Aeva Technologies

AEVA | NASDAQ | 2026-10-07

Q4 2027 model ceiling: USD 0.00

Analytical Base 37/60 = 62 | Fail / Early optical and sensing optionality

20x forward-four-quarter GAAP operating profit. Value the 60% qualified and 40% delayed optical operating states separately, match common shares and convertible claims to the window end, and multiply each state value by its conditional funding survival. Funding failure has zero common-equity value. Cash is reserved for the operating plan.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

Snapshot: USD 14.57 on 2026-10-06 close. Model diluted shares at Q3 2026: 83.369m. Indicative diluted capitalization: USD 1,214.7m. Quote and share dates/bases may differ; legal shares are reconciled in the analysis.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	-105.0	20x	103.235	0.00

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

The investment case

Aeva has commercial sensing products, automotive production awards and an optical-source development agreement aimed at a hyperscaler's next generation of interconnects. The investment question is whether those programs can produce accepted hardware at profitable prices before development costs require too much capital. A signed program creates a credible revenue path; qualification, delivered units and financing determine how much of that path belongs to today's common shareholders.

The active Q4 2027 ceiling is **Nil**, using 20x forward-four-quarter GAAP operating profit and matched financing claims. Both modeled optical outcomes lose money over Q4 2027-Q3 2028. The ceiling first becomes positive in Q2 2028, reaches **USD 6.14 in Q4 2028** and **USD 18.67 in Q1 2030**. These are dated model outputs, not a claim that the technology has no value before profits. This earnings method does not separately capitalize an unpriced technology option.

Analytical Base is **37/60, rounded to 62**: Core 14/20, Cycle 5/10, TAM 8/10, Catalysts 3/5, Macro 8/10, Alpha 4/5 and Risk -5. Differentiated engineering and named commercial programs earn credit. Qualification, concentration, capital access and uncertain commercial terms keep the company below the framework's Watchlist threshold. This initiation establishes coverage; no holding is established.

What Aeva sells and who gets paid

Aeva sells sensors and precision-sensing components, perception software and engineering services. The optical connectivity program would sell Aeva source content into another company's optical engine. It does not give Aeva the engine partner's revenue, the complete transceiver price or the hyperscaler's network spend. Nikon and SICK likewise buy Aeva technology for their products; their entire system prices are not Aeva ASPs.

External manufacturing partners' components, factory capacity, packaging, test and required returns remain in cost of goods. Asset-light design does not create cost-free output. Qualification and customer acceptance govern recognition: delivered engineering milestones enter service revenue; accepted hardware enters product revenue. The same sample is never counted again as a production sensor.

The engineering claim and the qualification boundary

Frequency-modulated continuous-wave sensing measures distance and radial velocity from coherent light. Velocity information can improve selected perception and measurement tasks. The comparison still depends on usable range, accuracy, integration, software, reliability and cost against cameras, radar, time-of-flight LiDAR and other FMCW designs.

The January 2026 amplifier announcement cited output above 28 dBm, equivalent to more than 0.631 W, and wall-plug efficiency above 20% at temperatures up to 50°C. These are issuer amplifier specifications. They do not establish packaged power at the customer's engine, end-to-end efficiency, datacom wavelength qualification or field reliability. A 1550 nm sensing heritage is not proof of a qualified 1310 nm data-center source.

Coupling loss, thermal design, drive circuitry, wavelength stability, burn-in and accepted yield determine usable output and cost. Reusing a photonics platform may shorten development, but does not eliminate product-specific qualification. The model gives successful commercialization a positive probability while retaining development and outside manufacturing costs. It does not declare competing Lumentum or Coherent products obsolete.

The current earnings engine

The June-quarter filing reports **USD 6.136m revenue**: USD 2.546m product and USD 3.590m services. Product cost was USD 2.614m, leaving a USD 0.068m product gross loss. Services generated USD 2.257m gross profit. The USD 2.189m consolidated gross profit therefore cannot be extrapolated as mature hardware economics.

GAAP operating expenses were USD 36.749m: R&D USD 24.889m, G&A USD 10.216m and selling and marketing USD 1.644m. Operating loss was USD 34.560m. SBC remains an expense, added back only in cash flow, with new awards also entering shares. Depreciation receives the same treatment. Non-cash warrant remeasurement is not operating cash use.

The near-term forecast is calibrated to that starting point. Q3 2026 revenue is USD 6.23m, gross profit USD 2.14m and operating loss USD 35.97m. Product gross profit is only USD 0.041m. Q4 revenue is USD 7.15m and operating loss USD 36.44m. These are model assumptions, not quarterly issuer guidance. Hardware margins improve gradually rather than immediately inheriting service margins.

The May 6 and August 5 calls were reviewed through attributed transcript reproductions against releases, filings and decks. Both original 2026 quarterly presentations and the June 10-Q are now archived locally. Repeated discussion of one program is overlapping evidence.

AevaQ2 issuerrelease,August5,2026 | Issuer income statement: product and services economics have different margins.

Automotive programs

Each program has a separate sensor-unit, ASP and execution schedule. Probabilities describe delivery of the bounded commercial path, not whether an announced agreement exists. Quantities and prices are analytical assumptions because the issuer does not disclose the necessary order-level information.

