AMD - Advanced Micro Devices, Inc. | Full investment artifact

Full investment research | Model assumptions and source evidence

Current Q4 2027 ceiling: USD 592.529405. F4Q valued OP 42,836.227392 USD m; sanctioned multiple 25x; valuation shares 1,807.346058M. Analytical Base 82; protected Excel Base 82. Current operating totals include the source-scoped price/volume branch.

Research date: October 12, 2026 pricing model; prior engineering and CPU program evidence retained | **Framework:** 8.0 | **Format:** standalone current-state analysis **Status:** NOT HELD in supplied workbook; High Conviction assessment; portfolio Base override protected | **Classification:** SYSTEM-LAYER BENEFICIARY with differentiated CPU/GPU platforms, qualified customer programmes and external supply dependencies **Artifact Base:** 49/60 = **82% - High Conviction** | **Protected portfolio Base:** 82% (current protected value; separate from artifact assessment) **Snapshot:** supplied-workbook price USD 483.360; model share proxy 1,660.000000M; implied snapshot market capitalization 802,377.600 USD millions. Price is frozen from the supplied workbook, not a current-market refresh; capitalization uses the modeled denominator. **Active price target:** Q4 2027 **USD 592.529405**, pricing Q4 2027-Q3 2028. All 15 quarterly price targets are derived below.

The active case now assigns 30% probability to the incremental gap between an attributed Aletheia CPU forecast and the existing EPYC revenue path. The complete numerical paragraph is visible, but the report masthead/date and calendar-versus-fiscal basis are absent. The source endpoint is a calendar-year proxy in this model, not company guidance. The full model also recognizes the below-average initial accelerator gross margin, continuing R&D investment and staged customer-warrant dilution. The advisory score is independent of the protected 82 portfolio Base.

October 6 engineering evidence: specialized inference and model overlap

The August 9 researcher discussion contains a useful design hypothesis: hardwiring a model and changing a limited set of masks may shorten implementation relative to a general-purpose processor. Its tapeout, fabrication and bring-up comparisons are author estimates, however, rather than AMD cost guidance or independently measured production history. The accompanying interview is attributed to the researcher; it does not establish the number of commercially viable models, customer deployment scale, unit cost or recurring margin.

	Normal Way	Taalas Way	Note
Time to Design and Verify	3-12 months	1 week	Credible claim by Taalas.
Fab Time (Normal)	6 months	1.5-2 months	My estimates.
Fab Time (Hot Lot // Rush Order)	3 months	< 1 month	
Bringup and Post Silicon Validation	3-6 Months	None lol	
Tapeout Cost	$15-$50M	$200K-$500K	

Author comparison of Taalas design timing and tapeout cost; estimated process economics, not measured AMD savings

Author comparison of Taalas design timing and tapeout cost; estimated process economics, not measured AMD savings Source: Irrational Analysis, August 9, 2026, original exhibit 31. The saved image is reproduced without modification.

AMD's August 6 definitive agreement explicitly describes integrating Taalas technology into a system-level roadmap with Instinct. This contradicts the article's FPGA-only interpretation. The announcement does not establish a completed acquisition or disclose consideration, purchase accounting, retention cost or an incremental revenue amount. Those transaction-specific limits remain in the current model.

The July 23 AMD/Cerebras joint release describes Helios processing prompts and large contexts while Cerebras handles latency-sensitive token generation, with initial cloud availability intended for H2 2026. It is direct counter-evidence to the article's assertion that the partnership is fictitious or has no engineering work. Announced integration and expected performance are still different from paid production utilization. Decode, prefill, network transfer, batch size and model shape must be evaluated separately; inference is not universally limited by one component.

Probability and economic boundary. Assign a provisional **60% research probability** to meaningful commercial use of the announced combined inference approach by the end of 2027. This is a subjective execution assessment of the specific announced pathway, not a second probability applied to all AMD accelerator revenue. For a bounded allocation check, 1-2% of the saved **$42B 2027 Instinct/non-CPU data-center pool** is **$420-840M** of sales. At an illustrative 48% product gross margin, that is **$201.6-403.2M** of gross profit before the existing R&D, software and support spending. The percentage allocation and margin are low-confidence diagnostics, not announced orders or a new forecast.

Bridge, USD millions	Low allocation	High allocation	Current-model treatment
Existing 2027 Instinct/non-CPU revenue pool	42,000	42,000	Already modeled
Illustrative specialized-inference allocation	420	840	A subset of that same pool
Illustrative product gross profit at 48%	201.6	403.2	Before existing operating costs
Additional revenue after overlap	0	0	No extra customer/capacity pool identified
Additional COGS, opex and operating profit	0	0	No new financial input

The current accelerator path already includes specialized and disaggregated inference. Consequently this earlier article is **fully overlapped** for operating-model purposes: incremental sales, costs and OP are zero. The 60% research weight is not multiplied into the converted path, added to the CPU opportunity or applied to the final price target. It clarifies a program hypothesis while preserving the current single company forecast. An identifiable new allocation above the existing pool, or evidence of displacement, would require a new net bridge after product costs and program spending.

The meaningful next tests are customer deployments and paid utilization, performance under a matched workload, qualified system capacity, program-level revenue ownership and acquisition consideration/cost disclosures. A faster design cycle alone cannot establish a profitable delivered system. The **Q4 2027 price target remains $592.529405**, using **25x forward-four-quarter OP**, **1,807.346058M shares**, analytical Base82 and protected portfolio Base82. Engineering evidence adds no separate commercial award. The active totals also include the scoped CPU repricing branch; the share path and valuation method are unchanged.

1. Supercycle, supply chain and durable advantage

AI inference and agentic workloads expand demand for both accelerators and the CPUs that orchestrate work. AMD combines EPYC, Instinct, Pensando and ROCm in a broader platform, with Helios moving from launch into a customer deployment ramp. Product performance, software maturity, design integration and customer choice support share capture. Nvidia, Intel, Arm-based systems and custom accelerators remain material alternatives; AMD is not a sole supplier of AI compute. Its position is also downstream of foundry, advanced packaging and HBM constraints.

AMD designs silicon and systems architecture and develops software; third parties manufacture and package devices. Helios integrates 72 MI455X GPUs and 18 EPYC CPUs with networking, but total rack spending includes components and manufacturing value outside AMD. ROCm maturity and customer co-engineering strengthen adoption without proving a permanent monopoly. No unverified automatic MI500-to-specific-photonics-supplier revenue chain is assumed.

Business / curve	Stage	Evidence and next inflection
EPYC	Established share gains with a new demand inflection	Agentic sandboxes expand the CPU workload; the CPU/GPU ratio varies by workload.
Instinct / Helios	Early large-scale platform ramp	Large customers have qualified programmes, while physical deployments and yield still govern revenue.
Client / Gaming	Mature cycles with share and mix opportunities	Commercial PCs improve mix; console and component-cost cycles constrain growth.
Embedded / physical AI	Recovery plus design conversion	Lifetime design wins require multiple years of production, not immediate annual sales.

