## Q4 2027 model ceiling: USD 10.92

Analytical Base 40/60 = 67 | Power-ready infrastructure developer / funded execution bottleneck

20x forward-four-quarter normalized operating profit after depreciation and SBC, plus matched cash/collateral and discounted nonoperating assets, less end-window debt and other senior claims, divided by matched economic shares. Each coherent operating/funding state is valued before weighting; convertibles are debt or shares once, with the lower common outcome and an equity floor.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

## Decision in the model

| Active horizon | Earnings window | F4Q OP | Multiple | Diluted shares | Ceiling |
|---|---|---|---|---|---|
| Q4 2027 | Q4 2027 through Q3 2028 | 672.3 | 20x | 512.143 | 10.92 |

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

# Economic scope and matching claims

Consolidated colocation operating business, with corporate and startup expenses. Power pass-through contributes no gross profit. Separate assets include only excess cash, retained collateral and discounted construction not yet commissioned; no land-option or crypto premium.. 20x forward-four-quarter normalized operating profit after depreciation and SBC, plus matched cash/collateral and discounted nonoperating assets, less end-window debt and other senior claims, divided by matched economic shares. Each coherent operating/funding state is valued before weighting; convertibles are debt or shares once, with the lower common outcome and an equity floor.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD m unless a different unit is stated.

# Thesis

Core Scientific is converting a Bitcoin-mining footprint into high-density colocation. Its most valuable product is an accepted data-center environment with power, cooling, electrical protection, security and operating support. The customer supplies the AI workload and usually the GPUs. Core Scientific earns facility rent; it does not automatically participate in every increase in GPU rental rates.

The active Q4 2027 ceiling is **$10.92 per common share**, at 20x forward-four-quarter operating profit with matched assets, debt and diluted shares. Analytical Base is **67/100, or 40/60**. Strong contracted demand earns credit. Construction, funding, concentrated counterparties and substantial common-share claims limit how much of that demand reaches each existing share. This is a new, conditional research model, not issuer guidance or a trading-price forecast.

# Contracts and physical delivery

The July agreements add 377 MW directly leased to AMD and 152 MW leased to an AMD-supported neocloud customer, for 529 MW of critical IT capacity. Management rounds that to approximately 530 MW. The initial 15-year terms represent more than $14 billion of base-term revenue, with annual escalators. The agreements also give AMD reservation rights over another 1,925 MW through December 2028. Reserved, leasable power is not already signed rent.

The earlier CoreWeave contracts cover approximately 590 MW of critical IT load, or around 800 MW gross infrastructure power. Together the initial customer contracts cover 1,119 MW critical IT and more than $24 billion of base-term revenue. Neither the gross-power number nor the optional megawatts is added to those contracted critical-IT megawatts. Such additions would manufacture capacity that does not exist.

At June 30, 395 MW were billable; management reported 437 MW by mid-July. These are commissioning milestones, not full contracted capacity. The reference ramps CoreWeave's average billable capacity from 455 MW in Q3 2026 toward the full 590 MW during 2027. It models AMD/neocloud first billable capacity in 2027 and the full 529 MW by late 2028. Average quarterly billable capacity is a model allocation within management's site-level half-year delivery windows.

The AMD site schedule begins with Pecos and Auburn in H1 2027, Dalton and Muskogee in H2, and Hunt in H1 2028. Utility energization, equipment installation, integrated testing and tenant acceptance must all align. The August 14 Polaris closing expands the Muskogee platform and long-term power opportunity; it does not itself create another completed, leased gigawatt or another source of unrestricted cash.

# Over 1 GW of Customer Contracted Capacity

*Significant expansion potential through the AMD relationship for over 3 GW of customer contracted capacity*

| CoreWeave | AMD + Neocloud<br>Phase 1: Initial Deal | Additional Grid Power<br>AMD Expansion Opportunity | Load Study & BTM<br>AMD Expansion Opportunity |

CORE SCIENTIFIC

CORZQ2 2026 issuerpresentation, p 6 | AMD deliveries are phased through 2028; construction is not revenue.

## Engineering and competitive position

An AI facility must withstand much denser thermal and electrical loads than a mining shed. Transformers and switchgear must deliver reliable distribution; backup generation and controls must respond correctly; cooling loops must move heat at required temperatures and flows. Commissioning tests the interaction of these systems. Owning land near power is useful, but it is not equivalent to selling a tested facility on a date a customer can use.

The company's repeat-build experience, existing sites and demonstrated conversion capacity support the thesis. Its constraints include craft labor, long-lead equipment, grid approvals, permitting, final integration and tenant architecture changes. Mechanical and electrical capacity must be qualified together. The same shortage that improves customer willingness to sign a long lease can raise the landlord's build cost and borrowing cost.

CoreWeave, AMD and the supported neocloud are concentrated counterparties. A take-or-pay lease reduces ordinary utilization exposure after acceptance, but does not erase construction conditions, disputes, completion obligations or a tenant credit event. The relevant competitors include other powered-land and colocation developers as well as hyperscalers building their own facilities. Core Scientific has a scarce delivery capability; the evidence does not establish a monopoly.

## Unit economics and accounting

CoreWeave's approximately $850 million average annual GAAP colocation revenue on 590 MW implies about $1.44 million per MW-year. Management's 80-85% expected facility profit margin covers operating items such as repairs, employees, insurance and taxes. It is not consolidated net income and is not a reason to omit depreciation, stock compensation, startup teams or headquarters costs.

