GLXY | NASDAQ | 2026-10-07

Q4 2027 model ceiling: USD 5.69

Analytical Base 37/60 = 62 | Power-ready infrastructure developer / funded execution bottleneck

20x forward-four-quarter normalized operating profit after depreciation and SBC, plus matched cash/collateral and discounted nonoperating assets, less end-window debt and other senior claims, divided by matched economic shares. Each coherent operating/funding state is valued before weighting; convertibles are debt or shares once, with the lower common outcome and an equity floor.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	459.7	20x	505.237	5.69

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

All consolidated LP operating earnings against Class A plus exchangeable LP economic units once. Services revenue is net of token purchase costs and matched trading borrowing cost. Proprietary treasury gains are not capitalized; retained net treasury assets receive a separate haircut. Gross project debt is matched with unspent restricted proceeds and uncommissioned construction once.. 20x forward-four-quarter normalized operating profit after depreciation and SBC, plus matched cash/collateral and discounted nonoperating assets, less end-window debt and other senior claims, divided by matched economic shares. Each coherent operating/funding state is valued before weighting; convertibles are debt or shares once, with the lower common outcome and an equity floor.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD m unless a different unit is stated.

Thesis

Galaxy combines a digital-assets services franchise, a proprietary investment portfolio and a Texas data-center development business. They have different accounting, capital needs and risks. A full model must separate them before translating a large power pipeline into common-share value.

The active Q4 2027 ceiling is **$5.69 per economic share**, with analytical Base **62/100, or 37/60**. It uses 20x normalized forward-four-quarter operating profit plus matched cash, discounted unfinished construction and a haircut on net treasury assets, less financing claims. The result is low despite compelling demand because the active window still contains construction, large financing costs and substantial prospective dilution. It is not a statement that approved power is worthless, nor a market-price prediction.

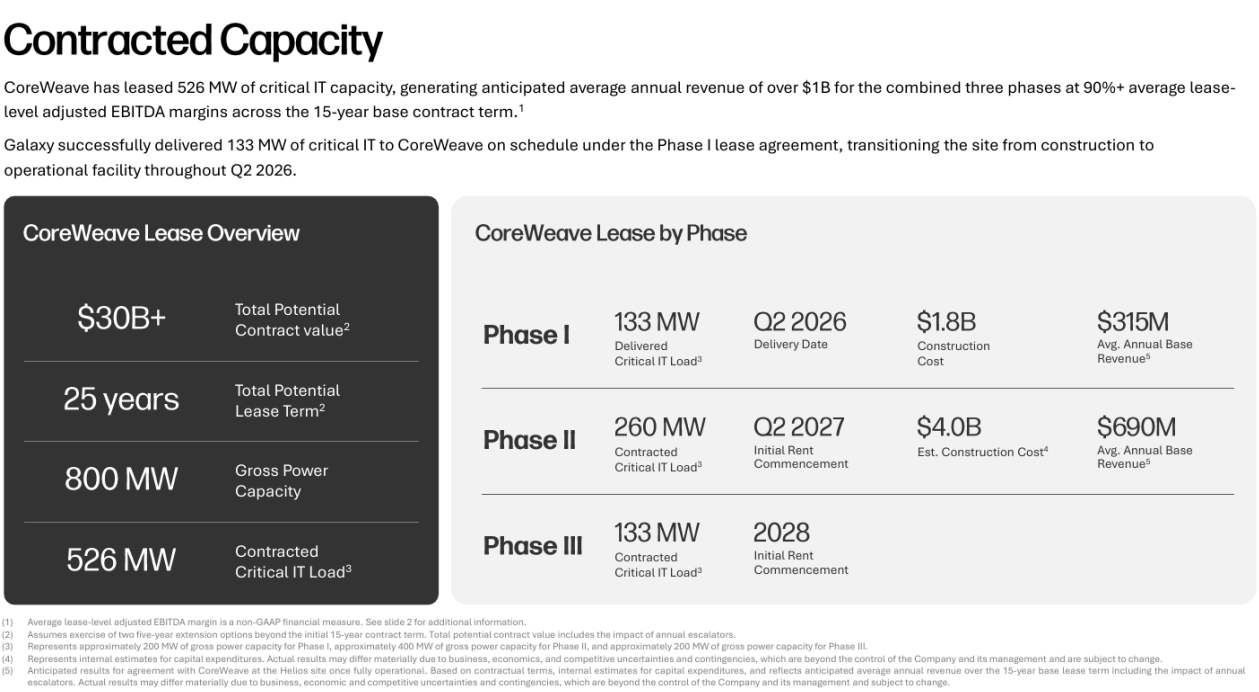

Contracted Helios economics

CoreWeave leases 526 MW of critical IT capacity across three phases at Helios I, supported by approximately 800 MW gross power. The 15-year base terms and over $1 billion expected average annual rent are different from the presentation's $30 billion potential value over 25 years, which includes two optional five-year extensions. Extensions and gross power are not automatically additional near-term earnings.

Phase I delivered all 133 MW critical IT in Q2 2026. Its disclosed construction cost is approximately $1.8 billion and average annual base rent $315 million. Beginning Q3, management expects roughly $80 million quarterly leasing revenue with more than 90% project-level adjusted EBITDA margin. The reference uses $78.75 million quarterly straight-line rent and 92% cash margin before depreciation. It retains corporate, compensation and development expenses separately.

Phase II comprises 260 MW critical IT, or around 400 MW gross, at approximately $4 billion construction cost and $690 million average annual base rent. Initial rent is expected in Q2 2027; seven of eight halls are targeted by end-2027, with the last early in 2028. Phase III adds 133 MW critical IT in 2028. Its construction budget and detailed rental terms were not separately disclosed in the retrieved materials; the model assumes $2.16 billion capex and $2.50 million annual rent per MW.