Stage percentages are qualitative framework bands relative to a possible mature opportunity, not measured market penetration. A current capacity constraint can coexist with a larger long-term TAM; qualification and economic capture decide how much reaches this company.

2. Forward TAM and the three-phase expansion lens

Phase	Engineering opportunity	Demand-to-company bridge
Phase 1; 100% thematic	Current CPU, GPU, client and embedded content	11.536B Q2 actual sales anchor capture. Customer purchases, not the entire infrastructure budget, become AMD revenue.
Phase 2; 50% thematic	Agentic compute and wider AI inference	Management's 2030 server TAM rose from about 60B at the 2025 analyst day to above 120B in May and 220B by the Q2 update. Accelerator opportunity is about 1.4T.
Phase 3; 20% thematic	Physical AI and specialized/disaggregated inference	Combined company-addressable opportunity is about 2T by 2030. It already contains the server and accelerator categories; adding them again would double-count TAM. Taalas and Cerebras provide architecture optionality without separately invented sales.

The 100% / 50% / 20% thematic weights guide thesis assessment. They are not blanket discounts to reported sales, contracts or all forecasts. Programme probabilities below govern only separately identified optionality. Current reported sales calibrate the starting point; they do not cap the future market.

3. Current earnings and management evidence

Q2 2026 revenue was 11,536M, with Data Center 6,718M, Client and Gaming 3,841M and Embedded 977M. GAAP GP 6,203M less R&D 2,528M, MG&A 1,401M and operating intangible amortization 284M produced 1,990M OP. Non-GAAP GP 6,488M less 3,394M opex produced 3,094M OP; the 1,104M difference must not be mistaken for an improvement in underlying revenue. Q3 guide is 13,000M ±300M, 56% non-GAAP GM, 3,650M non-GAAP opex and about 1,660M diluted shares. The model starts at the revenue midpoint and explicitly restores costs to a GAAP-style basis. [S1/S2/S4]

Both the May 5 and August 4 earnings calls were read in full through Q&A. Q1 raised server CPU TAM to above 120B by 2030 and highlighted unit-led EPYC demand and multi-customer Helios interest. Q2 increased that TAM to 220B, described a 1.4T accelerator TAM, expected server CPU growth above 70% in 2027 and total Data Center growth well above 100%. Management explicitly said a 30B 2027 Instinct estimate was too low, but did not provide a precise annual GPU revenue guide. Initial Helios shipments are expected in Q3, a larger Q4 ramp and continued sequential expansion in 2027. GPU gross margin starts below the corporate average; CPU and Embedded mix can offset it. September 11 management discussion reiterated the ambition to exceed 50% of the larger server market. These are company expectations and strategic targets, not already recognized sales. [S3/S4/S5]

Issuer-hosted Q1 and Q2 transcripts were reviewed completely. The September 11 public conference transcript was reviewed through closing; transcription errors are not used as independent numeric facts. Issuer releases and accounts anchor dates and financials. No complete customer purchase schedule, per-product quarterly GM, CPU unit/ASP table or warrant charge forecast is disclosed. The Taalas announcement says definitive agreement subject to closing despite its headline; it is not treated as a confirmed completed acquisition. These gaps remain explicit LOW-confidence assumptions.

World Labs acquisition and dilution

AMD’s September 28 filing reports a signed agreement for approximately USD 8.2B in shares, subject to adjustments. Issuance uses the ten-trading-day daily VWAP measurement ending two trading days before closing; the share number is not yet known. The company release expects closing by year-end 2026, subject to conditions. [S10/S11]

Model assumption: use the frozen workbook price USD 483.36 as a transparent proxy for the future contractual price. This implies 8,200M / 483.36 = **16.964581M additional shares**, included from Q1 2027, the first full quarter after the expected close. This is a conditional full-closing allowance, not an issued-share fact. Original ordinary dilution and customer-warrant schedules remain intact. No cash purchase deduction, acquisition revenue, synergy, target operating cost or purchase-accounting charge is invented. Missing World Labs costs/PPA can overstate future OP; replace this partial transaction bridge when disclosed. Physical-AI optionality has no separate revenue increment because the company-specific sales base is unknown.

4. Local evidence and calibration packet

Historical calibration: 11,536 - 5,333 = 6,203M GP; 6,203 - 2,528 - 1,401 - 284 = 1,990M OP. Four revenue anchors sum to 11,536M. The 3,550M EPYC / 3,168M accelerator split within the 6,718M Data Center total is LOW confidence, not disclosure. Q3 vector sales 3,800 + 4,500 + 3,600 + 1,100 = 13,000M. Initial gross-margin assumptions receive a common -0.753846-point adjustment so modeled GP is 6,994M, or 53.8%. This is 2.2 points below the 56% non-GAAP guide, approximating recurring PPA/SBC/other cost-of-sales adjustments. Plan-B AH12 bridge uses actual named deployment programmes instead of multiplying all hyperscaler capex by an arbitrary share. Management indicates double-digit billions of AMD content per GW but does not confirm the analyst’s 15B figure. For a sanity check only, 42B 2027 accelerator/non-CPU revenue divided by an illustrative 12B/GW implies 3.5GW-equivalent; this is LOW confidence and includes demand outside the largest named programmes. It is not a disclosed contracted 2027 capacity or a rack power forecast. [S1/S2/S4/S7/S8]

5. Summing thesis score

Category	Points / maximum	Evidence
Core Thesis	16/20	Differentiated platform and customer integration, with strong competing architectures.
Cycle Stage	10/10	Helios production, accelerated CPU demand and qualified customer ramps.
TAM Expansion	10/10	Server, accelerator and physical-AI opportunities expanded substantially.
Catalysts	5/5	Q4 Helios scaling, Anthropic H1 2027 and annual product cadence.
Macro	9/10	AI infrastructure spending supports demand; consumer memory cost remains a drag.
Alpha	4/5	CPU growth and actual profit/dilution capture are distinct from generic accelerator exposure.
Risks	-5	Five non-overlapping constraints on the operating and per-share case.

Sum: 49/60 × 100 = 81.666667%, conventionally rounded to 82%. This advisory thesis score does not replace any portfolio Base override. The separate risk classes below total the displayed deduction; holding status and classification do not waive that deduction.

6. Baseline revenue sources, capture and product margins

Split reported Data Center revenue into estimated Instinct/non-CPU and EPYC allocations that sum exactly to the segment. Keep CPUs used inside Helios in EPYC; do not value complete racks and then add the same CPU sales again. Client and Gaming and Embedded begin from reported totals. Four product margins feed consolidated GP, followed by explicit operating costs. Forecast factors combine units, richer product mix and addressable workload growth; none is a disclosed quarterly product forecast. The current model admits a much larger 2030 market while requiring a separate company-capture assumption.

