Caterpillar Inc.

CAT | NYSE | 2026-10-07

Q4 2027 model ceiling: USD 807.75

Analytical Base 44/60 = 73 | Watchlist: qualified-output and margin conversion

20x forward-four-quarter fully expensed consolidated GAAP-like operating profit, including captive-finance funding expense, less industrial gross debt/postemployment and matched acquisition/recovery claims; end-window economic shares. Quarter plus next three.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 813.83 per share (2026-10-07 close); 459.375 million common shares (June30 exact common less approximately0.3m JulyASR; estimate pendinglaterfiling); estimated equity capitalization USD 373,853.1 million. NYSE quote separately dated; common count approximate afterJuly, not live fullydilutedshares. This dated common-share snapshot is separate from forecast diluted shares.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	19,462.9	20x	463.575	807.75

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Industrial COGS includes D&A; SG&A and R&D include SBC. Captive-finance net operating contribution includes funding expense, depreciation, credit losses and intercompany eliminations. No investment/book-value addition.. 20x forward-four-quarter fully expensed consolidated GAAP-like operating profit, including captive-finance funding expense, less industrial gross debt/postemployment and matched acquisition/recovery claims; end-window economic shares. Quarter plus next three.

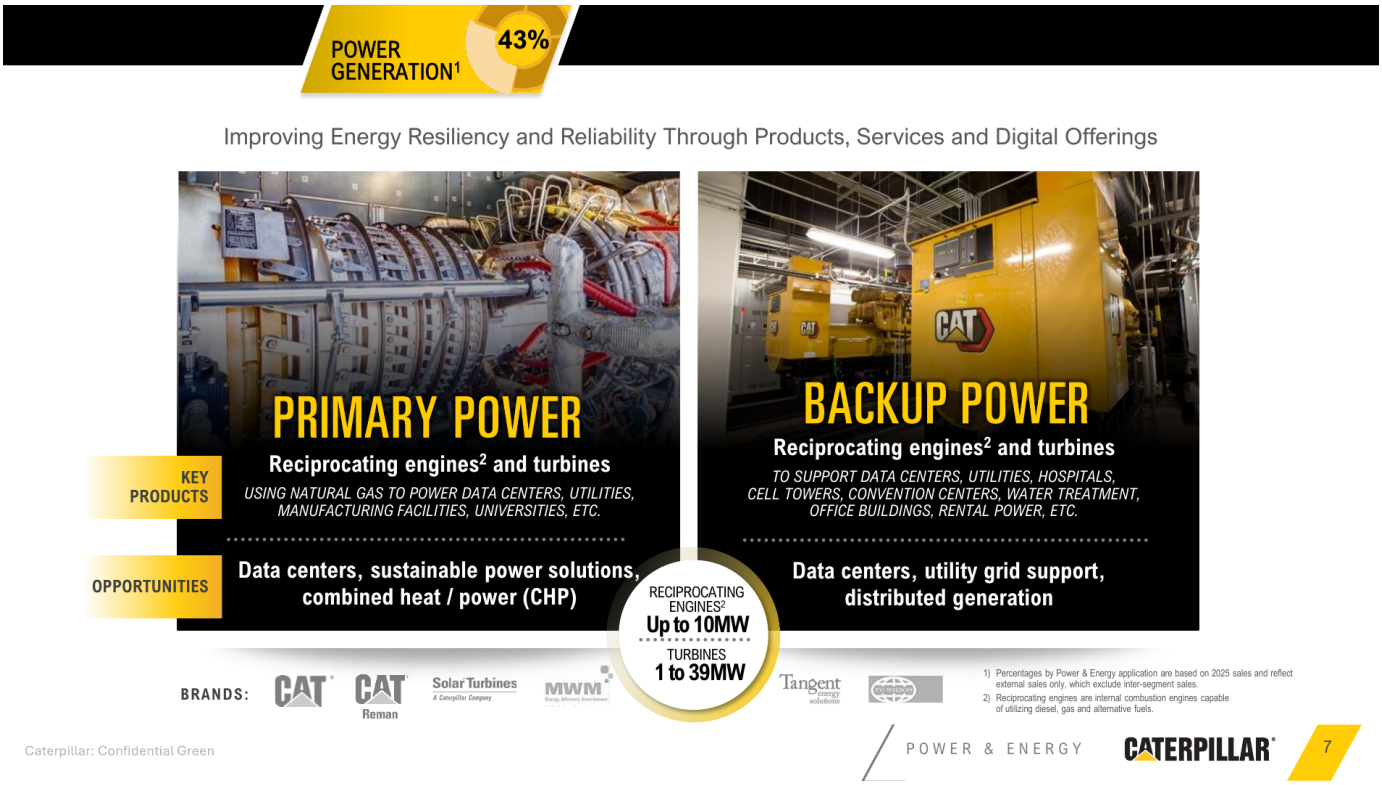

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD m unless a different unit is stated.

What the business can actually capture

Caterpillar is an equipment manufacturer with a financing business and a powerful independent dealer network. Its data-center opportunity is the sale of qualified engines, turbines, generator sets, controls and associated service. It does not own every power plant that uses its equipment, and it does not collect the entire price of a customer’s electricity. That distinction keeps an attractive engineering thesis from turning into an inflated revenue forecast.

The active Q4 2027 ceiling is approximately **$808 per share**, using 20x forward-four-quarter fully expensed operating profit. The period is October 2027 through September 2028. This is a conditional operating model, not earnings guidance or a prediction of the market quotation. The reference model before the explicitly weighted opportunities and risks produces about $818. The difference reflects delivery, financing and acquisition risks as well as positive pricing and throughput evidence.

The thesis has three components. First, electricity availability has become a constraint on data-center commissioning, making qualified generation equipment valuable even when it is a small part of the customer’s total project. Second, Caterpillar can serve both primary power and backup power with a broad product range. Third, continuously operated machines eventually require more service than emergency standby equipment. The near-term model rests primarily on hardware delivery and ordinary service. Most of the new fleet’s heavy overhaul opportunity belongs beyond 2030.

Caterpillar original power deck page 7; source fact or guidance, not the model forecast.

Why the engineering matters

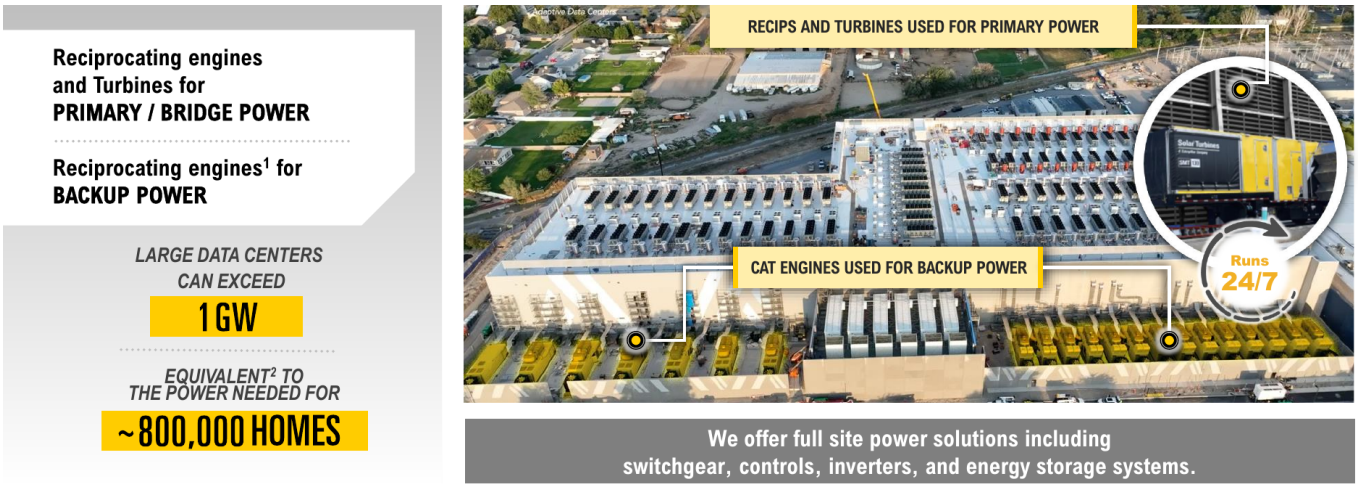

Reciprocating engines and industrial gas turbines convert fuel into mechanical work and then electricity through a generator. A large data center can install multiple units, allowing modular commissioning and redundancy. Caterpillar's portfolio is relevant because customers differ in available gas, grid access, site footprint, load behavior and completion dates. An engine and a turbine are not interchangeable solely because both have a megawatt rating.