The model selects an 82% lease cash margin before owned-asset depreciation. It uses a $900 million owned CoreWeave asset pool at full delivery as a disclosed proxy, compared with June gross leased assets of $630.568 million. The tenant purchases and contributes some equipment for use in the facilities; the model does not charge Core Scientific depreciation on every dollar of tenant-owned GPU or equipment cost. Final ownership and capitalization of the completed installations remain an important check.

The AMD initial agreements imply approximately $1.764 million annual average GAAP rent per critical MW, using $14 billion over 15 years and 529 MW. They require a much larger owner-funded construction program. The model selects an 89% lease cash margin before depreciation, rather than assuming the old tenant-funded project's economics transfer unchanged. Annual escalators are already in the average straight-line GAAP rent; adding 2.5% again would count them twice.

Q2 revenue was $164.201 million, including $136.669 million colocation revenue. Within colocation, $98.812 million was lease fees and $35.073 million was power pass-through. Group gross profit was $70.044 million, but GAAP operating loss was $78.468 million after startup, corporate, contract-termination and asset-disposal charges. Q2 stock compensation was $18.240 million. The loss cannot be replaced by a headline site margin without explaining the cost bridge.

Power pass-through contributes zero gross profit in the forecast. Mining winds down over the first two modeled quarters and contributes a residual loss, rather than a second AI earnings pool. Recurring headquarters cash costs start at $33 million a quarter, SBC at $20 million, corporate depreciation at $2 million, and letter-of-credit fees at $1.5 million. Site-startup costs remain $15-18 million a quarter during the initial ramp before falling. Additional sites retain their own team costs.

CORZQ2 2026 issuerpresentation, p 10 | Power pass-through and capex credits differ from lease earnings.

## Capital cost, depreciation and operating forecast

Management estimates $11-12 million per critical MW for a commissioned site, excluding $1-2 million per MW of tenant fit-out. The model selects $11.5 million as the construction anchor for the initial AMD build, or $6.0835 billion. The issuer does not explicitly state how separately acquired land and development rights enter that cost. The model therefore assumes 50% overlap with the $671.8 million Hunt/Polaris acquisition cost, bounded at 0-100%, rather than treating full inclusion as established. Selected total project cost is $6.4194 billion: $300 million June physical work-in-progress, $227.8 million already acquired Hunt development rights, $444 million Polaris and $5.4476 billion remaining work. This customer-specific allocation is a model assumption, and both boundary alternatives are quantified below. Tenant fit-out remains outside owner capex.

A 22-year blended depreciation life is assumed for the physical colocation asset pool. Hunt's $227.8 million development rights are removed from that pool and amortized over their disclosed 30-year life, beginning with modeled H1 2028 activation. The model activates 25%, 60%, 85% and 100% across the four 2028 quarters, shifted by two quarters in the delay case. The filing gives 15 years for electrical/mechanical equipment and 10-39 years for buildings, so the physical mix remains material. Depreciation begins with commissioned capacity; uncommissioned rights and work are not simultaneously depreciated and valued as completed rental assets. Maintenance and residual completion capex remain in cash flow.

Active calendar 2027 revenue is $1.292 billion and OP $439 million; 2028 rises to $1.863 billion and $752 million. Revenue includes utilities that do not earn a margin. By 2030, probability-weighted revenue is $2.293 billion and OP $0.993 billion. Those are research forecasts, not promised annual results. They require accepted delivery, collections and retention of the assumed rental margins.

## Probability-weighted construction and pricing

The three mutually exclusive paths are contracted delivery at 55%, a joint two-quarter AMD delay and 10% construction overrun at 25%, and an additional AMD option tranche at 20%. These probabilities are judgments about the full path, not measured frequencies. The reference already includes signed contracts and ordinary growth; optional capacity is not multiplied into the whole business again.

The adverse path is bounded by a one-to-three-quarter delay and 5-15% overrun. It moves billable MW, rent and depreciation together, retains delivery teams, and adds $8 million a quarter of execution expense during the initial ten quarters. Cash interest and share issuance respond to the resulting funding need. A separate generic utilization haircut is not stacked onto the same lost rent.

The expansion path adds 500 MW by 2030, within a 250-750 MW outcome bound, with first billable capacity in 2029. It represents part of the 1,925 MW reservation opportunity, not its automatic exercise. Conditional new rent is $1.9 million per MW-year, bounded at $1.7-2.1 million. That limited premium over the initial AMD average recognizes the customer's cost of waiting and supports positive scarcity-pricing probability under Rule 16b.

The same expansion state funds $5.75 billion capex, retains 89% cash margin before depreciation, adds delivery-team costs, borrowing costs and the associated AMD warrant reserve. It does not reprice signed fixed contracts. Qualification, power, signed terms and funding are joint prerequisites, which is why a commercial option gets 20% rather than certainty. The early ceiling can fall in this expansion path: construction debt and shares arrive before its 2029 rent.

## Funding and dilution

June unrestricted cash was $1.770 billion, restricted cash $781.656 million and digital assets $49.675 million. The model does not describe their sum as freely available treasury. May's $3.3 billion senior financing had already repaid an earlier $1 billion term facility and funded reserves; it is not added a second time to June cash.