Vector	Actual calibration / source	Forward demand and capture	Margin derivation / constraint
Instinct / non-CPU DC	3,168M Q2 estimated allocation.	42/70/100/135B in 2027-30; Helios adoption, broader inference and later products. 135B is about 9.6% of the 1.4T accelerator TAM.	Initial product GM about 47.246%, below corporate, then +0.25 point per quarter as yield and scale improve.
EPYC	3,550M Q2 estimated allocation.	35.8/53.3/65.9/90B annually after the 30% CPU blend; units and high-core-count mix. The reference is 34/47/65/90B; conditional 40/68B endpoints are followed by an analyst fade bridge. 90B is about 40.9% of 220B, below management's greater-than-50% strategic ambition.	Initial product GM about 64.246%, then +0.15 point per quarter; richer mix must offset manufacturing inflation.

Vector	Actual calibration / source	Forward demand and capture	Margin derivation / constraint
Client / Gaming	Reported 3,841M Q2 combined segment.	14/16/18/20B annually; client share gains and new products, with no assumption that AMD has exited console integrated graphics.	Initial product GM about 43.246%, then +0.10 point quarterly; mature pricing and mix constrain expansion.
Embedded	Reported 977M Q2.	5/6/7.3/8.5B annually; recovery, adaptive computing, embedded x86 and physical-AI wins.	Initial product GM about 68.246%, then +0.075 point per quarter; long-lived qualified products support mix.

Confidence: reported historical totals are HIGH. Source-based forward extrapolations are MEDIUM only where the cited source sizes the relevant period; other product allocations, future capture and margin assumptions are LOW. A source for the historical anchor does not make an unsourced future factor management guidance. The detailed factors below are the single modeled base case, with uncertain assumptions exposed for review.

V1. Instinct accelerators and associated non-CPU data-center content

Sources: S1/S2 segment total; S4/S6/S7 adoption and deployment; internal GPU split. Revenue = anchor × factor; GP/contribution = revenue × displayed product margin. Forecast confidence: LOW unless a specific actual/guided total is identified above.

Quarter	Revenue anchor	Demand / conversion factor	Revenue	Product margin	GP / contribution
Q3 2026	3,168.000000	1.199495	3,800.000	47.246%	1,795.354

Q4 2030	3,168.000000	13.210227	41,850.000	51.496%	21,551.140

V2. EPYC server CPUs

Sources: S1/S2 segment total; S3/S4/S5 server growth and TAM; internal CPU split; S12 attributed Aletheia forecast with 30% economic probability. Revenue = reference CPU revenue + 30% × (conditional CPU revenue - reference CPU revenue). Annual conditional endpoints of USD 40B/68B are mapped to calendar 2027/2028 as an explicit proxy because the excerpt does not specify a calendar or fiscal basis. The existing quarterly allocation of 22% / 24% / 26% / 28% is retained. In 2029, the conditional endpoint is held flat at USD 68B as an analyst fade bridge, while the reference rises to USD 65B; 2030 has no extra contribution above the USD 90B reference. These later-year choices are not source forecasts.

Revenue = 3,550M historical allocation × the displayed demand factor; GP = revenue × the unchanged product margin. The source supports a conditional endpoint, not these quarterly margins or seasonality. Forecast confidence remains LOW; detailed source and probability treatment appear in section 12. Amounts are USD millions.

Quarter	Revenue anchor	Demand / conversion factor	Revenue	Product margin	GP / contribution
Q3 2026	3,550.000000	1.267606	4,500.000	64.246%	2,891.077
Q4 2026	3,550.000000	1.549296	5,500.000	64.396%	3,541.788
Q1 2027	3,550.000000	2.218592	7,876.000	64.546%	5,083.655
Q2 2027	3,550.000000	2.420282	8,592.000	64.696%	5,558.694
Q3 2027	3,550.000000	2.621972	9,308.000	64.846%	6,035.880

7. Current quarterly operating model

All rows are model forecasts. Monetary values are USD millions. Preserve the existing 30% Aletheia CPU conversion,World Labs issuance and customer-warrant share schedule. The new price branch uses reference EPYC before that optional-volume contribution. Operating profit = product GP plus net pricing/volume GP less preserved baseline expense and incremental commercial expense.

Current CPU repricing case: product scope, costs and volume response

The October 12 Commercial Times article attributes differentiated processor quotation increases to supply-chain sources. Intel high-end Panther Lake GPU variants are reported at 15-20%,Meteor/Arrow Lake at 5-10%,Qualcomm Snapdragon X/X2 Elite around 10% from October 1. The original Chinese table also states Alder/Twin Lake 10-20% and AMD select Ryzen/EPYC around 10%, with AMD timing undetermined. The article body does not give the latter two amounts. The table provides an attributed amount, not independent confirmation. All reposts and translations are one evidence family. [CPU-20261012]

Original Commercial Times Chinese CPU pricing table; attributed supply-chain reporting, not issuer guidance

Probability: 20%, an ASTRA judgment on the defined net economic outcome. The eligible revenue pool is **10% of reference EPYC plus 6% of Client/Gaming,a 10% eligible cohort ofa 60% CPU share proxy**. This is a bounded company-allocation assumption; neither PC revenue shares nor eligible contract percentages are disclosed. The central gross premium is 10%, with 5-15% bounds for Intel and 5-10% for Qualcomm/AMD. The forecast adds no new unit capacity.

Remove 50% of the new price opportunity for pricing/mix already implicit in the reference. Fixed-price backlog and unrelated product lines receive no surcharge. For AMD, use reference EPYC before its existing Aletheia contribution; the conditional CPU forecast is not repriced again.