Program	Probability	Model timing	Conditional 2030 sensors	Expected sensors	Expected 2030 revenue
Daimler Truck	75%	Production-intent samples; targeted 2027 customer launch	80,000	60,000	USD 68.21m
Awarded European OEM	65%	Samples before targeted 2028 SOP	500,000	325,000	USD 271.86m
Bendix commercial ADAS	35%	Development award; assumed 2028 first production	100,000	35,000	USD 21.00m
Unawarded passenger/referral pool	25%	Small samples, then assumed late-2028 commercial entry	150,000	37,500	USD 30.00m

Daimler's production agreement and May C-samples justify the highest probability. The European award is exclusive outside China but does not reveal platform adoption. Its 500,000 conditional 2030 sensors are bounded by a 250,000-750,000 sensitivity range, rather than the OEM's entire production. Bendix has no disclosed SOP; 100,000 conditional sensors stay within the stated approximately 300,000 annual North American Class 8 market under a one-sensor assumption. NVIDIA access and the top-five development engagement are one overlapping prospect pool.

The programs generate **457,500 expected sensors and USD 391.08m revenue in 2030**. ASPs differ: Daimler stays above USD 1,100, European sensors approach USD 825, Bendix reaches USD 600 and the unawarded pool USD 800. Product gross margin moves from slightly negative near-term economics to 47%; this is a cost/yield assumption, not a disclosed contract margin.

The official **July 16, 2025 Daimler collaboration release** announced planned North American capacity up to 200,000 sensors annually for multiple customers. This is distinct from the July 29 LG Innotek collaboration. Daimler plus Bendix consume 180,000 conditional annual sensors in 2030. If Forterra and CityOS share that Atlas-family capacity, the total becomes approximately 197,800 before residual products. Full simultaneous success requires nearly all planned output or additional qualified capacity. Probability-weighted demand does not prove a factory can ship every successful branch. Passenger production capacity is a separate unresolved issue.

Aeva Q2 2026 original investor presentation, page 7 | Bendix development scope and approximately 300,000 annual North American Class 8 trucks; this is a market boundary, not an Aeva order.

Aeva Q2 2026 original investor presentation, page 8 | Issuer production-intent automotive progress; qualification does not establish annual production quantities.

Industrial, defense and CityOS

The model estimates **USD 62.04m** of industrial, defense and CityOS revenue in 2030, built from four named programs and a flat residual business. Commercial products and shipments justify nonzero forecasts; unknown orders and prices limit their magnitude.

Channel	Probability	Conditional 2030 deployment	Net Aeva content assumption	Expected revenue
Nikon	75%	5,400 component/system equivalents	USD 3,500 per component	USD 14.18m
SICK	65%	105,000 component/sensor equivalents	USD 400 per component	USD 27.30m
Forterra	60%	3,400 vehicles	Four sensors at USD 1,200	USD 9.79m
CityOS	65%	2,100 new intersections	Two sensors at USD 1,500 plus USD 500 initial software/support	USD 4.78m
Residual existing products	Existing-business allocation	Flat USD 1.5m per quarter	Excludes named programs	USD 6.00m

Nikon's APDIS MV5X and multi-year production agreement support 75% execution, but only Aeva component content is valued. The conditional 2030 bound is 2,700-8,100 components at USD 2,500-4,500. SICK's first Eve-powered commercial sensor supports 65%, with 50,000-150,000 conditional components at USD 250-550. Future SICK products remain inside this adoption path, not automatic separate awards.

Forterra has added a second vehicle platform and receives sensors. Four sensors is the MESA configuration described on the May call; applying that count across future deliveries is an explicit mix assumption. The 2030 bound is 1,700-5,100 vehicles with two to four sensors at USD 900-1,500. Defense budgets and delivery schedules justify a 40% execution shortfall probability.

CityOS has Georgia and Fargo deployment evidence. The product page illustrates two sensors per intersection. The active 2,100 new sites in 2030 sit within a 1,000-3,000 range, with USD 2,500-5,000 Aeva net content per site. Integrator installation revenue is excluded. A separate recurring subscription pool is not added: the USD 500 initial content already includes software/support, and another fee needs distinct billing economics. This is an overlap adjustment, not a claim that recurring revenue is impossible.

The residual USD 1.5m quarterly product line is an allocation within existing sales, held flat. Combined with named channels and automotive samples, Q3 product revenue is USD 2.73m against the filed USD 2.546m in Q2. It is not another growth market layered on those customers.

Component gross margin begins at 10% and reaches 48%; Forterra begins at zero and reaches 42%; CityOS begins at 10% and reaches 52%. Residual margin reaches only 30%. All include hardware costs and are assumptions. Forterra and CityOS pay an extra 5% of sales for deployment support above the base field team. Doubling named industrial deployments is an upside sensitivity only, producing USD 118.09m total industrial revenue in 2030.

First Commercialization with SICK

SICK launched its first industrial sensor powered by Aeva's Eve precision technology

Delivers high precision and velocity measurement reliably across a broad range of environments that can challenge legacy triangulation solutions

Part of strategic collaboration to scale Aeva's technology across SICK's product portfolio for a diverse range of industrial sensing applications at scale

AEVA + SICK Sensor Intelligence.

© 2026 Aeva, Inc.

Aeva Q2 2026 original investor presentation, page 9 | First commercial SICK sensor, distinct from future portfolio-wide adoption.