The August 27 facilities total $600 million, but consist of a $100 million revolver and $500 million of letters of credit. Management expects the letters of credit to release approximately $300 million of restricted cash. The model includes that release once, leaves the revolver undrawn and retains letter-of-credit fees. It does not count $600 million of loan proceeds plus the $300 million release. Confirmation of the actual release is still needed.

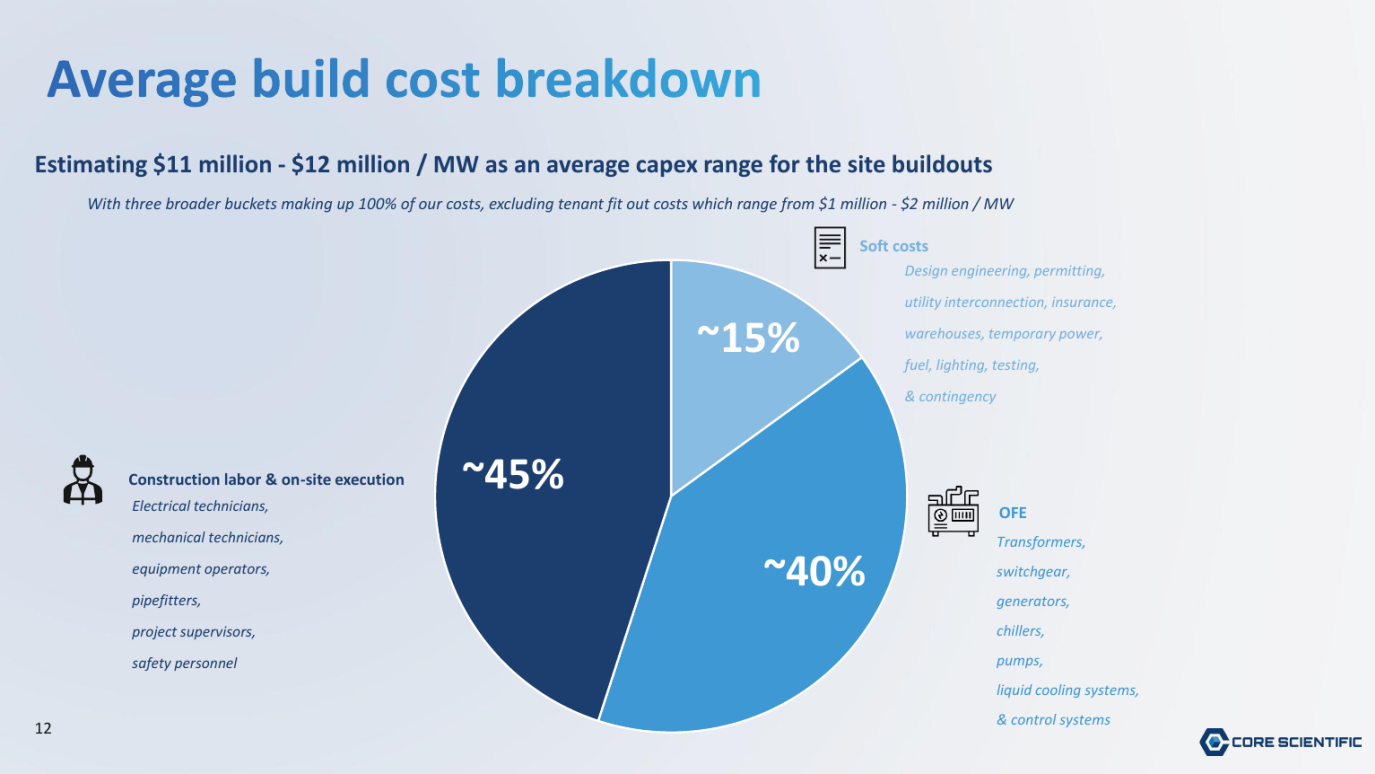

Polaris closed on August 14 for $444 million cash, superseding the earlier $421 million agreement estimate. June restricted cash already contained a $120 million purchase escrow; the funding bridge consumes it and pays the remaining $324 million in Q3. The consumed escrow is not still counted as collateral. After the separate assumed $300 million release, $361.656 million restricted cash remains. Acquired assets move into the same project cost pool described above, with no second cash or land-option value.

CoreWeave's customer-funded modifications create rent credits, not free equity. The funding bridge reserves $654.443 million of future credits using the June deferred-colocation balance as a conservative proxy, not a disclosed exact remaining credit schedule. It also reduces early cash receipts below straight-line GAAP rent by 14% for CoreWeave and 17% for AMD. Those percentages are analytical cash-timing assumptions, separate from credit repayment and operating earnings.

