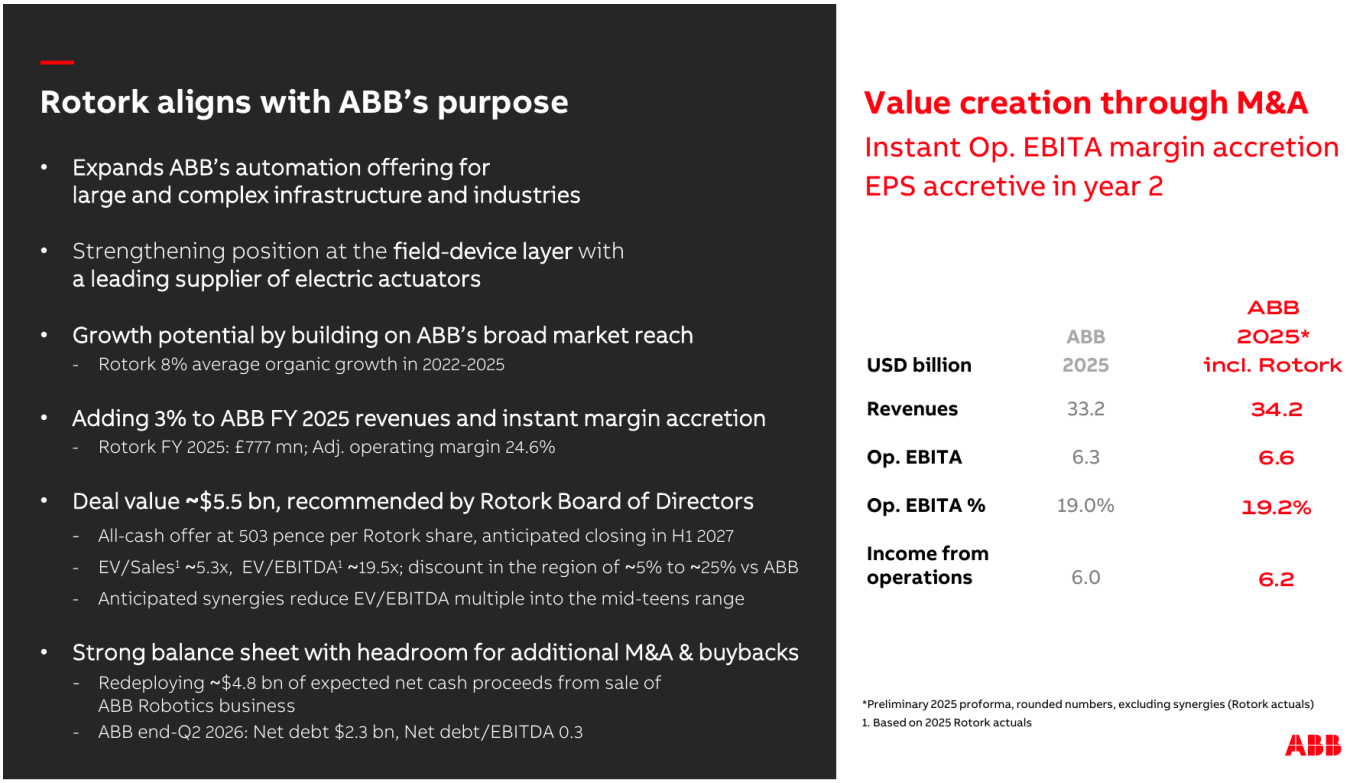

Fully loaded modeled gross margins in 2027 are 44.5%, 39% and 39.8% respectively. Group SG&A is 17.6% of core sales, R&D 4.3%, with a separate USD206m annual operating-risk allowance. By 2030, SG&A improves to 17%, R&D rises to 4.6%, and product margins improve modestly. Those improvements require utilization, mix and engineering productivity; they do not follow automatically from sales growth. Core OP is USD8.45bn in 2027 and USD9.81bn in 2028. Active probability-weighted totals, including transactions and downside, are USD8.46bn and USD9.94bn.

Robotics and Rotork: change the operating scope and the claims together

Robotics has already been reported as discontinued operations. ABB signed a sale to SoftBank for USD5.375bn enterprise value, and July materials indicate expected net cash proceeds around USD4.8bn. No official closing release was located by October 7. A 95% probability is assigned to a modeled Q4 2026 closing. The model does not receive both Robotics profits and its sale proceeds. Signed transaction.

The no-sale reference retains a USD2.4bn revenue and USD100m annual normalized-OP fallback, growing 3%. This restores USD66m annual depreciation absent from held-for-sale reported results; it is a bounded proxy, not a disclosed standalone forecast. The current half-year discontinued OP of USD83m cannot simply be annualized because depreciation has stopped and retained legacy obligations are included. Closing removes the fallback operations and credits the same USD4.8bn only once. Stranded corporate costs remain inside group SG&A; no automatic USD100m overhead elimination is assumed.

Rotork is the opposite transaction. The July cash offer is approximately USD5.5bn for the equity, with H1 2027 completion expected. Shareholders approved the transaction in September, while regulatory and other conditions remain. The model uses 85% probability of Q2 2027 closing. Conditional acquired sales are USD825m for three quarters in 2027, rising to USD1.15bn in 2028. The full purchase cash claim appears at the same probability and timing. Original ABB acquisition presentation.

Original ABB July 16, 2026 financial disclosure, PDF page 4. Product and market forecasts remain issuer estimates.

Rotork's electric actuators add a physical action layer beside ABB's sensing and control. Service, installed base and process qualification support the economics. They do not erase oil and gas cyclicality. H1 2026 Rotork sales were GBP367.2m and statutory OP GBP72m, including a GBP6.9m disposal gain; orders fell 4.9%. The forecast uses 46% GP, 26% operating expense, an additional USD50m annual acquisition-amortization allowance and USD25m integration expense per acquired 2027 quarter. Unknown purchase accounting is a material gap. The 24.6% 2025 adjusted margin is not used as acquired GAAP OP. Rotork original interim results.

