Modine Manufacturing Company

MOD | NYSE | 2026-10-07

Q4 2027 model ceiling: USD 338.34

Analytical Base 44/60 = 73 | Watchlist

20x forward-four-quarter fully expensed GAAP-basis operating profit, less matched end-window gross financial claims; divided by end-window diluted shares. No cash, distributed THRM shares or THRM dividend credit.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 189.44 per share (October 7, 2026 close); 53.113 million common shares (July 24, 2026; latest exact legal count); estimated equity capitalization USD 10,061.7 million. Dated StockAnalysis close and the latest 10-Q share count. Capitalization uses a dated common-share count; it is not an exact October share register. This dated common-share snapshot is separate from forecast diluted shares.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Claims	End shares	Ceiling
Q4 2027	Q4 2027 to Q3 2028	954.1	20x	404.95	55.200	338.34

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where financial claims or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Post-October 1 retained Data Centers and Commercial HVAC with all corporate costs. All NCI left with Performance Technologies; internal sales eliminated. 20x forward-four-quarter fully expensed GAAP-basis operating profit, less matched end-window gross financial claims; divided by end-window diluted shares. No cash, distributed THRM shares or THRM dividend credit.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD million unless a different unit is stated.

The investment case: qualified cooling capacity must become profitable shipments

Modine's remaining business combines Data Centers with Commercial HVAC. The attraction is a credible route from customer commitments and qualified cooling equipment to substantially greater operating profit. The constraint is equally concrete: a sold-out production plan creates little value until components arrive, completed systems pass testing, customers accept delivery and cash collection funds the next build.

The active Q4 2027 ceiling is **$338.34 per share**, using **20x $954.07 million of fully expensed, forward-four-quarter operating profit** for October 2027-September 2028, less **$404.95 million of matched financial claims**, divided by **55.2 million modeled shares at September 2028**. This is a conditional model ceiling, not company guidance. Cash receives no valuation credit. Depreciation and ordinary stock compensation remain expenses. The framework score is **44/60, or 73/100: Watchlist**.

The strongest evidence is an existing cooling business, meaningful qualification and service infrastructure, a customer-funded capacity agreement and a disclosed manufacturing ramp. The principal question is how much margin survives the costs of delivering that ramp. Modine is neither the only cooling supplier nor the owner of every dollar spent removing heat from an AI facility.

What an October 2026 MOD shareholder owns

Performance Technologies separated and combined with Gentherm on October 1. Eligible September 28 Modine shareholders received 0.44619 Gentherm shares per MOD share, representing 43.62% of the combined Gentherm ownership. Those shares were distributed to shareholders; they are not an asset retained inside Modine. A new MOD purchase after the separation buys the retained cooling business, with no additional THRM entitlement. The separation itself did not reduce the MOD common-share count. Modine closing announcement

Gentherm's $2.07 special dividend belonged to its September 28 record holders. It is not automatically payable to recipients of subsequently distributed shares or to a current MOD buyer. The model assigns neither this dividend nor THRM shares any value. January transaction estimates have been superseded by closing disclosures.

The October 7 pro forma reconciles $156 million of distribution proceeds plus a $42.6 million closing adjustment into $198.6 million of revolver repayment, subject to final adjustments. Its June balance sheet is an illustrative continuing-company opening position, not an actual October cash statement: cash is $54.1 million, debt carrying value is $319.4 million and noncontrolling interests are zero. Face debt is approximately $321 million after restoring deferred financing costs. October 7 pro forma

Figure E14. October 7, 2026 Exhibit 99.1: unaudited June 30 balance sheet after the Performance Technologies separation, in USD millions. Pro forma cash is $54.1 million; current and long-term debt are shown after transaction adjustments. This historical pro forma is not an actual October closing balance, and it contains no assumed $175 million future draw. | October 7 unaudited post-separation pro forma financial statements | 2026-10-07 | https://www.sec.gov/Archives/edgar/data/67347/000110465926114220/mod-ex99d1.htm

Establishing the correct earnings starting point

The same filing reports retained June-quarter revenue of **$596.3 million**, gross profit of **$131.6 million**, SG&A of $78.2 million and operating profit of **$51.2 million**, after $2.2 million of restructuring. For fiscal 2026, continuing revenue was **$2,055.4 million** and operating profit **$230.7 million**. These figures anchor the model, rather than subtracting an independently allocated PT profit from the old group's earnings. Continuing-company operations

	Historical Modine	Performance Technologies Discontinued Operations (a)	Transaction Accounting Adjustments	Pro Forma Modine
Net sales	$ 874.1	$ (277.8)	$ —	$ 596.3
Cost of sales	692.1	(227.4)	—	464.7
Gross profit	182.0	(50.4)	—	131.6
Selling, general and administrative expenses	103.3	(25.1)	—	78.2
Restructuring expenses	3.9	(1.7)	—	2.2
Operating income	74.8	(23.6)	—	51.2
Interest expense	(6.4)	—	2.5 (c)	(3.9)

Diluted	54.0			54.0

Figure E15. October 7, 2026 Exhibit 99.1: retained-company pro forma results for the three months ended June 30, 2026, in USD millions except per-share amounts. Revenue is $596.3 million, gross profit $131.6 million and operating income $51.2 million. Remaining noncontrolling interest is zero. The 54.0 million diluted weighted-average shares are a historical denominator, not the forecast end-window share count. | October 7 unaudited post-separation pro forma financial statements | 2026-10-07 | https://www.sec.gov/Archives/edgar/data/67347/000110465926114220/mod-ex99d1.htm

June Data Centers segment sales were $348.6 million, including $0.2 million of internal sales; Commercial HVAC reported $261.6 million, including $13.7 million internally. External revenue therefore reconciles to $596.3 million. Segment operating profits of $46.3 million and $31.4 million do not represent total-company earnings: corporate costs and eliminations reduce the combined result by $26.5 million. June 10-Q

Figure E16. October 7, 2026 Exhibit 99.1: retained-company pro forma results for the year ended March 31, 2026, in USD millions except per-share amounts. Revenue is $2,055.4 million and operating income $230.7 million. The $116.1 million pension-termination charge is shown below operating income; pro forma net income must not be substituted for the model's operating-profit valuation basis. | October 7 unaudited post-separation pro forma financial statements | 2026-10-07 | https://www.sec.gov/Archives/edgar/data/67347/000110465926114220/mod-ex99d1.htm

Products, customers and the paid thermal system

Airedale sells chillers, air handlers, fan walls, computer-room air handlers, coolant distribution units, controls, commissioning and service. The May presentation's preliminary fiscal 2026 external-sales mix was 45% chillers, 25% air handlers, 17% fan wall/CRAH, 6% aftersales, 3% modular and 4% other. This is predominantly an equipment business. Controls and service strengthen the relationship, but there is no disclosed software ARR or standalone service margin supporting a software valuation. May investor presentation

Figure E1. May 2026 investor presentation: preliminary FY26 Data Centers external-sales mix was chillers 45%, AHUs 25%, fan wall/CRAH 17%, aftersales 6%, modular 3% and other 4%. Product pictures are the available portfolio, not an assumption that every project buys every product. The slide itself labels the recast estimates preliminary. | Modine May 2026 investor presentation | 2026-05 | https://s205.q4cdn.com/270741342/files/doc_presentations/2026/Jun/01/Investor-Presentation-May-FY27-vFinal-rev1.pdf

Commercial HVAC adds heating, coils and components supplied to external equipment manufacturers. It provides a second revenue base, but an internal coil sold into an Airedale system is not another consolidated customer invoice. The forecast therefore removes internal sales and retains the segment's operating expenses before assessing total-company profit.