Expansion with Forterra

Forterra expanded use of 4D LiDAR to its new MESA autonomous ground vehicle

4D LiDAR's long range and velocity detection, vehicle positioning and undetectability by night vision systems enable stealth operation in GPS-denied environments

Working on further expansion with Forterra and other new opportunities such as drones

Engineering revenue and accounting

Recognizable NRE uses an 80% delivery probability. Conditional annual milestones are USD 20.75m in 2027, USD 19.5m in 2028, USD 15m in 2029 and USD 12.5m in 2030. Expected revenue is USD 16.6m, USD 15.6m, USD 12m and USD 10m. Current USD 3.590m quarterly services and announced customer development anchor the pool; it tapers as production replaces engineering. No precise contract balance is inferred.

LG Innotek's USD 7.5m JDA consideration is excluded from NRE revenue. The June filing treats the JDA and equity subscription as a combined contract, allocating all consideration to the subscription and none to service revenue. Cash receipt does not change that accounting. The forecast's 60% NRE gross margin includes direct delivery costs; corporate R&D stays separately funded. Physical sensor deliveries are not counted again as engineering milestones.

The optical program

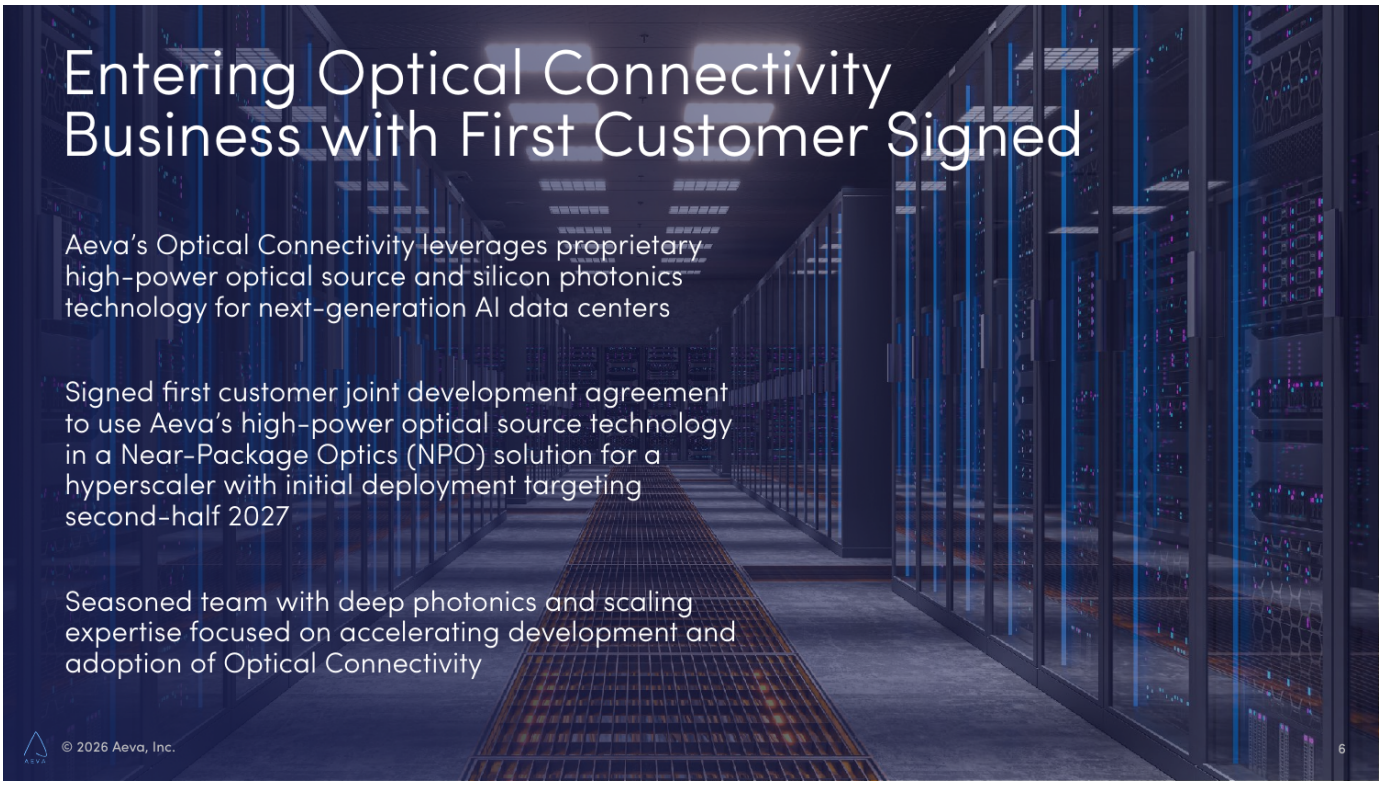

The August 5 agreement is with an optical-engine partner supplying a hyperscaler. The deck targets initial NPO deployment in H2 2027; the call describes a 2028 ramp and a potential opportunity of multiple millions of units and hundreds of millions of dollars. That is scale potential, not contracted volume, ASP or allocation.

The successful state starts with 20,000 source equivalents in Q3 2027 and 80,000 in Q4. It reaches **2.0m accepted units at USD 150 in 2028**, or USD 300m conditional revenue. A 60% probability contributes USD 180m to expected 2028 revenue. The bound is 1-3m units at USD 100-200. The 2030 conditional path reaches 4.1m units at USD 140. The 40% alternative has no optical product revenue through the forecast period, while preserving sensing operations and development costs.