Balance sheet, financing and common-share economics

June debt was USD8,177m. Cash and deposits available for the funding bridge were USD3,867m plus USD618m short-term time deposits. Another USD1,372m was equity securities, excluded from both funding and valuation credit. The valuation also excludes USD982m prepaid pension assets. It deducts the USD552m pension/employee-benefit liability conservatively, without asserting that all of it is an immediately payable pension deficit. Operating lease payments remain in operating expenses; the USD805m operating lease liability is not deducted a second time from an OP multiple.

The opening funding bridge pays the disclosed USD183m July 1 Specialtrasfo purchase and reserves USD100m for undisclosed smaller acquisition and closing requirements. It keeps a USD2bn operating cash reserve in the valuation. Starting net claims are therefore USD6,527m. Mature probability-weighted net claims are USD6,527m minus 95% of USD4,800m plus 85% of USD5,500m, or USD6,642m. Future FCF, future buyback share benefits and sale gains are not extra assets in the ceiling.

ABB Ltd Consolidated Balance Sheets (unaudited)

10 Q2 2026 FINANCIAL INFORMATION

Original ABB July 16, 2026 financial disclosure, PDF page 10. Product and market forecasts remain issuer estimates.

All 32 combinations of the five operating/transaction events are funded in the explicit cash bridge. It charges gross-debt interest, 25% cash tax on positive pretax profit, working capital at 20% of incremental sales, capex, legacy pension cash, minority distributions, residual buybacks and dividends. Ordinary D&A and SBC are added back only to cash flow, having first been included in operating earnings. Seventy-five percent of SBC is added back net of a withholding-cash reserve. Retained Robotics capex is charged separately: USD47.5m per unsold 2026 quarter and USD40m per later quarter in the no-sale case. If Robotics does not close, the discretionary final USD385m modeled buyback tranche is paused; no share benefit is credited in either outcome. Capex completes the USD1bn 2026 plan and rises thereafter; Infinitus has no second duplicate plant budget.

The worst combination is an acquired Rotork with no Robotics sale. It temporarily draws USD1,688.22m of the existing USD2bn committed revolver to preserve USD300m cash. This is modeled borrowing, not a reported draw. Cash above USD2bn repays the facility, and all debt maturity tests include its 2030 maturity without assuming an extension. Annual bond payments are front-loaded; the first four forecast quarters reconcile June's USD1,610m current debt. Across all modeled states, later actual net financial claims remain below the fixed conservative valuation claims. Larger delays, working-capital shocks or transaction costs can still exceed these bounds. Credit facility and maturity terms, annual report.

The issued share count after cancellation is 1,823.154m; June treasury shares are approximately 8m, making current outstanding shares approximately 1,815.154m. The market-cap snapshot uses that dated, rounded proxy. The ceiling starts with 1,823.154m economic shares, retaining an 8m award/dilution reserve, and adds 0.35m

each quarter. It gives no reduction for future buybacks even though the remaining authorization is charged in funding. Registered, issued, treasury, weighted-average EPS and future economic shares are different concepts. A 2% OP reserve approximates common attribution; no second USD506m book-minority deduction is made.

Competition, failure tests and catalysts

Schneider, Siemens, Eaton, Vertiv, Legrand and other specialists compete for the power-equipment budget. Motion also competes with WEG, Danfoss, Innomotics and others; process automation includes Emerson, Honeywell and Yokogawa. Local standards, installed-base interoperability, service response and qualification create friction, but customers can choose multiple suppliers. ABB's broad portfolio is an advantage, not proof of monopoly pricing.

The thesis weakens if Electrification backlog grows but acceptance and revenue lag, if extra plants produce poor yields or overtime costs, if price fails to recover input inflation, or if DC architecture reduces more legacy content than the new portfolio captures. A major acquisition with low initial returns can dilute the apparent benefit of selling Robotics. Native-DC design wins without dated paid deployments are insufficient to justify a faster model ramp. Roughly 32% of H1 sales came from the US and 11% from China; geography and process-market weakness remain relevant outside AI.

Near-term catalysts are Q3 order conversion and the revised margin bridge, the Robotics closing and final net proceeds, Rotork regulatory approval and purchase accounting, and proof that the residual buyback does not strain transaction funding. The later technical tests are paid commercial DC orders, protection qualification, real efficiency at varying load and accepted shipments in 2027-2028. Watch cash conversion alongside backlog; customer advances are liabilities and must not be counted as both free liquidity and incremental earnings.

The analytical score is 44/60, rounded to 73. Core17, Cycle8, TAM8, Catalysts4, Macro8 and Alpha3 are offset by a four-point risk deduction. The result reflects credible products and broad demand, with unresolved transaction and architecture economics. It does not authorize changing any protected portfolio override. The next research questions are exact acquisition amortization, the price/volume split of qualified DC shipments and whether project service economics improve as installations scale. These questions can change the model before formal earnings confirmation when bounded evidence supports a company-specific bridge.

Quarterly funding path

USD millions. Expected cash is probability weighted; minimum cash and maximum revolver may come from different states. Valuation reserves are not cash borrowing. Bond principal payments below exclude the separately modeled cash-sweep repayment of the temporary revolver.