Average quarterly delivered capacity, rather than the entire signed total, drives each phase's rent. The reference's Phase II average is 35 MW in Q2 2027 and 210 MW in Q4, reaching 260 MW in 2028. Phase III averages 20 MW in Q2 2028 and reaches 133 MW during 2029. These are model allocations of management's delivery windows, not additional issuer guidance.

GLXYQ2 2026 issuerpresentation, p 16 | Critical IT and gross grid power are different measures.

Engineering and delivery

Helios is more than an empty mining building. Its 345 kV substation, electrical yards, backup systems, cooling water and large land footprint are concrete assets. Converting that platform into accepted AI facilities requires integrated cooling, electrical protection and controls, fiber connectivity, commissioning and tenant acceptance. Available grid megawatts and usable compute megawatts differ because cooling and facility overhead consume power.

The original July campus image shows the scale of the supporting infrastructure. It supports a physical-construction thesis, not an inference that every pictured building is rented or that all the future campus capacity is qualified. Long-lead electrical equipment can help a prepared developer deliver earlier, but inventory deposits, construction labor and debt service consume liquidity before rent starts.

Galaxy competes for tenants and financing with other colocation developers, powered-land platforms and hyperscalers' internal projects. It has delivered Phase I, which is better evidence than a land option. CoreWeave remains its dominant signed data-center tenant. New customers could diversify credit exposure; until leases are signed, they remain probability-weighted opportunities.

Helios Campus Update as of July 2026

Phase I of the Helios Data Center campus, July 2026.

GLXYQ2 2026 issuerpresentation, p 17 | Physical substation, chiller and electrical yards explain the construction burden.

Power pipeline and probability

The August presentation describes 5.73 GW of potential gross capacity across Helios, Caspian, Selene and Merlin. That waterfall already includes contracted Helios I, the 830 MW Helios II opportunity and later expansion phases. Summing 5.73 GW with the separate campus numbers would count them twice.

September 8's ERCOT update supersedes the earlier provisional classification narrative. Five projects totaling approximately 4.2 GW received conditional classifications. Helios I and II retained Base Load status; Caspian, Selene and Helios III were classified as Studied Load. This is progress through a defined process, not an unconditional energization guarantee. Remaining milestones, construction, security requirements and executed tenants matter.

The reference includes only the existing 526 MW critical IT contracts. A 35% outcome assumes Helios II signs a tenant and delivers 550 MW critical IT by 2030, from the 830 MW gross opportunity. The usable range is 300-550 MW, with 2028-2030 delivery. The remaining multi-gigawatt pipeline receives no separate model rent because timing, qualified output, tenant economics and finance cannot yet be bounded defensibly; that is an overlap/timing decision, not disbelief in the land.

The new lease selects $2.3 million annual rent per MW, within a $2.0-2.6 million range, and $15 million capex per MW. The rate is below Phase II's roughly $2.654 million. Management's April discussion emphasized that the CoreWeave deal was unusually attractive and that net return matters more than repeating its gross rent. Rule 16b gives the customer's cost of waiting positive value through this new-contract state, but no premium is added to signed leases or already straight-lined escalators.

The Path to Multi-Gigawatt Scale

Galaxy continues to build out a multi-gigawatt power pipeline across Texas, now totaling over 5.7 GW of potential capacity, as it expands beyond Helios to meet accelerating demand for AI and HPC infrastructure.

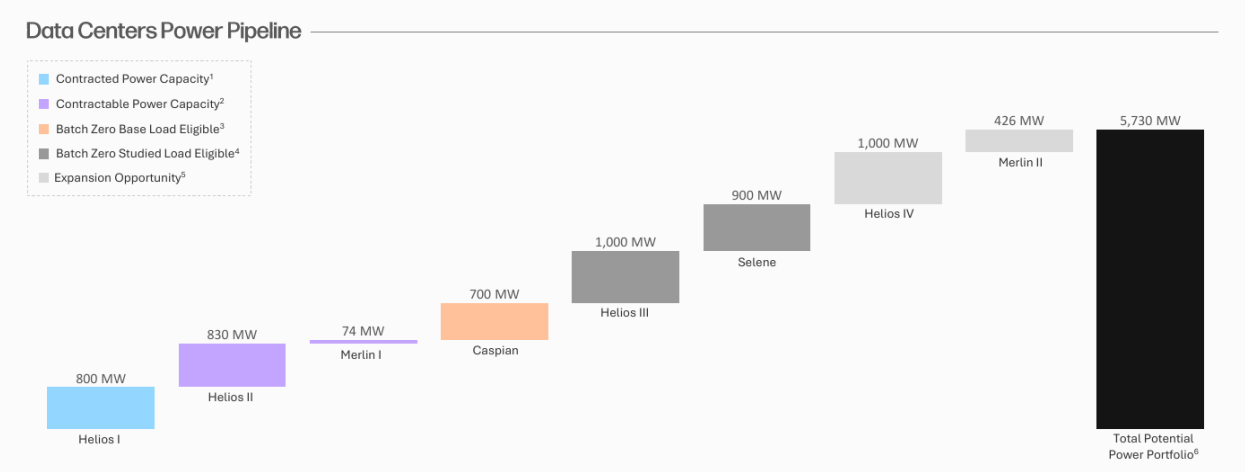

Chart depicts, as applicable, actual or expected potential gross power capacity.
(1) Represents power capacity contracted under executed options or lease agreements.
(2) Represents power capacity for which Galaxy has completed the relevant development milestones necessary to contract with a leasing partner.
(3) Represents capacity eligible to be classified as Batch Zero Base Load as a result of Galaxy's completion of required milestones, including signed interconnection agreements and posting of financial security.
(4) Represents capacity eligible to be classified as Batch Zero Studied Load as a result of Galaxy's completion of required Batch Zero attestations and posting of financial security ahead of applicable ERCOT deadlines.
(5) Represents potential capacity from identified expansion opportunities at existing Galaxy-owned sites.
(6) Assumes full approval and allocation of identified potential capacity.

