Infineon

IFX.DE | Xetra / Frankfurt | 2026-10-07

Q4 2027 model ceiling: EUR 53.34

Analytical Base 43/60 = 72 | Qualified power semiconductor bottleneck / Watchlist

20x forward-four-quarter statutory IFRS operating profit, less EUR8007m gross financial/lease/hybrid/pension claims, divided by end-window economic shares. No cash addition. Quarter includes itself plus next three.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in EUR m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	3,920.8	20x	1,320.000	53.34

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

IFRS consolidated operating profit including SBC, depreciation and acquired intangible amortization.. 20x forward-four-quarter statutory IFRS operating profit, less EUR8007m gross financial/lease/hybrid/pension claims, divided by end-window economic shares. No cash addition. Quarter includes itself plus next three.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use EUR m unless a different unit is stated.

Thesis

Infineon's strongest opportunity is selling qualified power semiconductors into increasingly demanding data centers. The October 7 model produces a **€53.34 Q4 2027 ceiling** and **analytical Base 72/100, or 43/60**. The ceiling values the four quarters from Q4 2027 through Q3 2028 at 20 times statutory operating profit, subtracts financial, lease, hybrid and pension claims once, and uses 1,320 million economic shares at the end of that window. The reference ceiling before the incremental probability branches is €50.44. These are model outputs, not management targets.

The essential distinction is between an attractive semiconductor franchise and the output it can actually ship. Infineon reports allocation, rising lead times and customers reserving capacity. It also reports weak pricing in electric-vehicle high-voltage products. The model therefore gives AI capacity and limited repricing positive weight while retaining an automotive downside and the cost of expanding factories. Factory floor space, a reservation agreement and finished qualified devices are different things.

Engineering and revenue capture

The company sells power switches, controllers, drivers, microcontrollers, sensors and connectivity devices. Its products regulate energy and control systems in cars, factories, appliances and data centers. Long qualification cycles, embedded software, failure consequences and manufacturing experience can protect a socket. They do not prevent competition or price declines when supply exceeds demand.

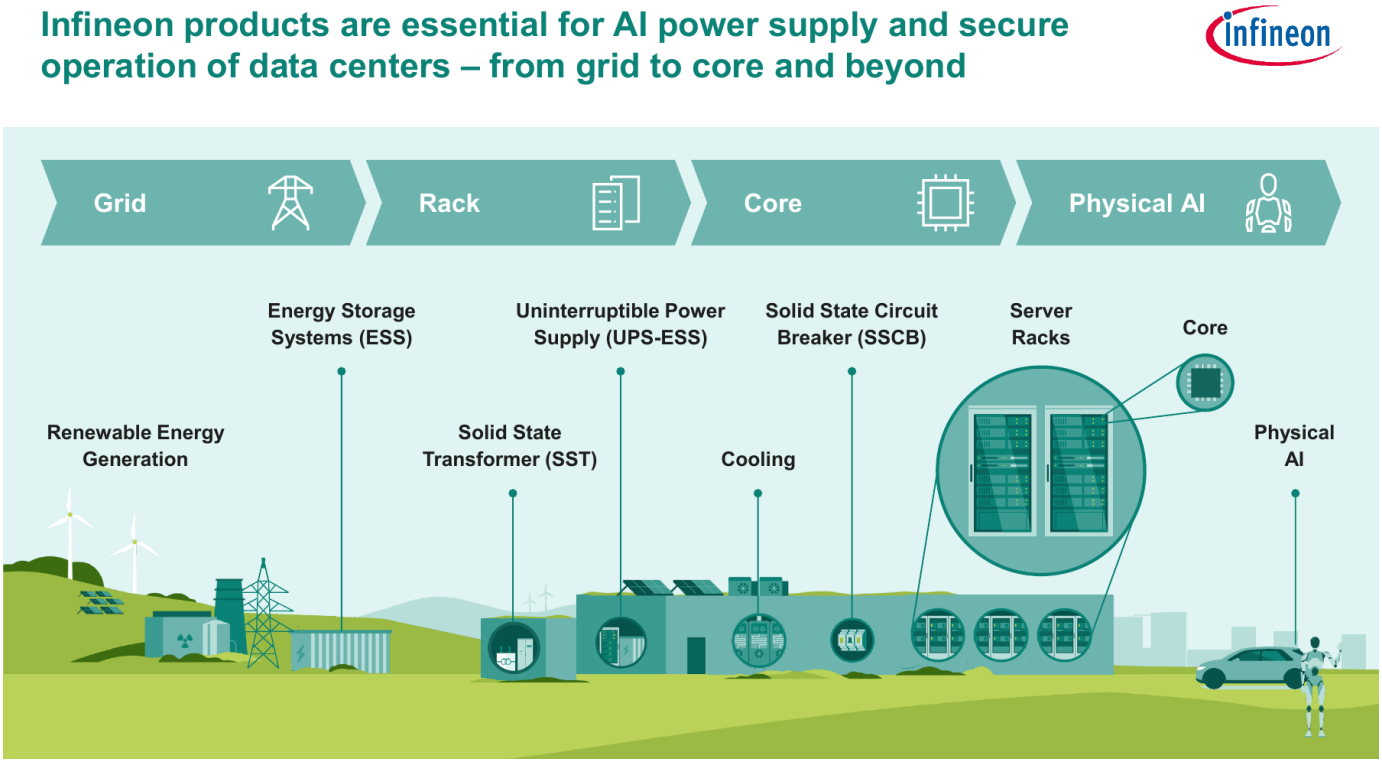

Data-center power is a chain of conversions. Silicon carbide suits high-voltage conversion from the grid toward the rack. Gallium nitride supports fast-switching, dense intermediate stages. Silicon power stages and controllers serve the processor's low-voltage, high-current requirements. The useful product is a qualified combination that meets efficiency, thermal, transient-response, reliability and physical-space constraints. A watt saved in conversion can reduce cooling requirements or leave more facility power available for useful computing.