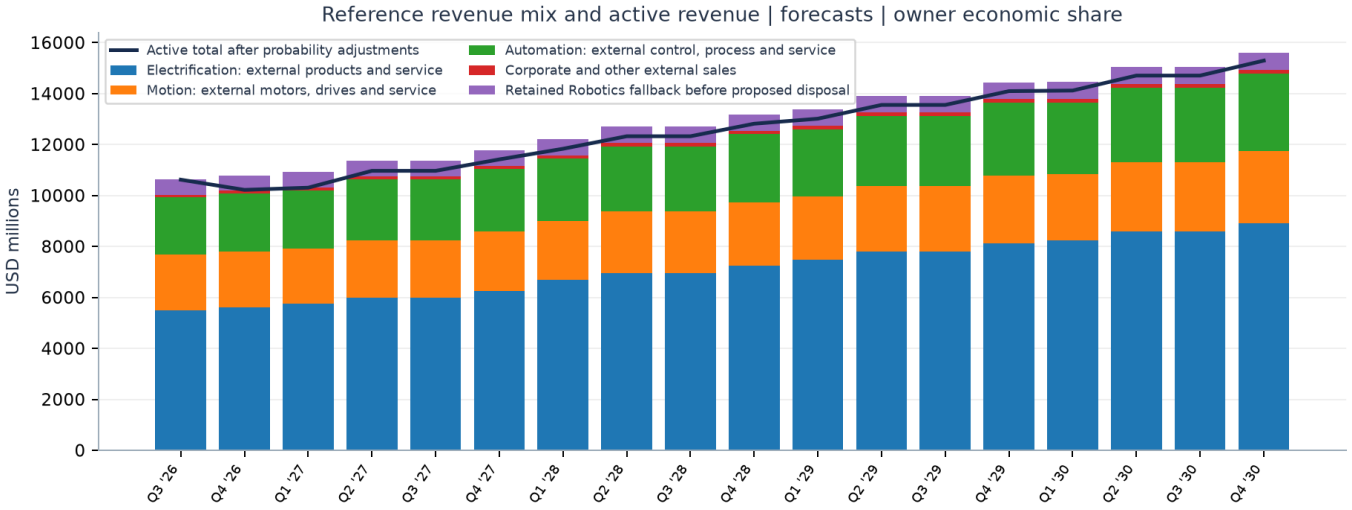

Quarter	Expected cash	Minimum cash	Maximum revolver	Expected capex	Bond/other principal
Q3 2026	4,270.0	4,270.0	0.0	339.0	458.0
Q4 2026	9,437.9	4,834.0	0.0	293.9	0.0
Q1 2027	9,272.0	5,022.6	0.0	277.0	1,152.0
Q2 2027	3,792.2	300.0	1,688.2	289.8	0.0
Q3 2027	5,248.6	1,713.1	1,688.2	289.8	0.0

Q3 2030	17,599.2	12,026.4	0.0	380.8	0.0
Q4 2030	19,748.1	14,131.5	0.0	380.8	0.0

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Qualified protection, controls and power-conversion design with service scale; architecture breadth reduces single-product risk.
Cycle	8	Strong multi-year project backlog but continued short-cycle and process exposure.
TAM	8	800VDC expands selected content while removing other ABB equipment; no global spending shortcut.
Catalysts	4	Order conversion, sale/acquisition closings and late-2027 commercial DC availability.
Macro	8	Electrification and AI support demand; rates, construction and export restrictions remain.
Alpha	3	Powertrain substitution and fully expensed transaction accounting matter more than AI labels.
Risk classes	-4	Two pending large deals, execution, minority claims, FX and cyclicality.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

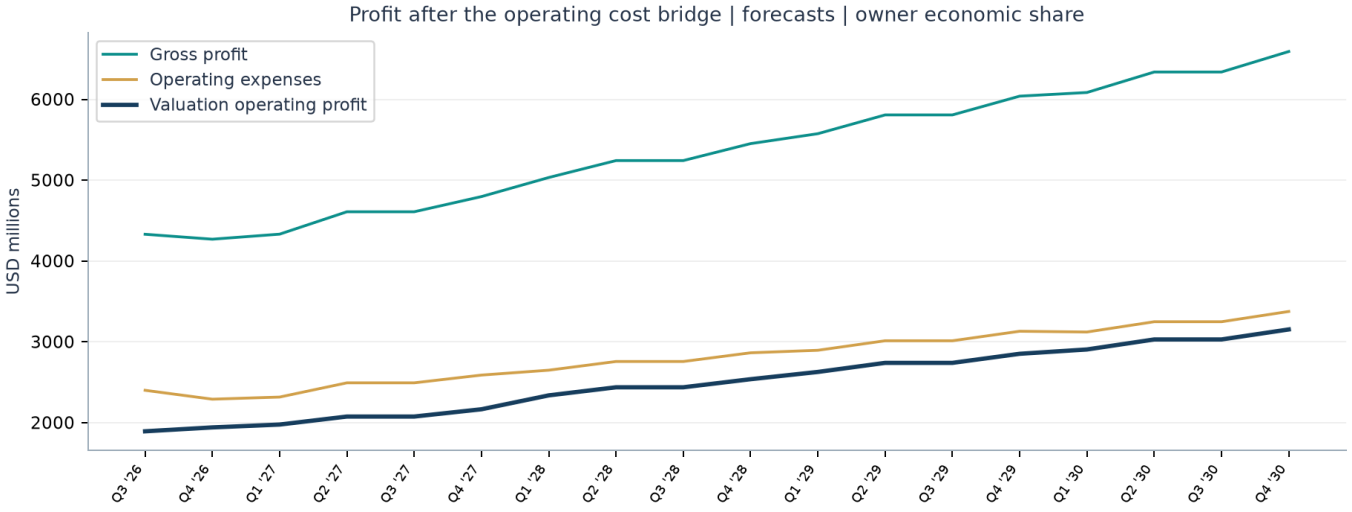

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	10,620.0	0.0	10,620.0
Q4 2026	10,790.0	-570.0	10,220.0

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Electrification: external products and service	5,500.0	43.7%	2,403.5
Q3 2026	Motion: external motors, drives and service	2,170.0	38.5%	835.5
Q3 2026	Automation: external control, process and service	2,250.0	39.6%	891.0
Q3 2026	Corporate and other external sales	100.0	20.0%	20.0
Q3 2026	Retained Robotics fallback before proposed disposal	600.0	30.0%	180.0
Q4 2026	Electrification: external products and service	5,600.0	44.2%	2,475.2
Q4 2026	Motion: external motors, drives and service	2,210.0	39.0%	861.9
Q4 2026	Automation: external control, process and service	2,280.0	39.6%	902.9
Q4 2026	Corporate and other external sales	100.0	20.0%	20.0
Q4 2026	Retained Robotics fallback before proposed disposal	600.0	30.0%	180.0
Q1 2027	Electrification: external products and service	5,760.0	44.5%	2,563.2

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Weighted OP below is after the stated minority operating-profit attribution. Conditional gross profit and expenses remain consolidated figures.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

NATIVE_DC

p: 0.55

source: ABB September 24 original portfolio deck and management Q&A

bounded: Qualified incremental project equivalents: 0-200 MW in late 2027, 300-900 in 2028, 500-1500 in 2029 and 750-2250 in 2030; select 100/600/1000/1500. USD0.5m incremental content per MW, bounded 0.25-0.75m, already net of legacy AC equipment displaced; remove another 25% reference overlap.

bridge: 38% incremental GP less 10% application/service expense and annual qualification costs of 20/30/40/40m in 2027-30. 55% applies to gains and qualification costs. Capacity investment remains within reference capex.

counter: Not an award or ASP disclosure. Late-2027 commercial availability is not mass acceptance. Alternatives, redundancy, tests and unchanged total power-equipment budgets constrain capture.