Optical gross margin increases from 32% to 48%, after external components, packaging, test and warranty. Both states pay USD 1m per quarter of specific development before H2 2027. Thereafter the qualified state pays USD 2m per quarter plus 5.5% of sales in support. The delayed state retains USD 2m per quarter through 2028, USD 1m in 2029 and zero in 2030 after assumed retrenchment. Corporate R&D continues. Development spending does not depend on success already being known.

Optical capex adds 6% of revenue to a USD 2.5m quarterly company base. Working capital consumes 20% of positive sequential revenue growth. These are Aeva cash needs; supplier factory economics remain in COGS. Accepted good units and customer qualification must support the shipment schedule.

Scarcity can support launch pricing because an unavailable qualified source can delay expensive infrastructure. The active USD 150 proxy already allows attractive initial pricing. No second scarcity premium is added to those units. Future repricing requires evidence about incremental terms and eligible orders. Qualification and yield are correlated supply constraints, not separate demand multipliers.

Aeva Q2 2026 original investor presentation, page 6 | Issuer NPO program: signed JDA and initial H2 2027 deployment target; no unit or price commitment.

The operating model through 2030

Figures are USD millions. They combine program-weighted sensing economics and the 60%/40% optical operating states, conditional on required financing being available. Financing survival is applied later to equity value, not multiplied into operating revenue a second time.

Calendar year	Industrial	Automotive	NRE	Expected optical	Revenue	GAAP operating profit
2027	15.05	13.03	16.60	9.00	53.67	-148.10
2028	27.30	85.56	15.60	180.00	308.46	-71.68
2029	43.63	225.21	12.00	287.10	567.94	42.28
2030	62.04	391.08	10.00	344.40	807.52	157.90

R&D, administration and selling expenses precede production revenue. Farther-out margins depend on yield, outsourced manufacturing and repeat orders. Those assumptions have lower confidence than the near-term cash bridge and are not issuer guidance.

Treasury and dilution

June cash and marketable securities totaled **USD 177.889m**. First-half operating and capital cash use was USD 59.425m. The June USD 115m gross offering, its fees and shares are already in opening balances. The USD 125m preferred facility is not cash. The filing says all advance conditions were met at June 30, but the facility expires November 8, 2026. It carries a 7% dividend, initial liquidation preference of 120% of issuance price and conversion rights. No draw is assumed; this is a financing-strategy assumption, not a statement that the facility was unavailable.

June legal common shares were **68.682947m**. Add 2.303765m options, 7.286827m RSUs, 1.695156m performance awards and 3m Series A warrants to reach **82.968695m gross potential common shares**, excluding the convertible. Expired warrants are excluded. This is a conservative gross-rights denominator, not GAAP diluted EPS or fully vested shares. Settlement of an already included award is not added again. No warrant-exercise cash benefit is assumed.

New awards add 0.4m shares per quarter beyond the opening inventory. The USD 100m note is valued once as either a cash claim or 6.303480m conversion shares, using the lower common value. Its 4.375% cash coupon is paid in modeled Q2 and Q4 at USD 2.1875m each. A stock-settlement alternative is not added as a second cash benefit. A 10% reserve against positive operating profit allows future tax leakage; it is not a statutory tax forecast or a claim that US NOLs are unavailable.

Each state has its own cash schedule. A USD 100m gross common raise at USD 12 and 3% fees is assumed whenever cash would fall below USD 50m. **Both states require raises in Q3 2027 and Q2 2028.** Each receives USD 194m aggregate net cash and adds 16.666667m financing shares. Access is not guaranteed.

The qualified state assigns 85% success to the first raise and 80% to the second, conditional on reaching it, for 68% cumulative survival. The delayed state uses 80% then 70%, for 56%. June financing and strategic support justify substantial probabilities; losses and uncertain commercialization leave material failure risk. These are subjective assumptions conditional on the operating and financing paths.

For the Q4 2027 valuation window, funded-qualified mass is 60% x 68% = **40.8%**; funded-delayed mass is 40% x 56% = **22.4%**; **36.8%** remains a financing-failure outcome with zero common-equity value in this bounded model. It is not reallocated to successful outcomes. Zero common equity does not imply creditors necessarily recover nothing.

AevaQ2 issuerrelease,August5,2026 | Issuer cash-flow evidence supports the funding bridge; non-cash remeasurement is not cashburn.

Valuation, sensitivity and recognition

For each labeled quarter, sum that quarter and the next three quarters of state operating profit and multiply by 20. Compute value after subtracting the USD 100m note and, separately, after adding conversion shares; take the lower, with a zero floor. Match common shares and funding survival to the **end of the same four-quarter window**. Then multiply by funding survival and the state's 60% or 40% operating probability. Reserved operating cash is not added to the ceiling.

Using early-quarter shares would omit funding needed to produce the valued earnings. Deducting the note while also adding conversion shares would count one claim twice. Flooring only after averaging would erase the successful program's asymmetric value. Operating revenue and profit are not financing-weighted again.