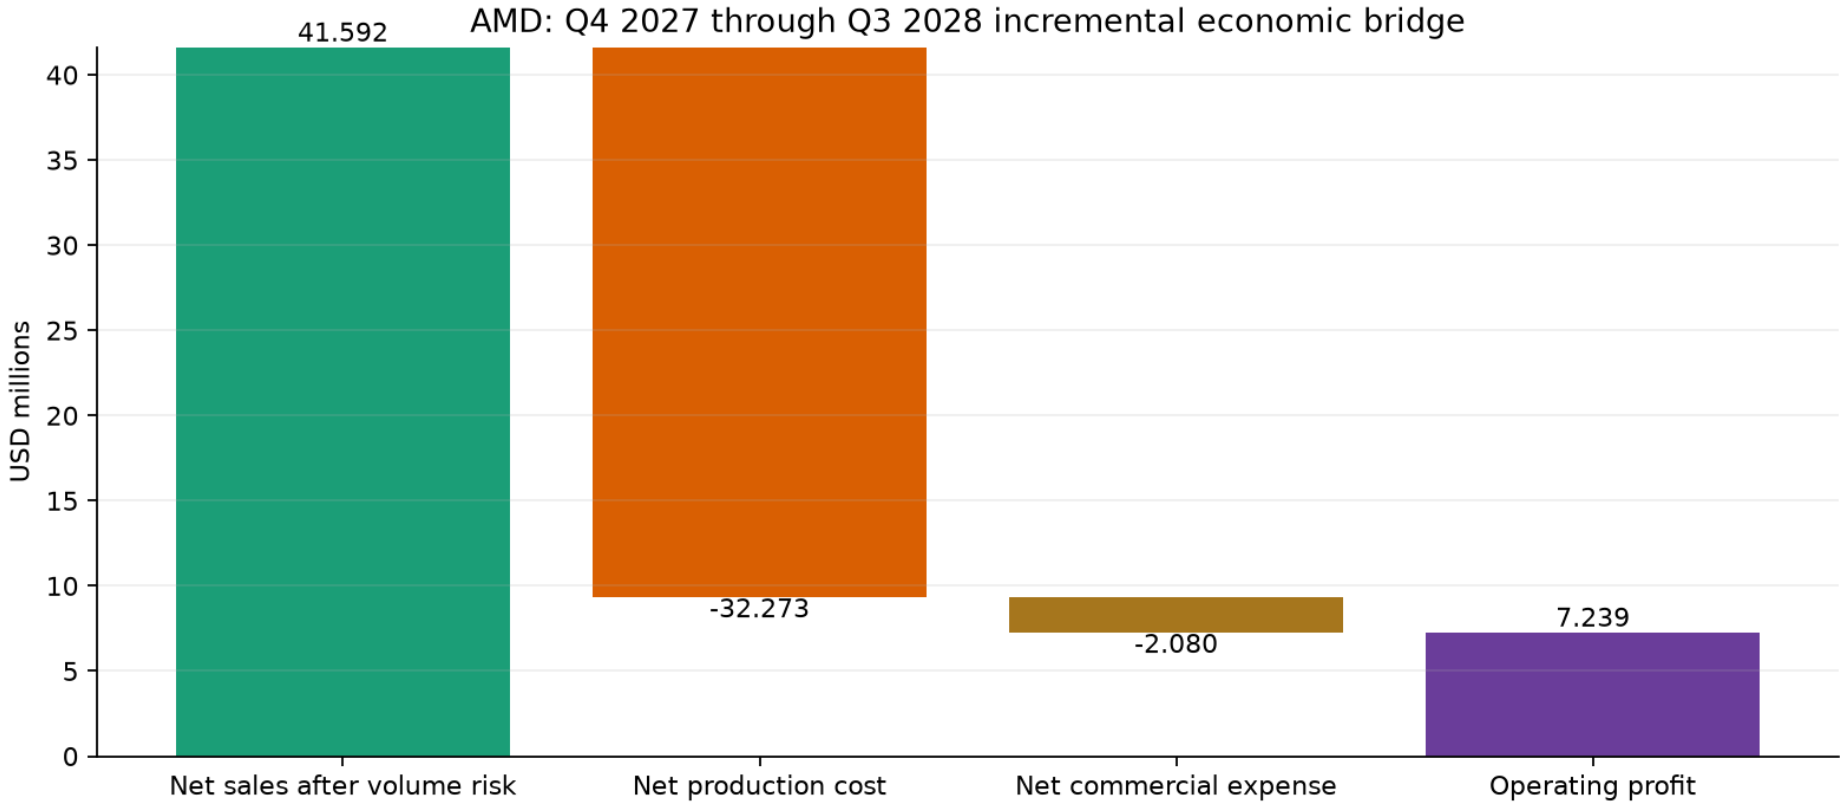

A coherent conditional outcome assumes 1% fewer units within the eligible cohort after repricing. Price revenue = eligible sales x 99% retained units x 10% premium x 50% remaining economic share x recognition phase. Lost-unit revenue = eligible sales x 1% x phase. Seventy percent of price dollars pays higher wafer, tile, packaging and other manufacturing costs; 5% pays incremental commercial/support expense. Lost units save 40% manufacturing costs and 5% variable operating expense, retaining fixed manufacturing depreciation and engineering. These cost and elasticity inputs are labeled proxies, not reported product margins. The same event carries both price and volume risk; no separate demand shock is added.

AMD starts at 25/50/75/100% in Q1-Q4 2027 because the effective date is unconfirmed. Half the price level remains in 2029; zero extra contribution in 2030 after the reference absorbs it. This schedule is an analyst implementation assumption, not a delivery promise. Q3 2026 guided rows receive no additional repricing. Unit-loss sensitivity is 0-3% of the narrow cohort; price-dollar GP retention is 15-50%.

The active Q4 2027 through Q3 2028 window includes **7.239100 USD millions** of net additional operating profit after probability, costs, volume response and overlap/replacement. Keep the existing valuation method, shares, financial claims and analytical Base. The protected Excel Base is 82. A quoted price increase is not the same as a matching profit increase.

Probability-weighted price, production cost and support bridge; calculated model outcomes

F4Q bridge item	Expected USD m
Net revenue after unit response	41.591920
Net production cost	32.273224
Net gross profit	9.318696

F4Q bridge item	Expected USD m
Net commercial/support expense	2.079596
Incremental operating profit	7.239100

Tests and counter-evidence: realized CPU invoice prices by generation, wafer/package input cost, customer mix, unit shipments, contract rollovers and credits. Lower-tier substitutions or delayed orders can offset prices. Reduce or remove the branch if price retention is cost-only, if the eligible cohort is smaller, or if delivery and acceptance slip. CPU lead-time commentary is unsourced hearsay; its image labels current CPUs 3-6 months and 2+ years only as a forward scenario. No extra delivery-delay or pricing uplift is added from that image.

8. Multiple, shares and recognition convention

Retain the original 25× forward four-quarter OP multiple as the artifact's named exception. The integrated compute platform, software and broadened customer opportunity support that premium; competition and external supply dependencies prevent classifying it as an absolute bottleneck. The multiple is unchanged by the stock price or by the portfolio's conviction override.

