## Q4 2027 model ceiling: USD 276.60

Analytical Base 40/60 = 67 | Contracted infrastructure with a bounded merchant scarcity option

20x rolling Q+next3 modeled US GAAP operating profit, less49.4% of CQP operating profit; subtract matched owner-attributed opening financial claims, then divide by window-end diluted common shares. Unknown future derivative marks have zero expected value; disclosed NPNS amortization retained.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 275.26 per share (2026-10-06 close); 206.534 million common shares (2026-07-31); estimated equity capitalization USD 56,850.6 million. Cross-date estimate: public daily close times the June10-Q cover July31 common outstanding count. Model diluted shares are separately higher. No ADR or split conversion. This dated common-share snapshot is separate from forecast diluted shares.

## Decision in the model

| Active horizon | Earnings window | F4Q OP | Multiple | Diluted shares | Ceiling |
|---|---|---|---|---|---|
| Q4 2027 | Q4 2027 through Q3 2028 | 3,772.7 | 20x | 208.800 | 276.60 |

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

# Economic scope and matching claims

100% of wholly owned Corpus Christi and marketing operating profit plus 50.6% of CQP operating profit. All production depreciation, operating lease cost and SBC remain expensed; unknown future derivative marks are zero expected value. The matched USD17.7bn financial-claim floor includes a conservative funding reserve and does not credit future buybacks or accumulated cash.. 20x rolling Q+next3 modeled US GAAP operating profit, less49.4% of CQP operating profit; subtract matched owner-attributed opening financial claims, then divide by window-end diluted common shares. Unknown future derivative marks have zero expected value; disclosed NPNS amortization retained.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD m unless a different unit is stated.

# Thesis and economic identity

Cheniere owns a difficult physical service: turning pipeline gas into exportable, cryogenic liquid reliably, then placing and delivering it under a large contract portfolio. Its most attractive characteristic is the combination of a protected fixed-fee business and limited uncommitted cargo that can capture a shortage premium. The distinction matters. A doubling of Asian gas prices does not double Cheniere earnings, and an announced future train does not create current saleable output.

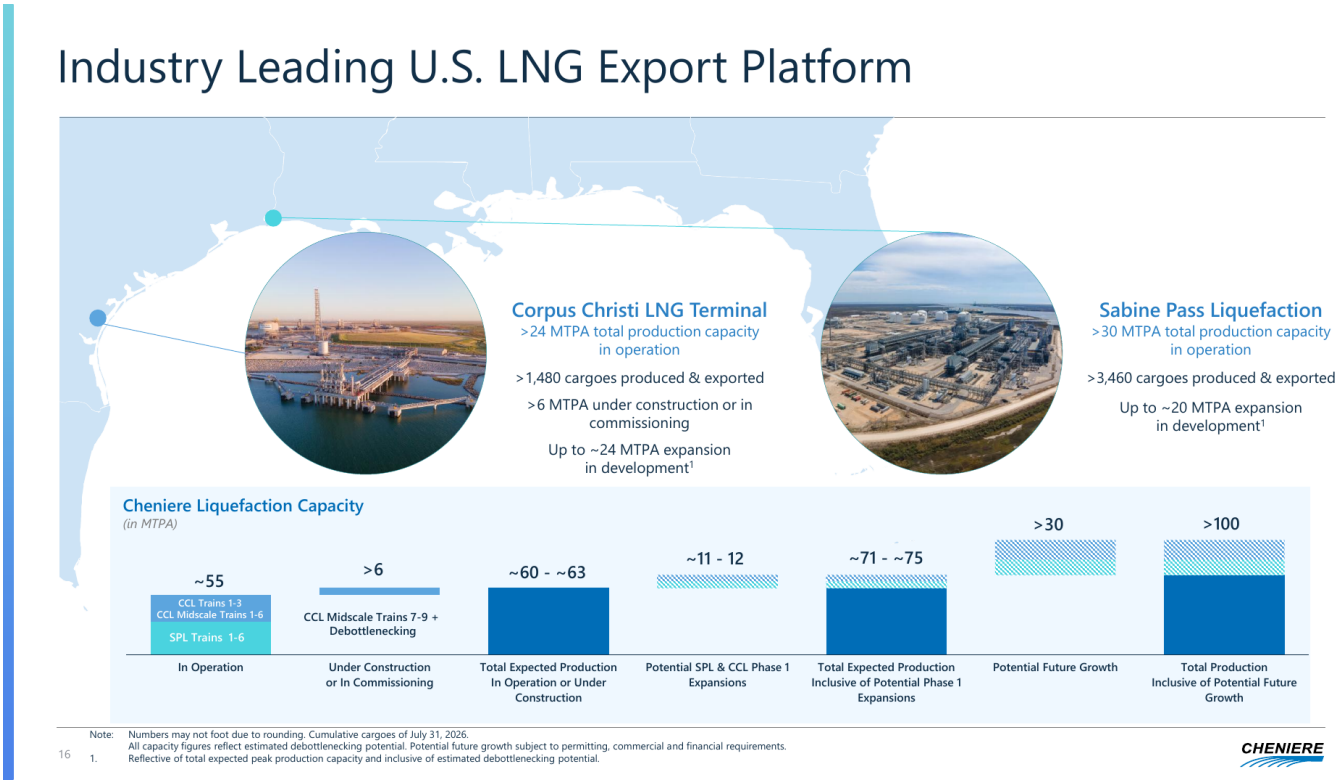

The active Q4 2027 ceiling is approximately **$276.60 per common share**, using **20x forward-four-quarter US GAAP operating profit after CQP minority attribution**, a $17.7 billion financial-claim floor and 208.8 million window-end diluted shares. That quarter values Q4 2027 through Q3 2028. The analytical Base is **67/100**, or 40/60 before normalization. This is a mature infrastructure business with a scarcity option; the model does not require permanent crisis pricing, a lower share count from unexecuted buybacks, or speculative trains to justify the operating forecast.

# Physical capacity and qualification

Liquefaction requires refrigeration to approximately -162°C, feedgas preparation, compressors, heat exchangers, reliable electricity and marine logistics. Compression alone is not liquefaction. High nitrogen content, refrigerant composition, ambient temperature, defrost cycles and maintenance can all reduce usable output even when installed nameplate capacity is unchanged. A new permit can create headroom for engineering work; it cannot itself create accepted tonnes.