Higher processor current also changes placement. Moving voltage regulation closer to, underneath or eventually into the substrate surrounding a processor can reduce distribution loss and improve transient performance. Infineon's May roadmap shows successive power-module density improvements and future backside/substrate solutions. Those future pictures are not evidence that every architecture has entered volume production. Integration can change which supplier captures a socket, reduce discrete component count and require new qualification.

Management's May estimate of addressable content was $100-250 per kilowatt, averaging about $175. This is an opportunity range across configurations, not a take rate on all installed data-center power. Not all facility watts use the same topology or all Infineon devices. The company replaced its earlier €8-12 billion end-decade market estimate with this content-based discussion because deployment plans were changing. This research does not multiply all announced gigawatts by the highest content number. It uses company revenue and qualified-capacity bounds, with content as a reasonableness check.

On September 29, Infineon announced that it will supply SiC devices to Eaton's MVSST 2.0 platform for APAC and emerging 800 VDC architectures. That establishes a named product relationship. It does not disclose purchased megawatts, device ASPs or a separate revenue commitment. Infineon captures semiconductor content; Eaton captures a different system-level product. Siemens' solid-state breaker relationship similarly provides a concrete route to revenue without making the whole switchgear price Infineon revenue. Both are included in the power pools already modeled.

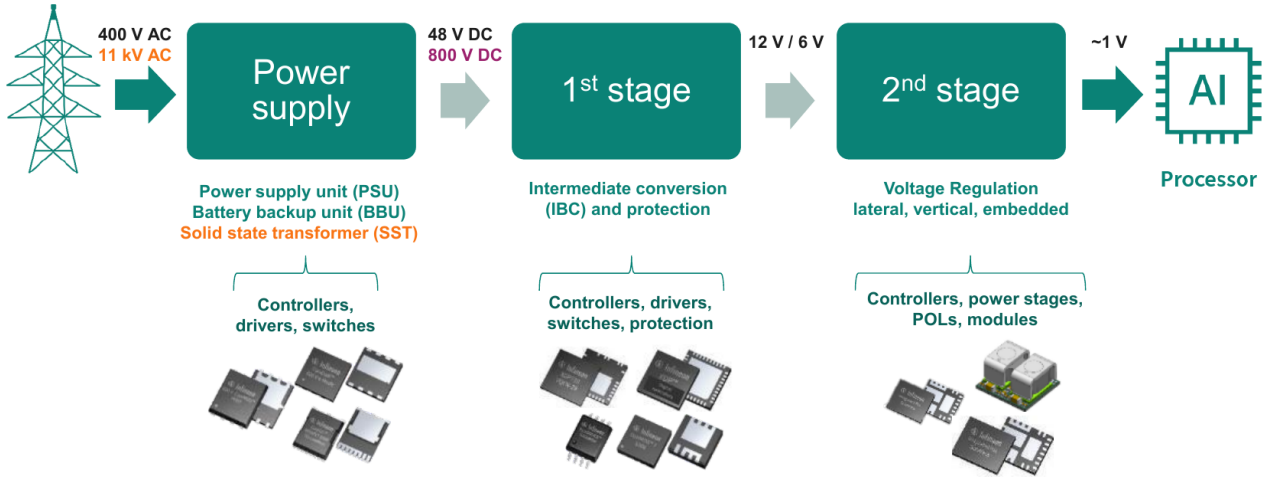

The October 5 completion of C2i Semiconductors adds digital multiphase controllers, smart power stages and power-architecture engineering. It strengthens the route toward vertical delivery and substrate-integrated regulation. No purchase consideration or standalone earnings were disclosed in the retrieved announcement. The model funds a clearly labeled €100 million cash reserve, tests €0-300 million, and does not fabricate a C2i sales figure.

Original issuer exhibit | Several conversion stages create semiconductor content; the entire rack or transformer price is not Infineon revenue.

With its energy efficient power semiconductors Infineon is serving all AI-related power conversion from grid-to-core

Current economics

Fiscal Q3 2026 ended June 30. Revenue was €4,172 million, gross profit €1,703 million, R&D €674 million, SG&A €433 million and net other operating expense €2 million, yielding **€594 million statutory IFRS operating profit**. The published €797 million Segment Result is different. The €203 million difference includes €105 million share compensation and €90 million acquisition-related amortization/other costs, as well as restructuring, impairment reversals and other items. Those costs remain within this model's statutory margins and expenses.

The old reporting divisions show the imbalance clearly. Automotive generated €1,932 million revenue and €356 million Segment Result. Green Industrial Power produced €447 million and €44 million; operational and inventory effects suppressed its margin. Power & Sensor Systems produced €1,442 million and €359 million, a 24.9% Segment Result margin. Connected Secure Systems generated €350 million and €34 million. PSS contains more than AI, and its margin is not a disclosed AI product margin.