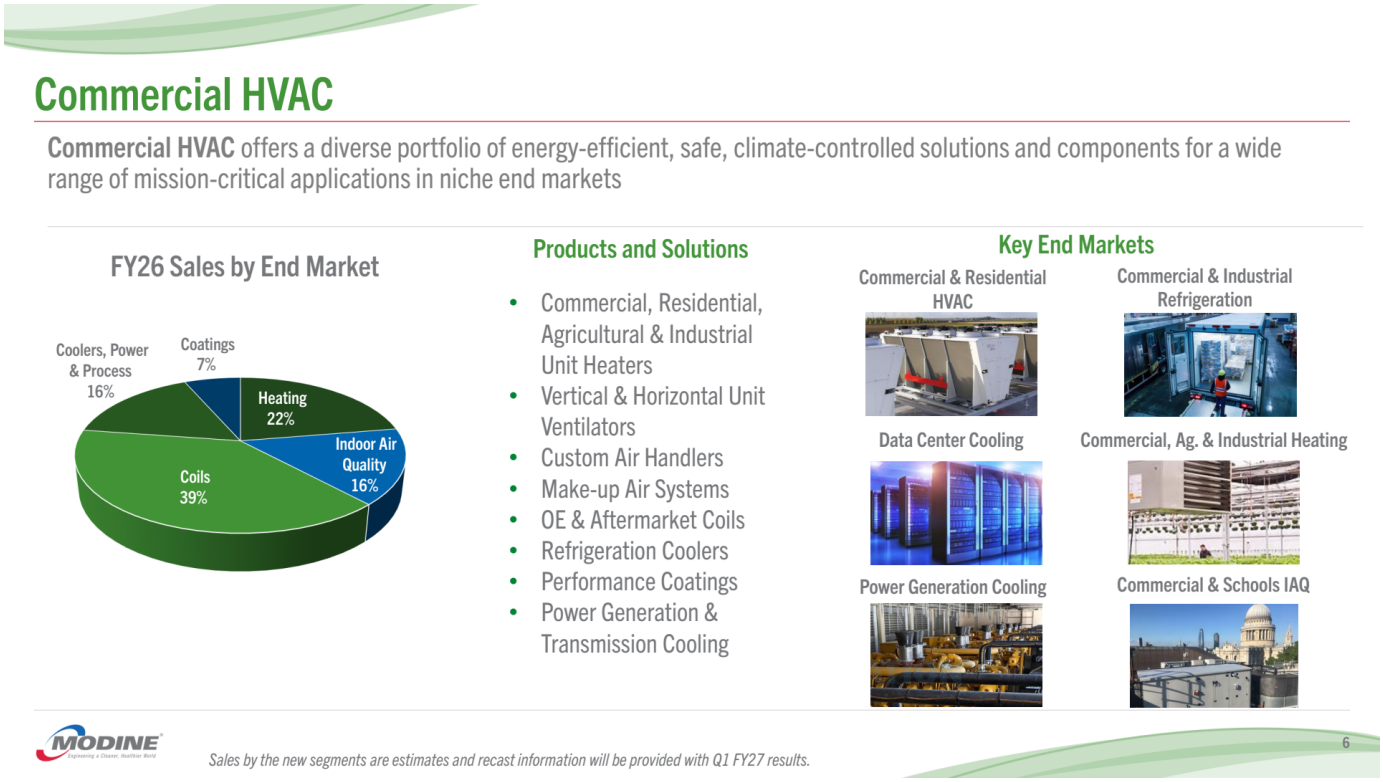

Figure E2. Commercial HVAC includes coils sold to external equipment customers as well as heating and other products. Data-center exposure here is a component invoice, distinct from a complete Airedale cooling system. Do not double-count intersegment coil transfers as consolidated external sales. | Modine May 2026 investor presentation | 2026-05 | https://s205.q4cdn.com/270741342/files/doc_presentations/2026/Jun/01/Investor-Presentation-May-FY27-vFinal-rev1.pdf

First principles: the heat remains, the product mix can change

A cold plate moves heat from the chip into coolant. A CDU can isolate loops and regulate flow, pressure, cleanliness and temperature. Facility chillers or dry coolers then reject that heat outdoors. Adding the thermal ratings of consecutive stages would count the same heat repeatedly. The investable market is the equipment and service purchased at each stage, after architecture choices and competitive allocation.

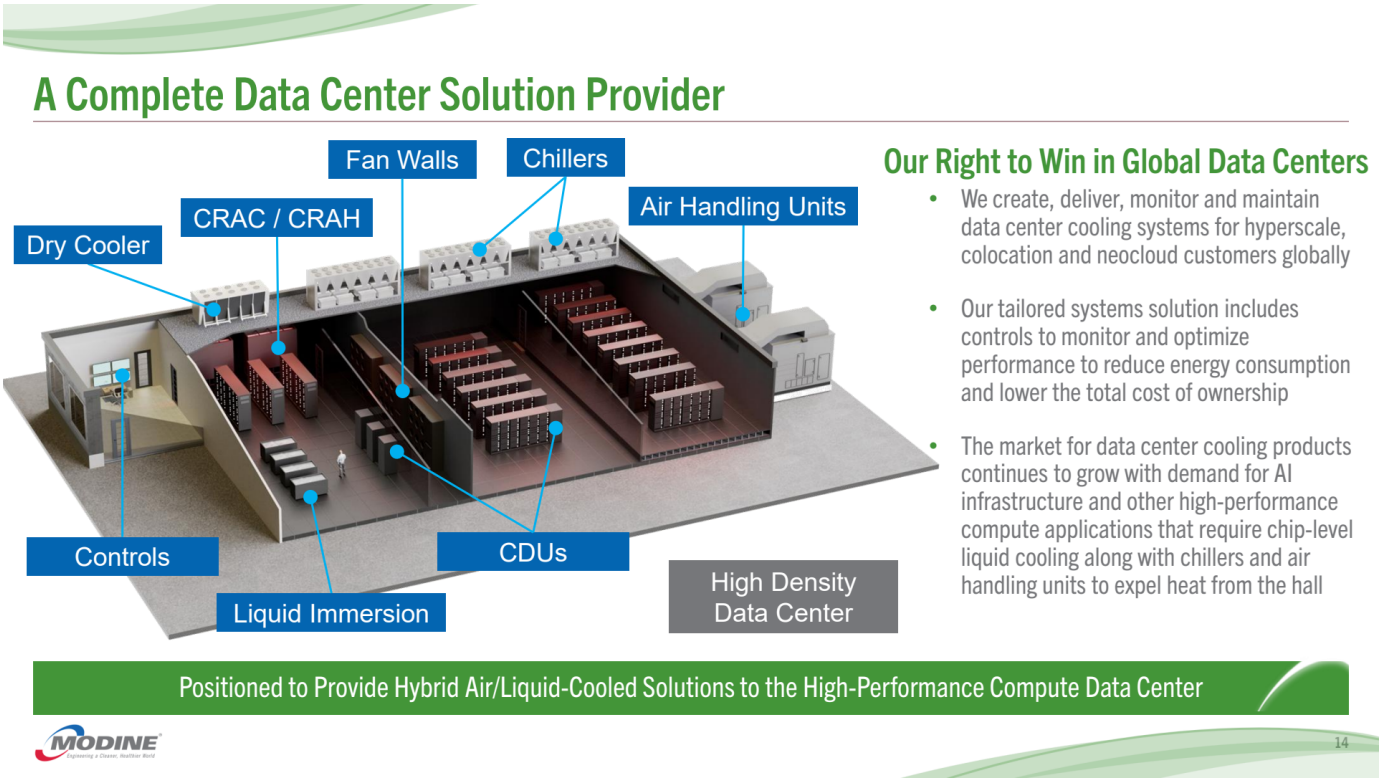

Figure E3. Airedale products span indoor heat collection, fluid transfer, outdoor heat rejection and controls. This is a portfolio diagram, not one mandatory architecture. Direct-to-chip cooling can reduce indoor air-handling intensity while preserving facility heat rejection; stainless primary-loop designs can eliminate a separate CDU. | Modine May 2026 investor presentation | 2026-05 | https://s205.q4cdn.com/270741342/files/doc_presentations/2026/Jun/01/Investor-Presentation-May-FY27-vFinal-rev1.pdf

Warmer coolant can increase free-cooling hours, but climate, approach temperature, recirculation, mixed rack requirements and uptime still determine the need for mechanical cooling. Conversely, a stainless primary-loop design can remove a separate CDU. Airedale can participate in several architectures, yet successful system engineering may reduce component count. Persistent heat demand does not guarantee constant Modine revenue per megawatt. Stainless chiller architecture

Product ratings require the same discipline. The stainless page's 55°C figure refers to ambient capability, not a universal 55°C water-supply rating. A CDU's quoted thermal capacity depends on coolant, flow and approach conditions; its heat-exchanger approach is not facility energy efficiency. The 3MW chiller adds 50% rated thermal capacity with approximately 9% more footprint, not necessarily 50% more selling price or profit. May management call, CDU specifications, 3MW launch