The final Corpus Christi Stage 3 train reached substantial completion on August 28, 2026, bringing operating capacity to approximately 56 Mtpa. Trains 8 and 9 are a separate sanctioned project. Their reported construction schedule targets the second half of 2028. Brownfield infrastructure lowers execution costs, but equipment acceptance, gas quality and safe operating envelopes still determine the actual ramp. Stage 3 completion.

The model’s reference production is 56, 57.5, 61 and 62 Mt in calendar 2027-30. It already includes full Stage 3 utilization and a staged Trains 8/9 ramp. Additional debottlenecking is limited to a conditional 0.5/1/1/1 Mt, weighted at 55%; it does not import the entire permitted increase. The additional tonnes receive normal merchant economics and explicit operating and depreciation costs. They receive no second scarcity premium.

q2_slides | Operating, construction and potential capacity are different stages. August28 final Stage3 acceptance supersedes this July-end operating snapshot.

## What the latest two management discussions changed

May management described gas-quality and refrigeration work, early Stage 3 deliveries, limited remaining 2026 open exposure and already-sold 2027 cargo. The most useful caution was that extra midscale power consumption can shift cost into feedgas and electricity rather than disappear. The latest delivered equipment therefore does not justify assuming uniform margin expansion. May discussion.

August management reported repeatable reliability improvements and additional 2027 forward selling. It also described strong competition for long-term offtake, major maintenance remaining a normal feature of an expanding fleet, and detailed 2027 open-capacity disclosure still to come. The reference includes 1.5 Mt of forward-sold 2027 cargo at a modeled blended $7.25/MMBtu contribution, distinct from the $2.75 normalized merchant contribution. The $7.25 figure is a calibration from disclosed transaction ranges, not issuer guidance for the entire merchant book. August discussion.

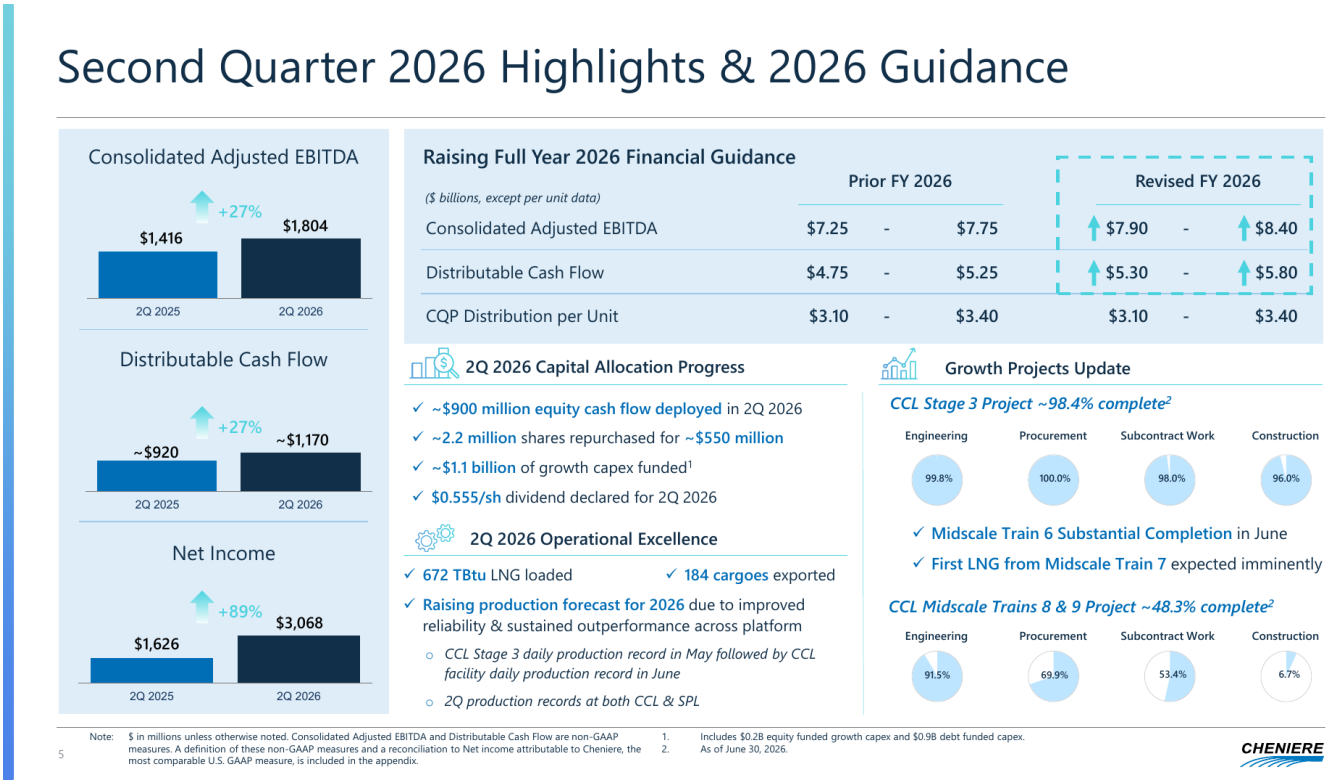

## Contracts, pass-through and the addressable earnings pool

Cheniere's annual report describes long-term sales with fixed fees and a variable charge commonly linked to 115% of Henry Hub. Feedgas and fuel costs absorb most of that variable revenue. IPM gas purchases can themselves follow international indices; counting higher LNG receipts while holding indexed procurement cost fixed would manufacture profit. 2025 annual report, revenue and gas-supply notes.

The reference separates six external revenue vectors: contracted Sabine sales, contracted Corpus Christi sales, each plant's merchant/forward sales, third-party optimization, and other services. Internal cargo transfers are eliminated. One Mt is modeled as 52 TBtu; one TBtu multiplied by $1/MMBtu equals $1 million. Reference fixed-fee proxies are $2.90 and $3.00/MMBtu in 2027, rising 1.5% annually. Henry Hub is $3.16 for 2027, following the October 6 EIA forecast, and a disclosed $3.50 long-range assumption thereafter. Feedgas/fuel cost is 108% of

Henry Hub, leaving a small lifting-margin component. These plant-level assumptions are calibrated allocations, not reported segments.