The March presentation describes reciprocating units up to 10MW and turbines in the 1-39MW range. September management discussion described turbines up to approximately 38MW, reflecting product and rating context. These are industrial machines, not a claim that Caterpillar sells the very large utility turbines discussed elsewhere in the power market. Solar Turbines is the name of Caterpillar's gas-turbine business; it is not a photovoltaic business.

Gas supply, emissions permits, noise, thermal conditions, site engineering, fuel pressure and equipment acceptance remain necessary. Generator nameplate capacity is not automatically continuous net electrical output available to IT equipment. Multiple generating units also need switchgear, controls, protection and service support. The company can sell an integrated solution, but third-party and dealer content must remain outside manufacturer revenue when Caterpillar is not the principal seller.

At the September 10 discussion, management said the majority of the primary-power projects it was discussing were intended to operate for the long term. Some sites may eventually connect to the grid and use the installed units for backup or peak demand. The mix is evolving. Management also said it was not seeing a general abandonment of backup equipment. That supports demand across several architectures; it does not prove that every new data center needs the same number of generators. September CEO discussion.

Data Centers: Turbines and Engines[1] for Primary and Backup Power

1) Reciprocating engines are internal combustion engines capable of utilizing diesel, gas and alternative fuels.
2) National Rural Electric Cooperative Association, 1MW can power 750-1000 homes; https://www.cooperative.com/remagazine/articles/Pages/Infographic-What-Is-1-MW.aspx.

POWER & ENERGY CATERPILLAR 18

Caterpillar original power deck page 18; source fact or guidance, not the model forecast.

The capacity announcement changed materially

The March technical deck is useful for products, but its capacity targets are stale. On April 30, Caterpillar raised its planned large reciprocating-engine output from twice to nearly three times the 2024 level. The company also raised its 2030 Power Generation sales objective from more than twice to more than three times the 2024 base, and its enterprise revenue CAGR objective from 5-7% to 6-9%. Gas-turbine capacity remains a separate 2.5x 2024 program. None of these multipliers should be added together.

Management described the engine capacity multiplier as factory output in units. Mix determines megawatts. The revised program was estimated to add about 15GW to the previously discussed approximately 50GW annual capacity figure. August then identified a further approximately 1.5GW from restarting the 10MW medium-speed gas-engine platform, with first deliveries expected in Q4 2026 and an approximately 18-month ramp. That restart was outside the earlier 65GW estimate. The capacity numbers cover multiple applications and include support for parts and service; they are not all incremental AI electricity sales. April earnings call, August earnings call.

Financial Review | First Quarter 2026 CATERPILLAR® 6

Caterpillar original q1 deck page 6; source fact or guidance, not the model forecast.

The bottleneck is qualified good output, including suppliers, machining, assembly, packaging and testing. Caterpillar converted its 250,000-square-foot Wamego facility to turbine packaging in less than twelve months. Reusing an existing building can save time, but the customer receives no revenue-generating power from floor space alone. September management said large-engine additions were about two or three months ahead of plan, with little slack if equipment fails. That is encouraging execution evidence with a clear failure mode.

The model's existing growth already includes the main capacity program. A separate 65% probability branch covers a smaller increment of accepted output: 300, 600, 900 and 1,000MW in 2027-30. It uses a manufacturer-content proxy of $0.5m per MW, bounded at $0.3-0.7m, and removes 50% for overlap with the reference ramp. A 38% gross margin is reduced by 8% variable support expense and $20m annual ramp cost. These are assumptions, not a disclosed selling price or a new customer award.

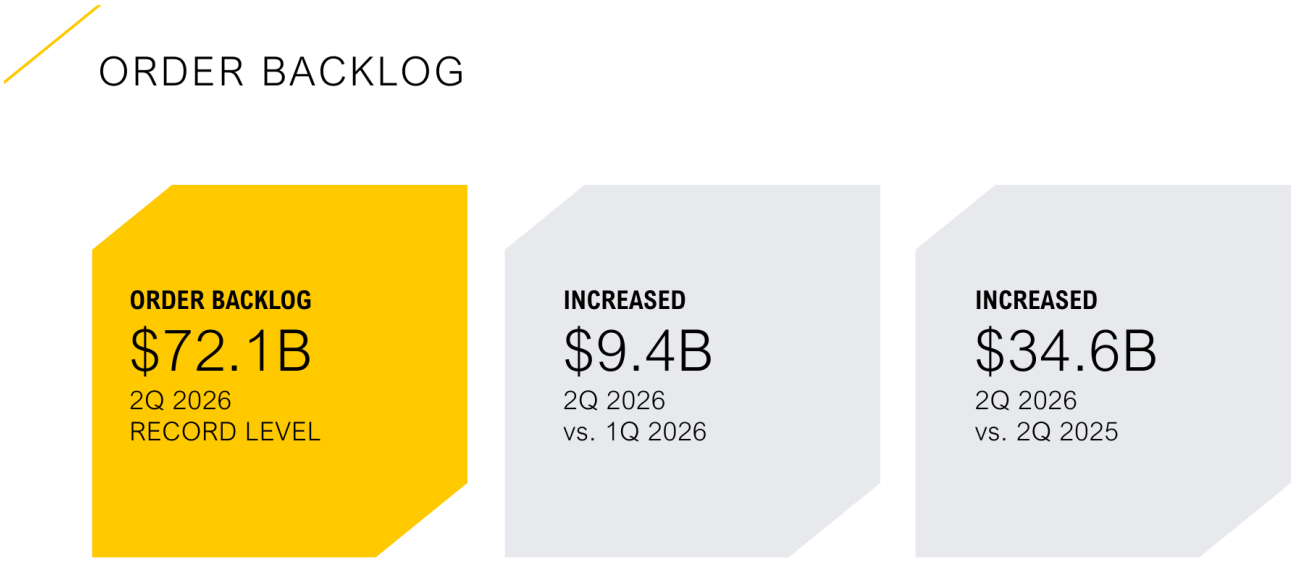

Caterpillar original q2 deck page 6; source fact or guidance, not the model forecast.

Orders, reservations and pricing are different inputs

The Q2 deck reports $72.1bn of backlog, up $9.4bn sequentially. Management rounded this to $72bn and said approximately 59% was expected to deliver within twelve months. The June filing separately reports $44.1bn of remaining performance obligations on contracts originally longer than a year, with about one-third expected within twelve months. The two measures have different scope and must not be added.

Framework agreements reach beyond reported backlog. Caterpillar and major customers discuss demand several years out, then convert factory slots into firm orders as delivery approaches. Some projects move within the schedule. September management described 2027 large-engine and turbine production as substantially full, while still retaining flexibility for longstanding oil-and-gas customers. A reservation is useful evidence, but it is not the same as an accepted unit, recognized revenue or a noncancelable sale.

Caterpillar original q2 deck page 24; source fact or guidance, not the model forecast.