SELECTIVE_PRICE

p: 0.5

source: Q1/Q2 calls: customer cost of waiting, 2% current price benefit, stable lead times and hyperscaler bargaining power

bounded: Only 20% of reference Electrification invoices are new/repriceable; 1% additional premium within 0-2%; remove 50% overlap with existing pricing. Net conditional revenue 0.10% of EL sales from 2027.

bridge: 65% GP retention after supplier cost and 10% selling/service cost; 55% conditional OP flow. Fixed-price backlog and added native-DC units receive no second price uplift.

counter: Lead times were stable, not lengthening; current 2% pricing is already represented in reference. No broad scarcity surcharge is assumed.

DELIVERY_DOWNSIDE

p: 0.25

source: Q2 call: project backlog into 2028, softer process markets, conversion and capacity risk

bounded: 5% fewer delivered invoices on 50% of reference Electrification sales from 2027, conditional net revenue -2.5% of segment. This is an acceptance/cycle stress, not another global-TAM decline.

bridge: 40% lost GP offset by 12% saved variable expense; fixed overhead remains. No subtraction from already haircut native-DC branch.

counter: High backlog and localized capacity support deliveries, but orders are not recognized revenue.

ROBOTICS_SALE

p: 0.95

source: Signed SoftBank agreement; July original deck updates net proceeds to USD4.8bn; no closing release located by October 7

bounded: Model Q4 2026 closing, net cash USD4.8bn; failure retains USD2.4bn annual sales and USD100m normalized annual OP growing 3%. The fallback restores USD66m annual D&A absent from held-for-sale reported OP; range USD75-150m normalized OP.

bridge: Sale removes the same fallback sales/GP/opex and reduces claims by USD4.8bn once. Stranded corporate costs stay in core SG&A. No sale gain is capitalized at 20x and no separate robotics asset credit is added.

counter: Regulatory clearance and legal-entity separation remain conditions. Closing failure or a further delay alters cash timing, but does not destroy all retained operating value.

ROTORK_CLOSE

p: 0.85

source: July16 signed cash offer; September3 shareholder approval; H1 Rotork issuer financials

bounded: Model Q2 2027 close at USD5.5bn equity cash cost, matching conditional claims and funding. Acquired revenue USD825m in partial 2027, then USD1.15/1.23/1.315bn in 2028-30, versus roughly USD1bn FY25 scope. No uncommitted separate acquisition assumed.

bridge: 46% GP less 26% operating expense, USD50m annual new PPA amortization and USD25m per acquired quarter integration in 2027. Ordinary D&A and SBC embedded; no 24.6% adjusted margin used as GAAP OP. p=0 removes cost and earnings together.

counter: H1 2026 Rotork orders -4.9%; statutory OP72m GBP included a6.9m disposal gain. Regulatory risk, weak oil/gas and PPA uncertainty can overwhelm sales synergies.

CAPACITY_AND_CASH

p: 1

decision: One million square feet is not independently saleable output. Reference EL growth already represents the capacity program; USD1bn 2026 capex and later growth are charged once. No separate 250GW global-TAM multiplication, patent royalty, cash-interest value, future FCF credit or buyback share benefit.

zero reason: Scope, substitution and overlap explain zero additional increments. Funding explicitly consumes cash for transaction costs, the residual buyback authorization, dividends and debt maturities.

Remaining bounded uncertainties

- No official Robotics closing release was located by October 7; the model retains sale and non-sale outcomes.

- Rotork acquisition accounting is unknown: USD50m annual incremental amortization and USD75m 2027 integration expense are assumptions.

- June treasury shares are rounded; market cap uses approximately1815.154373m outstanding, not an exact October7 legal count. The ceiling denominator starts at1823.154373m including an8m economic award reserve and rises0.35m quarterly.

- Public full call republications contain transcription errors; original issuer slides control units and the Q&A clarifies commercial timing.

- Native-DC accepted MW, net content, ASP, margin and qualification costs are bounded proxies, not disclosed customer awards.

- USD100m cash reserve for undisclosed smaller acquisition/closing requirements is an assumption, separate from the July1 Specialtrasfo USD183m cash cost.

- USD552m employee-benefit liability is conservatively deducted; USD982m restricted/prepaid pension assets get no cash credit. The allocation between pension and other employee liabilities is not a precise actuarial common-equity settlement claim.

- If Robotics does not close, the discretionary final USD385m modeled buyback tranche is paused; there is no share-count benefit in either outcome. Retained Robotics capex is charged separately from continuing-company capex.

- The committed USD2bn revolver, maturity2030, covers a temporary transaction gap if Robotics does not close. Draws only bridge a USD300m cash floor and are repaid from cash above USD2bn; no uncommitted credit is assumed.

- Cash funding starts at June plus the disclosed July1 acquisition; subsequent unpublished actual cash movements are forecasts.

- Maturity allocation front-loads annual bond payments and reconciles the June next12months total; actual bond dates and FX cash settlement can differ.

- 2% of operating profit is reserved for noncontrolling interests, approximating current attribution; no second book-NCI deduction.