The company's 2026 guidance has already captured much of this year's shortage. The remaining exposed pool in August was below 50 TBtu. The model does not add another full-year scarcity increment to that guidance. Its blended 2026 forward/spot contribution assumptions produce an adjusted-EBITDA comparison of approximately $8.15 billion, inside the $7.9-8.4 billion range, while the valuation itself retains depreciation and stock compensation. The $370 million first-quarter excise credit is historical and never repeated. August results.

q2_slides | August results and 2026 guidance; non-GAAP metrics are comparison controls, not the valuation numerator.

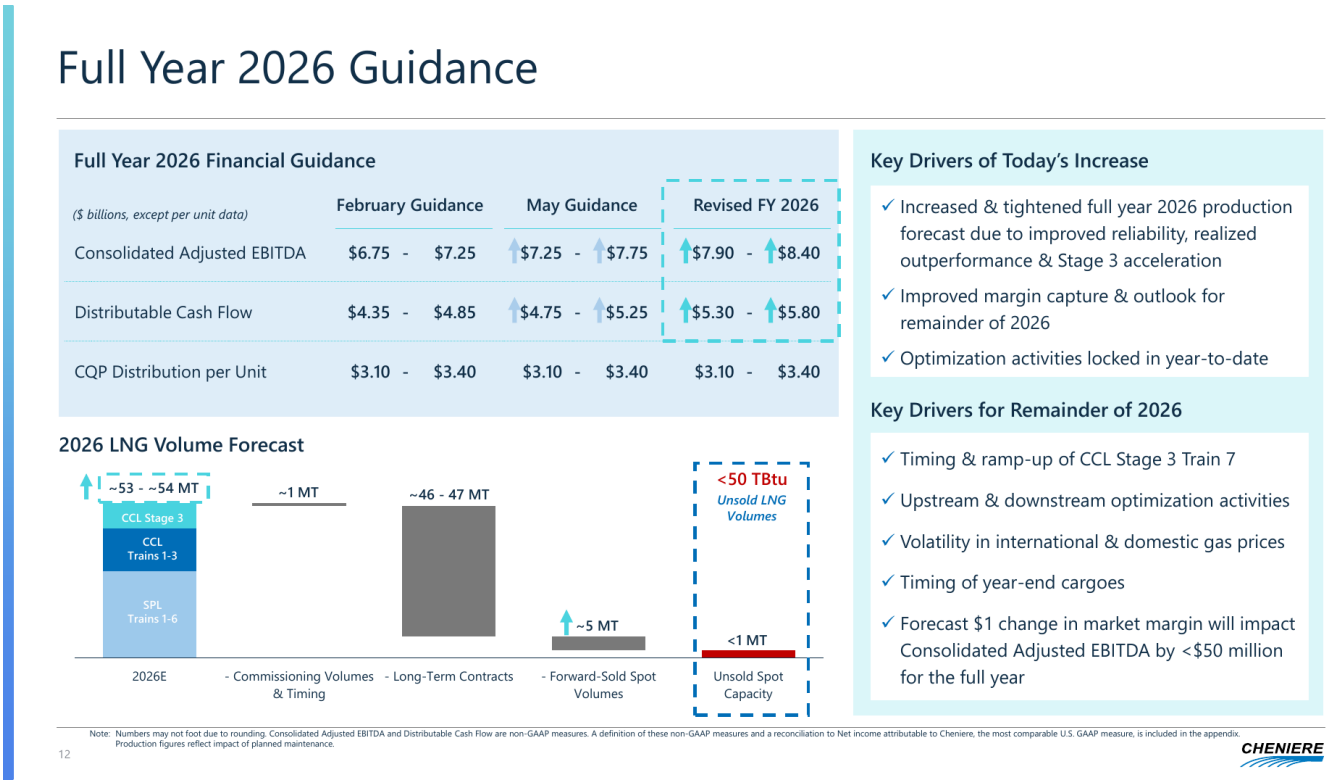

## Scarcity and pricing: the probability-weighted bridge

The active scarcity branch assigns **40% probability** to a residual 150 TBtu pool in 2027 earning an extra $2/MMBtu gross sales premium above its reference. Its conditional $300 million revenue increment retains 90% in gross profit and spends another 5% on commercial/collateral support. The result is $255 million conditional consolidated OP. Forty percent of that OP belongs to the CQP pool before its 49.4% minority allocation. The selected volume lies below modeled residual merchant capacity after removing 78 TBtu of already forward-sold cargo. A bounded alternative is 100-200 TBtu and a $1-3 premium.

The pool and premium fade to 130 TBtu/$1.50 in 2028, 75/$1 in 2029 and 40/$0.50 in 2030. The fade recognizes new supply and buyer substitution. It is not a forecast that global price volatility disappears. On the active Q4 2027 valuation window, this branch contributes $60.65 million of common-attributed OP; additional qualified production contributes $34.73 million, new-contract pricing $0.44 million, and the outage/repair reserve removes $38.29 million. The net $57.52 million OP increment increases the ceiling by approximately $5.51.

New-contract pricing is a different branch: **25% probability** of a $0.15/MMBtu premium on only 25/50/65 TBtu of newly recognized or repriceable deliveries in 2028-30, after incremental costs. Existing fixed backlog is excluded. The September Petrobras agreement supports customer duration, but its undisclosed fee and delivery start do not create a separate 2027 volume increment. Petrobras announcement.

A **25% probability** outage branch deducts one Mt of annual contribution and $35 million of repairs beyond planned maintenance. This is a contribution proxy after saved feedgas, not the entire canceled-cargo invoice; take-or-pay fees protect much of contracted revenue. Shortage rents and outage risk are therefore modeled together.