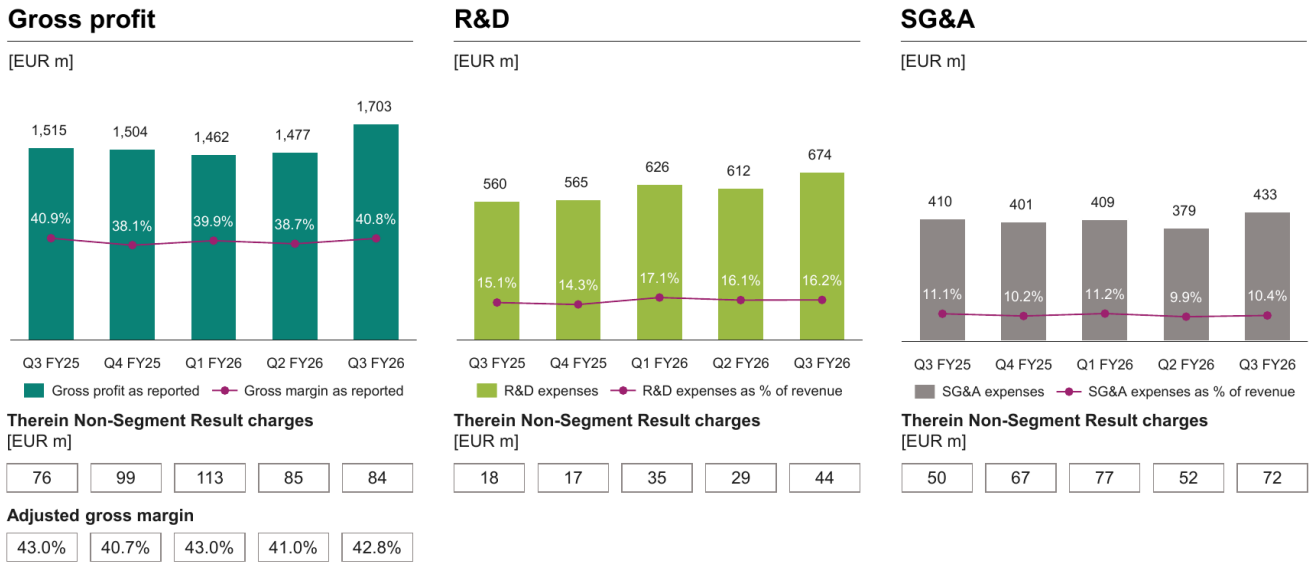

Dedicated AI-power revenue is expected to exceed €1.6 billion in FY2026, compared with over €700 million in FY2025. Classic non-AI data-center power adds about €500 million annually. In August management said its €2.5 billion-plus FY2027 AI projection would receive a material upward revision in November. It also said the updated category would include more forms of data-center computing. Simply relabeling the existing €500 million classic business is not incremental growth. The model keeps the two pools separate before adding any new output.

The order backlog approached €30 billion at June, but management defines backlog broadly as all received orders regardless of status. Capacity reservation discussions cover a high-single-digit-billion cumulative revenue amount over several years; some are concluded, others still negotiated, and certain agreements contain prepayments. These figures cannot be added to annual sales, classified entirely as binding backlog, or counted as unrestricted cash. They support the probability of a qualified production ramp.

Original issuer exhibit | PSS includes more than AI; its24.9% Segment Result margin is not a standalone AI margin.

Gross margin and Opex

Original issuer exhibit | Statutory gross margin and operating costs; adjusted financial figures retain an explicit reconciliation.

Guidance and forecast

The August outlook expects fiscal Q4 revenue around €4.7 billion and a 23% Segment Result margin. This quarter is **calendar Q3 2026**. The initial modeled statutory OP is €881 million: €1,081 million guided Segment Result less a €200 million non-segment expense proxy, consistent with recent quarters. It is not a statutory OP guide from management. Calendar Q4 2026 is already the first quarter of FY2027 and is independently modeled.