Q4 2027 uses 103.235362m end-window common shares in either state, excluding note conversion. F4Q operating losses are USD 80.69m qualified and USD 141.36m delayed, so both values are Nil. For Q4 2028, the qualified state's F4Q profit is USD 83.92m and the delayed state remains loss-making. The funded, weighted ceiling is USD 6.14.

Sensitivity; funding recomputed	Q4 2028	Q1 2030
Active model	USD 6.14	USD 18.67
Optical execution 40% / 80%	USD 4.10 / 8.19	USD 12.84 / 24.50
Optical ASP -25% / +25%	USD 2.78 / 12.61	USD 14.27 / 30.96
Optical gross margin -10 / +10 points	USD 2.50 / 12.97	USD 14.53 / 30.61
New common equity at USD 6	USD 5.30	USD 16.27
Named industrial deployments doubled; option only	USD 9.72	USD 28.62
Automotive deliveries 30% lower	USD 4.31	USD 14.26
Guaranteed funding; diagnostic only	USD 9.03	USD 27.61

Upside can avoid a funding round as well as improve earnings, creating nonlinear value changes. Guaranteed funding is not the active case. Program-weighted automotive units are not a complete distribution of correlated customer failures. Customer delays and weak capital access could coincide; this remains a model limitation.

Competition, catalysts and disconfirmation

The durable advantage would be repeatable qualified output at competitive delivered cost. A laboratory record is shorter-lived. Customers can choose another sensing architecture, optical vendor or internal design, and require second sources. Established laser companies have scale, reliability history and qualifications that a new entrant must earn.

Watch the next cash/share filing, the preferred facility's expiry or amendment, accepted source capacity, commercial terms and initial H2 2027 deployment. Automotive customer launches and shipped sensors matter; for industrial programs, repeat orders and net Aeva content matter more than announcement counts.

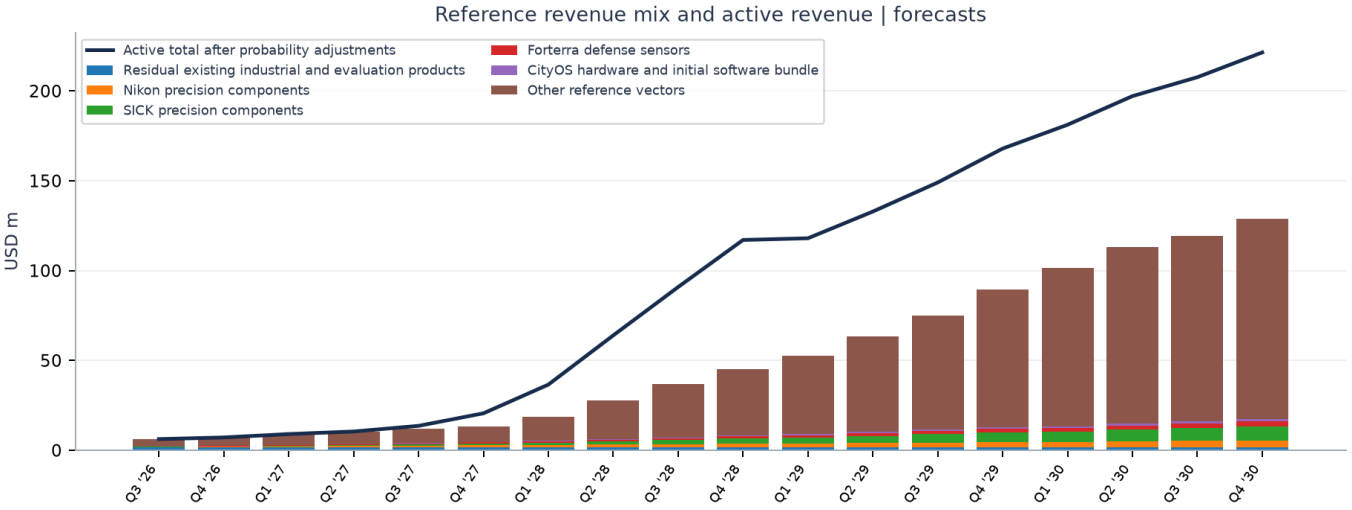

The thesis weakens if qualification requires redesign, the customer changes architecture, delivered pricing cannot cover packaging and support, or yield prevents promised output. Probabilities should change with credible evidence before official confirmation when a bounded cost/earnings bridge is possible.

Supplier read-through needs the actual product relationship. The optical agreement does not establish Sivers as the source vendor, Tower as the relevant foundry or LG Innotek as an optical revenue beneficiary. Sensing relationships cannot be imported into an unnamed data-center bill of materials. No other model gets an automatic increment from this initiation.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	14	A real differentiated sensing platform and signed optical JDA, but unknown qualified source economics.
Cycle	5	Industrial products are shipping; optical and passenger production predominantly begin in 2027-2028.
TAM	8	Named, bounded sensing and source-unit channels expand spend without converting a customer or sector TAM directly into Aeva sales.
Catalysts	3	Optical qualification, OEM samples and industrial orders are dated but not guaranteed.
Macro	8	Photonics and automation demand strong; auto launch budgets remain cyclical.
Alpha	4	Engineering-to-economics differentiation matters; source specifications remain incomplete.
Risk classes	-5	Qualification and yield; adoption and substitution; concentrated customer programs; financing and dilution; execution and governance.
Total	37/60	Rounded Base 62. Both artifact and new workbook row use this score; this is not a manual override.