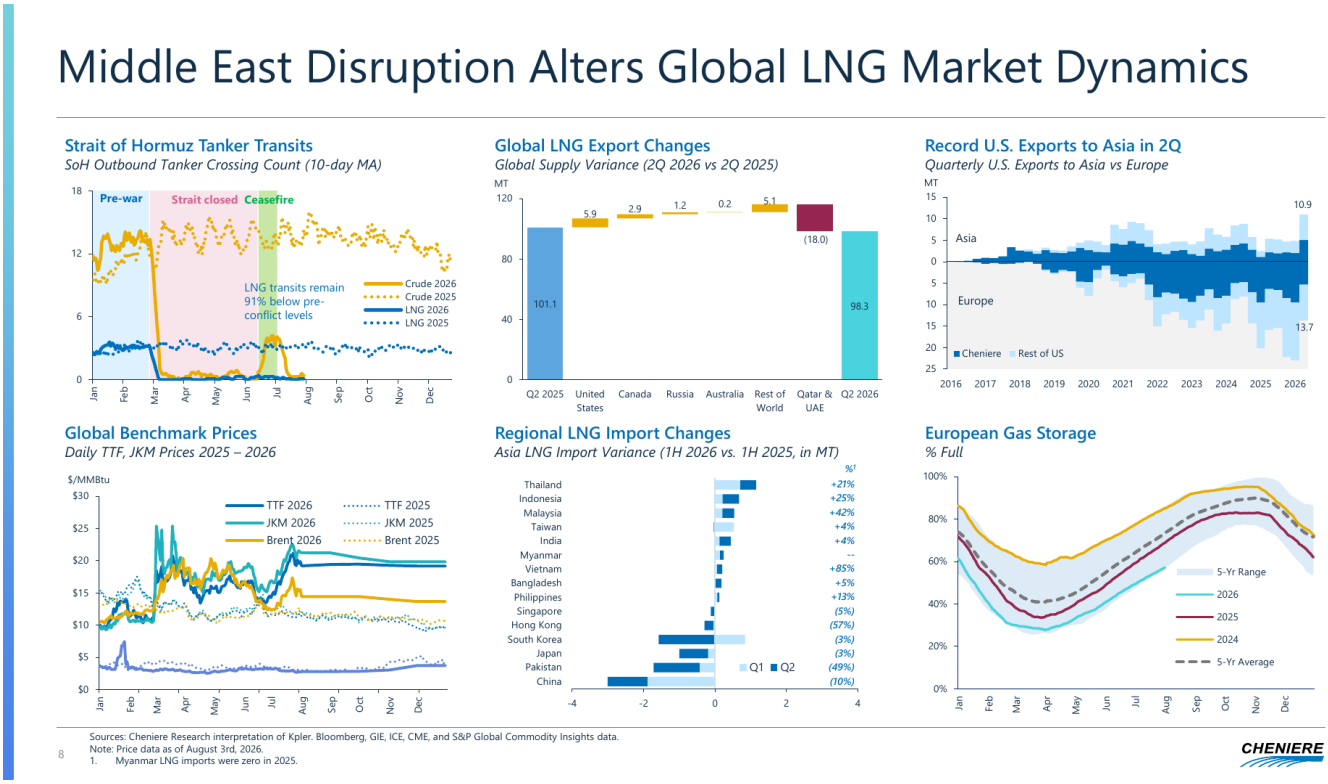

q2_slides | Most 2026 cargo is already contracted or forward sold; the unsold pool is below50TBtu.

## Competition, duration and substitution

Cheniere competes with existing Gulf export plants, future Venture Global and other US capacity, Qatar expansions and destination-flexible portfolios operated by global energy companies. Its advantages are accepted assets, integration and delivery reliability. Those advantages can support a premium on a scarce available cargo or a new agreement, but cannot force every buyer to accept permanently higher liquefaction fees.

The supply response is slow enough to support a near-term scarcity case but substantial enough to challenge its duration. EIA's October forecast increases US LNG exports from 17.6 Bcf/d in 2026 to 18.6 in 2027. Fuel switching, demand curtailment, renewable output, pipeline gas and storage also affect marginal willingness to pay. These substitutes are unequal across markets; a utility with no spare fuel option may pay much more than a flexible industrial buyer. The model isolates that marginal pool instead of turning a global deficit into Cheniere-wide pricing. EIA October outlook.

q2_slides | Issuer market snapshot dated August3; not relabeled as October conditions.

## GAAP earnings and CQP ownership

The latest completed quarter is Q2 2026. Reported revenue was $5,732 million and operating income $4,290 million; first-half figures were $11,600 million and $802 million. Large derivative marks explain why these reported profits cannot be extended mechanically. The model assumes no predictable future unrealized mark, but retains actual scheduled NPNS amortization, all plant depreciation, operating lease costs and stock compensation. Known NPNS gains are $100/$101/$85/$56 million for 2027-30. Their noncash character is recognized in the cash bridge. June 10-Q, statements and Note 1.

CQP owns Sabine; it is not a wholly owned asset of LNG shareholders. The model removes 49.4% of CQP OP only, retaining Corpus Christi and marketing at 100%. Sabine merchant margin is allocated 80% to CQP under the selected project/marketing tariff. CQP's GP and IDR cash rights produce a distribution allocation different from statutory income ownership. The model does not multiply all group profits by 50.6%, deduct full consolidated debt after minority attribution, or add a second IDR capitalization. CQP June filing.

The annual active common OP path is $3.90/$3.73/$3.95/$3.97 billion for 2027-30. The 2028 decline reflects the expiration of unusually profitable forward-sold 2027 cargo and a fading scarcity branch, partly offset by capacity. It is intentional. At the later 60-63 Mt operating scale, the model's comparison to issuer adjusted EBITDA is around the lower end of its $7.3-8.0 billion run-rate range after adding back only the appropriate D&A/SBC and removing NPNS gains. The model does not value EBITDA as operating profit.