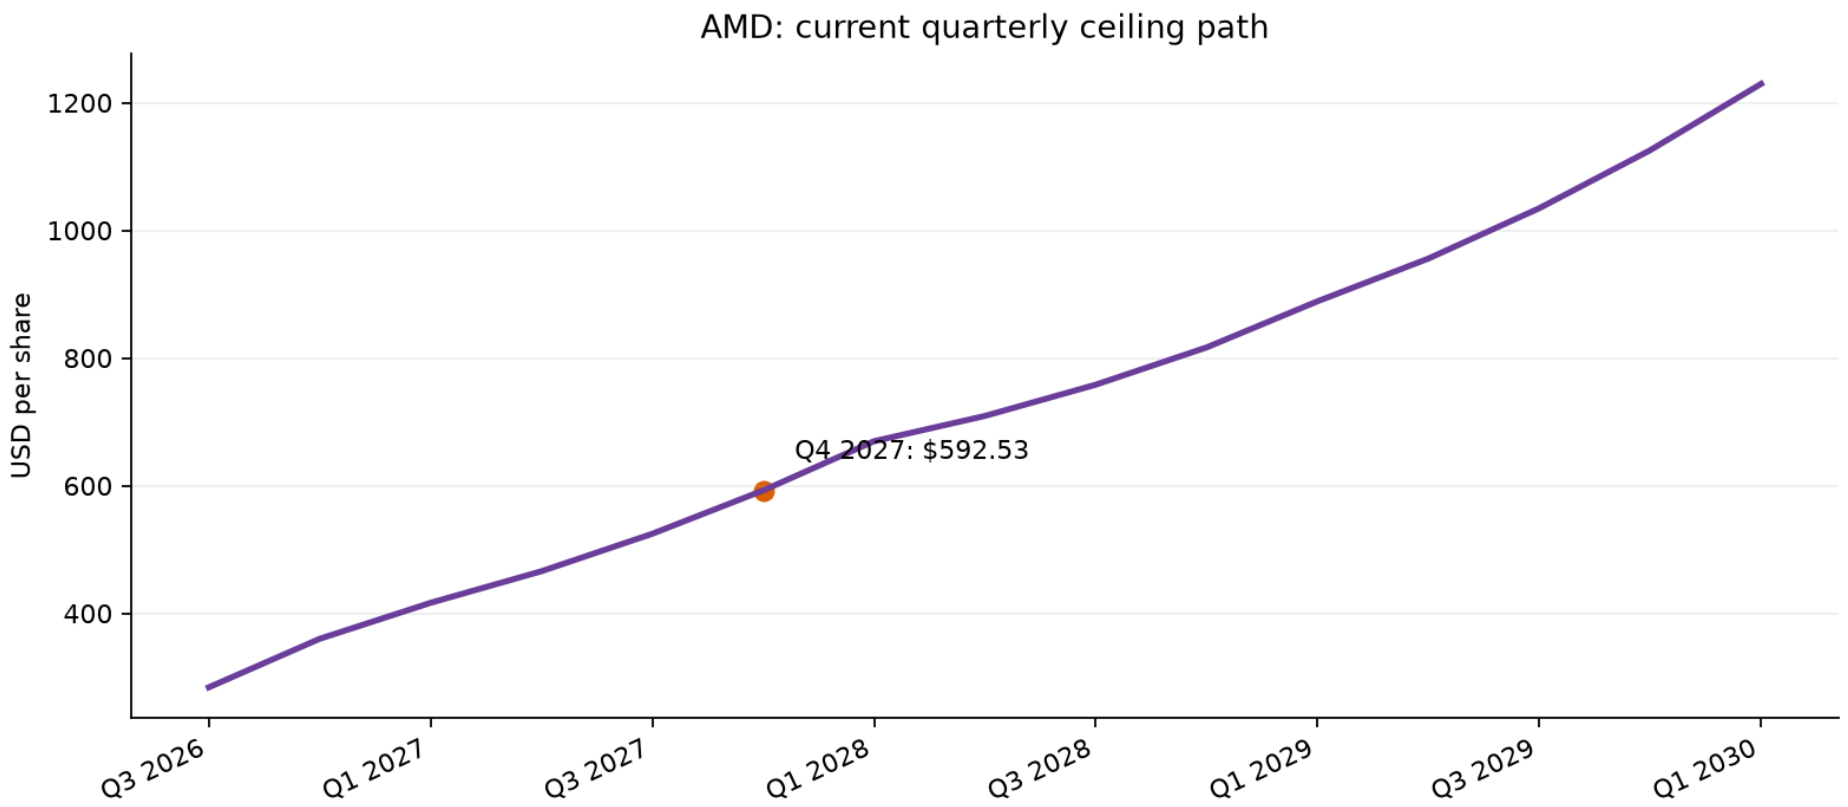

Start with the Q3 diluted-share guide of 1,660M. Add 0.5% annual underlying net dilution and staged warrant shares of 0, 10, 30, 60, 90, 120, 145, 170, 195, 220, 235, 250, 265, 280, 290, 300, 310, 320M across Q3 2026-Q4 2030. Each of OpenAI and Meta can receive up to 160M shares; none had vested or become exercisable as of June 27. Vesting also depends on purchases, stock-price and technical/commercial conditions. The staged path is a forward economic dilution proxy, not a prediction of GAAP weighted-average EPS shares or the precise legal vesting schedule. It reaches the full 320M capacity by Q4 2030 to remain consistent with a strong multiyear deployment case. The 1,632M June common shares and 107M equity-plan shares available are different concepts; ungranted plan capacity is not added wholesale on top of the net-dilution forecast. The 66.9M treasury shares retired in Q2 were already treasury shares, not a second new repurchase. No offset from unexecuted buyback authorization is assumed. [S2/S4]

World Labs adds a fixed estimated 16.964581M shares from Q1 2027 on top of that original schedule, using the disclosed consideration and assumed contractual-price proxy. Delayed closing or a different VWAP changes this allowance. [S10/S11]

The valuation denominator is the price target quarter's diluted-share proxy. It is not a historical EPS weighted-average assumption disguised as a fully known future capitalization. Unit factor: 1; this converts the model units to USD per share. No cash balance, enterprise-value adjustment or after-tax earnings substitution is added to the operating-profit price target.

9. Complete rolling four-quarter price target derivation

Quarter Q values Q plus the next three calendar quarters at 25x,using the existing starting-quarter share schedule. No probability is applied to the final ceiling after it enters the operating bridge.

Q2 2029: (15,803.897998 + 18,611.842617 + 21,072.852790 + 19,061.389808) x 25 x 1 / 1,949.889565 = **USD 955.823147 per share**. Window: Q2 2029 through Q1 2030.

Q3 2029: (18,611.842617 + 21,072.852790 + 19,061.389808 + 22,660.461923) x 25 x 1 / 1,966.989289 = **USD 1034.659258 per share**. Window: Q3 2029 through Q2 2030.

Q4 2029: (21,072.852790 + 19,061.389808 + 22,660.461923 + 26,530.875385) x 25 x 1 / 1,984.091632 = **USD 1125.522361 per share**. Window: Q4 2029 through Q3 2030.

Q1 2030: (19,061.389808 + 22,660.461923 + 26,530.875385 + 29,916.481635) x 25 x 1 / 1,996.196598 = **USD 1229.453162 per share**. Window: Q1 2030 through Q4 2030.

The final three operating rows remain modeled through Q4 2030; they do not have a ceiling because there is no complete forward-four-quarter window.

10. Annual trajectory cross-check

Calendar year	Revenue	GP	Opex	Operating profit	OP margin
2027	96,821.706040	52,960.187675	24,456.576564	28,503.611111	29.4393%
2028	145,344.714000	80,449.824738	31,313.072148	49,136.752590	33.8070%
2029	191,229.941000	106,700.440204	37,980.844960	68,719.595244	35.9356%
2030	253,500.000000	143,869.208750	45,700.000000	98,169.208750	38.7255%

These are active calendar-year sums of the quarterly path, not extra revenue or the valuation method. The S12 2027E/2028E endpoints do not disclose their calendar-versus-fiscal basis; mapping them to calendar 2027/2028 is a model proxy and a timing limitation. A four-quarter run rate is not automatically the same fiscal year. Outer-year outputs are conditional TAM/capture trajectories, not verified management sales targets.

The forecast totals 96.8/145.3/191.2/253.5B revenue in 2027-30. 2027 Data Center is 77.8B versus modeled 2026 32.793B, or about 137.2% growth. Modeled 2026 EPYC is 16.65B using an estimated 3.1B Q1 plus 3.55/4.5/5.5B; 35.8B in 2027 is about 115.0% growth. Both remain analyst cases requiring capacity, orders and acceptance, above management's directional lower bounds.