GLXYQ2 2026 issuerpresentation, p 14 | 5.73 GW is a staged gross-power pipeline, not paid critical IT.

Galaxy's Power Capacity Ramp Schedule

Galaxy's development path spans multiple sites and multi-gigawatt scale, with visibility extending through 2030 and beyond.

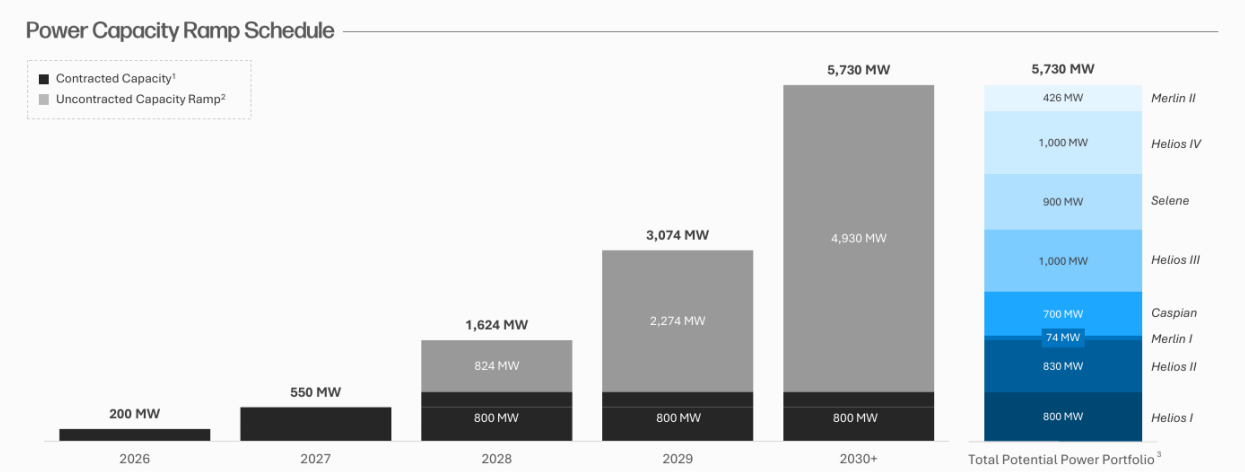

Chart depicts, as applicable, actual or expected potential gross power capacity and actual or estimated earliest potential energization timeline, assuming applicable power approval and related agreement with leasing partner.
(1) Represents power capacity contracted under executed options or lease agreements.
(2) Represents potential capacity from identified expansion opportunities at existing Galaxy-owned sites.
(3) Assumes full approval and allocation of identified potential capacity.

GLXYQ2 2026 issuerpresentation, p 15 | Issuer energization timeline is conditional on approvals and leases.

Digital services economics

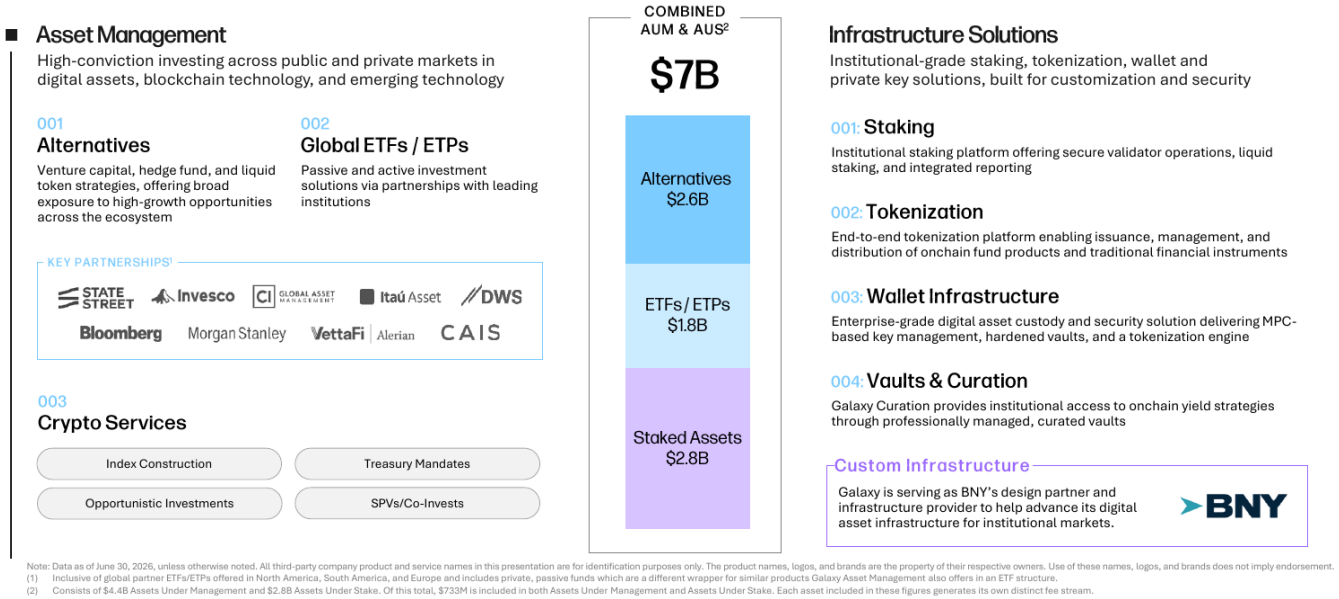

Galaxy's $8.711 billion of Q2 GAAP revenue and gains is not a platform subscription run rate. Gross token sales involve substantial offsetting purchase costs. Q2 transaction expenses were $8.486 billion and digital-asset impairments $181 million. Group net loss was $85.316 million. Capitalizing gross turnover would turn pass-through activity into fictitious economic earnings.