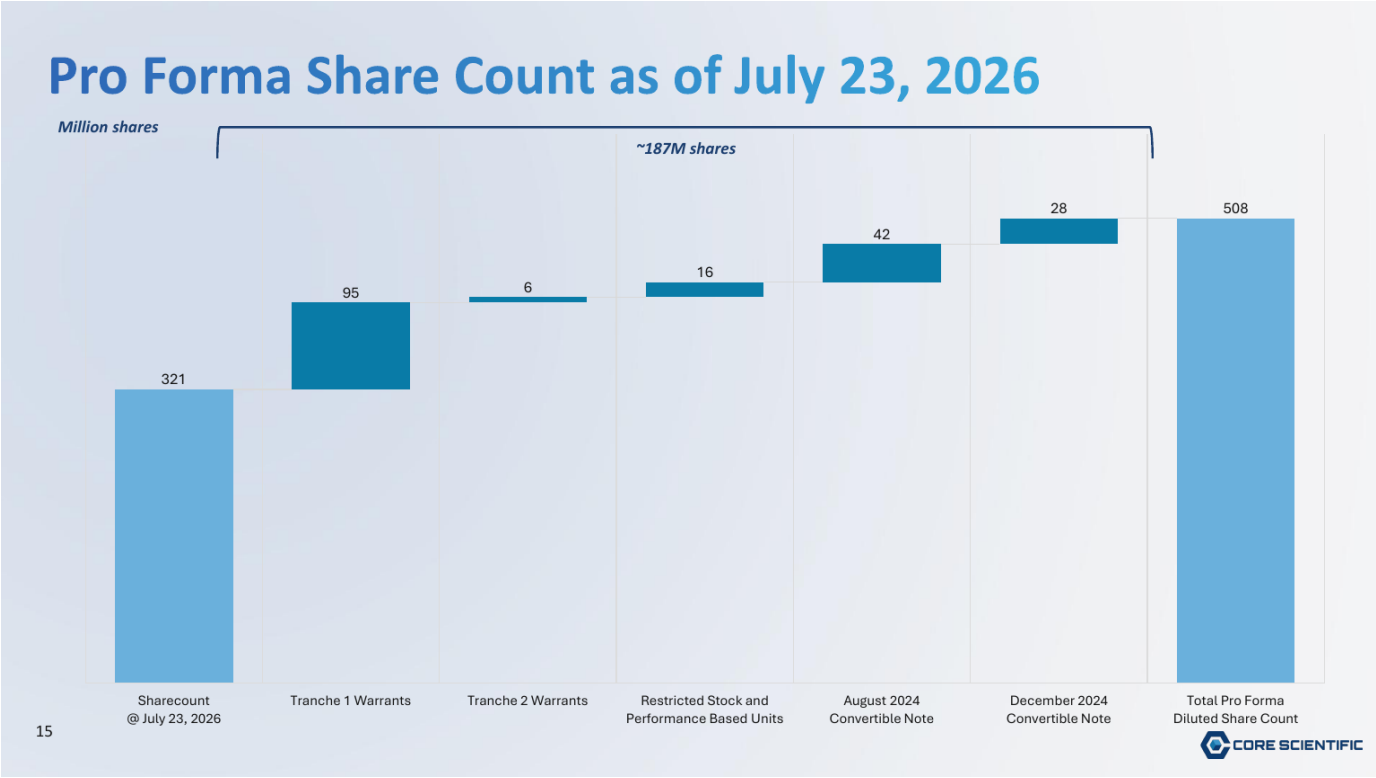

New AMD/optional construction is assumed financed 85% with debt at 9.5% cash interest and 2% issuance costs. The remaining need is funded from internal liquidity and common issuance at $18 with 3% issue costs when unrestricted cash would fall below $350 million. None of that future borrowing or equity is represented as committed finance. The adopted paths require gross common issuance of approximately $1.39 billion, $1.94 billion and $2.56 billion through 2030 in reference, delay and expansion respectively.

The existing $3.3 billion notes pay 7.75% and amortize at 11.5% of original principal annually after the contractual rent/credit-abatement conditions. The model starts $189.75 million semiannual principal payments in November 2028. The exact first date depends on tenant-credit abatement and must be reconciled to actual collections. The $460 million 2029 convertible is repaid in cash at maturity in the funding stress; the $625 million 2031 convertible remains outstanding through the modeled period.

July 23 common shares were 321.340 million. Management's approximate 508 million pro forma bridge also includes old warrants, penny warrants, awards and both convertibles. The July 27 AMD warrant is later: up to 30 million shares at $23.47, with 6.5 million vested on the initial agreement and further vesting tied to qualifying capacity. The model reserves old warrants and awards without relying on exercise cash, then adds 0.5 million future awards per quarter and shares issued for funding. Conversion of each note removes its principal claim and adds its shares once; the lower common-share outcome across the conversion combinations is selected.

CORZQ2 2026 issuerpresentation, p 12 | Infrastructure equipment and installation dominate construction cost.

CORZQ2 2026 issuerpresentation, p 15 | July 23 pro-forma share bridge precedes theJuly 27 AMD warrant issuance.

## Assets, claims and valuation sensitivity

The earnings multiple covers commissioned facilities. Only modeled construction not yet commissioned receives a separate recovery credit: 70% of cost in reference, 40% in delay and 65% in expansion. These are bounded judgments, not appraisals. Cash above the $350 million operating reserve and $361.656 million retained restricted collateral offset matching gross claims. The model adds no undeveloped-land, entire-power-pipeline or crypto premium. Gross debt cannot fairly be charged against common shareholders while the matching unspent cash and unfinished investment are ignored.

Q4 2027 values Q4 2027 through Q3 2028. The three conditional common values are $13.18, $5.30 and $11.73, producing the $10.92 weighted ceiling. Their matched denominators differ because financing differs. Dividing weighted OP by a simple average share count would not reproduce the result. Negative residual common value is floored inside each outcome, before probability weighting.