## Run-Rate Guidance Update

*Assumes CMI Run-Rate of $2.50 - $3.00 / MMBtu*

| *($ billions, unless otherwise noted)* | 9 Trains + Stage 3 + CCL Midscale 8 & 9 + Debottlenecking *(Full Year)* | 9 Trains + Stage 3 + CCL Midscale 8 & 9 + Debottlenecking + CCL Expansion Phase 1 + SPL Expansion Phase 1 *(Full Year)* |
|---|---|---|
| **Liquefaction Production Capacity (MTPA)** | **60 – 63** | **71 – 75** |
| **CEI Consolidated Adjusted EBITDA** | **$7.3 - $8.0** | **$8.6 - $9.4** |
| Less: Distributions to CQP Non-Controlling Interest | $(1.0) - $(1.1) | $(1.1) - $(1.2) |
| Less: CQP / SPL Interest Expense / Maintenance Capex / Other | $(0.8) | $(0.9) |
| Less: CEI / CCH Interest Expense / Maintenance Capex / Income Taxes / Other | $(1.4) - $(1.5) | $(1.5) - $(1.6) |
| **CEI Distributable Cash Flow** | **$4.1 - $4.7** | **$4.9 - $5.6** |
| **CQP Distributable Cash Flow Per Unit** | **$4.00 - $4.25** | **$4.60 - $4.90** |

Note: Numbers may not foot due to rounding. Additional assumptions include 80/20 profit-sharing tariff with SPL/CCH projects, $3.00 / MMBtu Henry Hub, effective cash tax rate as percentage of DCF of ~10% - 15%, 5.00% interest rates for refinancings, completion of $500 million of future debt paydown at CQP with no debt paydown thereafter, and CMI open capacity sales at marketing margin of $2.50 - $3.00 / MMBtu, indicative of current contracting levels on a long-term basis before lifting margin. Consolidated Adjusted EBITDA, Distributable Cash Flow, Distributable Cash Flow per Share and Distributable Cash Flow per Unit are non-GAAP measures. A definition of these non-GAAP measures is included in the appendix. We have not made any forecast of net income on a run rate basis, which would be the most directly comparable measure under GAAP, in part because net income includes the impact of derivative transactions, which cannot be determined at this time, and we are unable to reconcile differences between these run rate forecasts and net income.

CHENIERE

q2_slides | Run-rate non-GAAP guidance with explicit margin and financing assumptions; used only to check the model scale.

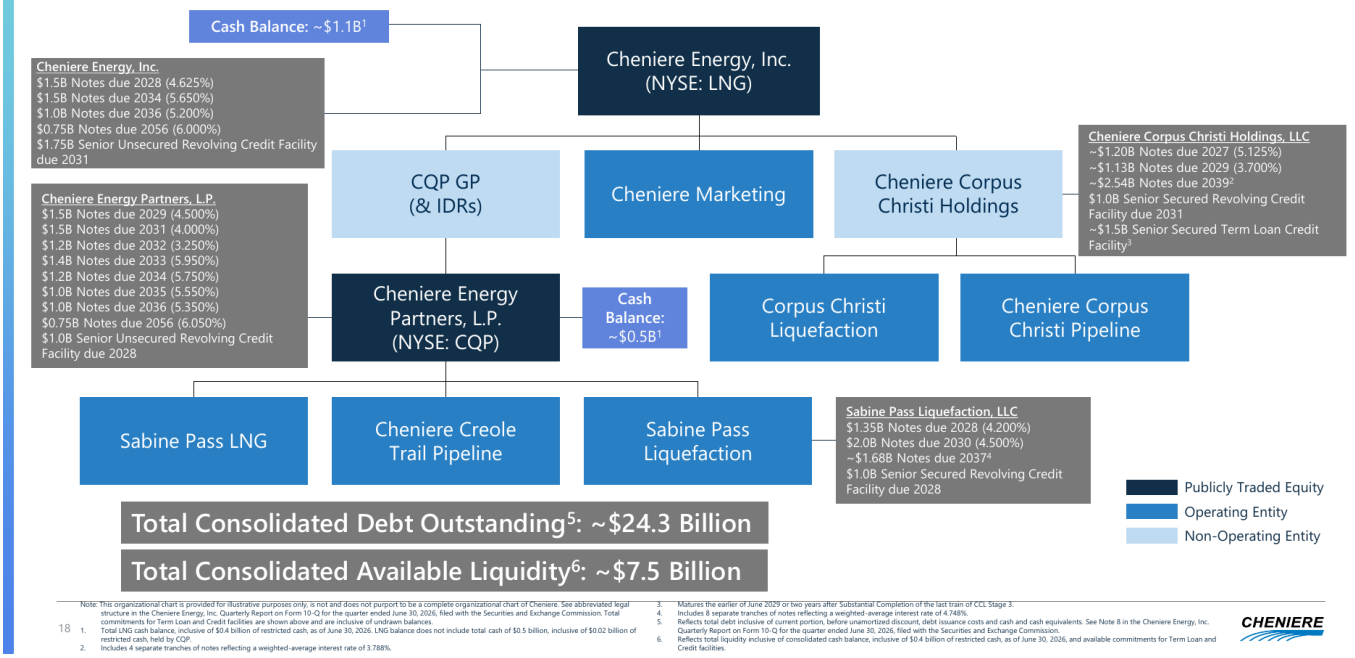

# Capital claims, shares and funding

Opening matched financial claims are $17,588.804 million: $9,680 million parent/wholly owned debt, 50.6% of $14,577 million CQP debt, $1,413 million finance leases, less $656 million parent unrestricted cash and 50.6% of $443 million CQP unrestricted cash. Restricted cash is excluded. Operating leases remain expensed and are not added again as debt. A **$17.7 billion valuation floor** covers the peak owner-attributed net claim at all selected valuation-window ends under reference and active financing cases. There is no projected excess-cash bonus.

The model starts with 208 million diluted shares, allowing modest net award issuance through 2030. The latest reported July 31 common count is 206.534158 million; the larger forecast denominator includes dilution and timing. A goal of 175 million shares and a buyback authorization are not completed repurchases. Future buybacks receive no denominator benefit and no cash expenditure in this model. Dividends remain a real cash use.

The funding schedule keeps CQP and parent/wholly owned cash separate. Reference and active cases refinance scheduled maturities around 5.2-5.3%, finance half of an illustrative $5.7 billion remaining SPL expansion budget with new project debt, and use a small part of existing parent facilities. This assumes continued investment-grade market access and a completed project financing; it does not call an unclosed financing committed. CQP distributions can be retained for construction before cash crosses a minimum buffer. The 60/40 parent/external distribution split is a cash-planning proxy for current GP/IDR economics, not a substitute for the statutory OP split.