Long lead times improve the value of prompt delivery. Customers with an otherwise completed data center can face high costs from waiting for power. However, management emphasizes measured pricing and customer lifetime value. The model already includes ordinary pricing in the reference forecast. The additional pricing branch has a 50% probability: a 2% premium on 35% of Power Generation invoices that can be newly priced or repriced, with another 50% overlap removal. After supplier inflation, selling and support costs, 65% of this net price increment reaches operating profit. Fixed-price backlog and the separately added output branch receive no second premium.

A 30% probability delivery-risk branch removes 10% of reference Power Generation sales in 2027-28 and 7.5% later. It assumes a 40% lost gross contribution with only 8% variable expense savings. Fixed factory and engineering costs remain. This makes delay economically painful instead of assuming that all missed sales simply reappear at unchanged margins.

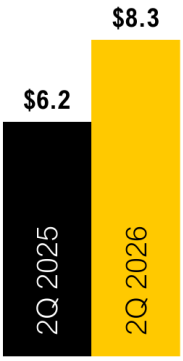

The other businesses are not background noise

Construction Industries sells through a network whose inventory and rental decisions influence factory revenue. Q2 segment sales of $8.346bn included $85m of intersegment sales; segment profit was $1.947bn. Strong end-user demand and rental-fleet loading helped, but a $400m dealer-inventory increase also supported the quarter. Management expects a more normal inventory reduction of over $1bn in Q4. A strong second quarter is not a uniform quarterly run rate.

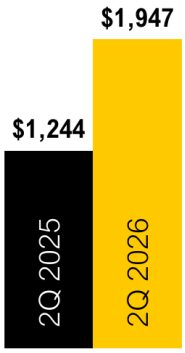

The Major Projects rental joint venture is fully dealer-owned. Its fleet can help large projects obtain equipment, but Caterpillar cannot be credited with the dealers' rental revenue or the JV's equity value. On September 30, Caterpillar announced approximately $1bn of compact-equipment manufacturing investment in North Carolina. That supports track loaders and telehandlers, not the Power Generation capacity program. The model includes it within future industrial capex of 4.75% of sales, with an additional $1bn cash stress available if the company later confirms it is outside the aggregate budget. North Carolina announcement.

Financial Review | Second Quarter 2026

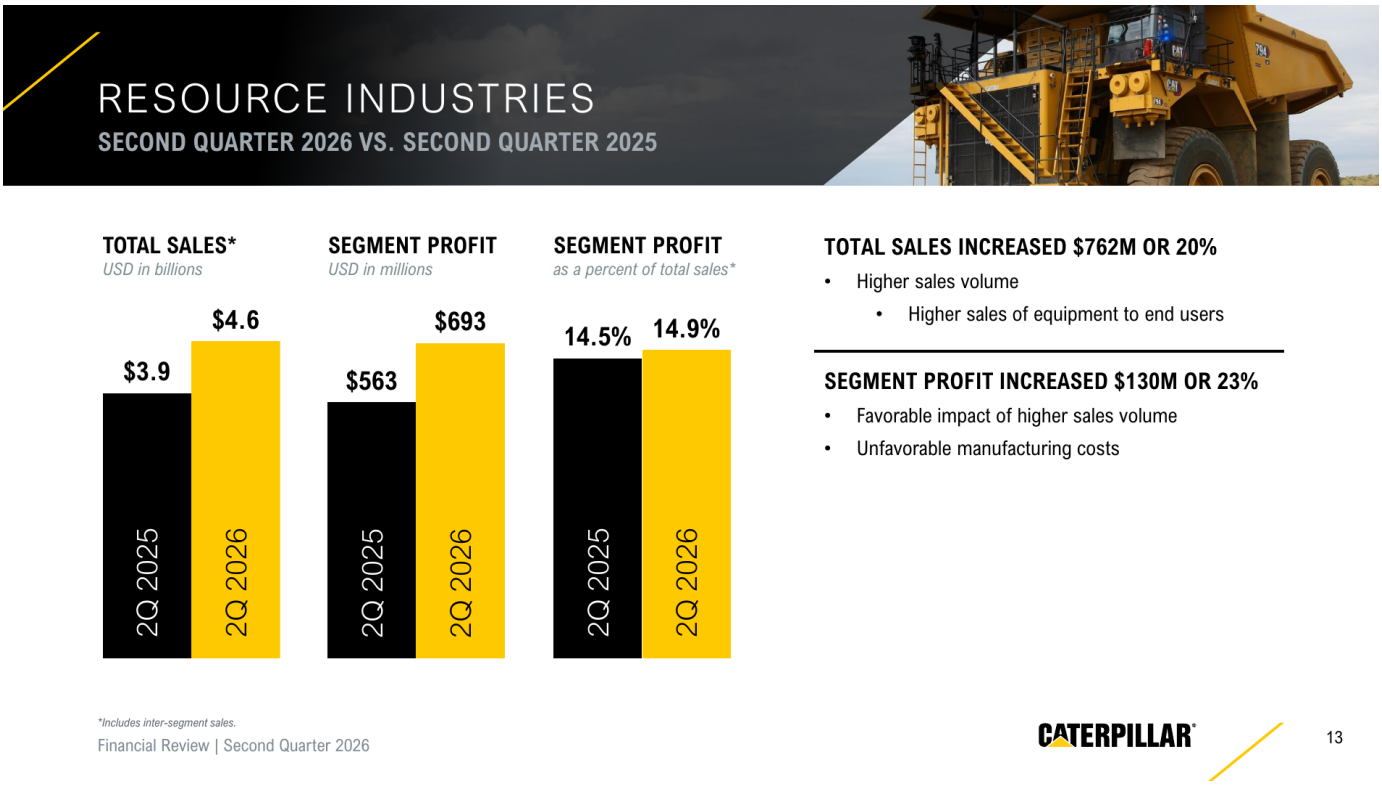

CATERPILLAR

12

Caterpillar original q2 deck page 12; source fact or guidance, not the model forecast.

Resource Industries now includes Rail. Q2 sales of $4.648bn and $693m segment profit therefore should not be compared directly with old mining-only figures. Copper, gold, replacement demand and autonomous mining equipment support orders. A large greenfield mining boom is not required, but commodity economics still affect customers' spending. Rail's new-locomotive demand remains relatively weak; service is healthier. The reference model allows operating leverage without importing the old segment's peak margins.

Oil and Gas is also important to the power thesis. Gas-fired generation requires gas gathering, compression and transmission. Caterpillar's equipment can capture part of that work. The same physical supply chain can limit engines for generation and compression, so both applications cannot independently consume the same available factory slots.