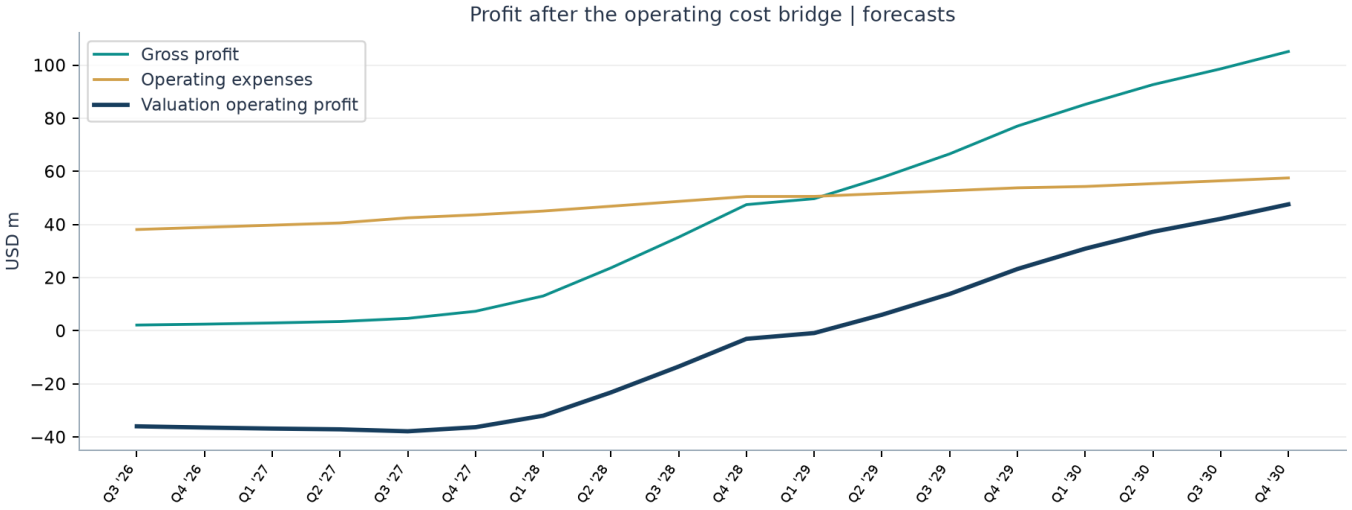

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	6.2	0.0	6.2
Q4 2026	7.1	0.0	7.1
Q1 2027	9.0	0.0	9.0
Q2 2027	10.5	0.0	10.5
Q3 2027	11.8	1.8	13.6
Q4 2027	13.4	7.2	20.6
Q1 2028	18.6	18.0	36.6
Q2 2028	27.9	36.0	64.0

Q4 2029	89.6	78.3	167.9
Q1 2030	101.4	79.8	181.2
Q2 2030	113.2	84.0	197.2
Q3 2030	119.5	88.2	207.7
Q4 2030	129.1	92.4	221.5

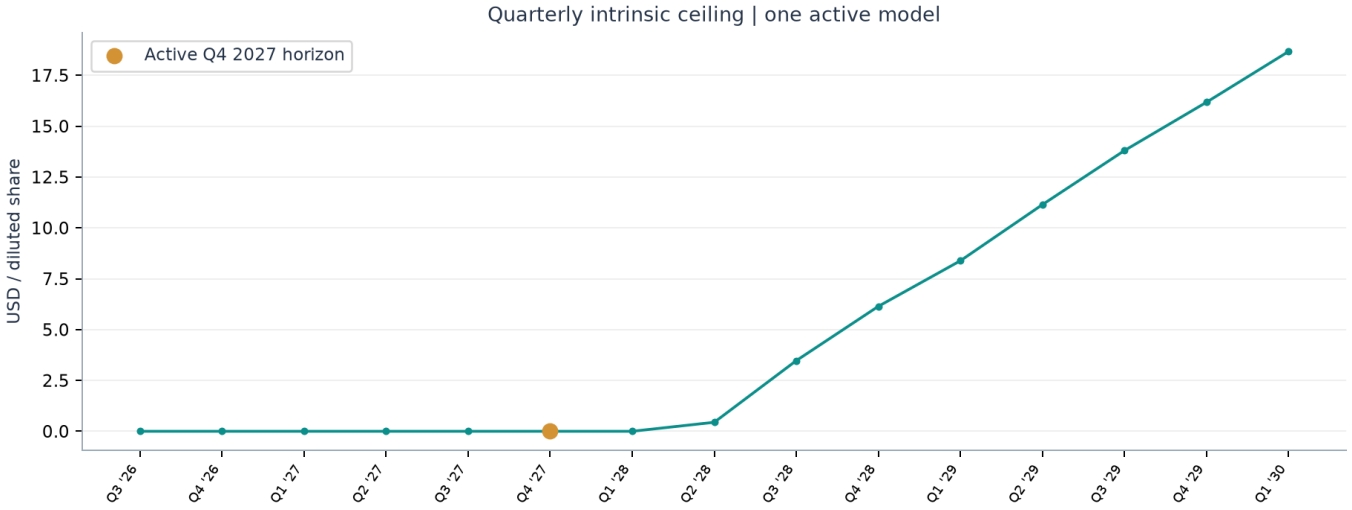

Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter	Revenue	GP	Opex	Valuation OP	OP margin
Q3 2026	6.2	2.1	38.1	-36.0	-577.2%
Q4 2026	7.1	2.5	38.9	-36.4	-509.8%
Q1 2027	9.0	2.9	39.8	-36.8	-407.4%
Q2 2027	10.5	3.5	40.6	-37.1	-355.1%
Q3 2027	13.6	4.7	42.5	-37.8	-278.2%
Q4 2027	20.6	7.3	43.6	-36.3	-176.4%
Q1 2028	36.6	13.1	45.1	-32.0	-87.5%
Q2 2028	64.0	23.7	46.9	-23.2	-36.3%