The digital-assets operating segment reported $66 million adjusted gross profit and a roughly $11 million adjusted EBITDA loss. Data centers produced $20 million adjusted gross profit and $11 million adjusted EBITDA. Treasury results were volatile and negative during the quarter. These adjusted measures are useful for separating activities but cannot replace consolidated operating costs or recurring share compensation.

The model therefore uses net digital-services revenue after token purchase costs, reward distributions and matched trading borrowing costs. Corporate/project financing interest is treated separately in cash flow and claims. Proprietary investment and crypto marks do not become a perpetual earnings stream. Digital cash compensation, technology, compliance and support begin at $75 million quarterly, corporate cash costs at $28 million, development staff at $10 million, recurring SBC at $24 million and non-data-center depreciation at $4.5 million. Credit/protocol losses retain a recurring reserve.

The August BNY relationship supplies a concrete route into institutional infrastructure. The broader asset-management and staking presentation also shows existing products and distribution. However, the $4.4 billion assets under management and $2.8 billion assets under stake overlap by $733 million, and neither balance is revenue. Fees differ by product, ownership and service, so multiplying a headline asset base by a universal fee is not justified.

Net services revenue grows from $70 million quarterly in Q3 2026 to $105 million in Q4 2027 and $234 million by Q4 2030. These assumptions require monetization, retention and operating leverage; they are not guidance. The Q4 2027 reference is a 60% achievement-weighted result between an approximately $80 million no-win run rate and $121.7 million conditional successful result. The named partnerships are already in that path and receive no second increment. A weak-crypto state reduces near-term service revenue 25% while most people and compliance costs remain.

GLXYQ2 2026 issuerpresentation, p 10 | Assets under management and stake can overlap; fees are distinct from asset balances.

Operating forecast and asset lives

The active 2027 model has $856 million economic revenue and $87 million operating profit; 2028 rises to $1.567 billion and $574 million. The revenue label deliberately differs from GAAP gross token turnover. By 2030 it reaches $2.598 billion economic revenue and $1.293 billion OP, conditional on lease delivery and improving services. The current-window margin is far below the project's 90%-plus EBITDA margin because it includes depreciation and the whole platform cost base.

Owned facility depreciation uses a 25-year blended life. Buildings, electrical and mechanical equipment do not all have that economic life, and replacements may arrive sooner. The model begins depreciation with commissioned capacity and adds it back only in the cash-flow reconciliation. New development budgets include recurring maintenance cash; no GPU fleet is assumed owned merely because a tenant installs GPUs in the building.

Funding and dilution

June cash and equivalents were $895.744 million, including $211.4 million at brokers and $53.6 million at trading platforms. The cash-funding bridge starts with $630.744 million after excluding those operating/trading balances. The reported $1.563 billion of stablecoins is not treated as another freely spendable construction account. Token inventory, collateral and matching client/trading obligations cannot be added gross to common equity.

Phase I debt was $1.268 billion at June under a $1.4 billion facility, with an August 2028 maturity and a minimum 1.4x debt-service coverage covenant after stabilization. The active bridge assumes refinancing at par with no extra cash proceeds. That is a refinancing dependency, not an undrawn cash asset or a verified future commitment.

The July 28 Phase II financing issued $3.507 billion of 9.875% secured notes due 2031 at 99.5% of face. Net proceeds fund construction and debt-service reserves. The model uses a combined 2.5% original-discount/fee reserve and keeps unspent project proceeds ring-fenced. Restricted construction cash cannot pay the December

corporate convertible. The parent completion guarantee matters: calling debt project-level does not remove every obligation from the parent.

The original indenture's Article 14 requires 4% annual original-principal amortization, payable semiannually after the commencement test. The model starts full $70.14 million installments in February 2029, or August 2029 in the delayed state; actual first-period proration remains dependent on commencement. Remaining Phase II capex is $3.4 billion, reflecting a modeled $600 million already spent. The customer-specific allocation within June work-in-progress is not fully disclosed.

Phase III and optional Helios II construction use 80% modeled project borrowing at 10%. Common equity is issued at $18, less 3% issuance costs, whenever genuinely available cash would fall below $400 million. The model pays $445 million remaining 2026 exchangeable principal in Q4 2026 and $402.5 million in Q3 2029 rather than assuming convenient conversion. The $1.3 billion 2031 note remains outstanding. It also funds tax, working capital and the August buybacks.

The existing LUNA settlement also requires $60 million cash in each of 2027 and 2028. The model allocates those payments to Q2 of each year because the filing discloses the years, not exact payment quarters. It carries the $120 million, then $60 million, unpaid obligation as a separate claim until payment, and removes that claim when cash is paid. The historical legal provision is not charged to operating profit again. The presentation's net treasury investment exposure does not already deduct this settlement.

The LP agreement requires tax distributions using allocated taxable income and the highest relevant combined NYC marginal rate. The model's 24% effective cash-tax/distribution proxy, plus $3 million quarterly reserve, is an aggregate cash assumption, not that contractual rate. The taxable-to-book bridge, deductions, basis, NOLs and holder mix are not fully disclosed. Replacing 24% with 35%, 45% or 55% changes the Q4 2027 ceiling to $5.6930, $5.6921 or $5.6912 because little positive post-interest profit falls in that window. The Q4 2029 ceiling changes from $28.61 to $28.46, $28.34 or $28.21, and common funding increases. These are replacement cash-outflow sensitivities; cash tax and LP distributions are not both charged on the same income.