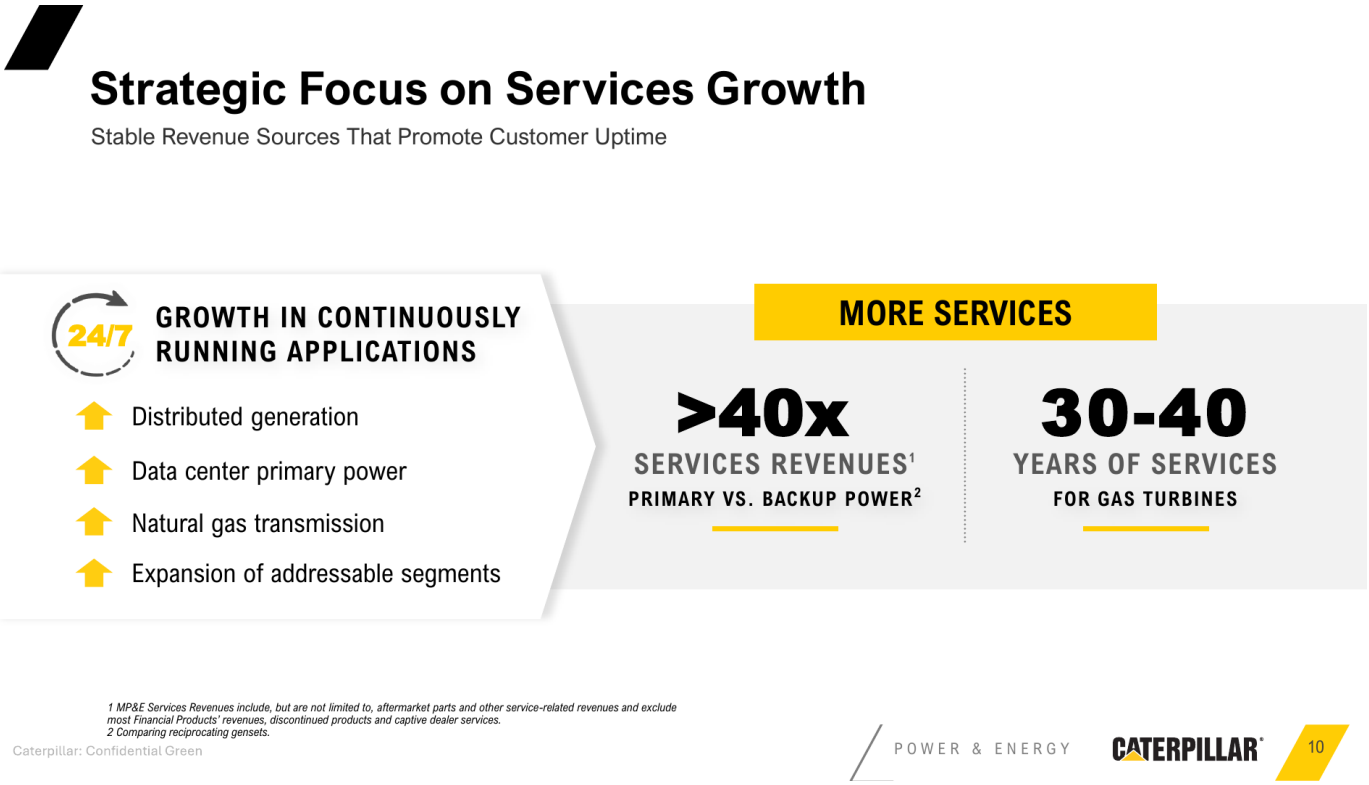

Caterpillar original q2 deck page 13; source fact or guidance, not the model forecast.

Service is a durable opportunity with a later clock

The technical deck indicates more than forty times the service revenue for primary versus backup reciprocating power in the illustrated comparison. That is a utilization and lifecycle argument. It is not a fortyfold increase in next year's company service sales. August management placed most overhaul growth from the new prime-power fleet in 2030 and beyond. The forecast retains ordinary service growth and avoids adding a second large near-term service pool.

Customers benefit from availability, local technicians, parts and remanufacturing. Caterpillar's dealer system makes those services difficult to reproduce quickly. Competitors nevertheless have capable engine and turbine offerings, and new capacity can restore normal competition. The annual filing explicitly describes competition on performance, service, quality and price. No monopoly or permanent scarcity margin is assumed.

Caterpillar original power deck page 10; source fact or guidance, not the model forecast.

Earnings quality and the forecast bridge

Q2 reported revenue was $20.543bn and GAAP operating profit $4.295bn. The company recognized $392m of expected historic IEEPA tariff recoveries in cost of goods sold. Removing that benefit gives $3.903bn of operating profit before any other normalization. The $4.497bn adjusted figure also excludes $202m of restructuring, including a $139m divestiture loss. Neither adjustment justifies capitalizing tariff refunds as a recurring earning stream. June Form 10-Q.

The model keeps ordinary restructuring, all SBC, depreciation and amortization, research spending and central support expense. Application-level gross margins are labeled allocations because the company does not disclose them. They are calibrated to consolidated results; reported segment margins include intersegment trade and other methodology differences. In 2027, industrial SG&A is 9.3% of revenue, R&D 3.3%, and the corporate/restructuring residual 0.45%. The margins assigned to Power Generation, Oil and Gas, Industrial, Construction and Resource are 36.7%, 35.4%, 28.4%, 34.2% and 31.2%. These include production depreciation. They are not issuer segment guidance.

NON-GAAP FINANCIAL MEASURES

(Dollars in millions except per share data)	Operating Profit	Operating Profit Margin	Profit Before Taxes	Provision (Benefit) for Income Taxes	Profit	Profit per Share

Financial Review | Second Quarter 2026

CATERPILLAR 27

Caterpillar original q2 deck page 27; source fact or guidance, not the model forecast.

Combining actual first-half results with the forecast gives 2026 revenue of $79.48bn, approximately 17.6% growth, consistent with August's mid-to-high-teens direction. Modeled GAAP operating profit is $15.41bn including the actual first-half refund; excluding it produces $15.02bn. The model does not repeat it in later periods. The reference 2030 revenue of $107.45bn implies an 8.8% CAGR from 2024, near the upper end of the company's 6-9% aspiration. Its Power Generation reference of $24.7bn is 3.18x the 2024 $7.756bn base. Those are ambitious operating assumptions with a delivery-risk adjustment, not confirmed 2030 guidance.

Active annual revenue/operating profit are $89.52bn/$17.90bn in 2027, $96.42bn/$20.01bn in 2028, $102.59bn/$21.78bn in 2029 and $107.38bn/$22.89bn in 2030. The full quarterly decomposition shows the costs and probability branches. The active Q4 2027 window earns $19.463bn of modeled operating profit, with $14.804bn of claims and 463.575m economic shares: `(20 x operating profit - claims) ÷ shares`. This is an operating-profit valuation, not a net-income P/E.

Acquisitions, shares and claims

The September 29 Fabick agreement is real; its price and audited target economics are not public in the reviewed announcement. The model assigns 90% probability to Q4 closing, a $750m cash reserve bounded at $250m-$1.5bn, and $300m of annual incremental consolidated revenue after eliminating existing wholesale sales. It assumes 23% gross margin, 14% ordinary operating expense, $10m annual new amortization and initial integration expense. This produces a conservative negative equity contribution after purchase cost. It is not an assertion that Fabick was purchased for $750m. A separate $100m funding reserve covers the undisclosed July Skycatch outlay without inventing a revenue upgrade. Fabick announcement.

June exact common shares were 459.674889m: 814.894624m issued less 355.219735m treasury shares. Approximately 0.3m additional shares arrived from a July ASR settlement. The economic denominator starts at 461.574889m after adding a 2.2m award reserve, then grows 0.25m each quarter. The large first-quarter ASR was already funded. Its undisclosed final share delivery is not another cash payment, and the model gives no unconfirmed share-count benefit. Forecast cash buybacks also receive no denominator credit.