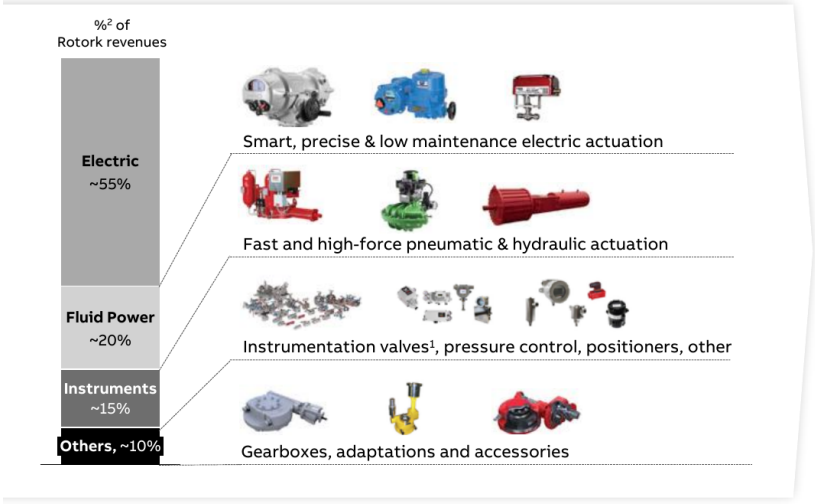

- No credit is assigned to USD1372m equity securities or future cash accumulation. The excluded portfolio may have realizable value; zero is a conservative valuation scope, not an assertion of worthlessness.

Selected original evidence

Source exhibit 1

ABB | Original ABB July 16, 2026 financial disclosure, PDF page 6. Product and market forecasts remain issuer estimates.

ABB acquiring world-class technology for electric actuation

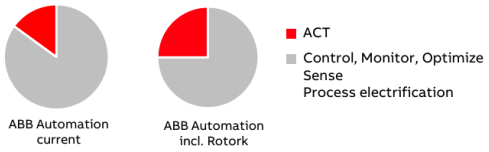

1) Unlike process valves designed for high flow control, instrumentation valves are built to handle smaller flow rates with precision. They are used to control, isolate, or monitor the flow within pipelines connected to pressure gauges, transmitters, and other instruments
2) ABB estimates

© 2026 ABB. All rights reserved. Slide 6

Benefits of electric actuators

- Higher precision and accuracy in control of position, speed and force
- Energy efficiency as consume power only when move
- Higher level of digital diagnostics
- Easy installation requiring only electric power supply and wiring control
- Easy maintenance as fewer components

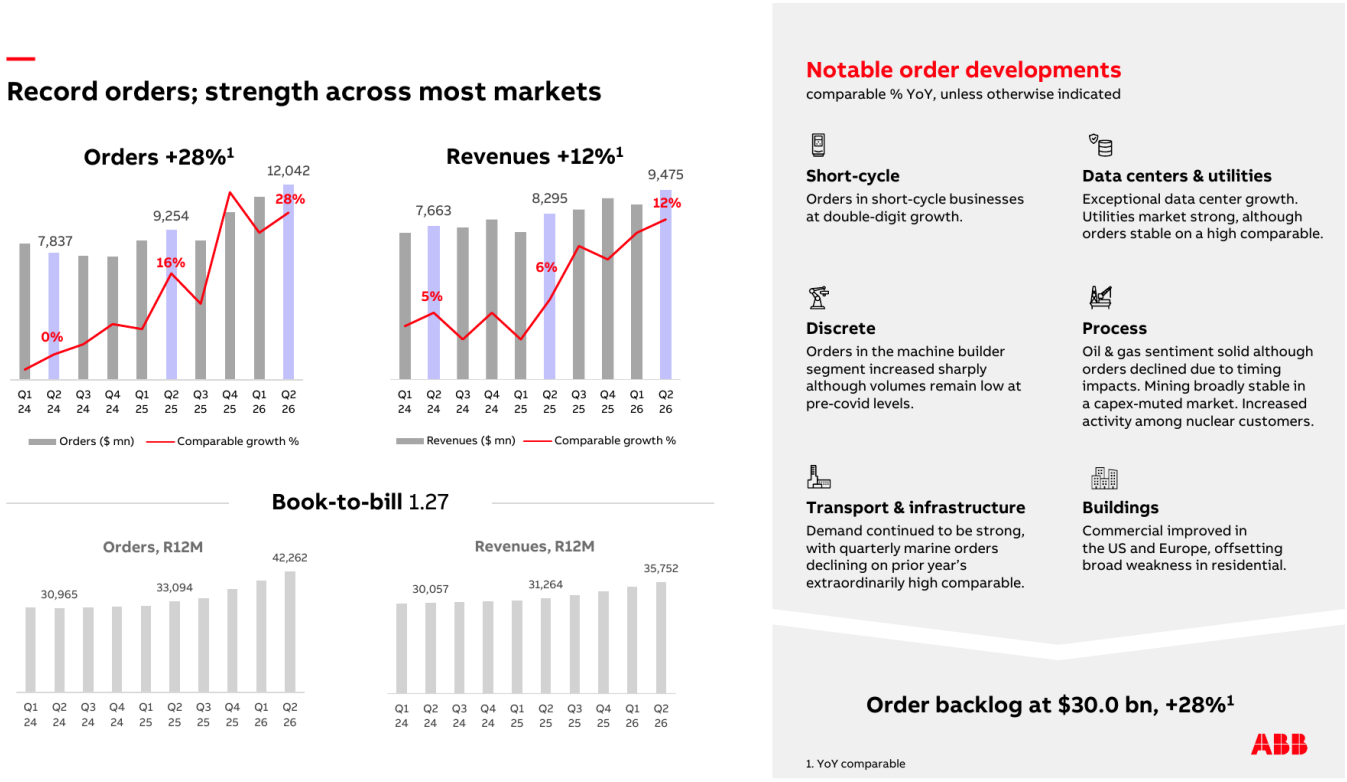

Balancing ABB's offering in sense-control-act automation loop

Record orders surpassing the $7 bn mark; broad-based market strength

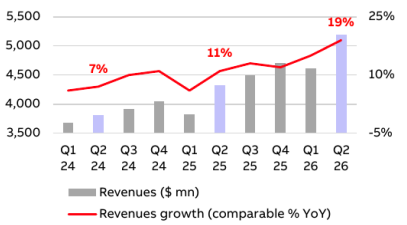

Q2 2026 Electrification

Orders $7,231 mn

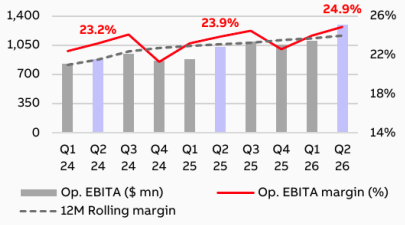

- Record-high orders, first time surpassing $7 bn
- Orders improved at a strong double-digit rate in both short-cycle and project businesses
- Rapidly expanding investments in data center build-out remained a primary catalyst with the segment seeing triple-digit growth
- Stable orders in the utility segment on last year's high comparable, underlying market strength
- Buildings improved, driven by commercial demand in the United States and Europe, while the residential market remained muted
- Backlog $13.7 bn (prior Q-end $11.5 bn)