These assumptions require approximately $1.53 billion new common funding through 2030 in the contracted reference, $2.66 billion in the delayed/weak-services outcome and $3.08 billion with Helios II expansion. A positive modeled cash balance is created by those funding assumptions; it is not evidence that the facilities are already financed. Selling treasury investments, tenant prepayments or an equity partner could change the mix, but would also change asset ownership or claims and must be modeled consistently.

The August 7 legal denominator is 194.292 million Class A shares plus 196.597 million Class B shares paired with exchangeable economic LP units. The paired Class B shares have no separate economic entitlement; one LP economic unit is counted once. Using consolidated LP earnings against only listed Class A shares would materially overstate per-share value. The model adds 10.738 million existing award reserve, 0.6 million quarterly future awards and financing shares. It does not deduct the same LP ownership again as a separate minority expense.

Initial exchange ratios imply about 53.6 million potential shares on remaining corporate notes. The filing's maximum 74.2 million includes contingent adjustments; it is not interchangeable with ordinary conversion at initial rates. For each valuation window, principal and conversion shares are mutually exclusive, with the lower common value retained. $162.2 million of existing tax-receivable-agreement liability is separately reserved; future exchange-related TRA remains uncertain.

For a computed maximum-share stress, initial conversion rates are proportionally scaled from 53.564 million aggregate potential shares to the filed 74.2 million maximum. This is an illustrative allocation because the maximum per-tranche adjustment schedule has not been reconciled. Only still-live notes receive more shares, and their principal is removed only in conversion cases. The tested Q4 2027, Q4 2029 and Q1 2030 ceilings remain

$5.6939, $28.6053 and $30.8687: debt repayment remains the lower common-value outcome even at those enlarged conversion rates. This does not prove that every contractual make-whole event is immaterial.

State values, assets and sensitivities

The mutually exclusive outcomes are contracted delivery at 40%, two-quarter construction delay plus a 12% capex overrun and weaker digital activity at 25%, and the Helios II win at 35%. The downside is bounded at one-to-three quarters of delay, 8-16% overrun and 20-30% weaker near-term services. These are coherent operating and financing paths, not a collection of independent additive demand shocks.

Uncommissioned construction receives 70%, 40% and 65% recovery credit in reference, stress and expansion respectively. Only the portion outside commissioned rental assets is included. Unspent restricted project cash offsets the gross bond claim once. Cash needed for operations earns no separate asset premium. This prevents construction debt being deducted while the corresponding unfinished investment is assumed to vanish.

June's $1.159 billion net treasury portfolio includes crypto and venture/liquid investments. The model retains 65% of that net value in reference/expansion and 40% in stress, combining market, tax and liquidity uncertainty. This is a dated, haircut asset value, not current NAV. No perpetual treasury investment gain is also capitalized, and no treasury sale is simultaneously used as construction cash. A new treasury disclosure is a material next input.

For Q4 2027 through Q3 2028, the conditional common values are $8.33, zero and $6.75. The weighted result is $5.69. The stress outcome has positive OP but leaves no positive residual common value after matched claims; that is a financing result, not a zero probability assigned to an unconfirmed opportunity. The expansion's early value is limited because new construction consumes capital before its full income enters the active window.

Removing all separate asset credits produces a $2.51 gross-debt earnings-only diagnostic. Issuance at $12 gives $5.24, while $24 gives $5.95, with all share issuance recalculated. A 15-year blended depreciation life gives $0.86; 20 years gives $3.88 and 30 years $6.90. These sensitivities keep the same multiple, horizon and business scope; they do not import external price targets. Later-quarter ceilings are shown in the complete path so delayed earnings are not confused with absent earnings.

Catalysts, failure tests and score

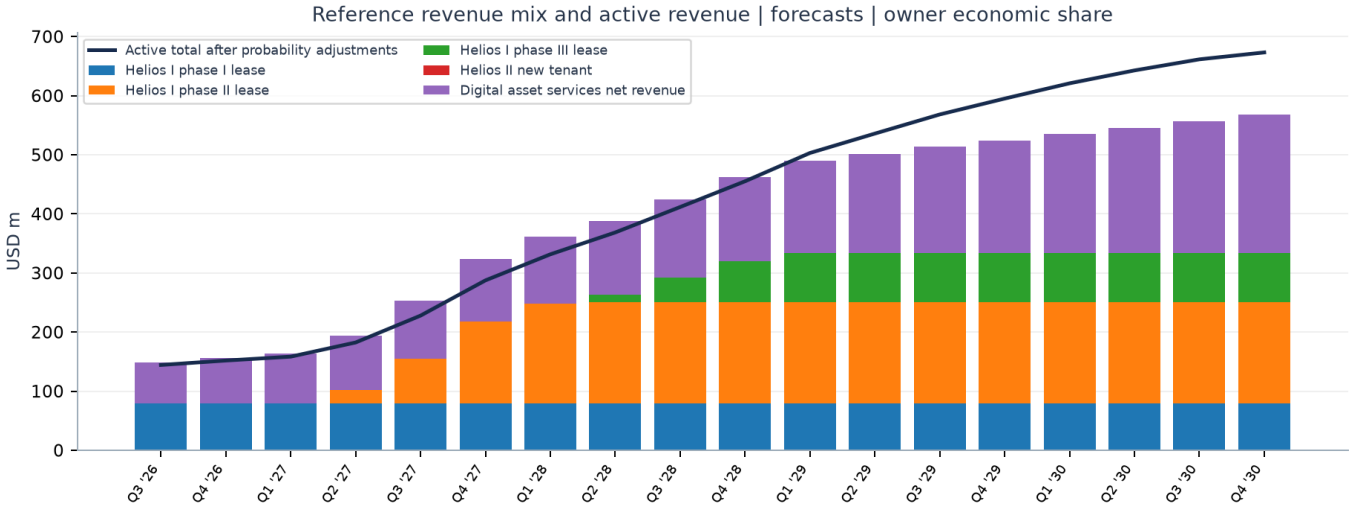

The next important events are accepted Phase II halls, an executed Helios II lease, financing that proves a net common return, actual post-maturity cash/share changes, and digital-services revenue that covers its full recurring cost base. A bigger gross-power announcement without tenant, construction and financing terms cannot answer those questions.