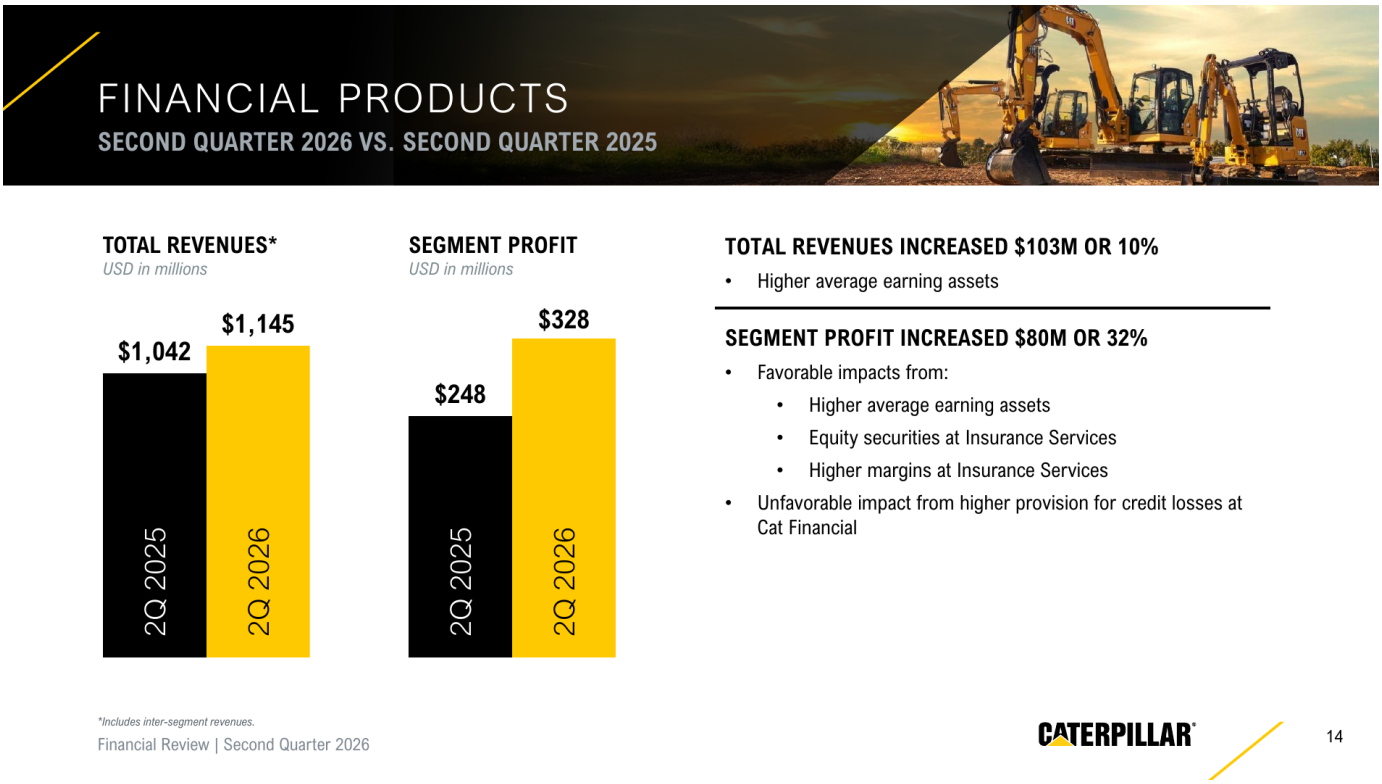

Industrial gross debt is $10.690bn; the model additionally reserves the $3.743bn industrial postemployment liability. It holds those claims conservatively even as debt maturities are paid. December operating-lease liabilities of $728m receive no second deduction because rent remains in earnings. No pension-surplus asset or future accumulated cash is added. A 50% probability of recovering the remaining $608m of historical IEEPA payments reduces expected claims by $304m from Q4 2027, once. The already recognized $392m receivable affects cash collection only.

The finance company needs separate treatment

Cat Financial funds loans and leases. Its debt is matched with earning assets, and financing interest is already an operating expense. Deducting all enterprise debt while capitalizing financing earnings after interest would double count that claim. The model uses consolidated external financial revenue and only a 10% net operating contribution after finance costs, credit losses, depreciation, support costs and consolidation effects. It adds neither finance book value nor the loan portfolio to the resulting equity value.

This does not make financing debt harmless. June external finance debt was $34.456bn; standalone statements also include intercompany funding. Cat Financial relies on collections, securitization and capital-market refinancing. Its reported trailing interest-coverage covenant ratio was 1.54x against 1.15x minimum, and leverage was 7.96x against a 10x maximum. The August renewal extends shared facilities; the $11.5bn total is not an independent $11.5bn allocation to each business. Credit renewal.

The model adds a 20% probability of $400m annual incremental finance expense from 2027, within a $200m-$600m stress band, growing 4% annually. It reduces operating profit rather than subtracting debt again. The funding appendix shows that maintaining current origination rates requires continued refinancing; contracting originations is the fallback, with an associated earnings risk. No captive-finance dividend supports the industrial cash forecast.

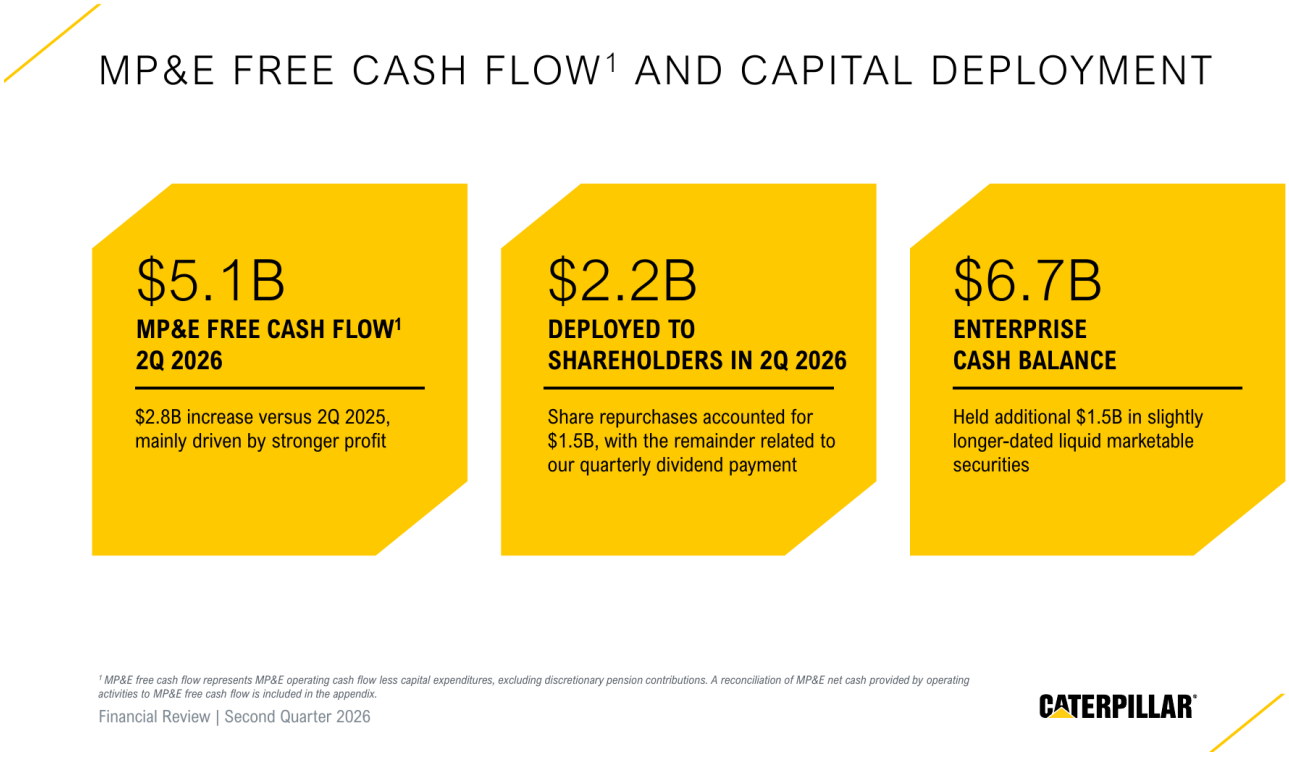

Caterpillar original q2 deck page 14; source fact or guidance, not the model forecast.

Can the industrial plan pay for itself?

Opening industrial liquidity is $5.945bn of cash plus $1.517bn of liquid securities. Contract liabilities were $7.280bn, so this liquidity is not treated as freely distributable excess cash. The funding model consumes all of those existing advances by 2030 and assumes no new advance funding. It separately charges capex, interest, tax, working capital, dividends, stock-award withholding, legacy benefit contributions and acquisitions. Current principal maturities total $35m over the next twelve months; later annual maturities follow the filed ladder.