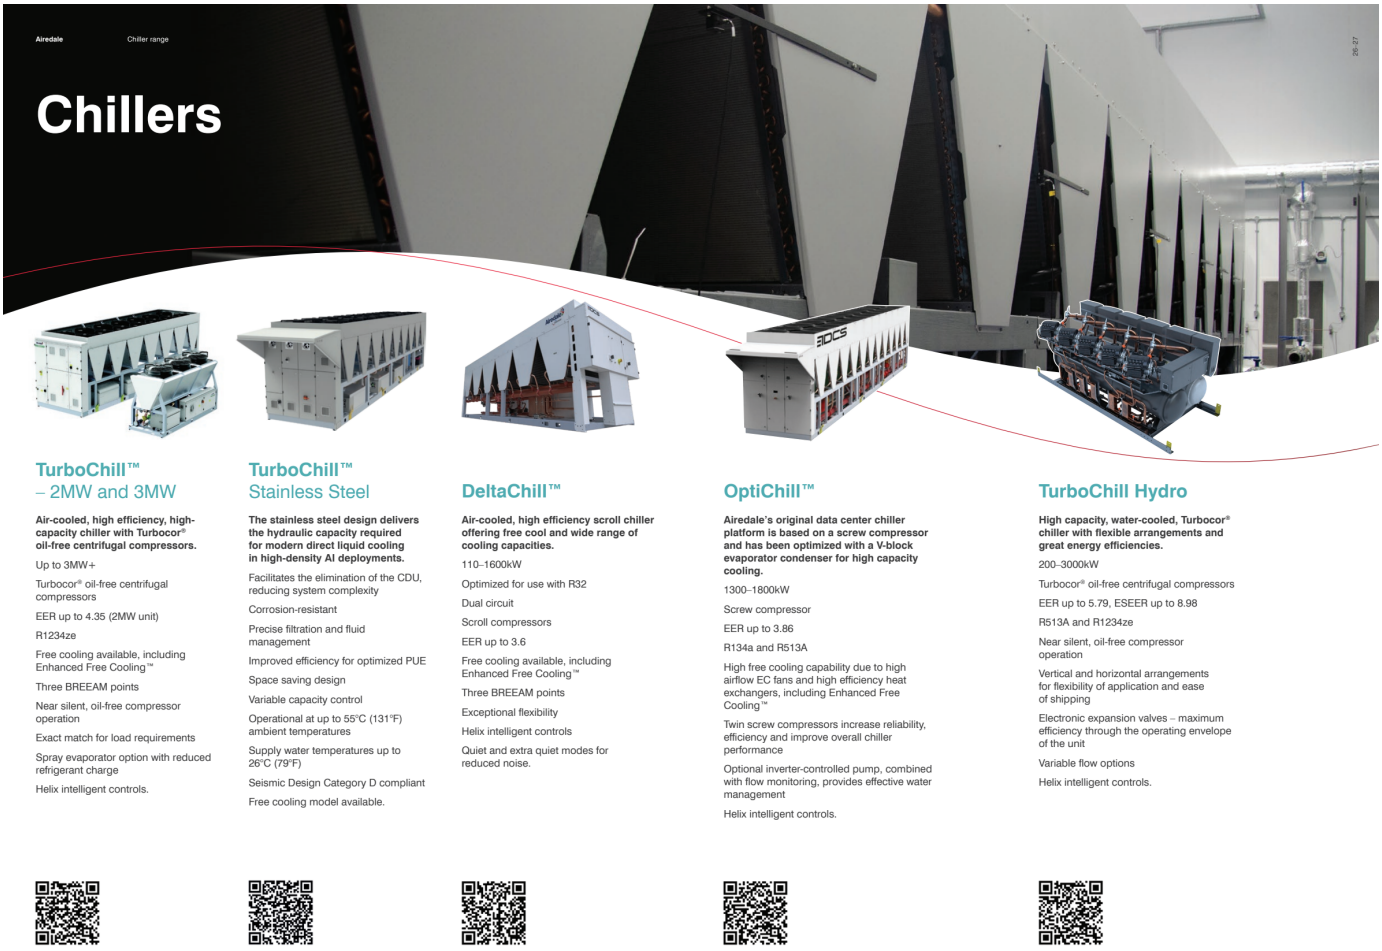

Figure E9. Airedale February 2026 brochure, printed pages 26-27: 2MW/3MW, stainless, scroll, screw and water-cooled products. Capacity and efficiency depend on rating conditions. Stainless construction supports a primary-only loop and potential CDU removal; 55°C ambient capability is not a 55°C water-supply rating. | Airedale product and capabilities brochure, February 2026 update | 2026-02 | https://www.airedale.com/wp-content/uploads/2025/07/Airedale_A4-32pp_Overview-Product-Brochure-Feb-26-Update_WEB.pdf

Figure E10. Airedale February 2026 brochure, printed pages 28-29: in-row and skid CDUs, immersion and other cooling products. CDU capacity is thermal transfer capacity, not additional IT demand. The 1-4K approach is a liquid-to-liquid heat-exchanger design parameter, not overall facility energy efficiency. | Airedale product and capabilities brochure, February 2026 update | 2026-02 | https://www.airedale.com/wp-content/uploads/2025/07/Airedale_A4-32pp_Overview-Product-Brochure-Feb-26-Update_WEB.pdf

Qualification, competition and usable capacity

Factory testing, commissioning, controls and service matter because a late or unstable cooling system can delay a much larger compute investment. This supports willingness to pay for reliable delivery and qualified integration. It does not establish exclusive supply. Large customers can qualify alternatives, divide orders, standardize components or internalize more system design. Modine's annual report describes competition from specialist manufacturers and larger groups, alongside customer demands for multiple suppliers. Fiscal 2026 annual report