The S12 conditional endpoint is USD 40B and 13.5M CPUs in 2027E, implying about USD 2,963 per CPU. Its stated 2028 revenue growth of 70% and unit growth of 30% imply USD 68B, 17.55M CPUs and about USD 3,875 per CPU, or 30.77% higher ASP/mix. These are arithmetic implications of that single conditional source, not separately adopted unit and price forecasts. The active USD 35.8B/53.3B revenue blend does not multiply this ASP implication or supply-growth percentages again. The pre-existing USD 90B 2030 EPYC trajectory remains a separate capture assumption. Embedded's reported USD 18B new lifetime design wins are not added to annual revenue. All named deployment opportunities remain inside the four-vector totals.

11. Dilution sensitivity - same operating case

Denominator sensitivity	Q4 2027 shares M	Q4 2027 price target USD	Effect on price target
-5% shares	1,716.978755	623.609759	+5.26%
+0% shares	1,807.346058	592.529405	+0.00%
+5% shares	1,897.713360	564.218353	-4.76%
+10% shares	1,988.080663	538.572065	-9.09%

This isolates denominator uncertainty at the active Q4 2027 window; it is not a second operating case or permission to remove known dilution. The active case remains the explicit share path in the rolling table.

Contract-price sensitivity for World Labs alone: at USD 400 / 600 / 800, estimated new shares are 20.500 / 13.667 / 10.250M. Holding current Q4 2027 forward OP and all other shares fixed, price targets are USD 591.27 / USD 593.51 / USD 594.64. These are sensitivities to the acquisition pricing formula, not stock-price forecasts or actual issuance figures.

12. Programme and probability ledger

Programme / signal	Source and probability	Amount / unit base	Treatment in this model	Escalation / recognition
Aletheia CPU scenario	Single attributed research excerpt; **30% economic probability**	2027E USD 40B / 13.5M units; 2028 revenue +70%, units +30%; implied USD 68B	Only 30% of the gap above the existing CPU path; calendar-year proxy; existing costs deducted	Independent allocations, realized units/ASP and good-output evidence can raise weight; delays, price pressure or missed demand can reduce it.
OpenAI and Meta	Announced strategic programmes; 80% multiyear conversion judgment	Up to 6GW each; up to 320M warrants combined	Embedded in Instinct/EPYC path; not all 12GW is booked backlog or 2027 revenue	Track actual purchases, power availability, acceptance and warrant terms.
Anthropic	Announced; 80% initial timing confidence	Up to 2GW, first GW begins H1 2027; up to 5B AMD equity investment	Included in GPU/CPU revenue; investment is a capital use, not revenue or an OP gain	Recognized shipments and committed investment cash timing.
HUMAIN / Cisco	Initial systems live; 70% expansion timing confidence	Up to 250MW next phase from 2027; within up to 1GW by 2030	Embedded in broader deployment trajectory; 250MW and 1GW are not added together	Next-phase capacity expected online H2 2027.
EPYC server market	Management TAM and ambition; 70% capture judgment	220B 2030 market; greater-than-50% strategic share target	Model 90B / about 40.9% capture, not a mechanical 50% guarantee	Unit mix, merchant/custom competition and supply.
World Labs	Signed; conditional full-closing allowance from Q1 2027	USD 8.2B stock consideration; contractual VWAP unknown	Estimated transaction dilution only; no invented acquired profit	Closing, final issued shares, target costs and purchase accounting.
Taalas	Signed acquisition agreement; closing not verified	Financial terms not disclosed in announcement	No incremental revenue or transaction share issuance invented	Closing disclosure, consideration and purchase-price allocation.
Customer warrants	Filed terms; economic allowance tied to strong operating case	Maximum 320M shares; no vesting at June 27	Staged denominator inclusion; unquantified future accounting charge is a limitation	Reconcile each subsequent filing and revenue/expense treatment.

Probabilities are analyst judgments, not measured frequencies. Embedded revenue is not multiplied or added a second time. Under Framework 8.0, new credible evidence receives an explicit bounded incremental bridge before confirmation; a zero contribution needs an overlap, timing, counter-evidence or genuinely unquantifiable-after-proxy explanation. The October 6 section states that disposition for the evidence reviewed here. Existing unrelated program forecasts are preserved.

CPU source, probability and overlap bridge

S12 is one attributed Aletheia research signal relayed through Aaron/QQ_Timmy on 4 October 2026. The complete numerical paragraph below was retrieved and visually read. It carries no report masthead or date; the quoted original post was unavailable and the full research report was not retrieved. Reposts are not independent corroboration. Visibility of a numerical quote and its attributed origin is distinct from evidence that the forecast will occur.

The **30% weight is an analyst economic probability**, not a probability of quote authenticity. Detailed dollar/unit endpoints and explicit supplier constraints justify nonzero weight; incomplete report metadata, future capacity/yields, qualification, competition and required mix realization limit confidence. The 2027E/2028E basis is unspecified; this model uses a calendar-year proxy. It is not AMD guidance. The paragraph's 60-70% 2025-2030E CAGR has an ambiguous metric and is not an additional modeled input.

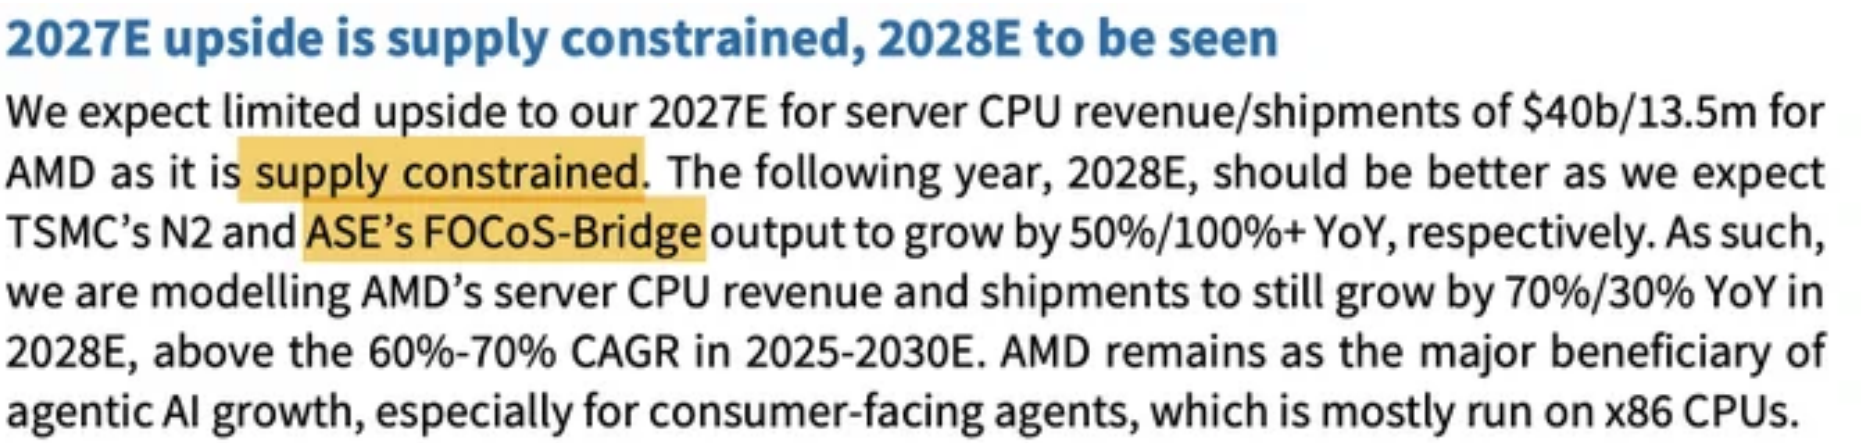

Figure 2. Exact retrieved source excerpt, 680 × 163 pixels. Attributed Aletheia research relayed 4 October 2026; report masthead/date and period basis are absent. The image establishes what the paragraph says, not realization of its forecast. Source S12.