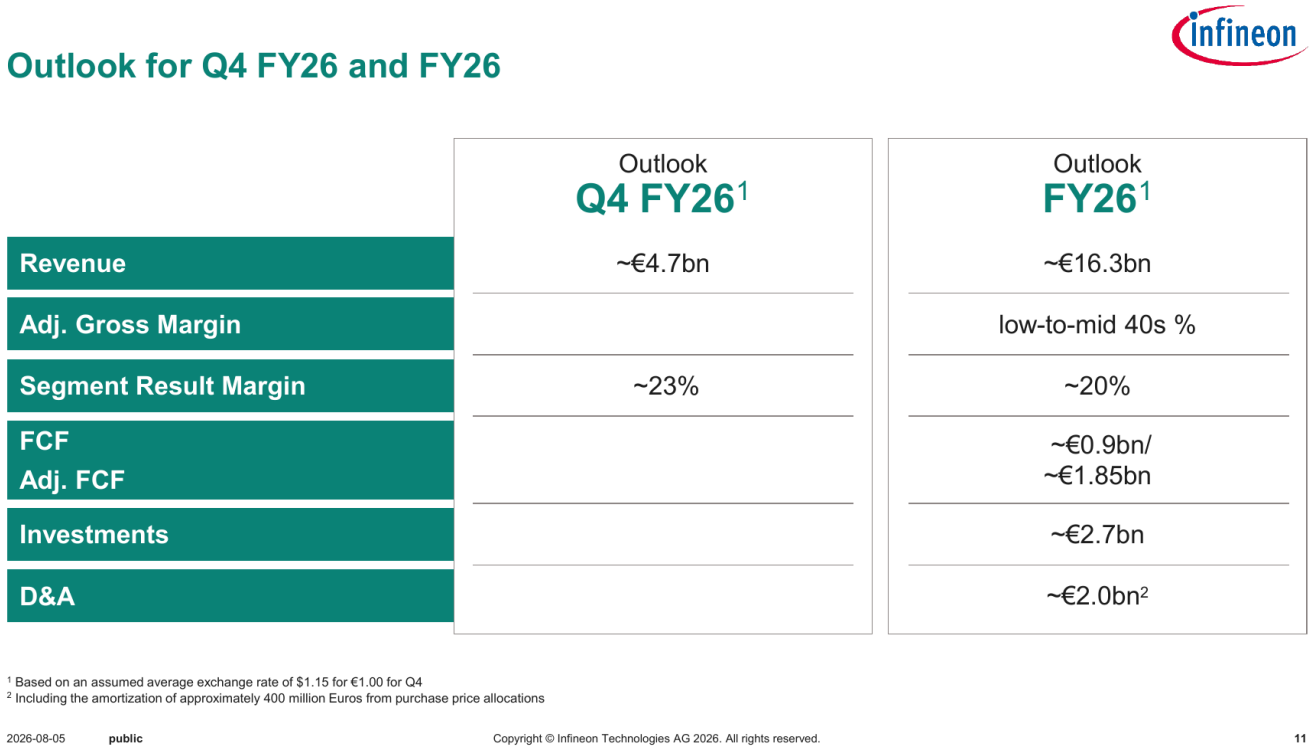

The annual FY2026 outlook is around €16.3 billion revenue, low-to-mid-40s adjusted gross margin, around 20% Segment Result margin, €2.7 billion investments and €2.0 billion D&A, including approximately €400 million purchase-price-allocation amortization. Reported free cash flow is guided to €900 million, including the July sensor acquisition. Adjusted FCF of €1.85 billion excludes major frontend buildings and M&A; the larger number is not freely distributable cash.

Reference calendar 2027 sales are €18.0 billion: dedicated AI power €2.7 billion, classic data-center power €600 million, automotive €8.2 billion, other industrial/consumer power €4.0 billion and edge/sensors/connectivity/security €2.5 billion. These economic vectors are mutually exclusive model categories, not the new reporting segments. The July reorganization combines old GIP and power PSS into Power Systems and moves sensor/RF/USB plus CSS into Edge Systems. Adding old and new divisional numbers would double-count revenue.

Reference dedicated-AI quarterly sales imply €2.5345 billion for FY2027 before the new-capacity branch, close to the earlier €2.5 billion indication. Thus the model starts with a substantial ramp already funded by existing capacity plans. Calendar 2028-2030 reference sales of €20.01 billion, €21.875 billion and €23.55 billion require continuing AI growth, automotive content gains and industrial recovery; they are research assumptions, not dated issuer guidance.

Product gross margins are also assumptions. Dedicated AI begins at 55% in calendar 2027, versus 43.5% automotive and 40.5% other industrial power. The weighted group statutory margin is far below the highest-margin

product. R&D rises from €3.0 billion in 2027 to €3.71 billion in 2030; SG&A rises from €1.86 billion to €2.2 billion. These costs retain SBC, depreciation and amortization. A separate recurring operating reserve remains. The model does not count the €650 million FY2026 idle-cost burden as an automatic future profit addback; recovery is embedded in gradual product margins and still requires utilization.

Outlook for Q4 FY26 and FY26

	Outlook Q4 FY26[1]	Outlook FY26[1]
Revenue	~€4.7bn	~€16.3bn
Adj. Gross Margin		low-to-mid 40s %
Segment Result Margin	~23%	~20%
FCF Adj. FCF		~€0.9bn/ ~€1.85bn
Investments		~€2.7bn
D&A		~€2.0bn[2]

[1] Based on an assumed average exchange rate of $1.15 for €1.00 for Q4
[2] Including the amortization of approximately 400 million Euros from purchase price allocations

Original issuer exhibit | August guidance is fiscal; FY26 ends September. It supersedes May financial outlook.

Probability-weighted incremental economics

Qualified AI capacity: 75% realization probability. Above the existing roughly €2.5 billion FY2027 reference, the conditional additional output range is €0.4-0.9 billion, with €0.6 billion selected across October 2026-September 2027. Calendar 2027 receives €650 million conditional incremental sales. At 55% gross margin, less 17% variable R&D/support and €50 million annual ramp expense, its conditional OP is €197 million; the weighted contribution is **€487.5 million revenue and €147.75 million OP**. Incremental capital cash is 20% of realized branch sales. The probability covers qualification, output and delivery, not whether management really announced a revision.

Calendar 2028-2030 conditional additional sales are €900 million, €1.15 billion and €1.35 billion, with rising ramp costs. These amounts represent accepted additional devices, not the entire reservation pool. Dresden, Kulim, GaN, C2i, Eaton and vertical modules are mechanisms supporting this same commercial outcome. Adding them again as independent revenue shocks would count the same sockets several times.

Selective repricing: 60% probability. There is stronger evidence than a generic shortage story: management identified April pricing changes, longer lead times and willingness to pay for expedited deliveries. The conditional premium is 1-5%, selected at 3%, on 25% of reference AI sales plus 10% of other industrial/power sales. Half is removed for overlap with guided pricing and normal mix. A 0.6% input/expediting burden on the same adjusted eligible pool and 4% incremental selling expense remain. In 2027 this adds **€9.675 million weighted revenue and €7.353 million OP**. It applies neither to all group revenue nor to the separate new-capacity branch or fixed-price backlog.

Automotive downside: 30% probability. Management describes acute EV high-voltage pricing and excess capacity; the affected business is only one part of automotive. The branch applies an additional 10% revenue shortfall, bounded at 5-15%, to 20% of reference automotive sales. A 60% lost gross contribution is partly mitigated by 15% avoidable operating costs. Calendar 2027 weighted revenue falls €49.2 million and OP €22.14 million. The already disclosed HV reset remains in reference; this is prolonged competitive weakness beyond it.