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Conditional accepted optical source equivalents, million units	Status
Q3 2026	0.000	ASTRA forecast; customer units, ASPs and execution probabilities are assumptions
Q4 2026	0.000	ASTRA forecast; customer units, ASPs and execution probabilities are assumptions

Q4 2030	1.100	ASTRA forecast; customer units, ASPs and execution probabilities are assumptions

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Residual existing industrial and evaluation products	1.5	0.0%	0.0
Q3 2026	Nikon precision components	0.3	10.0%	0.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Coherent operating and funding outcomes

These mutually exclusive states have separate capacity, earnings, funding and dilution paths. Common equity is valued within each state before applying its probability. The displayed expected operating profit is informative; it is not substituted into a nonlinear equity waterfall.

Q4 2027 state	Operating probability	Funding survival through window	F4Q OP	Matched shares	Common ceiling
qualified	60%	68%	-80.7	103.235	0.00
delayed	40%	56%	-141.4	103.235	0.00

Conditional funding and dilution paths

Operating probabilities are shown above. Financing survival or construction-recovery probabilities are applied separately within each outcome where stated. USD millions except shares in millions and probabilities.

Quarter	State	End cash	Cumulative equity raised	Common shares before note	Funding survival

Claim decisions, overlap and triggers

AEVA-OPTICAL-JDA

source date: 2026-08-05

fact: Signed optical-engine JDA; initial NPO deployment targets H2 2027, followed by 2028 production. Customer and commercial terms unnamed.

p: 0.6

Conditional outcome: 2028: 2.0 million accepted source equivalents at USD 150, or USD 300 million revenue. Bounded 1-3 million units and USD 100-200 ASP. 2030: 4.1 million at USD 140, or USD 574 million. These are analytical proxies, not orders.

overlap: One evolving customer program; release, deck and call are not independent awards. Source revenue only; no extra NPO, CPO, engine or transceiver TAM.

cost bridge: 32% to 48% gross margin after external components, packaging, test and warranty. Fixed development is paid in both operating states; qualified state adds 5.5% of optical revenue in operating support, 6% in capex and 20% of incremental quarterly revenue in working capital.

zero early: No product revenue before H2 2027 because the dated deployment follows development and qualification. Fixed program spending remains nonzero.

next test: Accepted good-unit capacity, commercial source specifications and rates, initial customer deployment.

AEVA-AUTO-PROGRAMS

p: Daimler 75%; awarded European OEM 65%; Bendix 35%; unawarded passenger/referral pool 25%

Conditional outcome: Explicit quarterly conditional sensor units and per-program ASPs in program_schedules. 2030: 80k, 500k, 100k and 150k conditional sensors respectively; 457.5k expected aggregate sensors.

overlap: Daimler and Bendix sum to 180k conditional annual units, within the stated up-to-200k planned Atlas capacity, which still requires good yield and acceptance. NVIDIA distribution access and the top-five engagement are one prospect pool, not added markets.

cost bridge: Product gross margin moves from negative 2% to 47%; supplier manufacturing economics remain in COGS. Field support, R&D, working capital and financing remain funded. European supplier capacity is a qualification gap, not free output.

AEVA-NRE

p: 0.8

Conditional outcome: Recognizable engineering milestones: conditional annual USD 20.75m in 2027, USD 19.5m in 2028, USD 15m in 2029 and USD 12.5m in 2030; probability-weighted revenue USD 16.6m, 15.6m, 12m and 10m.

overlap: Excludes LG Innotek USD 7.5m JDA consideration: all was allocated to the share subscription under the filed contract accounting. Excludes physical sensor sales already modeled in product units.

cost bridge: 60% service gross margin after direct engineering delivery costs; corporate R&D remains separate. Revenue follows work delivered, not cash receipt or equity proceeds.

basis: Current USD 3.590m quarterly service revenue and announced customer development work support a nonzero path. 80% represents delivery of this bounded milestone pool; the pool tapers as programs enter production.

AEVA-CAPITAL

p: Conditional first / later common-equity funding success: qualified 85% / 80%; delayed 80% / 70%. Multiply successive probabilities along each operating path.

Conditional outcome: USD 100m gross, USD 97m net raises at USD 12 per share whenever the funded operating path would fall below USD 50m cash. Capital failure has zero common-equity value. No assumption of guaranteed access.

overlap: June offering is already included. Undrawn USD 125m preferred facility was drawable under the June filing, but expires November 8, 2026 and is not booked as cash. Model chooses later common equity and does not assume a free preferred draw.

cost bridge: State-specific cash burn, dilution, semiannual cash coupon, 10% positive-OP cash-tax reserve and all required funding through the F4Q end. Note is treated once: cash claim or conversion shares, using lower common value.

basis: The completed June financing and strategic support justify substantial access probabilities; pre-profit commercialization and repeated losses justify material failure masses. The probabilities are subjective, conditional on this operating path and proxy pricing, not market-derived.