The severe combined stress lowers CQP/parent OP by 25%/35%, increases capex 25%, adds $1 billion working capital and removes refinancing/new project financing. It produces substantial funding deficits. The available responses would include postponing the unapproved expansion, retaining distributions, reducing shareholder returns and obtaining finance; none is represented as guaranteed. Exact quarterly note amortization, future lease commencements and cash-transfer covenants remain important limits. The normal plan is fundable under explicit financing assumptions; the stress is not.

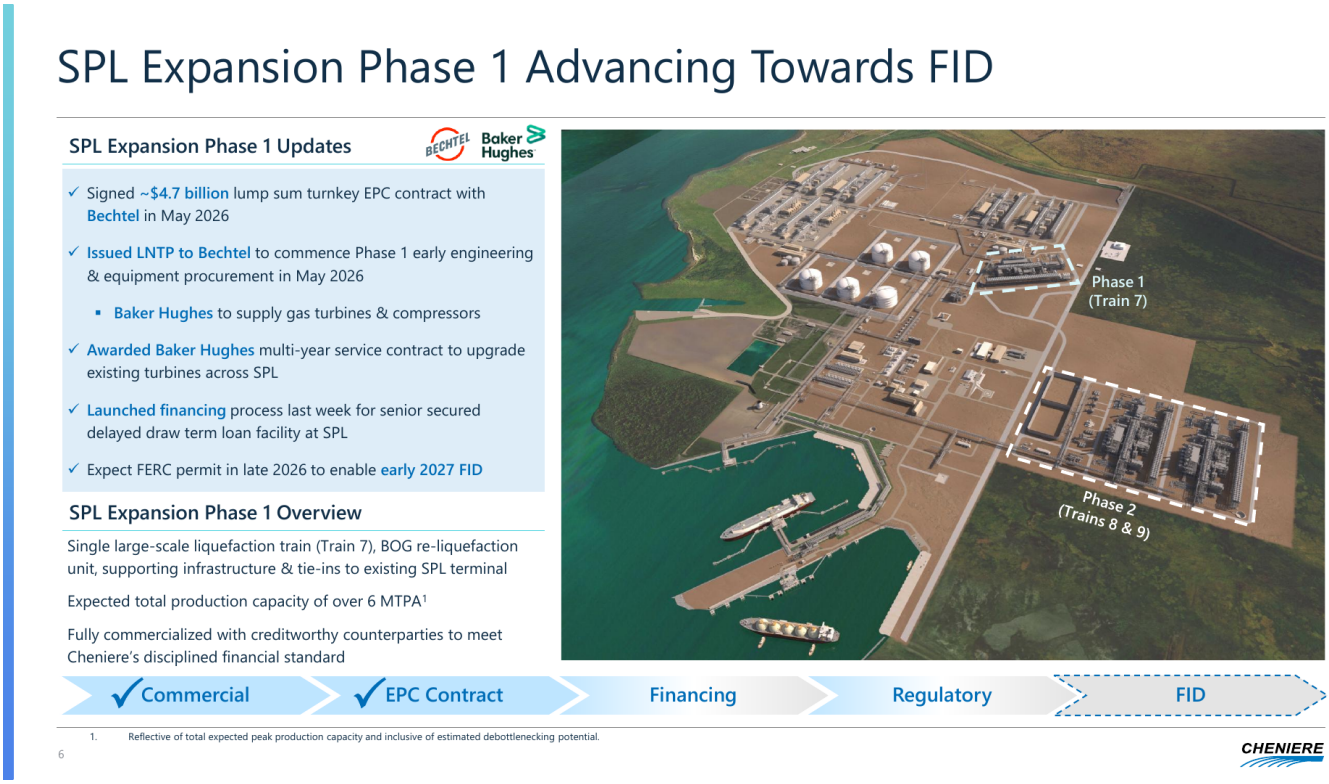

q2_slides | Separate legal entities, ownership and debt stacks: a consolidated total is not automatically a common-share claim.

## Future projects and valuation discipline

The signed $4.7 billion SPL EPC scope is meaningful forward evidence. The model assigns **65% probability** to early-2027 FID followed by a multiyear build. Its full capital requirement is tested in treasury, but no commercial Phase 1 profit is recognized through 2030 without a defensible accepted-delivery schedule. This is a timing-specific zero operating increment, not a dismissal of unofficial information. An earlier-start sensitivity must pair the extra tonnes with depreciation, owner costs and financing; the model does not import an eventual >100 Mt aspiration into near-term revenue.

Twenty times OP is the selected framework ceiling convention for this initiation, not an assertion that a capital-intensive terminal commands a particular traded multiple. Lower normal merchant margins, reduced production, more expensive financing and a heavier diluted share count should be considered together. The main underwriting question is whether reliable existing assets and funded expansion can keep common OP near the modeled path after scarcity fades.

q2_slides | SPL Phase1: signed EPC and early procurement, with financing and final approval still separate milestones.