Together, the branches move calendar 2027 revenue from €18.0 billion to **€18.448 billion** and OP from €3.121 billion to **€3.254 billion**. Calendar 2028 active revenue and OP become €20.644 billion and €4.153 billion. By 2030 they reach €24.520 billion and €5.373 billion. The resulting statutory operating margin approaches 22%, requiring utilization and cost discipline. It cannot be justified merely by quoting the company's 25% through-cycle **Segment Result** ambition, which uses a different accounting measure.

Capacity and competition

Dresden's new Smart Power Fab opened in July; expansion is modular, and the FY2026 budget pulled forward approximately €500 million for AI. Available cleanrooms in Germany, Austria and Malaysia create options to add equipment and convert capacity. They do not guarantee qualified output on the required date. Different materials, device designs and packaging stages have different yield, test and qualification constraints. Transferring underused EV capacity to AI reduces some capital burden but still requires process/customer qualification.

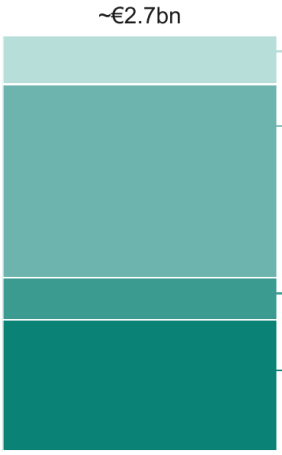

Bangkok's backend site opened October 1. Its initial module can expand to five modules; approximately 350 current employees can rise toward 1,000 as the first building ramps. The announcement provides scalability and geographic diversification, not a device-per-month capacity figure. The model therefore does not multiply potential modules by an invented output or add a second capacity premium.

Infineon's issuer-cited market comparisons identify onsemi, STMicroelectronics, Mitsubishi, Fuji, NXP, Renesas and Texas Instruments among relevant competitors across power and automotive categories. Silicon, SiC and GaN are not interchangeable at every conversion stage, but competing suppliers can qualify alternate devices or integrated solutions. Strong automotive MCU share does not prove equivalent AI-power share. Infineon's system breadth and manufacturing scale are valuable; neither establishes monopoly pricing.

FY2025 customer sales were diversified, with no customer above 10%. Mainland China and Hong Kong represented 29% of regional revenue, plus a separately reported Greater China balance. Sales geography is not end-use geography or export-control exposure. AI reservations may raise concentration and bargaining power at a few large buyers. Automotive replenishment can also overstate durable end demand when customers restock after a long correction.

Modular investment approach for long-term value creation – pull-in of AI related investments for faster ramp

Infineon investments[1] FY26

Strategic investments
- Dresden module 4

Capacity investments
- Smart power and logic: enabling further growth for ”powering AI” and analog/mixed-signal products
- Includes pull-in of €500m to accelerate AI capacity ramp

Research and development
- IFRS capitalization of development cost

Basic investments
- Maintenance, process optimization, quality, IT

[1] Investments are defined as the total amount invested in property, plant and equipment and in other intangible assets, including capitalized development costs

Original issuer exhibit | May SST market scenario; September Eaton supplies a named platform bridge, without disclosing volume or ASP.

Original issuer exhibit | FY25 geographic and customer distribution; no customer exceeded10%, but future AI concentration may increase.

Claims, shares and funding

At June 30, cash of €1,068 million plus financial investments of €588 million produced €1,656 million gross cash. Financial debt was €6,841 million, so reported net debt was €5,185 million. Lease liabilities of €400 million sit outside that reported financial debt. A remaining €600 million perpetual hybrid is an equity claim senior to ordinary shares, despite IFRS equity classification; its first call is January 2028. Pension liabilities were €166 million. The valuation subtracts **€8,007 million** in total gross claims once. It adds no cash or investment assets. Hybrid coupons are not separately capitalized as another valuation claim.