AEVA-RESIDUAL-EXISTING

p: 1

Conditional outcome: USD 1.5m per quarter residual industrial/evaluation products, flat through 2030, excluding all named programs separately forecast.

overlap: A residual allocation inside the existing product run rate, not an additional launch. Q3 expected product revenue including all named programs and auto is approximately USD 2.73m against Q2 actual USD 2.546m.

cost bridge: Residual gross margin starts at zero and reaches 30% in 2028. Named industrial components begin at 10%, defense at zero and CityOS at 10%, with staged improvements as manufacturing and deployment scale. This prevents immediate extrapolation of profitable services margins onto hardware.

AEVA-NIKON

source date: 2026-04-28

fact: A commercial Nikon product and multi-year production agreement support 75% execution of this bounded adoption path. Component count and Aeva ASP are analytical proxies, not disclosed orders or the complete Nikon machine price.

p: 0.75

Conditional outcome: 2030 conditional 2,700-8,100 components at USD 2,500-4,500; active 5,400 at USD 3,500.

overlap: One Nikon agreement. No separate revenue from the customers of the same metrology system.

cost bridge: Component COGS and outsourced production retained; gross margin 10% to 48% as yields and scale improve.

next test: Repeat orders, accepted units, Aeva net content and realized margin. No disclosed unit or price is replaced by a point forecast presented as fact.

AEVA-SICK

source date: 2026-06-02

fact: The first commercial Eve-powered product and management discussion of volume over 12-18 months support 65% execution. Portfolio-wide adoption is not awarded.

p: 0.65

Conditional outcome: 2030 conditional 50,000-150,000 components at USD 250-550; active 105,000 at USD 400.

overlap: Only one bounded family of sensing components; additional SICK products are not separate automatic TAM capture.

cost bridge: Component COGS and outsourced production retained; gross margin 10% to 48% as yields and scale improve.

next test: Repeat orders, accepted units, Aeva net content and realized margin. No disclosed unit or price is replaced by a point forecast presented as fact.

AEVA-FORTERRA

source date: 2026-05-06

fact: Two vehicle platforms and continuing shipments support 60% execution. Four sensors is the MESA configuration described on the May call, generalized here as an explicit fleet-mix assumption; government deployment and budgets remain uncertain.

p: 0.6

Conditional outcome: 2030 conditional 1,700-5,100 vehicles, 2-4 sensors per vehicle at USD 900-1,500. Active 3,400 vehicles with four sensors at USD 1,200.

overlap: Only Forterra ground-vehicle programs. Drones and the entire defense autonomy market are excluded.

cost bridge: Defense gross margin zero to 42%; CityOS bundle 10% to 52%. Both pay an additional 5% revenue deployment-support reserve above base field expenses.

next test: Repeat orders, accepted units, Aeva net content and realized margin. No disclosed unit or price is replaced by a point forecast presented as fact.

AEVA-CITYOS

source date: 2026-06-10

fact: Georgia deployment and Fargo selection support 65% execution; two sensors per intersection is shown on the company product page. No disclosed deployment quantity or Aeva billing rates support a stronger point forecast.

p: 0.65

Conditional outcome: 2030 conditional 1,000-3,000 intersections with USD 2,500-5,000 net Aeva content per new site. Active 2,100 sites at USD 3,500.

overlap: Only Aeva sensors and initial software/support. Excludes integrator installation revenue and a separate recurring subscription pool that would double count the bundle without a billing contract.

cost bridge: Defense gross margin zero to 42%; CityOS bundle 10% to 52%. Both pay an additional 5% revenue deployment-support reserve above base field expenses.

next test: Repeat orders, accepted units, Aeva net content and realized margin. No disclosed unit or price is replaced by a point forecast presented as fact.

Remaining bounded uncertainties

- Optical partner identity, wavelength, usable launch power, reliability, accepted yield, capacity and commercial source ASP remain undisclosed.

- Automotive and industrial quantities and ASPs are analytical assumptions, not order backlogs. Program probabilities are applied to units once; they are not probabilities that the announced agreements exist.

- The 200k planned North American annual capacity is not a verified good-unit run rate. If Forterra and CityOS share that Atlas-family capacity, combined 2030 conditional demand reaches 197.8k sensors before residual products; full simultaneous success needs near-full output or additional qualified capacity. Weighted units do not establish factory capability. Passenger capacity is separate and remains unverified.

- Financing probabilities and USD 12 issue price are assumptions. Common-equity access can fail; the undrawn preferred facility could change the capital path but brings senior claims and dividends.

- Expected non-optical program economics are not a full joint distribution of correlated customer failures. Funding access and operating execution can be more correlated than the two-state approximation.

- The 10% cash-tax reserve is a leakage assumption. US NOLs, foreign profits, Section 382 limits and future capital events require filing-specific review.

- No conclusion that 1550nm sensing proves 1310nm datacom qualification; no assumption that Sivers supplies this optical source.

- Gross potential common rights include options and awards without assuming treasury-stock proceeds. New grants, option expiry and stock-settled interest require reconciliation each filing.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