The five risk classes are funding/dilution, power and construction execution, concentrated tenant credit, digital counterparty/protocol exposure, and ownership/governance/TRA complexity. Core capability scores 15/20, cycle 8/10, TAM 8/10, catalysts 4/5 and macro 7/10, with no obscurity premium and a five-point risk deduction. The April 28 and August 5 full issuer transcripts, including Q&A, were reviewed with the filings, presentations and September ERCOT update. The updated Q2 filing is signed August 10; its subsequent-event information is not mislabeled as known on August 5.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	15	Delivered Phase I and secured power create value; financial-services execution is still mixed.
Cycle	8	Rental revenue starts while much construction remains ahead.
TAM	8	526MW contracted critical IT,830MW approved gross opportunity; larger pipeline is conditional.
Catalysts	4	Phase II delivery, lease of Helios II, digital infrastructure customer monetization.
Macro	7	Power scarcity helps; crypto, funding costs and Texas approvals add exposure.
Alpha	0	Well-known, actively followed multi-business developer.
Risk classes	-5	Funding/dilution, power/construction, tenant concentration, digital counterparty/protocol and governance/TRA.
Total	37/60	Rounded Base 62. Both artifact and new workbook row use this score; this is not a manual override.

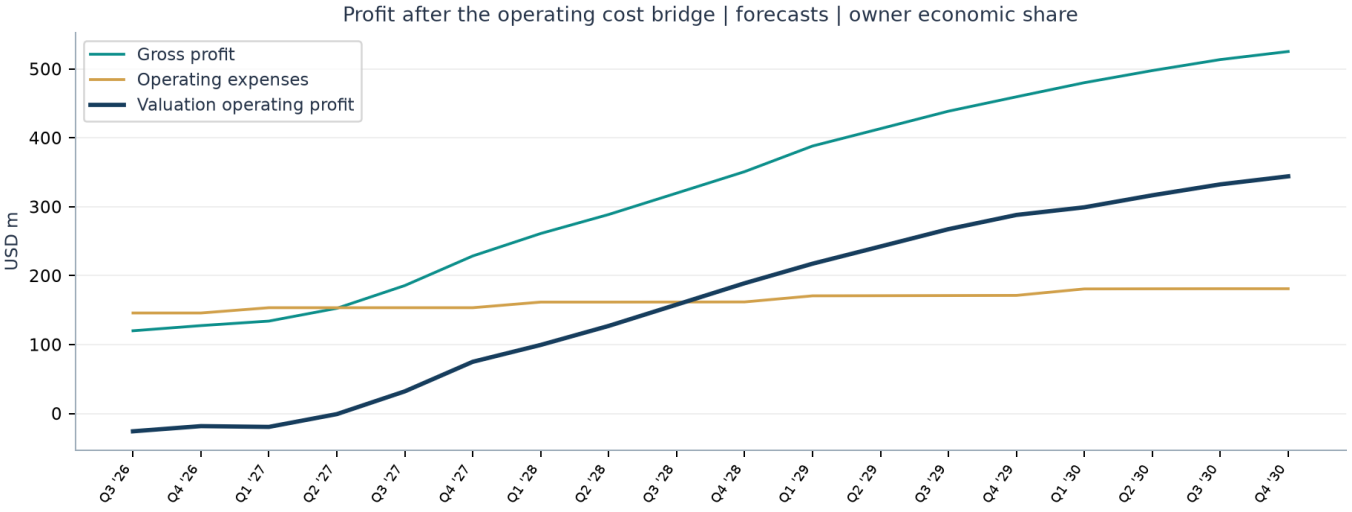

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	148.8	-4.4	144.4
Q4 2026	156.8	-4.9	151.9
Q1 2027	163.8	-5.3	158.4
Q2 2027	194.0	-11.6	182.4
Q3 2027	253.0	-25.2	227.8
Q4 2027	323.1	-35.6	287.5
Q1 2028	361.9	-30.3	331.6
Q2 2028	387.8	-19.2	368.6
Q3 2028	424.9	-13.3	411.6
Q4 2028	462.0	-6.8	455.2
Q1 2029	489.4	13.7	503.1
Q2 2029	501.4	34.5	535.9
Q3 2029	514.4	53.9	568.2
Q4 2029	524.4	70.7	595.1
Q1 2030	535.4	85.5	620.9
Q2 2030	545.4	97.4	642.7
Q3 2030	556.4	105.1	661.5
Q4 2030	568.4	104.8	673.2