Revenues $5,200 mn

- Strong improvement in both the short-cycle and project businesses
- Majority of growth due to higher volumes, with additional support from positive price contribution of ~2%, which also improved sequentially
- 2% additional growth from FX
- Book-to-bill 1.39x

Operational EBITA $1,301 mn, +26% YoY

- 140 bps YoY gross margin decline
  - Almost half the decline due to impact from unrealized FX and commodities derivatives
  - Some pressure from the price/cost gap on higher input costs
- Operational EBITA margin +100 bps YoY
  - Supported by operational leverage on higher volumes and operational efficiency improvements
  - SG&A declined in relation to revenues

Source exhibit 4

ABB | Original ABB July 16, 2026 financial disclosure, PDF page 12. Product and market forecasts remain issuer estimates.

Strong orders, but pressure on profitability

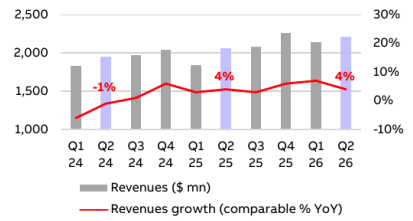

Q2 2026 Motion

Orders $2,592 mn

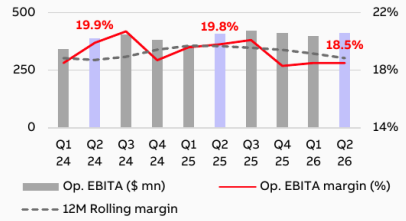

- Strong development in both short-cycle and project businesses resulted in record-high orders
- Grid stabilization demand strong; large order of ~$150 mn booked
- Strong momentum also in HVAC linked to commercial buildings and data center cooling
- Rail segment persistently strong, with strength also noted in food & beverage, marine, mining and low carbon areas like nuclear and wind
- Oil & gas remains broadly stable, while chemical and pulp & paper demand was soft
- Backlog $7.0 bn (prior Q-end $6.6 bn)

Revenues $2,217 mn

- Driven mainly by higher volumes and ~2% price
- Gamesa power electronics acquisition contributing 1% of portfolio change impact
- 2% additional growth from FX
- Book-to-bill 1.17x

Operational EBITA $413 mn, +1% YoY

- Gross margin drop of 120 bps primarily from Gamesa acquisition, and some impact from unrealized FX and commodities derivatives
- Operational EBITA margin declined 130 bps YoY
  - Positively impacted by operational leverage on comparable growth
  - Margin pressure in the High Power division, including 70 bps linked to the Gamesa acquisition
  - Lower profitability in the Traction division due to delayed production volumes

Source exhibit 5

ABB | Original ABB July 16, 2026 financial disclosure, PDF page 13. Product and market forecasts remain issuer estimates.

Robust market; book-to-bill 1.12

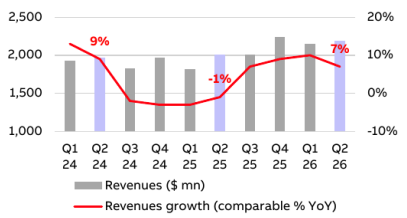

Q2 2026 Automation

Orders $2,454 mn

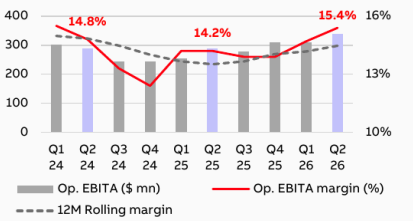

- Year-on-year decline due to an extraordinarily large order of $600 mn booked in the prior year
- Persistently high customer activity linked to marine and port automation and electrification
- Customer activity in the oil & gas segment solid, with softness linked to the Middle-East conflict contained to the local market
- Demand remains softer in the process industry-related markets like pulp & paper, chemicals as well as mining
- Backlog at $10.5 bn (prior Q-end $10.4 bn)

Revenues $2,193 mn

- Contribution from solid backlog execution, positive trend in service and product business
- 2% additional growth from FX
- Book-to-bill 1.12x