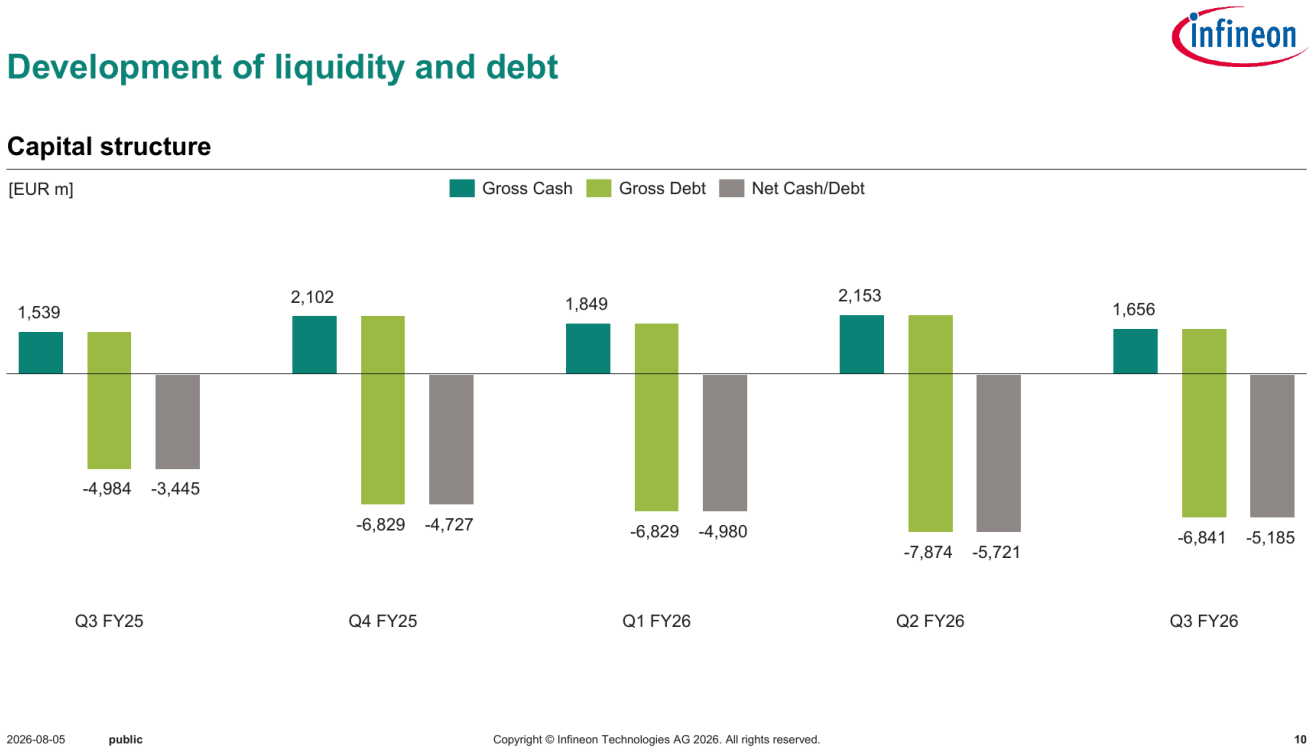

The model intentionally gives no speculative debt-paydown credit from future cash accumulation. Debt maturities are assumed to refinance at par, with €320 million annual interest as a funding proxy. That is a financing assumption, not a committed refinancing facility. It is tested against operating cash generation and exposes rate sensitivity. The July ams OSRAM sensor acquisition cost about €570 million and was already prefunded in June debt; adding new acquisition debt again would double-count the financing. Its approximately €230 million annual sales run rate is already inside the edge vector.

Legal issued shares were 1,305.921137 million in the latest retrieved full capital disclosure. June-quarter basic and diluted weighted averages were 1,304 million and 1,316 million. These are different measures, not a share-count inconsistency. The August program bought three million shares for €175.349 million and completed August 20. Its purpose is employee-plan delivery, not cancellation. The model starts with 1,316 million economic shares and adds 0.5 million each quarter; it does not subtract all treasury purchases from the valuation denominator while ignoring future awards.

Funding begins with the full €1,656 million gross-cash balance, counting investments once. For calendar Q3, issuer FY2026 FCF guidance less reported first-nine-month FCF implies €563 million, already including the €570 million acquisition. The file exposes the reconciliation between this cash guide and independently modeled

operating earnings, capex and working capital. It is not a reported September cash balance. August employee-share purchases, leases, pensions and hybrid distributions are separately paid.

Subsequent funding uses statutory OP, cash tax after interest, D&A and SBC addbacks, working-capital needs, capital expenditure, employee-share replenishment, dividends and the C2i reserve. SBC remains an earnings cost; adding it back in cash flow does not remove dilution. No capacity-reservation prepayment is counted as unencumbered cash. Eight coherent operating-branch combinations retain positive cash; the lowest modeled quarter-end balance is about €2.01 billion after the opening balance. Raising the C2i reserve to €300 million leaves a conservative minimum bound of about €1.81 billion. Adverse refinancing, acquisition consideration or a much larger inventory build remains a reason to rerun funding.

Original issuer exhibit | June gross debt and cash are reconciled; cash used by acquisition and working capital is not added to common value.

Failure tests and next evidence

The November 10 earnings release is the most direct test: it should clarify FY2027 dedicated AI versus broader data-center scope, the revised divisional base and the actual September cash bridge. Successful technical architecture is insufficient if capacity fails qualification, customers postpone acceptance, input prices consume the premium or competitors win replacement sockets. A two-quarter production delay, renewed EV pricing deterioration or rising days of inventory should reduce the capacity branch and defer cash generation.

For sensitivity, an additional €100 million annual statutory OP changes a 20x ceiling by roughly €1.52 per share at 1.32 billion shares. Another €1 billion of senior claims reduces it by roughly €0.76. Management's annual-report currency sensitivity is approximately €40 million annual Segment Result and €100 million revenue per one-cent EUR/USD movement, conditional on correlated cost currencies; translating that into statutory OP requires separate cost/accounting work. These effects are material enough to track explicitly.