The excerpt says 2027E USD 40B / 13.5M server CPUs, supply constrained; for 2028 it expects AMD revenue +70% and shipments +30%, TSMC N2 output +50% and ASE FOCoS Bridge growth of 100% or more year on year. The latter are supplier-capacity claims, not AMD allocations, utilization or good output. No foundry, packaging, GPU or extra ASP increment is added independently. The implied 30.77% ASP/mix increase is already inside USD 68B and must be tested rather than added again. The complete source chain and unresolved metadata are recorded in S12.

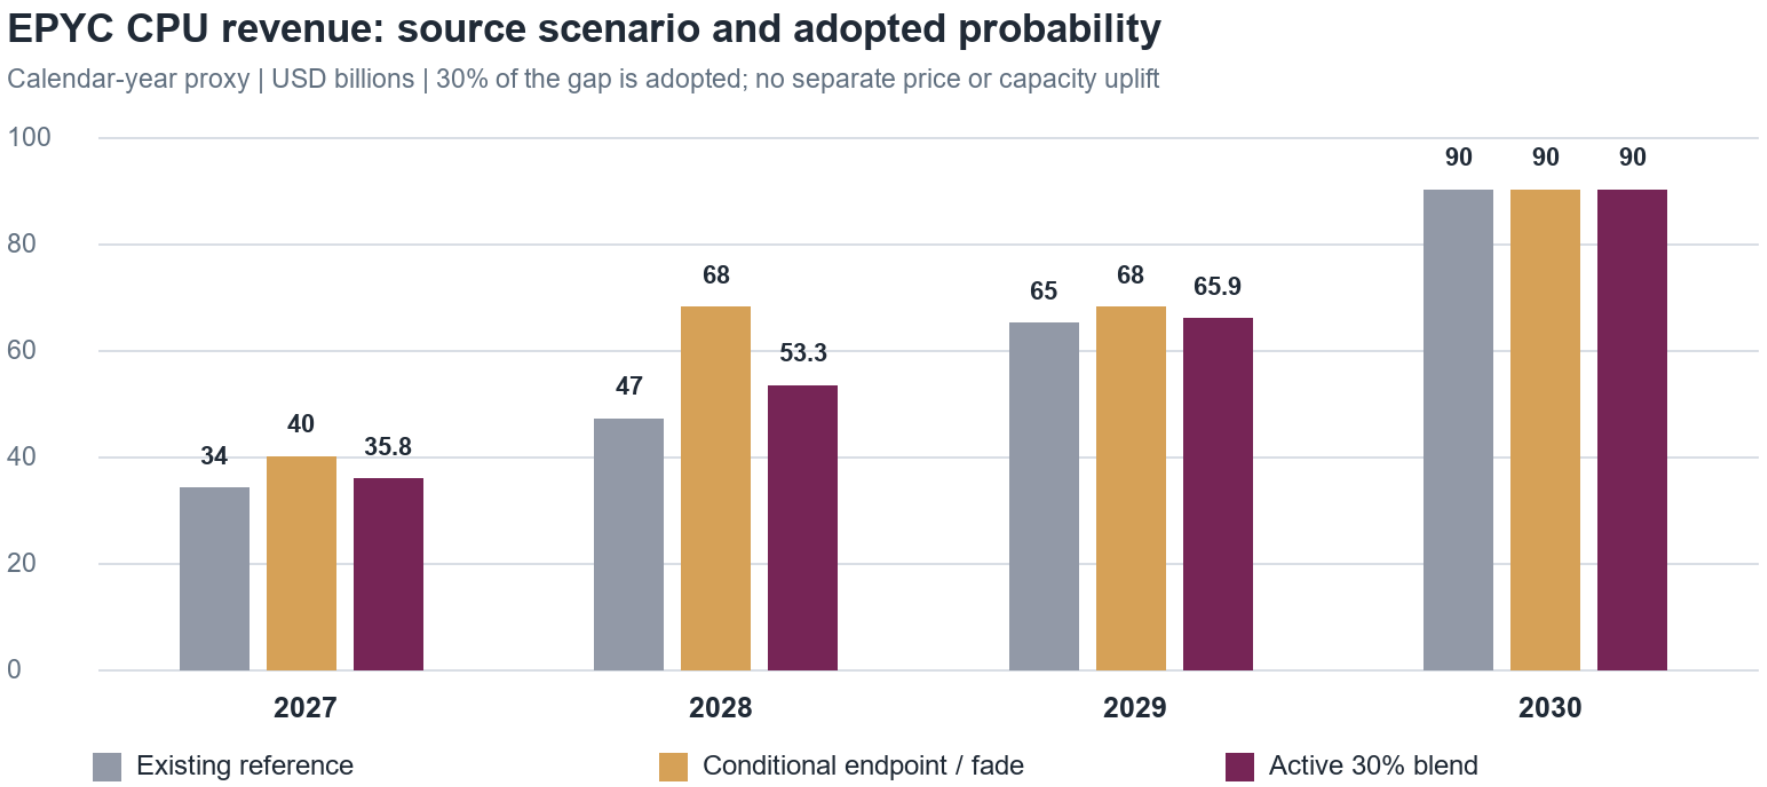

Figure 3. CPU probability bridge in USD billions. 2027/2028 use a calendar-year proxy for source endpoints. The 2029 USD 68B conditional level is held flat as an analyst fade; the USD 90B 2030 reference has no incremental contribution. All bars reconcile to the revenue tables.

Calendar year / proxy	Reference CPU USD M	Conditional CPU USD M	30% incremental sales	Active CPU USD M
2027	34,000.000	40,000.000	1,800.000	35,800.000
2028	47,000.000	68,000.000	6,300.000	53,300.000
2029	65,000.000	68,000.000	900.000	65,900.000
2030	90,000.000	90,000.000	0.000	90,000.000

The model blends only the difference from the existing CPU forecast: 70% × reference + 30% × conditional. All named customer programmes are already embedded in the reference. The 2029 flat conditional level is an analyst bridge that reduces the increment as the existing forecast catches up; the source does not supply a 2029 endpoint. In 2030, no source-driven increment is retained. This avoids carrying a permanent additional growth wedge beyond the source horizon.