Operational EBITA $338 mn, +17% YoY

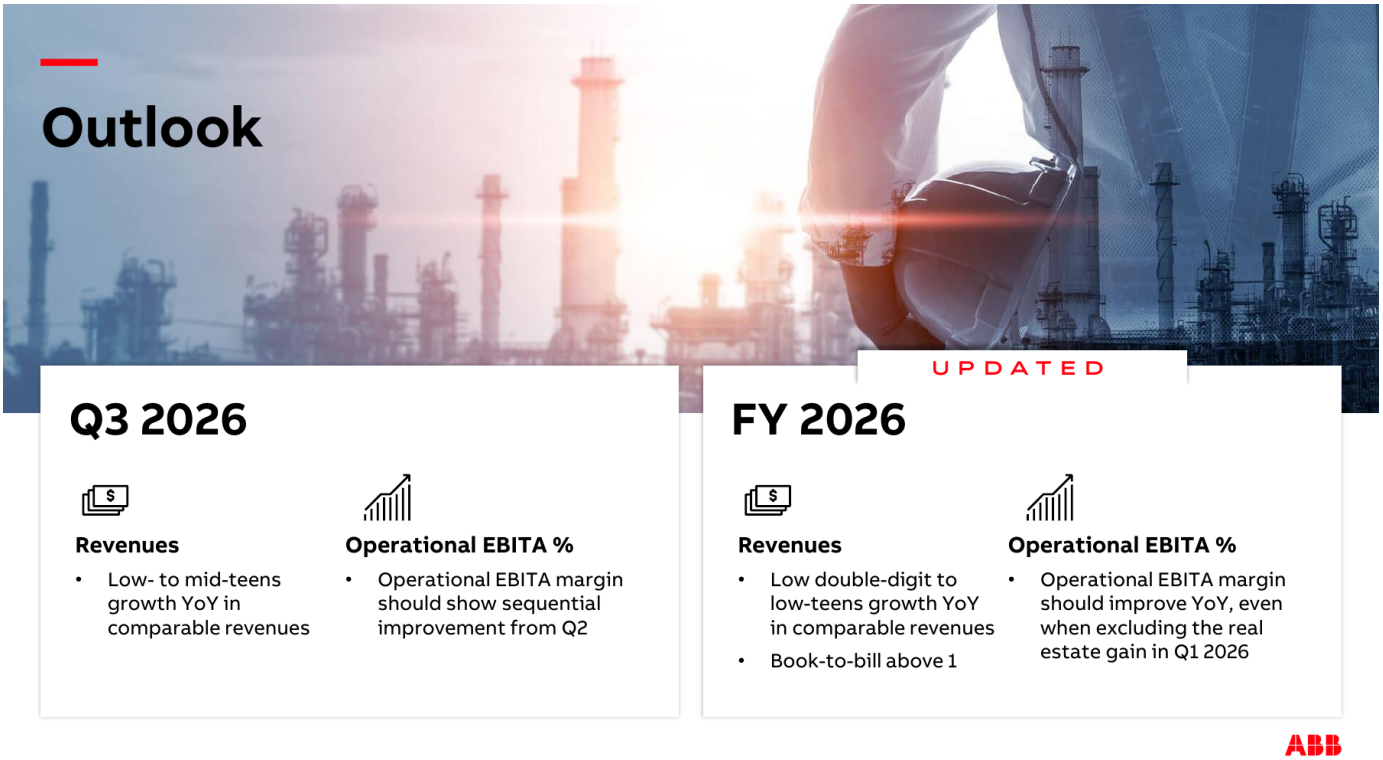

- Operational EBITA margin +120 bps YoY
  - Slight gross margin decline of 10 bps due to an adverse mix with higher share of revenues derived from the project- and system integration businesses
  - R&D spend increased in relation to revenues, while stringent cost control reduced SG&A ratio, supporting the improvement in Operational EBITA margin
  - Additional margin support from project settlement triggering a provision release of ~$15 mn

Subsequent events

Completed acquisition

On July 1, 2026, the Company acquired the shares of Specialtrasfo S.p.A. Specialtrasfo is an Italian manufacturer of specialized medium voltage transformers, including converter and rectifier transformers, with a worldwide installed base. To complete the transaction, the Company's cash outflows amounted to $183 million. This acquisition closes a gap in the Company's industrial automation portfolio. The initial accounting and disclosures for this acquisition are incomplete as Specialtrasfo was only recently acquired.

Planned acquisition

On July 16, 2026, the Company announced that it had reached an agreement on the terms of a recommended cash offer for the entire issued and to be issued share capital of Rotork plc (Rotork) for 503 pence per share (approximately $5.5 billion based on issued share capital at June 30, 2026). Rotork, headquartered in the United Kingdom, is a provider of intelligent flow control solutions and a manufacturer of electric actuators. The acquisition is expected to expand the Company's offering for large and complex infrastructure and industries within its Automation business area. The Company expects to complete the acquisition in the first half of 2027 subject to approval by Rotork's shareholders and customary closing conditions, including regulatory clearances.

Note 10

Debt

The Company's total debt at June 30, 2026, and December 31, 2025, amounted to $8,177 million and $8,304 million, respectively.

Short-term debt and current maturities of long-term debt

The Company's Short-term debt and current maturities of long-term debt consisted of the following:

($ in millions)	June 30, 2026	December 31, 2025
Short-term debt	56	26
Current maturities of long-term debt	1,554	449
Total	**1,610**	**475**

Short-term debt primarily represented short-term bank borrowings from various banks.

Long-term debt

The Company's Long-term debt at June 30, 2026, and December 31, 2025, amounted to $6,567 million and $7,829 million, respectively.

Significant long-term borrowings (including maturities within the next 12 months) were as follows:

	June 30, 2026		December 31, 2025	
(in millions)	Nominal outstanding	Carrying value[1]	Nominal outstanding	Carrying value[1]
1.965% CHF Bonds, due 2026	CHF 325	$ 402	CHF 325	$ 410
3.25% EUR Instruments, due 2027	EUR 500	$ 569	EUR 500	$ 586
0.75% CHF Bonds, due 2027	CHF 425	$ 525	CHF 425	$ 535
3.8% USD Notes, due 2028	USD 383	$ 382	USD 383	$ 382
1.9775% CHF Bonds, due 2028	CHF 150	$ 185	CHF 150	$ 189
3.125% EUR Instruments, due 2029	EUR 500	$ 569	EUR 500	$ 588
1.0% CHF Bonds, due 2029	CHF 170	$ 210	CHF 170	$ 214
0% EUR Instruments, due 2030	EUR 800	$ 819	EUR 800	$ 838
2.375% CHF Bonds, due 2030	CHF 150	$ 185	CHF 150	$ 189
3.375% EUR Instruments, due 2031	EUR 750	$ 846	EUR 750	$ 871
Floating rate EIB R&D Loan, due 2031	USD 539	$ 539	USD 539	$ 539
0.8725% CHF Bonds, due 2032	CHF 350	$ 431	CHF 350	$ 440

3.375% EUR Instruments, due 2034	EUR 750	$ 847	EUR 750	$ 872
1.2762% CHF Bonds, due 2036	CHF 250	$ 308	CHF 250	$ 314
4.375% USD Notes, due 2042	USD 609	$ 593	USD 609	$ 592
Total		**$ 7,749**		**$ 7,905**

(1) USD carrying values include unamortized debt issuance costs, bond discounts or premiums, as well as adjustments for fair value hedge accounting, where appropriate.