## Score, catalysts and falsifiers

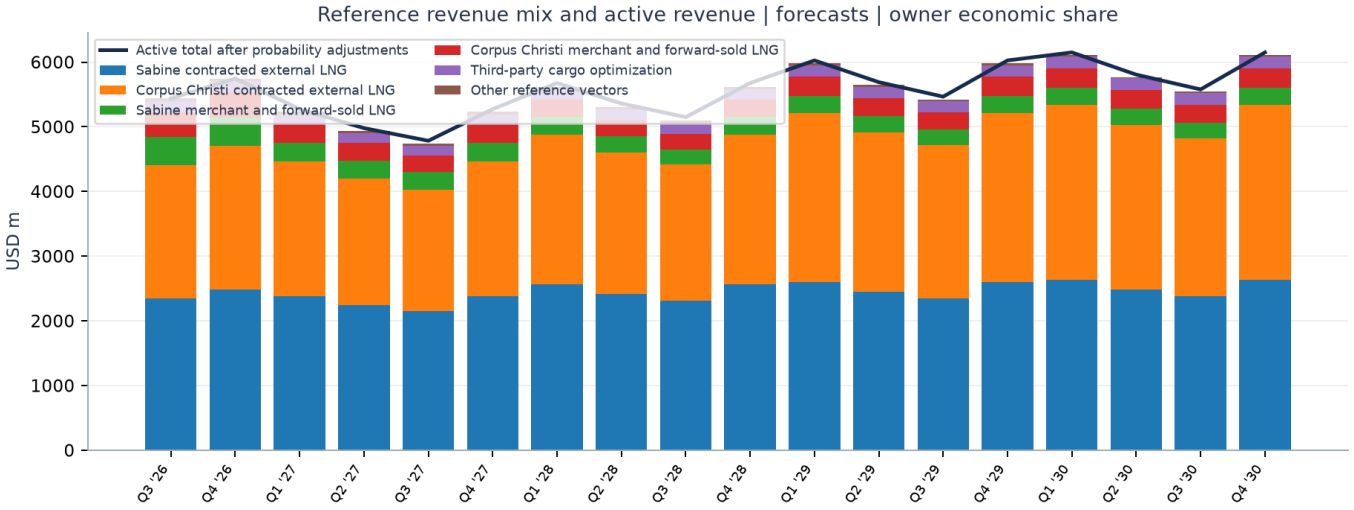

Core thesis16/20, cycle7/10, TAM6/10, catalysts4/5, macro7/10 and alpha4/5, less4 risk points, total40/60 and Base67. Engineering reliability and contractual protection support the score. Commodity competition, capital requirements, minority ownership and expansion uncertainty prevent treating the entire company as an unqualified shortage beneficiary.

The next decisive evidence is the actual 2027 production/open-capacity book, new forward-sale margins, repeatable availability and the Trains8/9 schedule. Reduce the scarcity probability if the remaining open pool is below100TBtu or new supply eliminates the premium. Reduce the debottleneck branch if nitrogen, refrigeration or maintenance limits consume the theoretical output gain. Revisit the financing floor if capex, covenants or refinancings require materially more owner-attributed debt. Raise the case only when accepted tonnes, new contract economics and funded dates improve independently of what is already embedded.

## Score arithmetic

| Category | Points | Evidence / treatment |
|---|---|---|
| Core thesis | 16 | Existing cryogenic assets, operating reliability and contracted counterparties are difficult to reproduce quickly. |
| Cycle | 7 | Stage3 accepted,8/9construction; near-term merchant rents face a future supply wave. |
| TAM | 6 | Physical production expands under existing project plans; globalpriceisnotwholecompanyprofit. |
| Catalysts | 4 | 2027 production and open-book disclosure, Trains8/9 construction milestones and possible SPL final investment decision. |
| Macro | 7 | Ex-Hormuz supply security supports margins, but competing capacity, weather and fuel substitution remain. |
| Alpha | 4 | Separate protected fees, forward sales, uncommitted cargo and IPM accounting from spot price. |
| Risk classes | -4 | Operating and construction risk, commodity and hedging exposure, capital and minority claims, plus regulation and geopolitics. |
| Total | 40/60 | Rounded Base 67. Both artifact and new workbook row use this score; this is not a manual override. |

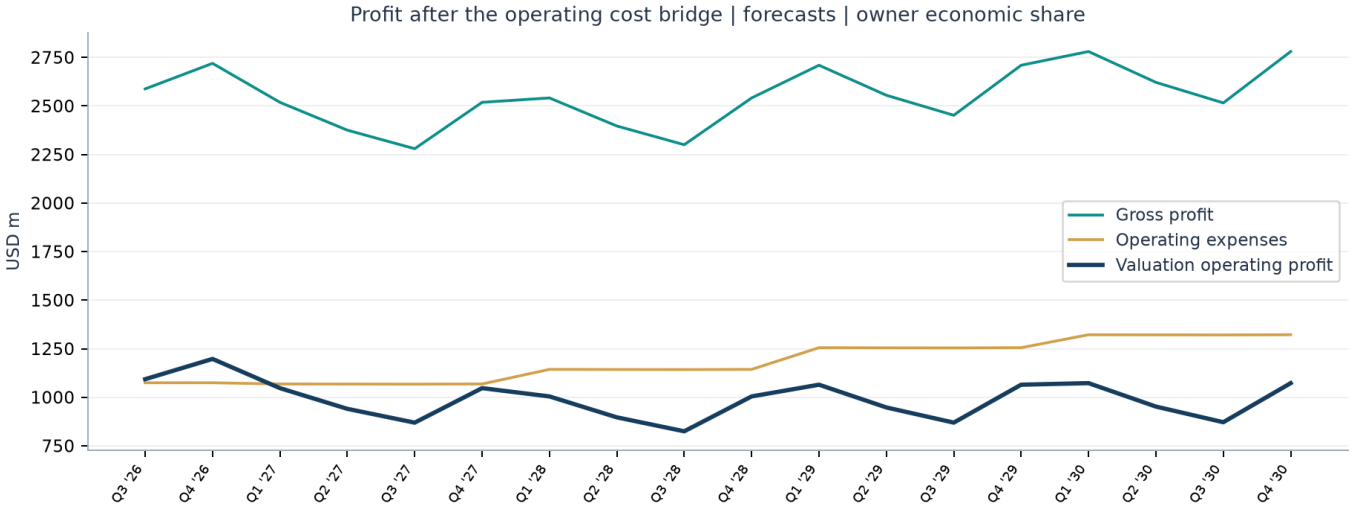

# Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

| Quarter | Reference revenue | Weighted net change | Active revenue |
|---|---|---|---|
| Q3 2026 | 5,438.5 | 0.0 | 5,438.5 |
| Q4 2026 | 5,746.9 | 0.0 | 5,746.9 |
| Q1 2027 | 5,230.2 | 43.2 | 5,273.4 |

# Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

| Quarter | Revenue vector | Revenue | Gross margin | Gross profit |
|---|---|---|---|---|
| Q3 2026 | Sabine contracted external LNG | 2,352.2 | 45.1% | 1,060.8 |
| Q3 2026 | Corpus Christi contracted external LNG | 2,059.5 | 45.9% | 945.0 |
| Q3 2026 | Sabine merchant and forward-sold LNG | 435.8 | 67.1% | 292.3 |
| Q3 2026 | Corpus Christi merchant and forward-sold LNG | 376.1 | 67.1% | 252.3 |
| Q3 2026 | Third-party cargo optimization | 175.0 | 10.0% | 17.5 |
| Q3 2026 | Other services and regasification | 40.0 | 50.0% | 20.0 |
| Q4 2026 | Sabine contracted external LNG | 2,481.1 | 45.1% | 1,118.9 |
| Q4 2026 | Corpus Christi contracted external LNG | 2,222.9 | 45.9% | 1,020.0 |
| Q4 2026 | Sabine merchant and forward-sold LNG | 439.6 | 65.6% | 288.3 |
| Q4 2026 | Corpus Christi merchant and forward-sold LNG | 388.3 | 65.6% | 254.6 |