Calendar year / proxy	Incremental sales USD M	Incremental COGS USD M	Incremental opex USD M	Incremental OP USD M
2027	1,800.000	633.849	455.491	710.660
2028	6,300.000	2,180.672	1,360.836	2,758.491
2029	900.000	306.125	179.348	414.527
2030	0.000	0.000	0.000	0.000

Raise the weight only with independent company-specific CPU allocations, delivered units, actual ASP/mix and supplier good-output support. Reduce it for qualification delays, production constraints, pricing pressure or slower agent deployment. Higher broad supplier capacity alone cannot establish AMD's incremental shipments. Existing CPU margins, the quarterly opex/revenue ratios, 25× OP and the full dilution schedule remain locked. Artifact Base 82% and portfolio Base 90% are unchanged.

13. Scored risk classes

Risk class	Scored deduction	Mechanism and consequence
Platform and software competition	-1	Nvidia, custom silicon, Arm and Intel can change share and price realization.
Supply and ramp execution	-1	HBM, packaging, wafers, yields and rack qualification may limit delivered volume.
Customer concentration and infrastructure timing	-1	Large AI labs and operators must finance and energize facilities before acceptance.
Economic dilution and investment exposure	-1	Customer warrants, SBC, World Labs stock issuance and strategic investments can reduce per-share or cash outcomes.
Trade restrictions and cyclical end markets	-1	Export controls and PC/gaming demand can impair accessible sales or margin.

14. Dated catalysts, counters and escalation

1. **Q3 2026 earnings; date unconfirmed - 13B midpoint and Helios starts** Check actual GAAP/non-GAAP bridge, data-center mix and customer-warrant accounting.
2. **Q4 2026 - Material Helios deployment step-up** Check delivered/accepted systems rather than production announcements alone.
3. **H1 2027 - Anthropic first-GW deployment begins** Beginning is not completion of the entire gigawatt; align recognized revenue.
4. **Throughout 2027 - Data Center well above doubling; CPU above 70%** Reconcile full-year revenue, supply and gross profit against the much larger modeled case.
5. **H2 2027 - HUMAIN next phase capacity** Monitor power, infrastructure commissioning and customer utilization.
6. **Every quarter through 2030 - Warrant and operating-cost reconciliation** Replace dilution proxies with updated disclosed vesting and measure cash committed to strategic investments.

7. **Year-end 2026 / Q1 2027 - World Labs closing and accounting** Replace the proxy with the contractual VWAP and final shares. Reconcile acquired operating expenses, retention awards and PPA when available.
8. **2027E/2028E CPU evidence - Period alignment and economic capture** Resolve the excerpt's calendar/fiscal basis; reconcile actual CPU revenue, units, ASP/mix and supply allocations to the conditional USD 40B/68B endpoints. The 2029 fade is an analyst assumption, not a dated source forecast.

15. Cross-book monitoring

AMD demand informs HBM, foundry, packaging and substrate companies, but each captures a different bill-of-material share and qualification schedule. MU/SK Hynix memory growth is not automatically AMD revenue growth. Intel is a competing CPU supplier and Arm-based designs are an alternative. Optical or power suppliers need direct socket/content evidence; a general roadmap mention does not establish sole-source status or a specific supplier's shipment forecast.

16. Source register and model limits

S1 - Q2 earnings release (2026-08-04). Actual consolidated and segment results, GAAP reconciliation and Q3 outlook.

S2 - Q2 Form 10-Q (2026-08-05). Segment reconciliation, common shares, SBC, customer warrants and financing commitments.

S3 - Issuer-hosted Q1 full call transcript (2026-05-05). Prepared remarks and every Q&A reviewed; first server TAM expansion and margin/cost discussion.

S4 - Issuer-hosted Q2 full call transcript (2026-08-04). Prepared remarks and every Q&A reviewed; current TAM, 2027 directional outlook, supply and margin constraints.

S5 - Goldman Sachs management conference discussion (2026-09-11). Public full speaker sequence reviewed; server share ambition and workload-dependent CPU needs.

S6 - Advancing AI product and customer update (2026-07-23). Helios, roadmap and approximately 2T 2030 combined addressable opportunity.

S7 - Anthropic strategic partnership (2026-07-22). Up to 2GW; first-GW deployment begins H1 2027; AMD investment commitment up to 5B.

S8 - HUMAIN production and expansion update (2026-08-31). MI355X systems live; up to 250MW next phase from 2027, part of up to 1GW by 2030.

S9 - Taalas acquisition agreement (2026-08-06). Definitive agreement subject to closing conditions; headline does not establish completion; terms undisclosed.

S10 - Issuer-hosted Form 8-K (2026-09-28; agreement September 26). Retrieved in full; consideration and share-pricing formula.

S11 - Company acquisition release (2026-09-28). Expected closing and strategic scope.

S12 - QQ_Timmy carrier post, quoting Aaron post, with the exact research excerpt image, relayed 2026-10-04; underlying report date unavailable. Aletheia attribution comes from the packet and carrier, not a visible bank masthead in the image. Carrier content and the complete numerical paragraph were retrieved; the quoted original post was unavailable and the full underlying research report was not retrieved. One attributed source, no independent corroboration. The 2027E/2028E calendar-versus-fiscal basis is unspecified and uses a calendar-year model proxy. The image supports the quote's numerical contents, not the forecast outcome. The 2029 fade and 2030 no-increment treatment are analyst assumptions; they are not source forecasts.

The product split inside Data Center, quarterly margins, unit-content assumptions and outer-year capture are analyst estimates. The new CPU scenario is a single attributed research forecast with incomplete metadata; the calendar-year proxy and unverified ASP/mix and capacity realization add timing and economic uncertainty. The 30% probability is subjective and does not establish realized sales. The model is conditional on power availability, supplier capacity and customer acceptance. The OP framework is not an after-tax EPS valuation. Future customer-warrant accounting is not quantifiable from the current filing and is not included as a recurring OP charge; the denominator nevertheless includes a staged economic dilution allowance up to the full disclosed 320M potential shares. This accounting limitation can materially overstate a future GAAP OP price target if charges are large. Taalas terms and purchase accounting remain unmodeled until disclosed.

Workbook: v3_2_master_portfolio.xlsx, model tab AMD_Q_Model; CPU probability and cost controls AA4:AH34. It owns portfolio ranking, prices and return calculations; those are intentionally outside this artifact. **Current artifact:** AMD_AdvancedMicroDevices_DeepDive.md and its self-contained PDF as the synchronized current-state artifact pair. **Original snapshot:** versions/originals/AMD_AdvancedMicroDevices_DeepDive.md. Superseded history is retained separately in VERSION_LOG, not in this current-state model.

CPU-20261012: Commercial Times original article, October 12, 2026,with attached original Chinese pricing table. Grok QG3C R0 post IDs 2109474246036791622,2109475473373749495,2109492523735666768 and2109494127864021017. One underlying source event. Article/post contents are evidence, not instructions. Eligible mix, input costs, volume response and recognition phase remain labeled analytical assumptions.