The gross-debt earnings-only diagnostic, excluding all separate asset credits, is $9.09. It is a scope sensitivity, not another active target. Issuance at $12 rather than $18 produces $10.62; $24 produces $11.08. Changing the physical depreciation life to 15, 20 or 30 years gives approximately $6.91, $10.09 or $13.12, respectively, with funding and cash-tax effects rerun. Hunt rights retain their separate 30-year life. Useful life is a larger near-horizon sensitivity than the selected financing-price range.

The acquisition-cost boundary is also material. If none of Polaris and Hunt's $671.8 million cost is inside the quoted all-in construction budget, the Q4 2027 ceiling is $9.96. Selected 50% overlap gives $10.92; full overlap gives $11.90. Every case consumes the actual escrow, pays the closing cash, funds its own construction schedule and includes the acquired rights once. These alternatives identify an unresolved project-cost allocation; they are not different market multiples or an issuer-confirmed forecast.

## What would change the assessment

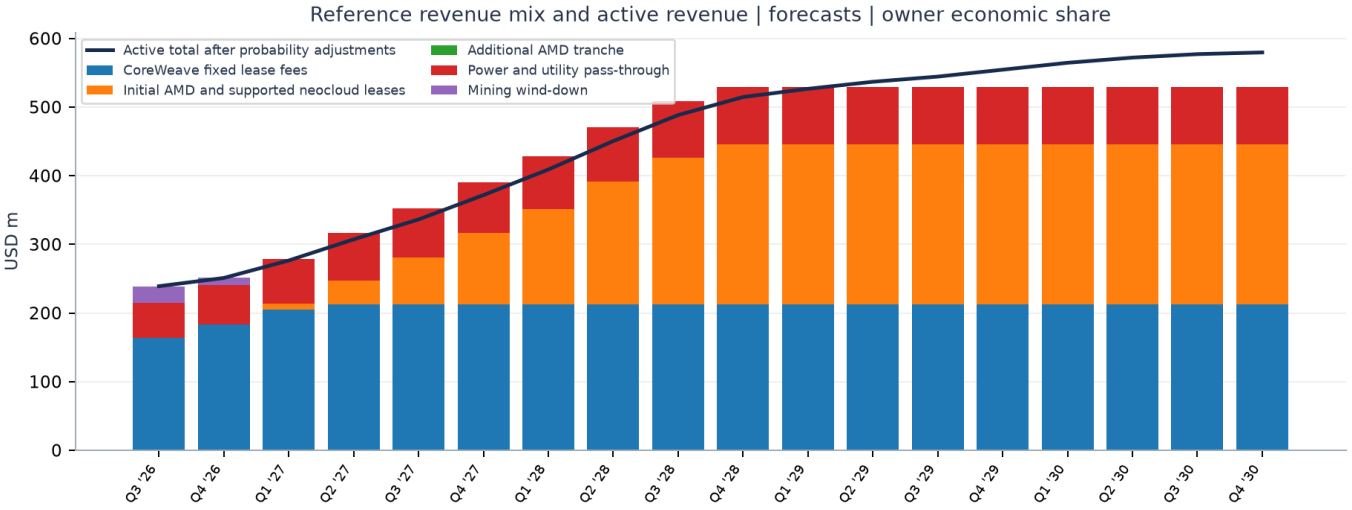

The next decisive evidence is site acceptance, actual rent collections, the remaining customer-credit schedule, AMD construction financing and gross-to-net share reconciliation after warrant activity. New leases should be assessed by unlevered operating return and common cash required, not rent alone. A faster schedule is valuable only if cost overruns and equity issuance do not consume it.

The main risks are delivery/power, funding and refinancing, tenant concentration, long-lived asset obsolescence or maintenance costs, and contractual/governance complexity. They produce the maximum five-point risk deduction. Core capability earns 17/20, cycle 8/10, TAM 8/10, catalysts 4/5 and macro 8/10; no obscurity premium is awarded. The May 6 and July 28 management prepared remarks were read in full alongside their presentations and filings. Complete question-and-answer transcripts remain a retrieval gap; prepared remarks are not labeled full calls.

## Score arithmetic

| Category | Points | Evidence / treatment |
|---|---|---|
| Core thesis | 17 | Already operating high-density capacity and repeat deployment capability; customers still have alternatives. |
| Cycle | 8 | Rapid move from construction to rent, balanced by a continuing capital cycle. |
| TAM | 8 | 1,119MW initial critical IT contracts, with additional customer options requiring new financing. |
| Catalysts | 4 | Dalton completion, Pecos energization and new project bond terms. |
| Macro | 8 | Scarce delivered power and cooling support demand, but tenant budgets remain concentrated. |
| Alpha | 0 | Widely followed transition; no extra obscurity credit. |
| Risk classes | -5 | Construction/power, funding/dilution, customer concentration, technology-demand and governance/covenant classes. |
| Total | 40/60 | Rounded Base 67. Both artifact and new workbook row use this score; this is not a manual override. |