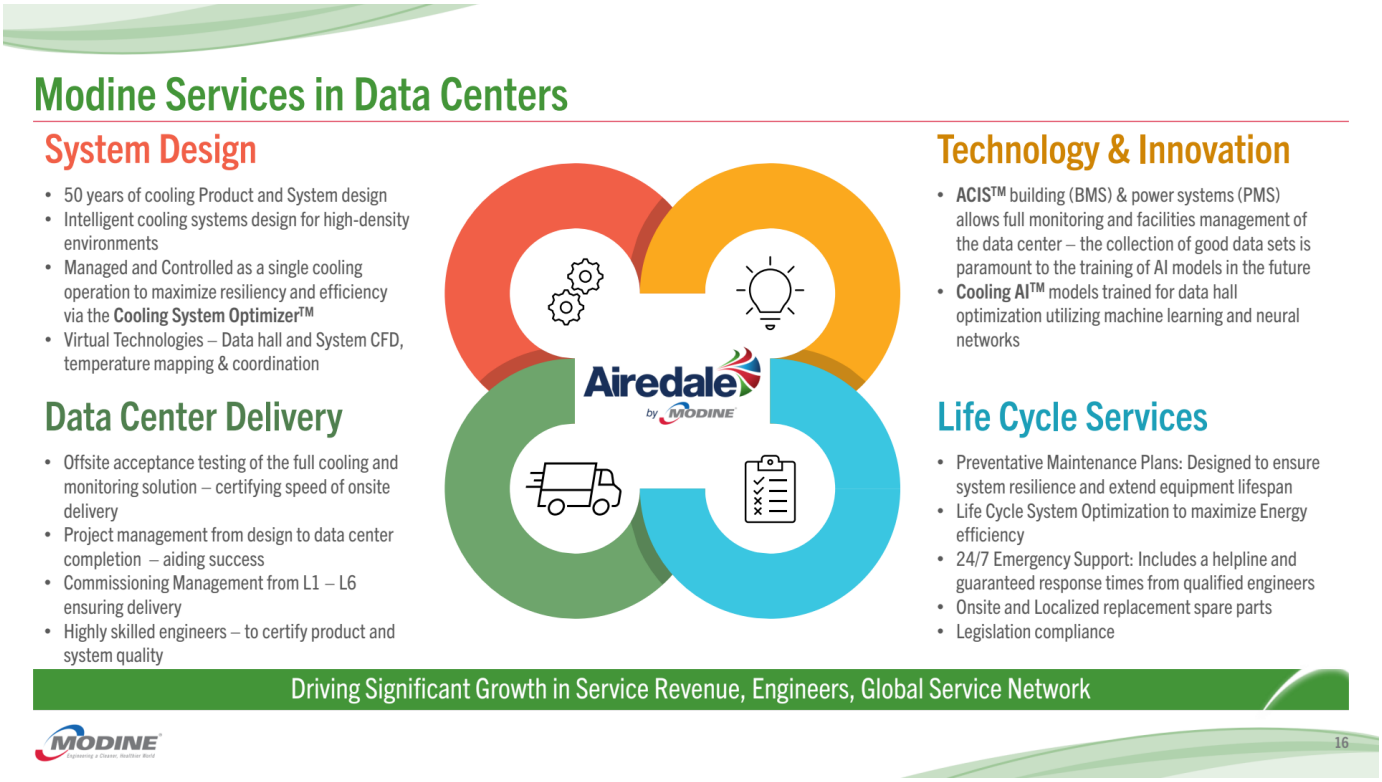

Figure E4. Factory acceptance testing, commissioning, controls and lifecycle support strengthen the relationship beyond hardware. These capabilities support retention but the company does not disclose software ARR or standalone service margins on this slide. | Modine May 2026 investor presentation | 2026-05 | https://s205.q4cdn.com/270741342/files/doc_presentations/2026/Jun/01/Investor-Presentation-May-FY27-vFinal-rev1.pdf

The manufacturing bottleneck is good, tested output. Floor space without compressors, controls, trained labor and validated assemblies is not saleable capacity. June results demonstrated this directly: orders coexisted with shortages and production resequencing. A listed 2.2MW test capability at Rockbridge does not independently prove qualification of every 3MW configuration or annual factory throughput. Product brochure

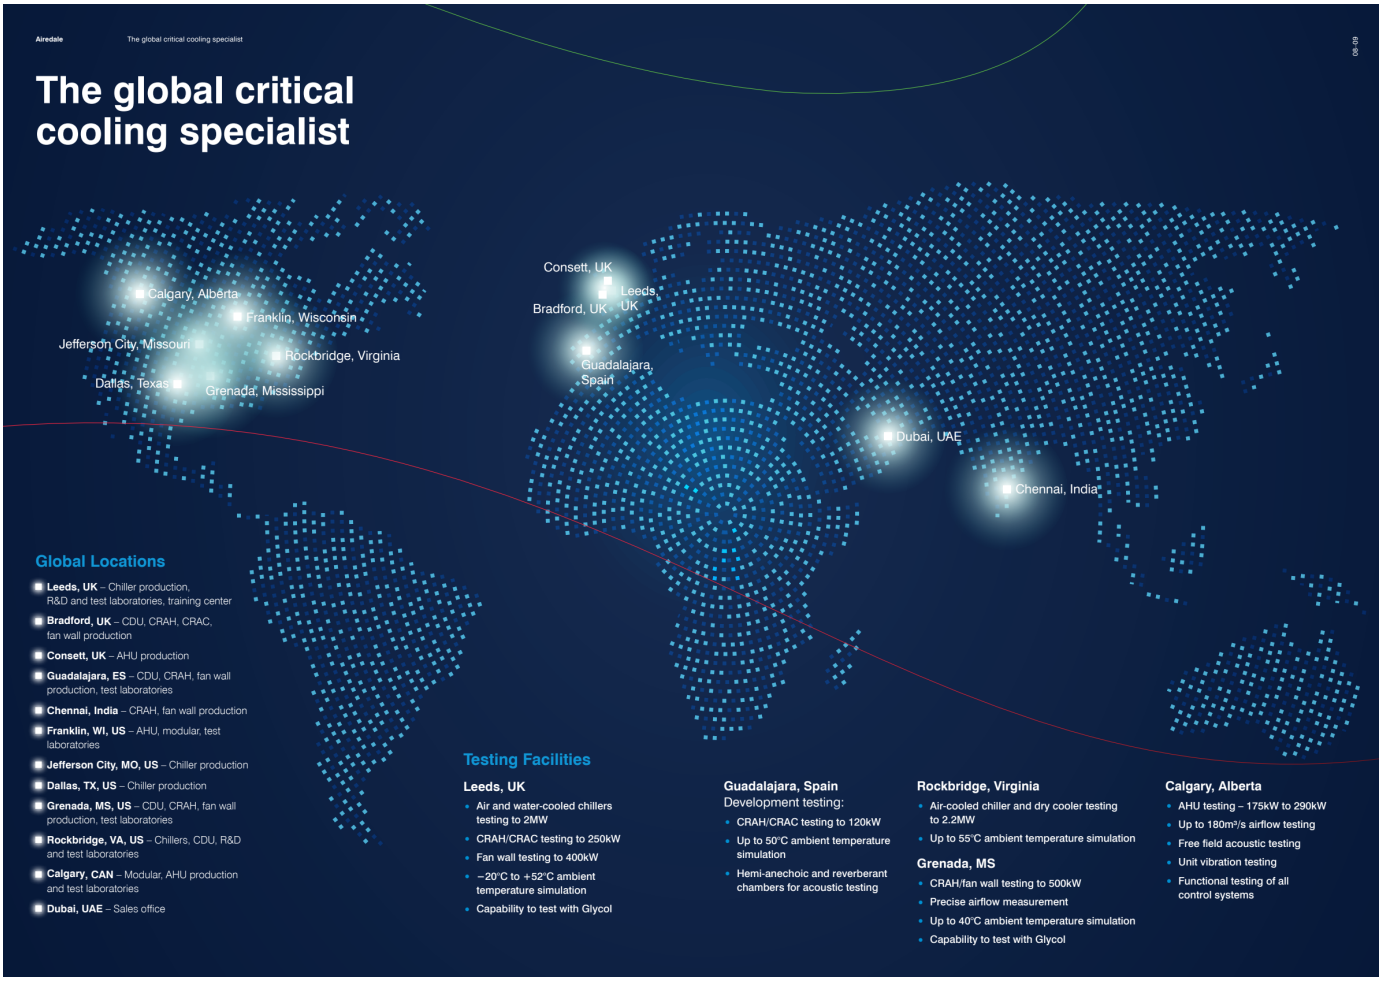

Figure E7. Airedale February 2026 brochure, printed pages 8-9: manufacturing and test locations. Listed test capacity is equipment-specific; the Rockbridge 2.2MW test statement does not establish an independent 3MW qualification or annual production capacity. | Airedale product and capabilities brochure, February 2026 update | 2026-02 | https://www.airedale.com/wp-content/uploads/2025/07/Airedale_A4-32pp_Overview-Product-Brochure-Feb-26-Update_WEB.pdf

The CyrusOne example is useful evidence of integrated delivery. Its 54MW campus context, 64 CRAHs and 12 chillers do not establish that those units cool the entire campus at maximum load, so no universal units-per-MW ratio is inferred. Likewise, the brochure's energy-saving and PUE figures have different measurement boundaries.

Figure E8. CyrusOne case study: 54MW campus context, 64 CRAHs, 12 chillers and controls. The brochure does not establish that these unit counts serve the entire 54MW at full campus load, so they must not be used to infer universal units/MW. PUE and 34% energy-reduction claims have different boundaries; no universal 34% facility-energy saving is assumed. | Airedale product and capabilities brochure, February 2026 update | 2026-02 | https://www.airedale.com/wp-content/uploads/2025/07/Airedale_A4-32pp_Overview-Product-Brochure-Feb-26-Update_WEB.pdf

The capacity agreement and the evidence already in the forecast

The agreement exceeding $4 billion covers calendar 2027-2029 cooling supply to an existing, unnamed customer. Management indicated roughly 20-25% in 2027 and 35-40% in each subsequent year. The $165 million customer advance was received in March; it is financing already embedded in the opening balance sheet and a future performance obligation, not cash to collect again. The forecast allocates $0.9 billion, $1.5 billion and $1.6 billion across those years. Agreement announcement

An 85% judgment on timely realization reflects meaningful commercial evidence. Its incremental model contribution is zero because the agreement is already fully included; delay risk enters the execution branch. Similarly, a 70% judgment that facility cooling remains a material wallet through 2028 adds no second architecture revenue stream. Existing product forecasts already capture that mechanism.