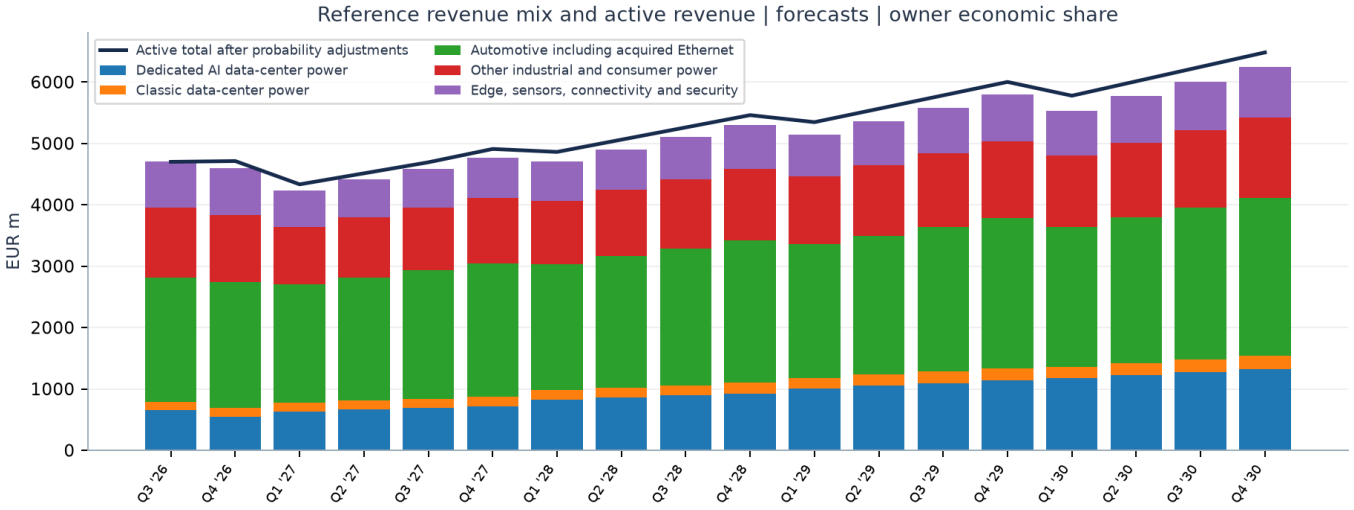

The analytical Base is 43/60: Core 17, Cycle 8, TAM 8, Catalysts 4, Macro 8, Alpha 2, Risk -4. Qualified product breadth and visible demand earn a strong score; cyclical auto exposure, factory execution, claims and uncertain

contract economics prevent treating the upside as assured. The first two official management statements were read in full, but full Q&A transcripts and separate AI product margins remain retrieval/disclosure gaps.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	17	Qualified full power-chain portfolio, manufacturing and customer engineering; strong competitors persist.
Cycle	8	Allocation and broad recovery visible, balanced by EV high-voltage overcapacity.
TAM	8	More power stages and content, with dollar-per-kW efficiencies and mix constraints.
Catalysts	4	November forecast revision, factory qualification and customer reservations.
Macro	8	AI power demand and electrification; FX and geopolitical costs.
Alpha	2	Specific power economics improve screening but widely researched leader.
Risk classes	-4	Ramp/yield, undisclosed reservation terms, automotive pricing, refinancing and acquisition accounting.
Total	43/60	Rounded Base 72. Both artifact and new workbook row use this score; this is not a manual override.

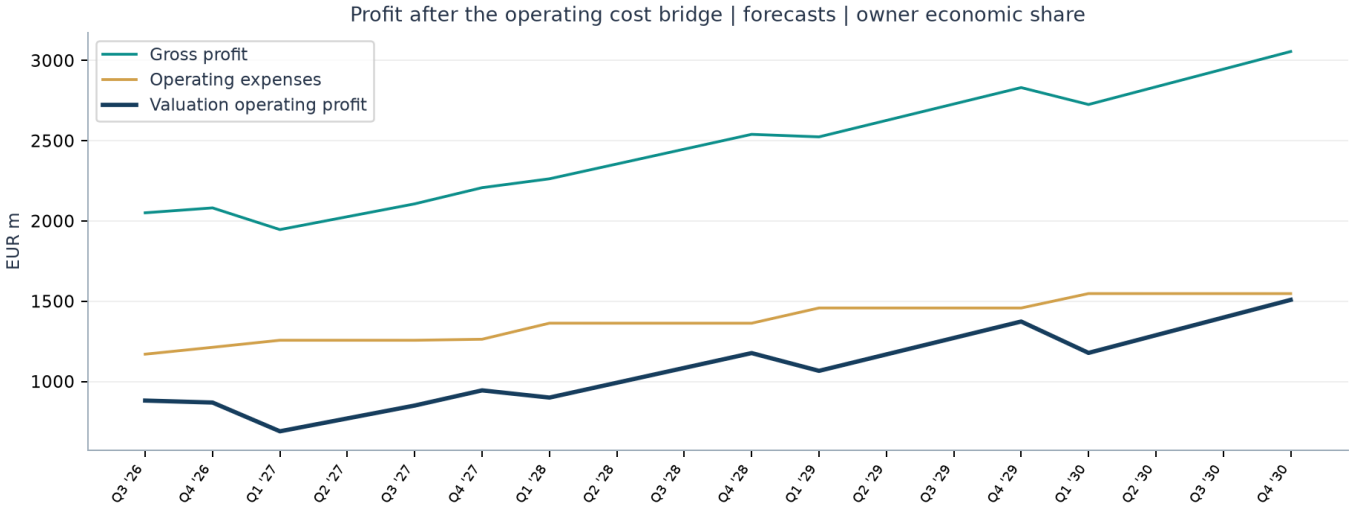

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	4,700.0	0.0	4,700.0

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Dedicated AI power revenue before incremental qualified capacity, EUR millions	Status
Q3 2026	650.000	Guidance-anchored model
Q4 2026	550.000	Model assumption
Q1 2027	634.500	Model assumption

Q4 2030	1,325.000	Model assumption

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	Dedicated AI data-center power	650.0	55.0%	357.5
Q3 2026	Classic data-center power	135.0	49.0%	66.2
Q3 2026	Automotive including acquired Ethernet	2,025.0	43.0%	870.8
Q3 2026	Other industrial and consumer power	1,140.0	38.1%	434.1
Q3 2026	Edge, sensors, connectivity and security	750.0	43.0%	322.5
Q4 2026	Dedicated AI data-center power	550.0	55.0%	302.5
Q4 2026	Classic data-center power	140.0	49.0%	68.6
Q4 2026	Automotive including acquired Ethernet	2,050.0	43.0%	881.5
Q4 2026	Other industrial and consumer power	1,090.0	40.0%	436.0
Q4 2026	Edge, sensors, connectivity and security	770.0	43.0%	331.1

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Claim decisions, overlap and triggers

IFX-AI-CAPACITY

probability: 0.75

source: August5 management: dedicated AI >EUR1.6bn FY26; announced material upward revision to EUR2.5bn+ FY27; allocation and CRAs with prepayments, some still negotiated.