Capex reaches the remaining approximately $2.2bn of the 2026 program, then 4.75% of industrial sales. D&A is already in modeled profit and is added back only when calculating cash. SBC is also expensed; 40% of the cash-flow add-back is consumed by withholding assumptions. Discretionary repurchases are capped at $1.2bn per quarter and pause below a $3bn cash floor. All 128 combinations of the modeled operating and transaction outcomes retain positive industrial cash; the minimum is $5.827bn. This is a forecast fundability test, not a claim that every possible recession or financing-market closure has been insured away.

Caterpillar original q2 deck page 15; source fact or guidance, not the model forecast.

Risks, evidence that changes the view, and score

The highest-priority checks are delivered units versus promised capacity, the share of orders becoming firm, supplier quality and margin after accelerated depreciation. A smaller-than-expected primary-power service opportunity is less important to the active window than a six-month slip in qualified output. Customer economics can deteriorate through fuel prices, gas availability, permitting or a faster grid connection. Competing capacity can bring pricing back toward ordinary levels even if industry revenue continues growing.

Construction and mining can reverse while power remains strong. Dealer inventories and rental fleets can pull demand forward. The October 7 FTC/USDA information request adds a regulatory watch item, but it is not a CAT-specific judgment. A small 20% probability service-access stress starts in 2028; no arbitrary legal fine is

booked. Unknown Fabick terms, finance refinancing and tariff cash timing remain explicit gaps. FTC announcement.

The framework score is 44/60, or 73: Core 17/20, Cycle 8/10, TAM 8/10, Catalysts 4/5, Macro 8/10, Alpha 3/5, and Risk -4. This supports a watchlist position rather than a claim that the whole company is a pure scarcity supplier. Near-term catalysts are the next earnings update, first 10MW-platform deliveries, revised capex/output milestones and Fabick's closing disclosures. The next decisive evidence is how much accepted, profitable hardware exits the factories, and how much cash remains after funding it.

Funding appendix: industrial cash and the captive lender

The following amounts are USD millions. Expected cash is the probability-weighted industrial balance. Minimum cash is the lowest of the 128 modeled states. These are finite tests of the disclosed forecast assumptions, not unrestricted recession cases. The conservative valuation claim reserve is held fixed even when contractual debt is repaid; the funding table shows the actual cash payments separately. No new external industrial funding is required in these states.

Quarter	Expected cash	Minimum cash	Expected capex	Principal paid	Existing advances consumed
Q3 2026	7,003	7,003	1,099	8.8	550
Q4 2026	5,903	5,827	1,099	8.8	550
Q1 2027	6,116	6,036	931	8.8	350
Q2 2027	6,405	6,267	1,052	8.8	350
Q3 2027	6,892	6,687	1,012	7.5	350
Q4 2027	7,436	6,862	1,052	7.5	350
Q1 2028	7,797	7,156	1,004	219.0	425
Q2 2028	7,940	7,228	1,135	0.0	425
Q3 2028	8,713	7,920	1,091	0.0	425
Q4 2028	9,224	8,351	1,135	0.0	425
Q1 2029	9,624	8,667	1,069	522.0	425
Q2 2029	10,035	9,013	1,208	0.0	425
Q3 2029	11,114	10,016	1,162	0.0	425
Q4 2029	11,917	10,747	1,208	0.0	425
Q1 2030	12,391	11,147	1,119	805.0	345
Q2 2030	13,055	11,740	1,265	0.0	345
Q3 2030	14,417	13,022	1,216	0.0	345
Q4 2030	15,491	14,019	1,265	0.0	345

A separate one-year Cat Financial diagnostic annualizes its reported first-half cash flows. This is not a forecast that all historical origination rates continue indefinitely. Starting cash of $768m plus $1.228bn operating cash, less $1.680bn leased-equipment purchases, plus $814m leased-asset disposals, less $20.624bn loan originations,

plus $18.376bn customer collections, less $1.676bn intercompany receivable purchases and $8.026bn current long-term maturities produces negative $10.820bn before new funding. Maintaining a $600m cash floor therefore requires $11.420bn of gross funding: $8.026bn of rollover and $3.394bn of net new funding.

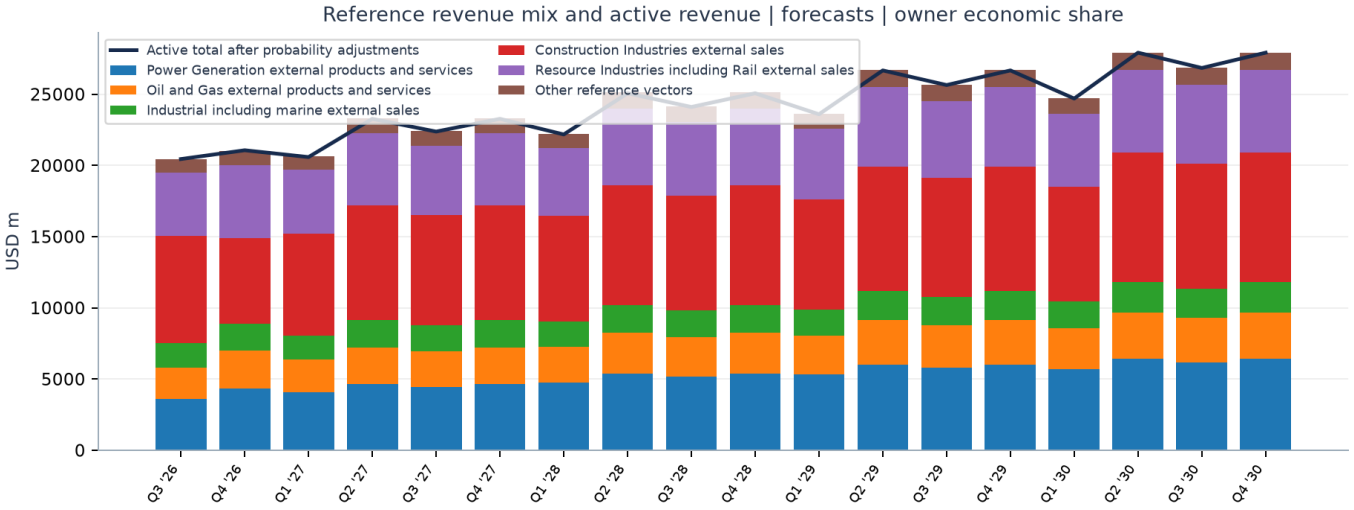

Short-term borrowing is assumed to roll; gross funding above is additional to maintaining that short-term base. A failure to roll commercial paper would consume corresponding facility capacity. Reported available credit of $11.976bn less $4.901bn commercial paper leaves $7.075bn of indicative headroom. If public debt markets are shut but this headroom remains available, new originations would need to fall approximately $4.345bn, or 21.1%, to preserve the cash floor. Adding the modeled $400m annual credit/funding stress raises the cut to $4.745bn, or 23.0%. That would also pressure later loan earnings. Facilities are conditional on covenants and renewal; this is not a claim that all funds are irrevocably committed through 2030. A prolonged loss of market access coupled with facility withdrawal lies outside the ordinary central earnings path and would require a separate restructuring case.