A December 2025 Serenity attribution involving TPU v7 remains a speculative customer-identification breadcrumb. The model gives it 35% probability and a bounded $0-50 million annual program outcome, fully overlapping the unnamed funnel. It neither identifies the agreement customer nor adds revenue. Repeated copies of one post are not independent confirmations.

Management's approximately $4 billion annual Data Centers capacity ambition is built into the reference ramp. Further capacity receives a separate, costed branch only beyond that level. Qualified output, order conversion and mix determine the attainable revenue, rather than the advertised capacity alone.

What the latest calls support - and what they do not

The full May and July calls were reviewed. July's fiscal 2027 group revenue guidance of $3.82-4.29 billion and adjusted EBITDA of $650-680 million included Performance Technologies for the full year. Those figures cannot be copied into retained MOD. Management guided Data Centers growth of 60-80% in fiscal 2027, 50-70% in fiscal 2028 and fiscal 2027 adjusted EBITDA growth above 85%; Commercial HVAC sales growth was 5-10%. July call, May call

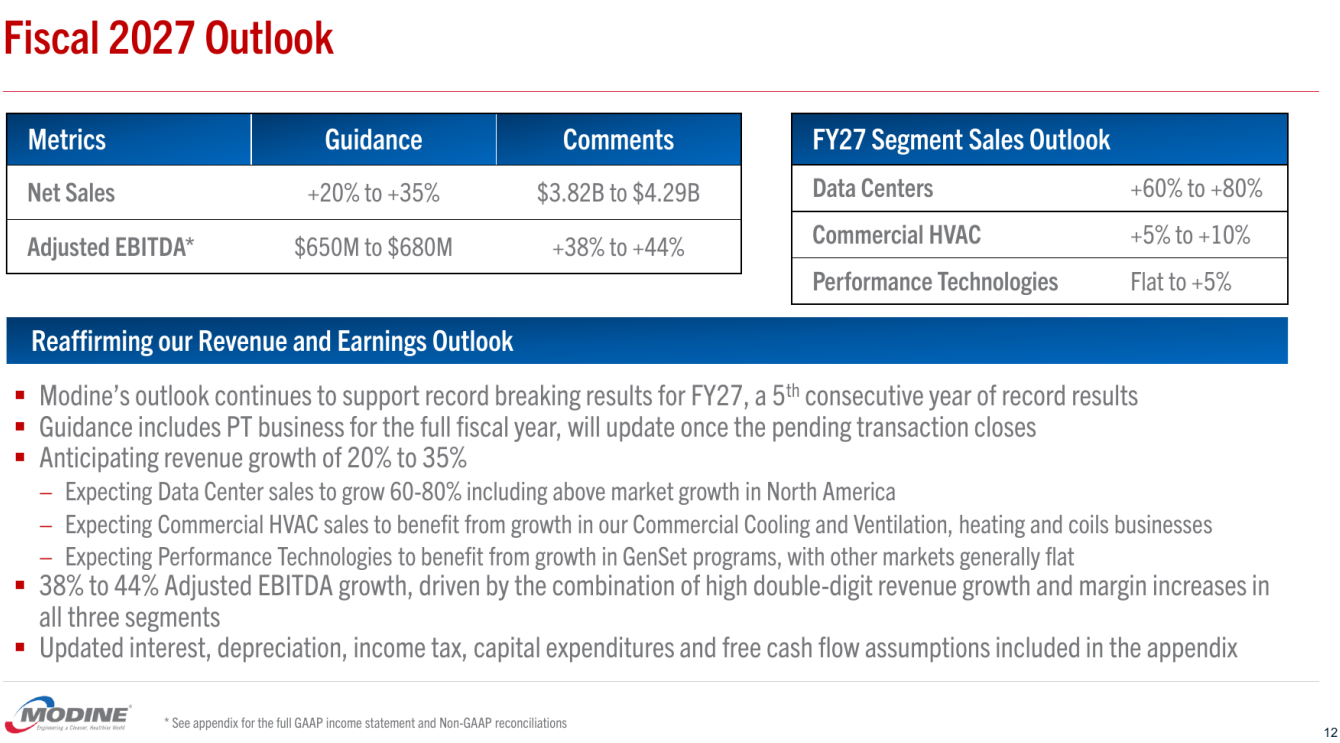

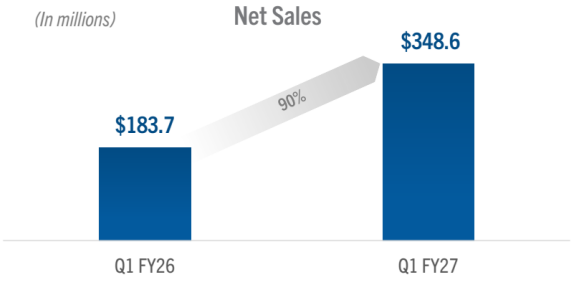

Figure E13. The July 2026 FY2027 outlook explicitly included Performance Technologies for the full fiscal year. Its $3.82-4.29 billion consolidated sales range and $650-680 million adjusted EBITDA range are not a post-separation retained-company guide. DC growth of 60-80% and Commercial HVAC growth of 5-10% provide segment context. | Modine Q1 FY2027 earnings presentation | 2026-07-30 | https://s205.q4cdn.com/270741342/files/doc_financials/2027/q1/Earnings-Call-FY27-Q1-vFinal_.pdf

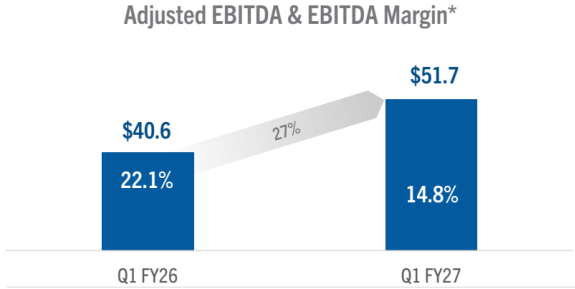

June Data Centers adjusted EBITDA was $51.7 million, or 14.8%. Idle labor and absorption represented 450-550 basis points of pressure; a separate 150-basis-point prior-year warranty comparison is not another recurring margin recovery. Management expected approximately $100 million of sequential September sales growth and 19-20% adjusted EBITDA margin, then above 20% in the second half. These are prospective management statements, not observed September results.

Data Centers

112% Americas — Strong growth across hyperscale customers, driven by a growing order book

18% EMEA — Growth driven by hyperscale and colocation customers

- 27% increase in Adjusted EBITDA driven by strong sales growth
- As expected, 1Q27 margin declined from the prior year
  - ~150 bps impact from Q1 FY26 warranty settlement
  - ~450-550 bps impact from excess labor and unfavorable overhead absorption driven by production ramp and supply chain shortages
  - The balance due to unfavorable product mix and higher material costs; related to supply chain shortages and commodities
- Anticipating full-year earnings growth in excess of 85%, based on the current revenue and margin outlook

MODINE

* See appendix for the full GAAP income statement and Non-GAAP reconciliations

7

Figure E6. Q1 FY27, the quarter ended June 2026: Data Centers sales $348.6m and adjusted EBITDA $51.7m, 14.8%. The 450-550bp labor/absorption impact is separate from a 150bp comparison effect from a prior-year warranty settlement. These are EBITDA figures, not GAAP operating profit. | Modine Q1 FY2027 earnings presentation | 2026-07-30 | https://s205.q4cdn.com/270741342/files/doc_financials/2027/q1/Earnings-Call-FY27-Q1-vFinal_.pdf

Data Centers

- Decisive actions taken to address shortages of key components during the quarter
  - Working with suppliers to expand capacity to meet market demand
  - Negotiating commitments to secure volume for FY27 and beyond
- Activated contingency plans, including resequencing capacity rollouts
- Labor inefficiencies and lower overhead absorption caused by lower-than-planned capacity utilization
- Demand for our products continues to be unprecedented, with another record quarter of order intake
- New product launches have been a commercial success
- Addressing periodic growth challenges, but the revenue and earnings growth continues at high double-digit rates

MODINE

4

Figure E5. July 2026: record orders coexist with component shortages, production resequencing and underused labor. A building or production line is not automatically saleable cooling capacity. | Modine Q1 FY2027 earnings presentation | 2026-07-30 | https://s205.q4cdn.com/270741342/files/doc_financials/2027/q1/Earnings-Call-FY27-Q1-vFinal_.pdf

The reference assumes fiscal 2027 Data Centers growth of 75%; probability adjustments produce **73.3%**, followed by **60.7%** active growth in fiscal 2028. HVAC segment growth is 7.5%, before the internal-sales elimination. The active fiscal 2027 DC operating-profit build plus a conservative depreciation floor implies approximately $398.5 million of adjusted EBITDA, about 85.6% growth. Restoring an illustrative PT contribution to a retained-company diagnostic gives roughly $660.4 million, consistent with the old group range; this is a calibration check, not new issuer guidance.