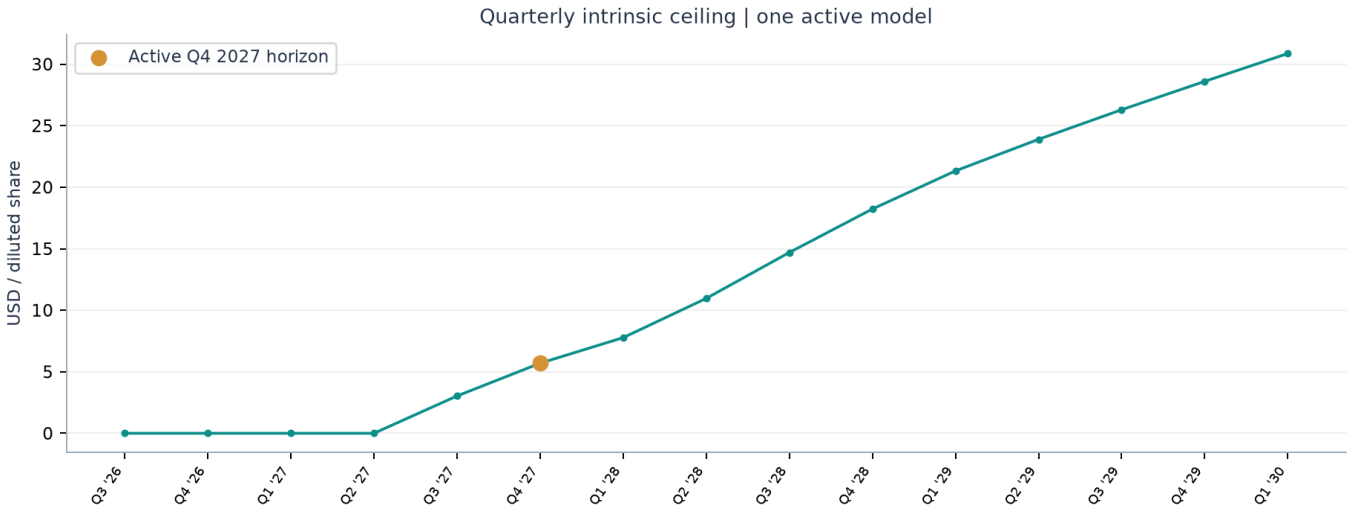

Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter	Revenue	GP	Opex	Valuation OP	OP margin
Q3 2026	144.4	120.1	145.9	-25.8	-17.9%
Q4 2026	151.9	127.6	145.9	-18.3	-12.0%
Q1 2027	158.4	134.1	153.6	-19.4	-12.3%
Q2 2027	182.4	152.7	153.6	-0.9	-0.5%
Q3 2027	227.8	185.7	153.6	32.2	14.1%
Q4 2027	287.5	228.6	153.6	75.1	26.1%
Q1 2028	331.6	261.2	161.7	99.5	30.0%
Q2 2028	368.6	288.8	161.7	127.1	34.5%

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Coherent outcomes and common-share value

The three outcomes are mutually exclusive and persist across the full path. End-window claims, assets and shares match each outcome. Convertibles are debt or shares, never both. The lower common-share result across conversion choices is floored at zero before probability weighting. Displayed expected shares do not reproduce a nonlinear weighted ceiling by division.

Q4 2027 outcome	p	F4Q OP	Matched net claims	Matched shares	Ceiling
Contracted Helios build	40%	541.1	6,827.7	479.335	8.33
Construction and crypto stress	25%	200.5	7,080.1	534.370	0.00
Helios II customer win	35%	552.0	7,571.8	514.030	6.75

Funding and dilution by outcome

USD millions except shares. Cash floors are conditional on the explicitly modeled new debt and equity issuance; they are not proof of committed funding. End cash may include ring-fenced project proceeds. The financing model, rather than this static table, must be rerun after changing operating assumptions.

Assets outside the operating-profit valuation

Only construction not yet commissioned remains in the separate construction pool. The recovery allowance is state-specific and is not a second multiple on rented facilities. Cash above the minimum operating reserve and matching restricted collateral offset gross claims. Galaxy treasury assets carry a haircut and produce no capitalized proprietary trading gains.

Quarter	Outcome	Unfinished construction	Recovery	Treasury credit	Total asset credit
Q3 2026	Contracted Helios build	1,050.0	70%	753.4	4,534.9

Claim decisions, overlap and triggers

GLXY-1

probability: 0.25

claim: PhaseII/III delivery slips two quarters while crypto-services demand is weaker.

Conditional bounds: 1-3 quarter delay, 8-16% capex overrun, 20-30% near-term net-services revenue reduction; selected 2 quarters, 12%, 25%.

cost bridge: Move earned MW and depreciation together, retain compliance and technology teams, fund overrun and interest, repay 2026/2029 notes in cash when due. New equity at 18/share plus 3% fees protects 400 m free-liquidity floor.

overlap: Joint macro/funding/execution state; no separate duplicate general risk discount.

trigger: Accepted halls, cost updates, retained clients and audited cash.

GLXY-2

probability: 0.35

claim: HeliosII signs a customer and delivers an incremental 550 MW critical IT by 2030.

basis: 830 MWgross already approved and retained BaseLoad status; equipment orders and tenant talks materially improve readiness. No executed lease is claimed.

Conditional bounds: 300-550 MW usable IT, 2028-30 delivery, 2.0-2.6 m annual revenue/MW; selected 550 MW and 2.3 m, below thePhaseII2.654 m rate.

cost bridge: 15 m/MWcapex, 91% leasecashmargin before 25 year depreciation, 80% projectdebt at 10%, incremental delivery team. Cash raise and dilution follow each quarter.

overlap: 830 gross is not 830 critical IT; the 5.73 GW pipeline includesHeliosI/II and is not added separately. Reference contains only 526 contractedcriticalMW.

trigger: Signed lease, funded construction and accepted halls.

GLXY-DIGITAL

probability: 0.6

claim: Bank infrastructure, staking and institutional trading improve recurring net fees.

decision: SignedBNY plus later distribution relationships are already embedded in the reference net-services revenue rising from 70 m inQ3 2026 to 105 m inQ4 2027. This is an assumed 60% achievement-weighted path around an approximately 80 m no-win run rate and 121.7 m conditionalQ4 2027 outcome; no second revenue increment is added.

cost bridge: Retain 75 m quarterlycashdigitalcost growing 7%annually, recurringSBC, technology/compliance and credit-loss reserve. No fee is earned on every dollar ofAUM.

overlap: AUM and assetsunderstake overlap by 733 m inQ2, and fee streams may differ; never add those asset bases as company revenue.