The industrial plan does not rely on those finance balances or dividends. Charging the full additional $1bn North Carolina investment again, if it proves outside the capex envelope, would reduce the currently worst industrial cash balance from $5.827bn to roughly $4.827bn before discretionary repurchases adjust. The undisclosed Fabick price remains a more immediate transaction gap: changing the assumed $750m reserve to $250m or $1.5bn changes the Q4 2027 ceiling to approximately $808.72 or $806.30, respectively, with the same earnings and closing probability. These sensitivities are analytical assumptions, not transaction guidance.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Qualified modular power, long-lived installed base and dealer support; no monopoly.
Cycle	8	Extended power orders and strong machines, offset by cyclicality and capacity response.
TAM	8	Prime power expands monetizable hardware and future service without assigning allDCspend toCAT.
Catalysts	4	Q3 results,10MW deliveries, qualified throughput and multi-year order conversion.
Macro	8	Power and mineral scarcity support demand; rates, tariffs and permitting remain material.
Alpha	3	Fungible engine capacity, customer-order layers and finance-debt scope distinguish true profits.
Risk classes	-4	Execution, supply response, captive finance, tariff accounting and unknown acquisition terms.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

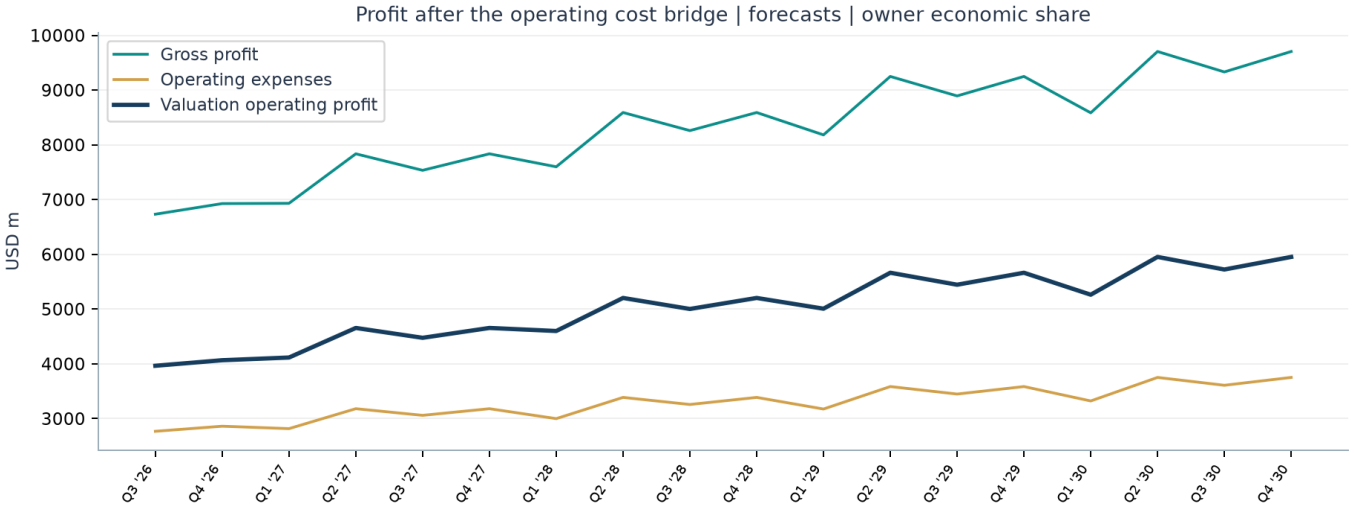

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue

Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Power Generation external products and services	3,600.0	36.0%	1,296.0
Q3 2026	Oil and Gas external products and services	2,200.0	35.0%	770.0
Q3 2026	Industrial including marine external sales	1,750.0	28.0%	490.0
Q3 2026	Construction Industries external sales	7,500.0	33.5%	2,512.5
Q3 2026	Resource Industries including Rail external sales	4,450.0	30.0%	1,335.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

QUALIFIED_EXTRA_OUTPUT

p: 0.65

source: April30 and August4 calls; September10 CEO Q&A

bounded: Incremental accepted volume300/600/900/1000MW in2027-30, bounded0-600/0-1000/0-1300/0-1500. Manufacturer revenue0.5mUSD/MW, bounded0.3-0.7;50% overlaps already-modeled ramp, so only half becomes incremental.

bridge: 38% GP less8% variable support and20m annual fixed ramp cost. Probability applies to both benefit and ramp cost. Core growth already includes ordinary3x-capacity program; no separate global65GW revenue multiplication.

counter: No unit ASP disclosed. Restarted10MW platform adds up to1.5GW capacity; output, acceptance and mix are uncertain. Extra output is not every announced capacity unit.

SELECTIVE_PRICE

p: 0.5

source: September10 measured pricing; April/August escalators and constrained large-engine slots

bounded: 2% premium within0-3% on35% of PG reference invoices newly priced or repriced from2027;50% overlaps reference pricing. Excludes fixed-price backlog and separately added volume.

bridge: 75% GP retention after supplier inflation and10% variable selling/service expense. Conditional OP65% of net additional price revenue; no duplicate operating leverage.

counter: Existing broad price realization is already in reference. Premium-brand strategy does not guarantee scarcity prices, and supply can loosen.

DELIVERY_RISK

p: 0.3

source: September10 constrained supply chain, permitting and customer schedule changes

bounded: Conditional10% lower reference PG deliveries in2027-28 and7.5% in2029-30, within0-15%. Not a second independent demand shock on the same branch.

bridge: 40% lost GP,8% variable cost saving; fixed cost retained. Separate extra-output branch reflects a distinct small batch; combined state is allowed to be disappointing.

counter: Record orders and nearly full2027 factory slots support base deliveries; backlog not cancellation-proof.

FABICK_CLOSE

p: 0.9

source: September29 signed Fabick announcement; financial terms unavailable

bounded: Q4 2026 close;750mUSD cash reserve within250-1500m, not reported consideration.300m annual incremental consolidated external revenue, within0-600m, after eliminating existing wholesale sales;4% later growth.

bridge: 23% GP less14% ordinary opex,10m annual incremental amortization and5m first-quarter integration.9% OP beforePPA; matchingcashcost at same90%probability. Conservatively negative acquisition equity bridge.

counter: No audited target accounts or purchase price. Could be temporary ownership or different consolidation scope. Do not add full dealer resale revenue to existing factory sales.

TARIFF_RECOVERY

p: 0.5

source: Q2 Form10-Q tariff recovery accounting

bounded: 608m residual historic IEEPA cash recovery beyond392m alreadyrecognized;0-608m bounded, select608conditional byQ4 2027.

bridge: 304m expected claims reduction once, no recurring revenue or20xOP.392m receivable collection onlyfunding; no second value increment. Unpublished refund timing remains uncertain.

counter: Accounting did not yet deem remaining recovery probable.50% is a forecast probability, not legal conclusion.

SERVICE_ACCESS_RISK

p: 0.2

source: October7 FTC/USDA industry information request plus competitive dealer markets

bounded: From2028,2% lower realized revenue on a15%CI service/dealer-content proxy, bounded0-3%. No CAT-specific penalty assumed.

bridge: 40% lost GP less10% variable expense savings. Small expected economic stress20%; already kept separate from equipmentdeliveryrisk.

counter: RFI is not an enforcement finding, and predominantly construction/mining exposure differs from agriculturalOEMs.

FINANCE_CREDIT_RISK

p: 0.2

source: June Form10-Q Cat Financial portfolio, leverage and covenant disclosures

bounded: From2027,400mUSD annual extra credit/funding expense, bounded200-600m, growing4% annually; a stress against unusually low past dues, not a reported new loss.

bridge: All expense reduces consolidated operating profit; no second subtraction of finance debt or finance book equity. Industrial funding excludes the captive contribution and its stress, with no dividend assumed. Standalone finance funding test separately exposes refinancing assumptions.

counter: Past dues1.31%, allowance0.84% and trailing covenant coverage1.54x were strong; loan collection and capital-market refinancing nevertheless remain necessary.

ZERO_AND_OVERLAP

p: 1

decision: No separate40x service uplift through2029: reference includes service growth and management places the bulk of new primary-power overhauls beyond2030. No construction rentalJV equity or dealer rental revenue is capitalized as CAT-owned; dealerJV is fully dealer-owned. The September1bn compact plant is included in4.75% capex; no duplicate spend or unqualified sales increment. No credit for future cash accumulation or future buyback share reductions.

zero reason: Product/ownership/timing overlap, not lack of official confirmation, determines each zero increment.

Remaining bounded uncertainties

- Product gross margins and manufacturer revenue per MW are model allocations, not disclosed customer economics.

- Fabick price, accounts and PPA are undisclosed; central cash reserve750m and all earnings are explicitly provisional.