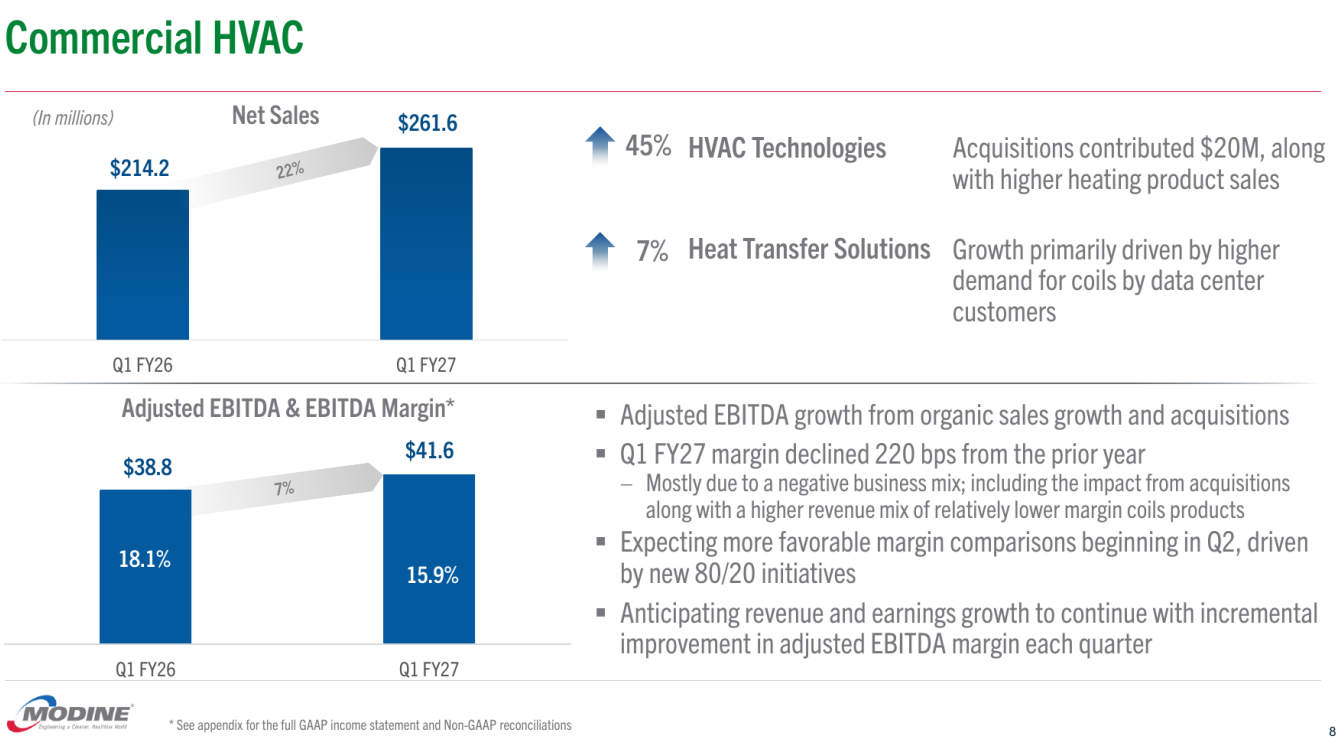

Figure E11. Q1 FY2027 Commercial HVAC segment sales were $261.6 million and adjusted EBITDA was $41.6 million, a 15.9% margin. Acquisitions contributed about $20 million to sales; growth in coils carried a lower-margin mix. Segment sales include internal transfers, so they are not all consolidated external revenue. Adjusted EBITDA is not GAAP operating profit. | Modine Q1 FY2027 earnings presentation | 2026-07-30 | https://s205.q4cdn.com/270741342/files/doc_financials/2027/q1/Earnings-Call-FY27-Q1-vFinal_.pdf

From revenue to fully expensed profit

Reference DC gross margin rises from 25% in September 2026 to 29% in December and 30% in March, ultimately 31%. The last percentage point above management's approximately 30% destination is a model assumption about mix and utilization. DC operating expenses remain 6.65% of sales; HVAC expenses are 11.6% of segment sales. Corporate costs start at $23.9 million quarterly and grow 4% annually. A further 0.35% revenue reserve covers imperfect scope and elimination mapping.

Depreciation and SBC remain embedded in these GAAP-calibrated margins and expenses. Cash-flow addbacks do not remove them from valued earnings. The $31 million disclosed post-June transaction-cost provision is expensed and paid once, across $12 million, $12 million and $7 million in the next three quarters.

Four explicit probability branches modify this reference. **Pricing: 35% probability**, with a 3% premium on an eligible new or repriceable pool equal to 25% of reference DC sales; bounds are 2-4% on 20-30%. Fixed agreement orders and cost pass-through are excluded. Seventy percent of incremental revenue becomes gross profit and 10% funds incremental operating expenses. This contributes $5.71 million of active-window operating profit after probability weighting.

Expansion: 50% probability, beginning in 2029 above already-modeled capacity. Conditional revenue is $250 million in 2029 and $500 million in 2030, bounded at $100-400 million and $250-700 million. Gross margin is 28%, operating expenses 8%, with $105 million additional capex and working-capital funding. It contributes nothing to the current October 2027-September 2028 window because that timing is already covered by the existing ramp.

Execution: 30% probability, combining supplier, qualification and ramp disruption. Conditional shipment shortfalls peak at 5%, within a 3-8% bound, alongside 1-2 percentage points of gross-margin pressure. Fixed operating expenses remain. Seventy-five percent of deferred 2027 orders is recovered once in 2028; the balance is lost. The active window receives some catch-up revenue but still loses **$10.78 million of weighted operating profit**.

Corporate normalization: 50% probability of removing up to $7.1 million quarterly, growing with the corporate cost base. This gives an initial expected reduction of $3.55 million, while the separate $31 million transaction charge remains. The entire $7.1 million has not been verified as a removable retained-company expense; the range addresses that allocation uncertainty. Weighted active-window benefit is **$15.14 million**, with no additional PT savings or estimated TSA income.

Funding, dilution and financial claims

The opening $54.1 million cash balance cannot fund every ramp cost unaided. The model therefore assumes a **$175 million revolver draw in the first forecast quarter**. This is a forecast financing action, not a reported borrowing. It fits within approximately $492.8 million of pro forma committed headroom. Interest is modeled at 5.5%, cash tax at 25% of positive earnings after interest and incremental working capital at 85% of sequential revenue growth.

Base quarterly capex progresses from $45 million to $50-52 million before easing; the expansion branch adds its separate investment. Depreciation and SBC are added back only in cash flow. Customer-advance recognition reduces cash receipts relative to recognized agreement revenue, preventing the March $165 million from being collected twice.