—

Note 11

Commitments and contingencies

Contingencies—Environmental

The Company has been notified by the United States Environmental Protection Agency (EPA) that the Company, along with others, has been identified as a potentially responsible party at a location on the EPA's National Priorities List of Superfund sites. This site is associated with a business acquired by the Company in 2012 and the claim relates to operations of the acquired business prior to the acquisition. The Company determined that a loss related to this matter is probable. The reasonably estimable range of loss based upon currently available information is between $31 million and $204 million. As no amount within the range is a better estimate than any other, the Company has recorded a provision of $31 million during the three months ended June 30, 2026. The estimated range reflects potential exposure associated with currently identified remediation activities while a subsequent phase of remediation could result in additional losses that are not presently estimable as the related remediation strategy is yet to be defined. Although the Company believes its estimated range of potential loss is reasonable, the outcome of these matters is inherently uncertain and actual losses could exceed the amounts accrued or disclosed.

Contingencies—Regulatory, Compliance and Legal

General

The Company is subject to proceedings, litigation or threatened litigation and other claims and inquiries related to various regulatory, commercial and other matters. The Company assesses the likelihood of any adverse judgments or outcomes to these matters, as well as potential ranges of probable losses. A determination of the provision required, if any, for these contingencies is made after analysis of each individual issue, with assistance, when necessary, from internal and external legal counsel and technical experts.

As it is not possible to make an informed judgment on, or reasonably predict, the outcome of certain matters and as it is not possible, based on information currently available to management, to estimate the maximum potential liability on other matters, there could be adverse outcomes beyond the amounts accrued; however, the Company does not expect the resolution of current matters to have a material adverse effect on its financial statements.

ABB HiPerGuard
Static Medium Voltage UPS

Application

- Data Center applications to power GW campus target high-density AI workloads from MV Source (Hyperscale)
- Industry heavy industrial plants with high power demand

© 2026 ABB. All rights reserved. Slide 19

01 MV POWERTRAINS

Benefits

- Industry's **first static MV UPS** designed for hyperscale data centers Modularity, N+3 internal redundant power converters
- **Scalability**, hard parallel configuration (up 50 MW UPS system blocks) satisfying Gigawatts AI factories' power demand
- Provides **CapEx & OpEx savings**, 30% less footprint, 24x less copper and associated heat dissipation, supporting lower CO_2 emissions
- Compatible with demand response, diesel generators, gas turbines, and aggressive AI load profiles
- Class-1 performance with superior efficiency ensuring uninterrupted and clean power during grid disturbances
- Full global grid code compliance with native ride-through readiness

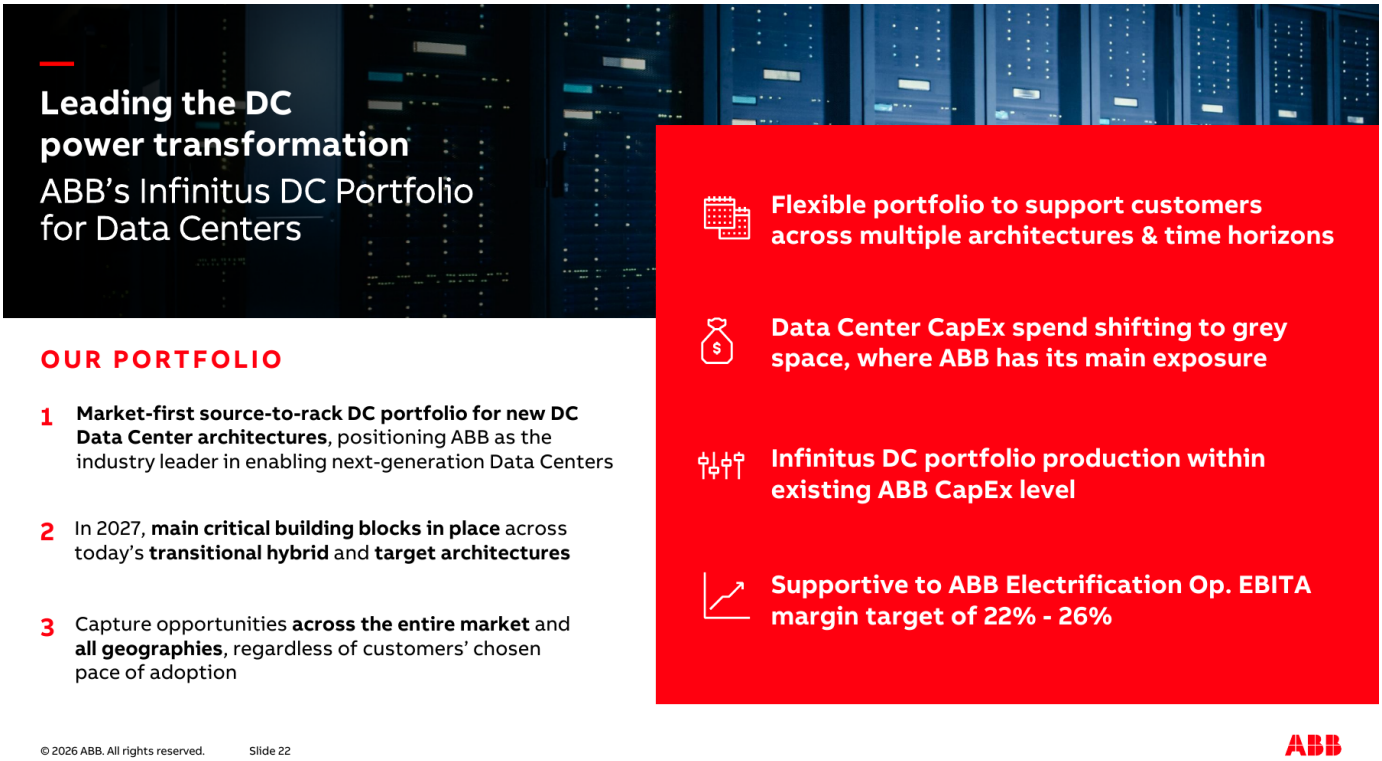

Did you know?

Since 2016, ABB HiPerGuard MV UPS established a worldwide installed base in the datacenter and industrial application sectors.