- The July Skycatch cash outlay is undisclosed;100m funding reserve is assumed and no separate revenue premium is added.

- No industrial cash credit: June cash and securities7462m are largely supported by7280m contract liabilities and operating needs. Existing advances are fully consumed in the funding path; future customer advances receive no funding credit.

- The model excludes financial debt from the industrial equity claim because financing interest and credit costs are already included in operating earnings. Captive finance still depends on market refinancing and receivable collection; this is not risk-free nonrecourse debt.

- June common459.674889m less approximately0.3m July ASR settlement plus2.2m awardreserve gives461.574889m opening economic shares. Later growth0.25m per quarter; no credit for remaining ASR delivery or discretionary buybacks.

- June stock-based awards outstanding and treasury-stock accounting do not equal new issuance. Actual future settlement/withholding can differ from40% modeled cash withholding.

- Gross industrial debt10690m plus3743m postemployment liability is retained as a fixed conservative claims reserve despite scheduled debt paydown. Rent remains expensed, so728m December operatinglease liability is not deducted again.

- Unpublished June-to-October working capital, acquisition payments and other cash movements remain forecasts.

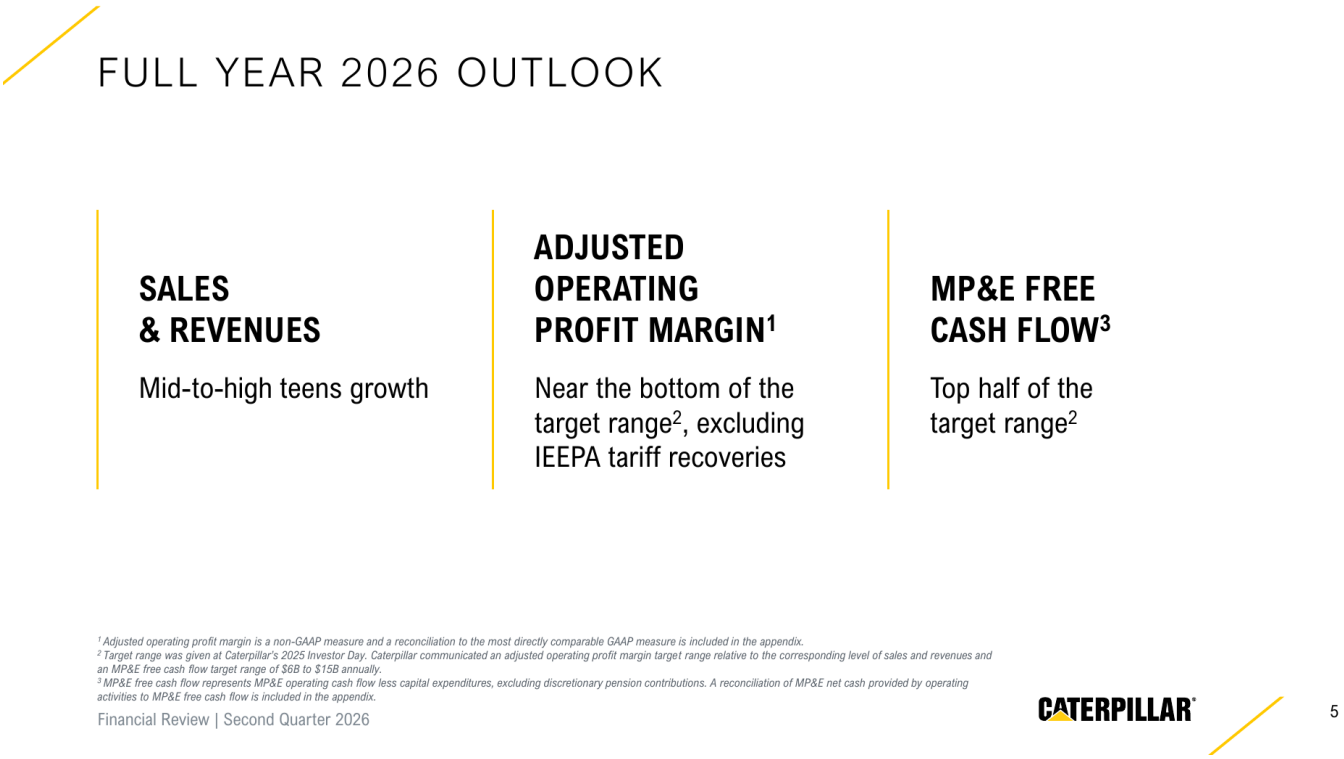

- Industry inquiry may affect customer/dealer economics, but no CAT-specific legal liability has been identified from theOctober7 primary announcement.

- Source web notes for September releases, credit renewal andquote preserve links/facts; direct HTML archive retrieval returned403. Original full annual,June filing,twoearningscalls andSeptemberCEOcall are archived.

Debentures—$160 million of 6.950% due 2042 [2]	7.02%	158	158
Debentures—$1,722 million of 3.803% due 2042 [2]	6.39%	1,395	1,375
Debentures—$500 million of 4.300% due 2044	4.39%	494	494
Debentures—$1,000 million of 3.250% due 2049 [2]	3.34%	985	984
Debentures—$1,200 million of 3.250% due 2050 [2]	3.32%	1,187	1,186
Debentures—$300 million of 5.500% due 2055 [2]	5.74%	289	—
Debentures—$500 million of 4.750% due 2064	4.81%	494	494
Debentures—$246 million of 7.375% due 2097 [2]	7.51%	241	241
Finance lease obligations & other [3]		6	(103)
Total Machinery, Power & Energy		10,678	8,564
Financial Products:			
Medium-term notes		19,675	18,568
Other		343	219
Total Financial Products		20,018	18,787
Total long-term debt due after one year		$ 30,696	$ 27,351

[1] Effective yield to maturity includes the impact of discounts, premiums and debt issuance costs.

[2] Redeemable at our option in whole or in part at any time at a redemption price equal to the greater of (i) 100% of the principal amount or (ii) the discounted present value of the notes or debentures, calculated in accordance with the terms of such notes or debentures.

[3] Includes $(88) million and $(170) million of mark-to-market adjustments related to fair value interest rate swap contracts as of December 31, 2025 and 2024, respectively.

All outstanding notes and debentures are unsecured and rank equally with one another.

On May 12, 2025, we issued $1.7 billion of 5.200% Senior Notes due 2035 and $300 million 5.500% Senior Notes due 2055. Interest on each series of notes will be paid semi-annually on May 15 and November 15 of each year, commencing on November 15, 2025.

Cat Financial's medium-term notes are offered by prospectus and are issued through agents at fixed and floating rates. Medium-term notes due after one year have a weighted average interest rate of 3.8% with remaining maturities up to 5 years at December 31, 2025.

The aggregate amounts of maturities of long-term debt during each of the years 2026 through 2030, including amounts due within one year and classified as current, are:

(Millions of dollars)	December 31, 2026	2027	2028	2029	2030
Machinery, Power & Energy	$ 35	$ 30	$ 219	$ 522	$ 805
Financial Products	7,085	8,890	7,528	2,590	456
	$ 7,120	$ 8,920	$ 7,747	$ 3,112	$ 1,261

Medium-term notes of $1.75 billion maturing in the first quarter of 2026 were excluded from the current maturities of long-term debt in Statement 3 as of December 31, 2025 due to a $1.75 billion issuance of medium-term notes on January 8, 2026 of which $1.25 billion and $500 million mature in 2028 and 2031, respectively. The preceding maturity table reflects the reclassification of $1.75 billion from maturities in 2026 to $1.25 billion in 2028 and $500 million in 2031.

Interest paid on short-term and long-term borrowings for 2025, 2024 and 2023 was $1,842 million, $1,738 million and $1,435 million, respectively.

Please refer to Note 18 for fair value information on long-term debt.