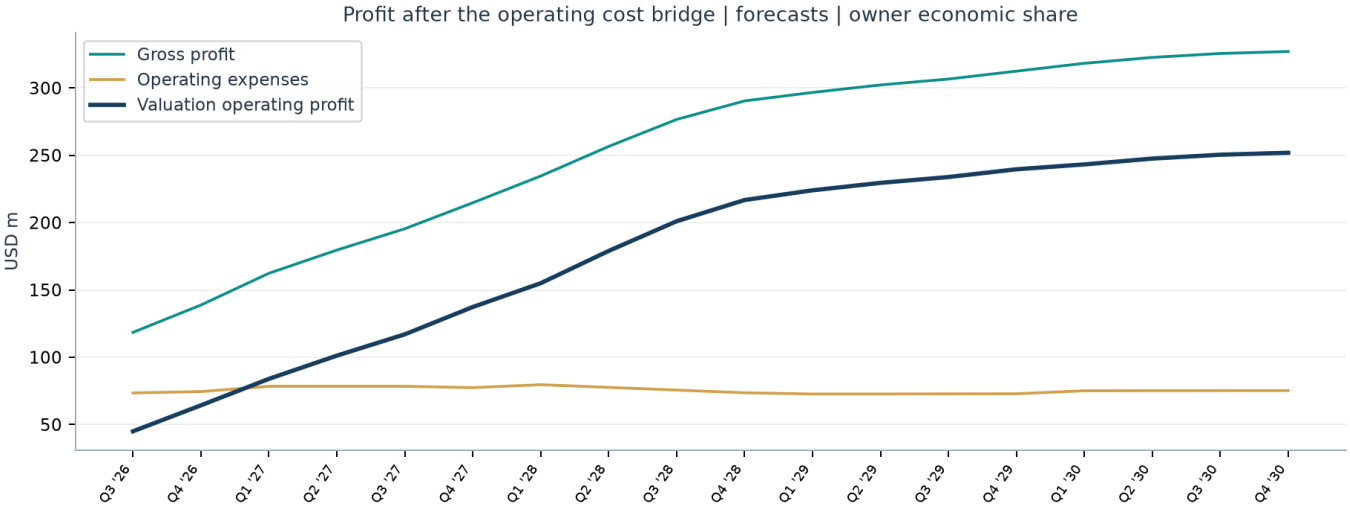

# Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

| Quarter | Reference revenue | Weighted net change | Active revenue |
|---|---|---|---|
| Q3 2026 | 239.1 | 0.0 | 239.1 |
| Q4 2026 | 251.1 | 0.0 | 251.1 |
| Q1 2027 | 278.9 | -2.4 | 276.5 |
| Q2 2027 | 316.7 | -9.5 | 307.3 |
| Q3 2027 | 352.3 | -16.0 | 336.3 |
| Q4 2027 | 390.1 | -18.3 | 371.8 |
| Q1 2028 | 428.0 | -18.9 | 409.1 |
| Q2 2028 | 470.6 | -20.1 | 450.5 |
| Q3 2028 | 508.5 | -20.1 | 488.4 |
| Q4 2028 | 529.3 | -14.7 | 514.6 |
| Q1 2029 | 529.3 | -2.7 | 526.6 |
| Q2 2029 | 529.3 | 7.5 | 536.9 |
| Q3 2029 | 529.3 | 15.1 | 544.4 |
| Q4 2029 | 529.3 | 25.2 | 554.5 |
| Q1 2030 | 529.3 | 35.2 | 564.5 |
| Q2 2030 | 529.3 | 42.8 | 572.1 |
| Q3 2030 | 529.3 | 47.8 | 577.1 |
| Q4 2030 | 529.3 | 50.3 | 579.6 |