Conditional bound: FY27 additional dedicated AI EUR0.4-0.9bn above roughly EUR2.5bn, selected EUR0.6bn before EUR34.5m existing reference excess; calendar2027 EUR650m incremental,2028 EUR900m,2029 EUR1150m,2030 EUR1350m.

bridge: 55% incremental statutory gross margin, 17% variable R&D/SG&A, EUR50m/60m/70m/75m annual ramp cost, and incremental capital cash of20% of conditional revenue. CY2027 weighted EUR487.5m revenue and EUR147.75m OP. FY27 probability is an execution judgment, not the authenticity probability of the announced revision.

overlap: The standalone EUR0.5bn classic data-center business is already a separate reference vector, so broadening November scope adds zero by itself. No additional revenue is assigned to high-single-digit-billion CRAs, C2i, GaN, vertical power, Eaton, or Dresden on top of the same qualified AI wallet.

triggers: November10 FY27 scope/guide, qualified capacity and product mix, conversions of negotiated CRAs, accepted deliveries and yields.

IFX-PRICE

probability: 0.6

source: August5 remarks cite actual April pricing, rising lead times and customers willing to pay expedite surcharges; higher input costs partly offset.

Conditional bound: 1-5% new-order premium, selected3% on25% of reference dedicated AI plus10% of other industrial/power sales; remove50% overlap with guided pricing/mix.

bridge: Subtract0.6% input/expediting cost on the same eligible and overlap-adjusted pool, plus4% of incremental revenue for selling/support expense. CY2027 conditional revenue16.125, OP12.255; weighted9.675 revenue,7.353 OP, EURm.

overlap: Applies to reference quantities only; no premium on the new AI branch, fixed-price capacity backlog or entire group. Ramp utilization improvement is already in reference gross margin.

triggers: Quoted new terms and sustained allocation; reduce if new qualified capacity or competition removes urgency.

IFX-AUTO-DOWNSIDE

probability: 0.3

source: May/Aug management: acute high-voltage EV pricing and capacity pressure; declining high-voltage revenue and resetting business despite SDV wins.

Conditional bound: Additional5-15% revenue shortfall on20% of reference automotive wallet, selected10%, beyond already weak HV reference.

bridge: 60% lost contribution margin,15% avoidable operating expense; CY2027 conditional revenue-164 and OP-73.8; weighted-49.2 and-22.14. This is a broad competitive downside, not a prediction all automotive products fall.

overlap: Existing low-margin/high-voltage weakness and capacity conversion are in reference. The incremental downside covers prolonged price competition, not the same disclosed restructuring charge.

triggers: Automotive bookings, utilization, net price and HV reset milestones.

IFX-SCOPE-AND-CAPACITY

probability: 0.75

source: Issuer May technology slides and Sep29 Eaton partnership; Oct1 Bangkok and Oct5 C2i close.

Conditional bound: Eaton/Siemens qualified SST devices and future vertical delivery reinforce the AI/industrial pools; no separately observed purchased MW, semiconductor bill or incremental output is disclosed.

bridge: Zero separate increment because the positive AI branch explicitly funds the same design wins and manufacturing ramp. C2i purchase cash is undisclosed; EUR100m reserve with EUR0-300m sensitivity in funding only, not presented as purchase price.

overlap: 100% of this incremental mechanism is routed into IFX-AI-CAPACITY or baseline industrial growth, not omitted for lack of official confirmation. Module/fab names are not saleable output.

triggers: Revisit distinct incremental units, realized mix, C2i financial terms and new end-market scope.

Remaining bounded uncertainties

- Prepared issuer statements for the latest two earnings calls were read in full; full Q&A transcripts were not recovered.

- Separate product gross margins, wafer yields, exact capacity-reservation signed share, price and delivery/cancellation schedule are undisclosed. Product margins and output bridge are explicitly model assumptions.

- C2i acquisition closed October5, but consideration and standalone earnings were not disclosed. Funding reserves EUR100m and tests0-300m; any material debt-funded payment changes claims.

- June30 gross debt excludes EUR400m lease liabilities and EUR600m remaining perpetual hybrid principal. Claims add both plus EUR166m pension liability once; no cash addition or hybrid coupon capitalization.

- September reporting is pending. First quarter funding follows implied issuer FY26 FCF, with an explicit reconciliation to forecast OP/working capital; it is not a known cash balance. No CRA deposits are counted as unrestricted cash.

- Maturing debt is refinanced at par with EUR320m annual interest proxy; no optional debt-retirement benefit. Rising rates and refinancing remain risks.

- Q3 basic/diluted averages1304m/1316m differ from legal1305.921137m issued shares. Three million August repurchases service employee plans, not cancellation; model starts1316m plus0.5m net dilution per quarter.

- The 2027/28 capacity path assumes high utilization and qualification; cleanroom opening or five potential Bangkok modules does not establish yield-adjusted good-unit capacity.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