Cash Flow and Metrics

Cash Flow and Metrics	Q1 FY27
Free Cash Flow	($5 million)
Net Debt (as of June 30)	$433 million
Leverage Ratio (as of June 30)	0.9x
Capital Expenditures	$46 million

Modine Maintains Strong Balance Sheet & Liquidity

- Negative free cash flow driven by higher contract assets related to revenue recognition, along with timing of cash taxes and incentive compensation, partially offset by favorable working capital; includes $14.9M of restructuring/disposition related costs
- Net debt increased $70M from the prior fiscal year end to June 30, driven by the repurchase of treasury stock in connection with Modine's share-based compensation program to cover individual tax withholding requirements for participants
- Leverage ratio remains low at 0.9x, anticipating further decrease by fiscal year end
- Balance sheet remains strong to support both organic growth and acquisition initiatives

MODINE * See appendix for the full GAAP income statement and Non-GAAP reconciliations 11

Figure E12. The July 2026 presentation shows the former consolidated group: Q1 FY2027 free cash flow of negative $5 million, June net debt of $433 million and capex of $46 million. These figures include Performance Technologies. Share-award tax withholding helped increase debt; the slide is historical context rather than the retained company's October opening balance. | Modine Q1 FY2027 earnings presentation | 2026-07-30 | https://s205.q4cdn.com/270741342/files/doc_financials/2027/q1/Earnings-Call-FY27-Q1-vFinal_.pdf

June 2026 share withholding consumed $64.6 million. The forecast allows $65 million each June from 2027, growing 3% annually, and $2 million in other quarters. It does not assume discretionary repurchases offset dilution. The latest exact legal count was 53.112708 million on July 24; modeled economic shares start at 54.4 million and increase 0.1 million quarterly, reaching 55.2 million at the active valuation endpoint. Post-separation award adjustments remain uncertain. Share and cash-flow disclosures

All 16 combinations of the four operating branches remain funded under these assumptions, with minimum cash **$68.11 million** and peak debt **$481.53 million**. Scheduled amortization is paid and the July 2030 facility maturity is retired from modeled cash in calendar Q3 2030; no automatic refinancing is assumed. These are scenario results, not protection against unlimited delays or covenant changes.

Operating rent is already expensed, so the approximately $123.7 million retained operating-lease liability is not deducted again as financial debt. All identified finance leases transferred with PT. A $5.7 million pension reserve is explicitly a mixed-date estimate, pending an exact retained balance. Gross debt and this reserve are matched to the valuation window's end; cash remains uncredited. PT financial statements

Score, failure tests and catalysts

The 44-point score comprises Core 16/20, Cycle 8/10, TAM 7/10, Catalysts 4/5, Macro 9/10 and Alpha 3/5, less three risk points. Qualification, controls and customer-funded capacity earn recognition once. Strong AI cooling demand earns a favorable cycle and macro assessment, but an already visible ramp limits discovery value. The addressable opportunity includes conventional HVAC and several thermal architectures, without assigning speculative robotics or space revenue.

The three risk deductions cover execution, customer concentration and architecture/competitive pricing. The old group's largest customer represented 11% of fiscal 2026 sales and its ten largest 49%; these are not exact post-spin concentration ratios. An unnamed large agreement increases dependence even without a published retained percentage. Annual customer disclosures

The next tests are sequential accepted shipments, supplier qualification, gross-margin recovery, completion of additional lines and 2027 agreement deliveries. Failure to recover utilization, receivables or inventory growing faster than accepted shipments, further withholding cash pressure, repeated delivery deferrals or declining content per facility would challenge the ceiling. Strong orders without these operating improvements would not justify a higher number.

The full May and July earnings discussions and available original presentations were reviewed. An August 27 presentation is listed in the issuer archive, but its original deck could not be retrieved; its contents are not assumed reviewed. Exact post-spin corporate costs, pension obligations, award adjustments and customer-specific pricing remain disclosure gaps.

Three additional research candidates

BELIMO Holding AG - SIX: BEAN - high research priority. Its first-half report connects data-center demand with flow-control applications and a new US application center. Valves, actuators and sensors can capture spending on precise, reliable coolant control. Qualification and OEM integration may matter more than component cost. Building-sector exposure, alternative suppliers and undisclosed data-center economics limit the inference. The next work is to quantify the paid product mix, capacity and pricing; no Modine supply award is established. Belimo management report

Alfa Laval AB - Nasdaq Stockholm: ALFA - medium-high priority. Plate heat exchangers and filtration participate in loop isolation, heat rejection and reuse. Cleanliness, pressure drop and compact thermal transfer create qualification requirements. Its disclosed cooling applications warrant investigation, but primary-only designs can eliminate intermediate equipment and the wider industrial group dilutes exposure. Orders, capacity and data-center margin capture need company-specific work. Alfa Laval cooling applications

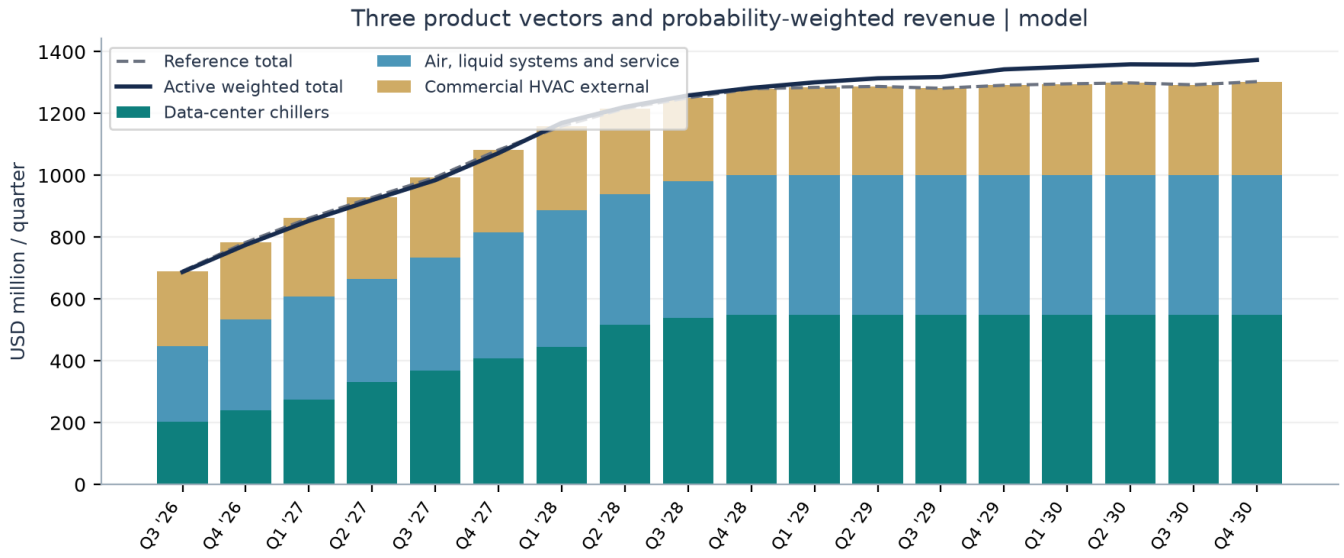

CAREL Industries - Euronext STAR Milan: CRL - medium priority. Its liquid-cooling controls, sensors and connectivity offer a distinct route into CDU and facility equipment. OEM qualification and firmware reliability could support repeat sales; product demonstrations do not establish recognized revenue. In-house controls and diversified refrigeration exposure are counterweights. Upcoming results and customer qualification evidence should establish timing and economics before modeling a contribution. CAREL liquid-cooling products

Targeted checks found no existing research coverage or backlog entry for these three names. They are research recommendations, not holdings, scored additions or inferred members of Modine's constrained supplier list.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Qualified cooling products, controls, testing and customer-funded capacity support the franchise. The confirmed customer advance is recognized once within this 16-point Core assessment under Rule 16c. Heat rejection is essential, but Modine is not the only qualified supplier. Domestic manufacturing receives no separate additional bonus.
Cycle	8	The fiscal 2027-2028 deployment ramp is strong and supported by orders. Execution is already visible, so the business is beyond the earliest inflection stage.
TAM	7	Data centers complement ordinary commercial HVAC, heat pumps, coils and controls. Thermal reuse is an adjacent opportunity, but the model does not invent robotics or space revenue.
Catalysts	4	Quarterly delivery and margin recovery, remaining production lines targeted for March 2027, and CY2027 LTA shipments provide identifiable tests. Qualification, acceptance and delivery dates can slip.
Macro	9	AI power density and energy-efficiency investment support demand. External power availability and construction schedules can also delay customer orders.
Alpha	3	The fresh post-separation financial scope and engineering reconciliation provide useful analytical detail. The broader cooling thesis and large LTA are already widely known.
Risk classes	-3	Three distinct risks are counted: supplier and factory-ramp execution; concentrated customer procurement; and architectural substitution or competitive pricing. The modeled liquidity need is funded within disclosed facility capacity, so no duplicate automatic financing penalty is imposed.
Total	44/60	Rounded Base 73. Both artifact and new workbook row use this score; this is not a manual override.