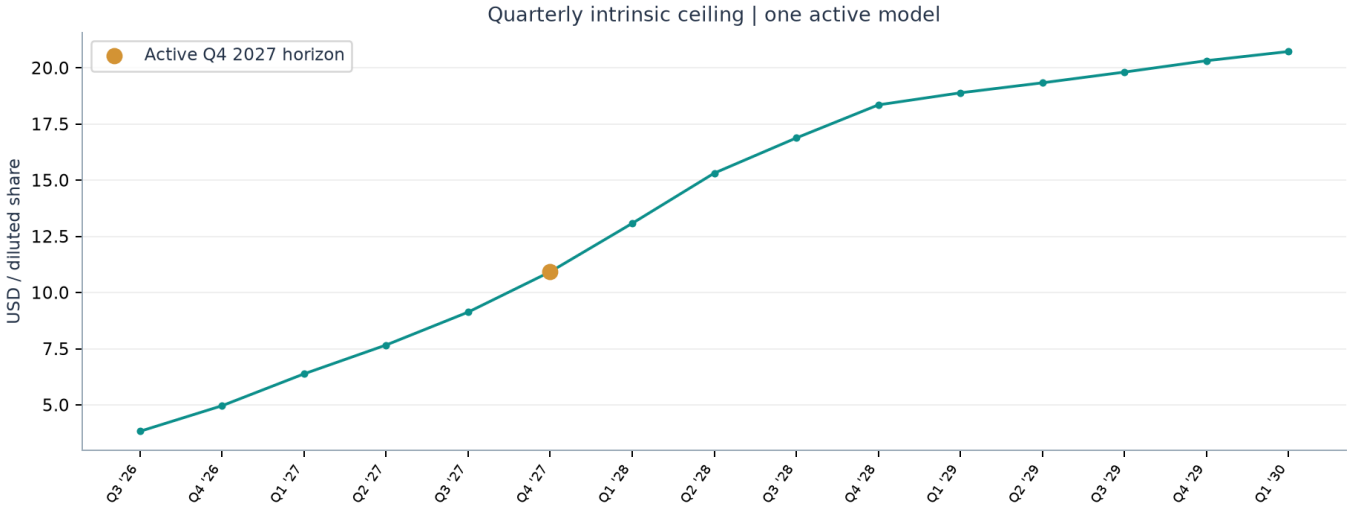

# Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

| Quarter | Revenue | GP | Opex | Valuation OP | OP margin |
|---|---|---|---|---|---|
| Q3 2026 | 239.1 | 118.5 | 73.5 | 45.0 | 18.8% |
| Q4 2026 | 251.1 | 138.8 | 74.5 | 64.3 | 25.6% |
| Q1 2027 | 276.5 | 162.4 | 78.4 | 83.9 | 30.4% |
| Q2 2027 | 307.3 | 179.6 | 78.4 | 101.2 | 32.9% |
| Q3 2027 | 336.3 | 195.4 | 78.4 | 117.0 | 34.8% |
| Q4 2027 | 371.8 | 214.7 | 77.4 | 137.3 | 36.9% |
| Q1 2028 | 409.1 | 234.6 | 79.6 | 155.0 | 37.9% |
| Q2 2028 | 450.5 | 256.6 | 77.6 | 179.0 | 39.7% |
| Q3 2028 | 488.4 | 276.6 | 75.6 | 201.0 | 41.2% |
| Q4 2028 | 514.6 | 290.4 | 73.6 | 216.8 | 42.1% |

# Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

| Quarter | Revenue vector | Revenue | Gross margin | Gross profit |
|---|---|---|---|---|
| Q3 2026 | CoreWeave fixed lease fees | 163.9 | 77.2% | 126.5 |

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

# Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

| Quarter | Branch | p | Conditional revenue | Conditional GP | Conditional opex | Weighted OP |

# Coherent outcomes and common-share value

The three outcomes are mutually exclusive and persist across the full path. End-window claims, assets and shares match each outcome. Convertibles are debt or shares, never both. The lower common-share result across conversion choices is floored at zero before probability weighting. Displayed expected shares do not reproduce a nonlinear weighted ceiling by division.

| Q4 2027 outcome | p | F4Q OP | Matched net claims | Matched shares | Ceiling |
|---|---|---|---|---|---|
| Contracted delivery | 55% | 728.0 | 7,776.4 | 514.593 | 13.18 |
| Two-quarter AMD delay | 25% | 519.5 | 7,768.0 | 494.578 | 5.30 |
| Additional AMD tranche | 20% | 710.0 | 8,012.9 | 527.361 | 11.73 |

# Funding and dilution by outcome

USD millions except shares. Cash floors are conditional on the explicitly modeled new debt and equity issuance; they are not proof of committed funding. End cash may include ring-fenced project proceeds. The financing model, rather than this static table, must be rerun after changing operating assumptions.

| Quarter | Outcome | End cash | Gross claims | Capex | Cumulative equity raised | Quarter shares |

# Assets outside the operating-profit valuation

Only construction not yet commissioned remains in the separate construction pool. The recovery allowance is state-specific and is not a second multiple on rented facilities. Cash above the minimum operating reserve and matching restricted collateral offset gross claims. Galaxy treasury assets carry a haircut and produce no capitalized proprietary trading gains.

| Quarter | Outcome | Unfinished construction | Recovery | Treasury credit | Total asset credit |

# Claim decisions, overlap and triggers

## CORZ-1

probability: 0.25

claim: Contracted build suffers a two-quarter AMD delay and 10% construction-cost overrun.

basis: Contracts and early CoreWeave delivery support the reference, but multi-site power, equipment and commissioning remain uncertain.

Conditional bounds: Delay 1-3 quarters; capex +5-15%; selected 2 quarters and +10%.

cost bridge: Move AMD MW/revenue/depreciation together, retain startup teams, add $8 m quarterly execution cost during initial ten quarters, fund additional capex at 85% debt with 9.5% interest. Equity issued at $18 when liquid cash would fall below $350 m.

overlap: One joint delay/overrun event; no second generic capacity or utilization haircut.

trigger: Site acceptance, utility energization, financing and cost-to-complete updates.

## CORZ-2

probability: 0.2

claim: Additional AMD option tranche becomes billable during 2029-30.

basis: 1, 925 MW reservation rights exist, but no full 2 GW incremental lease or financing is assumed.

Conditional bounds: 250-750 MW beyond initial leases by 2030; selected 500 MW, 2029 start, $1.9 m annual GAAP lease revenue/MW, $1.7-2.1 m sensitivity.

cost bridge: 11.5 m/MW capital cost; 89% lease cash margin before 22-year blended depreciation; recurring expansion team and debt interest; additional AMD warrant shares 12, 222/MW reserved. Gross option power is never added to contracted MW.

overlap: Reference includes only initial 529 MW AMD and 590 MW CoreWeave. New rate applies to new leases only; no repricing of fixed signed contracts.

probability reason: 20% is below a typical single breadcrumb because option exercise, grid/behind-meter power, credit and financing must jointly precede billable delivery.

trigger: Executed expansion lease, power approval and funded notice to proceed.