GLXY-PRICE

probability: 0.35

claim: Customer cost of waiting supports new lease economics.

decision: WithinGLXY-2, use 2.3 m/MW-year rather than automatically repeating the richerCoreWeavePhaseII contract. Financing and equipment costs offset rent premiums. No separate re-rate applied to the fixed existing lease or annual escalators.

GLXY-ASSETS

claim: Match gross funding claims with assets outside capitalized operating earnings.

probability: Same mutually exclusive operating probabilities; no independent additive event.

bounds: Uncommissioned construction recovery 40-70%; cash above operating reserve at par. Galaxy treasury retained value 40-65%.

overlap: Commissioned data centers, contractual rental earnings, token inventory matched by trading liabilities and minimum operating liquidity receive no second valuation.

trigger: Audited commissioned-asset balances, restricted-cash movement, updated treasury NAV and executed financing.

GLXY-LEGAL-CASH

claim: Pay the existing LUNA settlement without a second earnings charge.

probability: 1.0

basis: June 10-Q Note 15, pages 36-37, records $113.8m discounted liability and $120m undiscounted cash due, $60m in each of 2027 and 2028.

Conditional bounds: Calendar-year obligations are disclosed; Q2 payment timing is a model allocation. No extra damages from unresolved proceedings are invented.

cost bridge: Subtract $60m cash in Q2 2027 and Q2 2028. Carry $120m, then $60m, then zero unpaid claim before, between and after payment. Common financing responds to any liquidity shortfall.

overlap: The treasury pie is net digital-asset/investment exposure and does not deduct the legal liability. The historical provision is not charged to forecast OP again.

trigger: Actual settlement payment dates and any change in remaining legal obligations.

Remaining bounded uncertainties

- Q2 issuer call isAugust 5; the subsequently updated 10-Q is signedAugust 10 and contains August 6-10 buybacks. The model uses theAugust 7 legal denominator without subtracting the entirelaterbuyback again.

- A/Bpublic shares and LP units represent one economic unit per pair. TheQ2 loss EPS denominator excludes antidilutive awards and does not represent forward ownership.10.738 m award reserve and 0.6 m additional shares/quarter are modeled.

- The 2026 note maturity has 445 m principal outstanding, not original 500 m. The model repays it inQ4 2026 and 402.5 m notes inQ3 2029; 2031 notes remain an optional conversion claim.

- The reported 10.8 bn asset base contains collateralized trading assets and client obligations. No grosscash-plus-stablecoins or treasury NAV is added; funding excludescashatbrokers/platforms and allstablecoins.

- PhaseIII2.16 bn capital cost and futureHeliosII15 m/MW are assumptions, not issuer guidance. Funding stress uses 80%projectdebt and explicit common issuance for gaps.

- Financial services netrevenue normalizes proprietary mark-to-market and token turnover. Interest on trading funds remains in netrevenue; project and corporate interest is excluded from OP and handled as financing to avoid debt-service double counting.

- A25 year blendeddata-centerlife is a valuation assumption. It must be tested against final commissionedassetmix and shorter mechanical/electrical replacement cycles.

- Construction cost is not a market appraisal. Only modeled spending outside commissioned facilities is credited, at 70% recovery in reference, 40% under delay and 65% in expansion. No second value is added to income-producing facilities. The share-weighted cash and asset bridge is inseparable from the operating states.

- Funding is conditional on new debt and common issuance at $18 per share with 3% issuance costs. $12-24 issuance-price sensitivity is shown separately. Positive modeled cash does not demonstrate committed financing.

- A gross-debt-only earnings diagnostic is retained alongside the complete asset/claim reconciliation; neither should be confused with an analyst target or guaranteed trading price.

- The July indenture Article 14 requires 4% annual original-principal amortization, payable semiannually after the contractual commencement test. Modeled first repayment is February 2029, or August 2029 under delay; the first prorated installment is conservatively a full 2%. Phase I needs refinancing in August 2028.

- June net treasury assets of $1,159m receive 65% retained value in reference/expansion and 40% under stress; this combines market, liquidity and tax haircuts. They are not used to fund construction and do not also generate capitalized proprietary income. Updated asset marks are unavailable.

- The filing quotes up to 74.2m possible note shares including contingent adjustments, versus about 53.6m at initial exchange rates on current principal. Initial rates control the active model; make-whole dilution remains a sensitivity, not a guaranteed issuance.

- The $120m undiscounted LUNA settlement is a separate corporate obligation, not netted against the presentation's token/investment exposure. The model pays $60m in Q2 2027 and $60m in Q2 2028; the filing specifies the years but not those exact quarters. Only the unpaid balance is a valuation claim. There is no second operating expense after the historical provision.

- The LP agreement requires distributions based on allocated taxable income and the highest relevant marginal NYC rate. The selected 24% effective cash-tax/distribution proxy plus $3m quarterly reserve is not the contractual marginal rate or issuer guidance. Taxable-book differences, allocation across LP holders, deductions, basis and NOLs remain unquantified. A replacement 35%/45%/55% aggregate cash-outflow sensitivity is shown; it is not added on top of the existing cash tax.

- Positive modeled cash assumes access to the disclosed common issuance amounts and future project borrowing; these are conditional financing paths, not committed funding. A failure to raise the required capital would delay construction or reduce common recovery further.

- For a computed maximum-share stress, initial conversion rates are proportionally scaled from 53.564 million aggregate potential shares to the filed 74.2 million maximum. This is an illustrative allocation because the maximum per-tranche adjustment schedule has not been reconciled. Only still-live notes receive more shares, and their principal is removed only in conversion cases. The tested Q4 2027, Q4 2029 and Q1 2030 ceilings remain $5.6939, $28.6053 and $30.8687: debt repayment remains the lower common-value outcome even at those enlarged conversion rates. This does not prove that every contractual make-whole event is immaterial.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