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

# Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

# Claim decisions, overlap and triggers

## SCARCITY_NETBACK

p: 0.4

source: August management disclosure plus March disruption thesis, updated for August realized exposures

date: 2026-08-06

hypothesis: A residual open pool captures elevated margin after already forward-sold volumes.

reference: 2027 production56 Mt; 1.5 Mt already forward-sold at blended $7.25 modeled netback; remaining merchant baseline $2.75. 2026 guidance includes existing scarcity and is not uplifted again.

Conditional: 150/130/75/40 TBtu in 2027-30 at $2/$1.5/$1/$0.5 incremental sales price; bounded 2027 volume 100-200 TBtu and price $1-3.

derivation: 90% of additional sales retained in GP after freight/fuel/basis reserve;5% incremental marketing/collateral-support expense;40% of conditional OP allocated to CQP,49.4% of that removed as minority.

overlap: Exclude78 TBtu already forward-sold in2027, all fixed-price long-term cargo, all IPM index pass-through, and new-volume branch. 150 TBtu is a proxy below remaining modeled merchant capacity, not a disclosed open book.

counter: 2027 actual open capacity promised for next earnings call. Lower to20% if remaining open book<100 TBtu or global supply normalizes; raise toward60% if physically open cargo and locked higher netbacks are evidenced.

## QUALIFIED_DEBOTTLENECK

p: 0.55

source: August engineering/reliability discussion and accepted Stage3 final train

date: 2026-08-28

hypothesis: Further usable output above the already increased reference.

reference: Full Stage3 in2027 and Trains8/9 progressively in2028 already included;referenceproduction56/57.5/61/62 Mt in2027-30.

Conditional: Additional0.5/1/1/1 Mt annual accepted output, range0-1 Mt for2027; not the full permitted capacity increase.

derivation: 52 TBtu/Mt at$2.75 normal merchant contribution, plus matched feedgas revenue/cost. Incremental O&M$36/tonne and D&A$20/tonne;half output at each plant;CQP80%merchantmargin tariff.

overlap: No elevated scarcity premium on incremental output; maintenance improvements already supporting56 Mt are not counted twice.

counter: Reduce to25% if nitrogen, defrost or equipment limits prevent repeatability; increase to70% on sustained metered output without disproportionate maintenance.

## NEW_CONTRACT_PREMIUM

p: 0.25

source: August competitive-pricing and reliability discussion; September29 Petrobras SPA

date: 2026-09-29

hypothesis: Small reliability premium on genuinely new/repriceable delivered terms.

reference: Normal fee inflation1.5% and $2.90/$3.00 plant fixed-fee proxies already modeled. Announced Petrobras contract has undisclosed fee/start date.

Conditional: 25/50/65 TBtu in2028-30 at$0.15 additional fee;range$0-0.25;zero2027 because modeled eligible contract recognition begins2028.

derivation: 90% GP after cost escalation,5% incremental commercial expense;half attributed to each plant.

overlap: No repricing of fixed backlog or adding the Petrobras notional volume to capacity. No premium on new debottleneck units.

counter: 100 Mt competing unplaced supply and buyer affordability limit bargaining power. Reduce to10% if new tenders clear below base fee.

## OUTAGE_AND_REPAIR

p: 0.25

source: Annual physical-risk disclosures and August nitrogen/maintenance discussion

date: 2026-08-06

hypothesis: Unexpected downtime and repairs beyond planned maintenance.

reference: Normal seasonality, summer derating and scheduled maintenance already included.

Conditional: Annual1 Mt unavailable capacity with$3.2625/MMBtu foregone contribution and$35 m repair expense, range0.5-1.5 Mt.

derivation: Conservative contribution loss after saved variable gas cost;split equally acrossplants;half OP delta allocated CQP beforeminority. Take-or-pay fees protect much of contracted production, so exposed contribution proxy is not all canceled revenue.

overlap: Distinct unplanned event; no second premium reduction in scarcitybranch.

counter: Reduce to15% if repeated multiquarter availability beatsplan;raise if feedgas orhurricane outages recur.

## SPL_PHASE1_FID

p: 0.65

source: August EPC/financing statement

date: 2026-08-06

hypothesis: Early2027 FID followed by a multiyear construction program.

reference: No commercial Phase1 deliveries through 2030. Later operating options are outside the selected windows.

Conditional: 65% probability of early2027 FID. Eventual capacity exceeds6 Mtpa. The funding test reserves the full illustrative $5.7bn remaining capital requirement, rather than probability-averaging it away.

derivation: No operating increment before a supported commercial delivery schedule. Full construction cash is stress-tested; earlier commissioning must include matching depreciation and financing.

overlap: Stage3 and Trains8/9 are already separate reference projects. Zero current operating increment reflects delivery timing, not a requirement for official confirmation.

counter: Reopen on financial close, notice to proceed, metered construction progress and a commercial delivery timetable.

## Remaining bounded uncertainties

- The 2027 unsold cargo volume and hedge book are not disclosed; 150 TBtu is an explicit bounded proxy.

- CQP statutory income allocation and GP/IDR cash rights differ. The model uses a 49.4% minority OP reserve and matched financial claims, with no second IDR capitalization.

- Per-plant external sales, fixed fees and cost splits are assumptions because the issuer reports one segment.

- SPL Phase1 and potential CCL Phase1 owner cost, finance and commercial dates remain conditional. Future plant options are not automatically valued as current operating assets.

- Nonlinear NPNS delivery patterns are approximated with quarterly annual allocations. Remaining derivative marks cannot be predicted reliably.

- There is no credit for future buybacks. The issuer’s 175 million share objective is not the model denominator.

- Reference funding requires refinancing and new project debt. The combined no-financing stress is not fundable and is disclosed rather than erased.

## Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