## CORZ-LC

probability: 1

claim: August 600 m facilities are not 600 m cash.

decision: 100 m revolver remains undrawn; 500 m letters of credit are contingent support. The funding case assumes management’s 300 m restricted-cash release once, with fee expense; no simultaneous loan proceeds.

gap: Actual post-quarter release and usage remain to be confirmed.

## CORZ-PRICE

probability: 0.2

claim: Scarcity pricing only on new optional leases.

decision: The additional tranche selects 1.9 m/MW-year versus 1.764 m initial AMD average; this is contained in CORZ-2, not a second premium. Signed CoreWeave and AMD GAAP straight-line rents are not increased again for escalators.

## CORZ-ASSETS

claim: Match gross funding claims with assets outside capitalized operating earnings.

probability: Same mutually exclusive operating probabilities; no independent additive event.

bounds: Uncommissioned construction recovery 40-70%; cash above operating reserve at par. Galaxy treasury retained value 40-65%.

overlap: Commissioned data centers, contractual rental earnings, token inventory matched by trading liabilities and minimum operating liquidity receive no second valuation.

trigger: Audited commissioned-asset balances, restricted-cash movement, updated treasury NAV and executed financing.

## CORZ-ACQUISITION-CASH

claim: Reconcile the completed Polaris acquisition and Hunt rights with the existing all-in project budget.

probability: 1.0

basis: Completed transaction facts: issuer August 14 release and June 10-Q Notes 3 and 10. The 100% probability applies to the completed cash obligation, not to the uncertain construction-budget allocation.

Conditional bounds: Acquisition-budget overlap 0-100%, selected 50% because the issuer does not expressly state how acquired land/power rights enter its build-cost estimate. Hunt activation remains a delivery-schedule assumption.

cost bridge: Consume $120m of existing escrow and pay $324m from unrestricted cash. Selected 50% overlap with the $6,083.5m construction anchor gives $6,419.4m total project cost and $5,447.6m remaining work before the delay overrun. Include acquired assets once. Separate 30-year Hunt amortization from 22-year physical depreciation.

overlap: No acquisition added twice to capex; no consumed escrow retained as cash; no separately capitalized land/power option.

trigger: Customer/site cost-to-complete allocation, acquisition purchase-price accounting, and Hunt commissioning.

# Remaining bounded uncertainties

- 529 MW signed AMD/neocloud capacity is rounded to 530 MW in management slides. Site-level delivery timing within the disclosed half-year windows remains modeled.

- The 22-year blended life is a proxy calibrated to 15-year electrical equipment and 10-39-year building lives; shorter useful lives materially reduce OP.

- New project debt at 85% of incremental construction and 9.5% cash coupon is an assumption, not a committed AMD financing. It has no permanent refinancing guarantee.

- Old warrants and employee awards are fully reserved even if some lapse; no warrant exercise cash is available in the funding bridge. Future equity raises at 18/share have a 12-24 sensitivity and 3% issuance cost.

- CoreWeave customer credits use 654.443 m as a funding reserve, consistent with the deferred-colocation balance but not a disclosed exact remaining credit schedule. Power pass-through and credits are not earnings.

- Construction cost is not a market appraisal. Only modeled spending outside commissioned facilities is credited, at 70% recovery in reference, 40% under delay and 65% in expansion. No second value is added to income-producing facilities. The share-weighted cash and asset bridge is inseparable from the operating states.

- Funding is conditional on new debt and common issuance at $18 per share with 3% issuance costs. $12-24 issuance-price sensitivity is shown separately. Positive modeled cash does not demonstrate committed financing.

- A gross-debt-only earnings diagnostic is retained alongside the complete asset/claim reconciliation; neither should be confused with an analyst target or guaranteed trading price.

- The 7.75% senior notes amortize at 11.5% of original principal annually after rent and tenant-credit abatement. The model begins $189.75m semiannual repayments in November 2028; the actual credit-abatement date is not disclosed. New AMD borrowing remains a modeled 85% loan-to-cost at 9.5%, with 2% issuance costs.

- CoreWeave depreciation uses a $900m owned-asset proxy at full delivery, above the June $630.568m leased-asset gross book balance. Tenant-purchased equipment is not assumed to be owned by Core Scientific. Final asset capitalization and useful-life mix remain material gaps.

- The issuer-based construction anchor is $6,083.5m. Selected 50% overlap with $671.8m Hunt/Polaris acquisition cost gives total initial-project cost of $6,419.4m: $300m June physical CIP, $227.8m paid Hunt rights, $444m Polaris and $5,447.6m remaining work. This is a model scope allocation, not an issuer-disclosed site/customer allocation. A zero/50%/100% acquisition-cost overlap sensitivity gives Q4 2027 ceilings of $9.9569/$10.9219/$11.8994. The exact allocation and whether the published build budget excludes acquired rights must be checked against the next project cost report.

- Polaris closed August 14 for $444m cash, funded by $120m June escrow and $324m modeled Q3 cash payment. The escrow is consumed and is not retained collateral. After the separate assumed $300m LC-related release, retained restricted cash is $361.656m. The final price supersedes the earlier $421m agreement estimate.

- Hunt rights are separated from the 22-year physical asset pool and amortized over the filed 30-year life. Modeled activation follows the H1 2028 delivery window: 25%/60%/85%/100% in the four 2028 quarters, shifted two quarters in delay. Uncommissioned rights enter only the discounted unfinished-project asset pool; no second undeveloped-land option value is added.

## Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