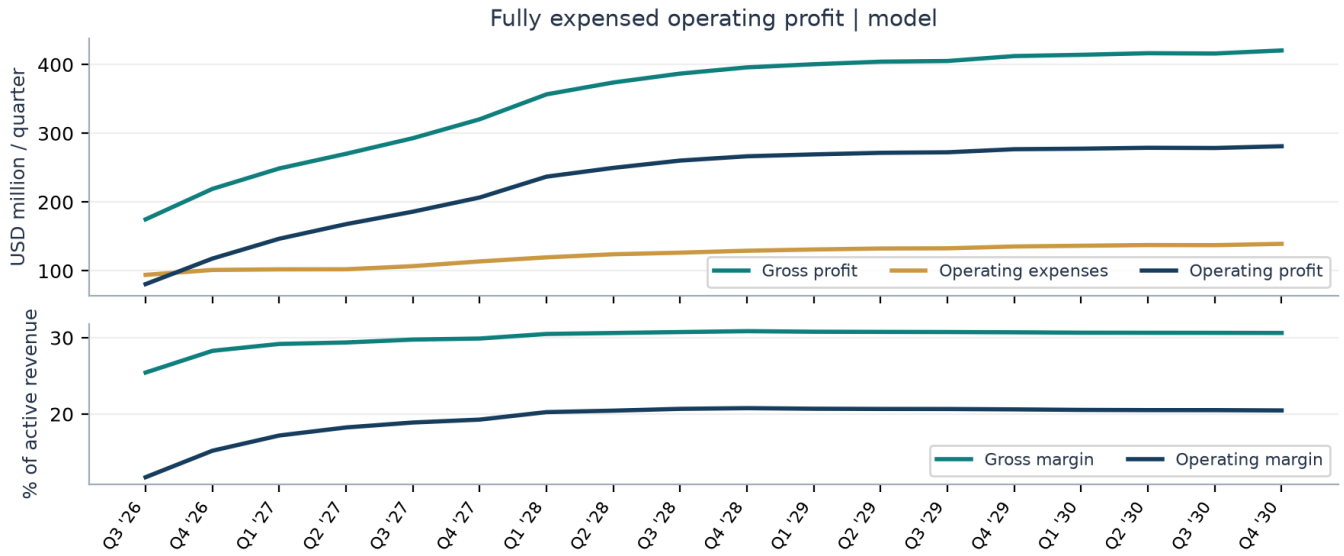

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Status	DC chillers	Other DC / service	HVAC external	Reference total	Weighted change	Active total

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Capacity is a model proxy expressed as quarterly sales throughput, not a disclosed count of chillers or cooling MW. LTA revenue is included within DC sales. The utilization line applies only to the reference capacity path; the separately costed expansion branch starts in 2029.

Quarter	Status	Reference DC sales	Usable DC capacity	LTA within DC	Reference utilization
Q3 2026	Model	448.6	520.0	0.0	86.3%
Q4 2026	Model	533.0	590.0	0.0	90.3%

Q1 2030	66.5	36.2	27.4	1.5	4.5
Q2 2030	66.5	36.6	27.7	1.5	4.5
Q3 2030	66.5	35.9	28.0	1.5	4.5
Q4 2030	66.5	37.1	28.2	1.5	4.6

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Quarterly funding and liquidity envelope

USD millions; all eighteen rows are model forecasts. Start and end cash are probability-weighted amounts. Lowest cash is the least cash across the sixteen complete operating paths at that quarter. Gross debt, scheduled principal, withholding and advance releases are common to all paths; capex is probability weighted. Cash is reserved for operations and is not added to the ceiling.

Quarter	Start cash expected	End cash expected	Lowest cash	Gross debt	Principal paid	Capex expected	Award cash	Advance used
Q3 2026	54.1	169.0	165.5	481.5	14.5	45.0	2.0	0.0
Q4 2026	169.0	140.4	133.8	467.1	14.5	45.0	2.0	0.0

Q3 2029	681.4	838.7	670.2	376.5	2.5	52.5	2.0	16.5
Q4 2029	838.7	979.5	794.6	373.9	2.5	52.5	2.0	19.0
Q1 2030	979.5	1,154.2	961.6	371.4	2.5	52.5	2.0	0.0
Q2 2030	1,154.2	1,271.0	1,080.1	371.4	0.0	45.0	71.0	0.0
Q3 2030	1,271.0	1,095.2	906.7	0.0	371.4	45.0	2.0	0.0
Q4 2030	1,095.2	1,280.9	1,095.5	0.0	0.0	45.0	2.0	0.0

The opening USD54.1 million cash and USD321 million face debt use the illustrative June pro forma, not an actual October bank statement. The modeled USD175 million draw in Q3 2026 is a liquidity reserve assumption, not a reported borrowing. The documented USD198.6 million separation repayment is already in opening debt and is not credited again.

Principal follows the disclosed conservative maturity budget, with all remaining debt repaid in Q3 2030 for the July maturity. Award cash is USD65 million each June beginning in 2027, growing 3% annually, plus USD2 million in other quarters. The USD165 million customer advance was already received: 4.125% of the modeled USD4 billion LTA deliveries reduces later collections once.

Cash in each persistent path = prior cash + operating profit - interest - tax + depreciation and amortization + stock compensation - working-capital change - capex - award withholding - advance release + borrowing - principal repayment. Working capital is 85% of the quarterly sales change. Interest uses average beginning/end debt; cash tax is 25% of positive profit after interest. The USD31 million separation costs remain in operating profit and are funded once.

State bits follow PRICE / EXPAND / EXEC / CORP, with occurrence probabilities 35% / 50% / 30% / 50%. A 1 in EXEC is adverse. Event independence is an analytical assumption. Expansion capex is USD15 million per quarter in Q3 2028 through Q1 2030 when EXPAND occurs; the expected capex column therefore includes USD7.5 million in those quarters. The same claims and shares apply to every outcome, and all common-equity values remain positive; state weighting does not add a second financing discount.

The full diluted-share path

Shares in millions; all eighteen rows are model assumptions. The latest legal common count of 53.112708 million at July 24, 2026 is a dated reference, not the diluted forecast. The initial 54.4 million reserve and net increase of 0.1 million per quarter allow for retained awards and future net issuance. Final post-spin award adjustments remain a gap; transferred Performance Technologies awards are not a separate retained-company share pool.

Quarter	Reference diluted shares	Active diluted shares	Net change from prior quarter
Q3 2026	54.400	54.400	Opening forecast
Q4 2026	54.500	54.500	0.100
Q1 2027	54.600	54.600	0.100

Q3 2027	54.800	54.800	0.100
Q4 2027	54.900	54.900	0.100
Q1 2028	55.000	55.000	0.100
Q2 2028	55.100	55.100	0.100
Q3 2028	55.200	55.200	0.100
Q4 2028	55.300	55.300	0.100
Q1 2029	55.400	55.400	0.100
Q2 2029	55.500	55.500	0.100
Q3 2029	55.600	55.600	0.100
Q4 2029	55.700	55.700	0.100
Q1 2030	55.800	55.800	0.100
Q2 2030	55.900	55.900	0.100
Q3 2030	56.000	56.000	0.100
Q4 2030	56.100	56.100	0.100

Each ceiling uses the diluted shares at the end of its four-quarter earnings window. For Q4 2027, that date is Q3 2028 and the denominator is 55.2 million shares. Cash withholding is funded in the liquidity table; it is not an additional share issuance or an expense added a second time.

Enterprise-to-equity reconciliation

20x forward-four-quarter fully expensed GAAP-basis operating profit, less matched end-window gross financial claims; divided by end-window diluted shares. No cash, distributed THRM shares or THRM dividend credit.

Valuation quarter	Claims date	Reference claims	Weighted change	Total claims used	Ceiling / share
Q3 2026	Q2 2027	449.4	0.0	449.4	179.49
Q4 2026	Q3 2027	440.5	0.0	440.5	217.79

Q4 2029	Q3 2030	5.7	0.0	5.7	397.19
Q1 2030	Q4 2030	5.7	0.0	5.7	398.02

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

MOD-LTA

date: 2026-05-26; clarified on May 27 and July 30, 2026

source: Issuer capacity agreement and the latest two earnings calls; one underlying event.

probability: 0.85

outcome: At least $4 billion of chiller supply in calendar 2027-2029.

reference: The reference already includes $900 million in CY2027, $1,500 million in CY2028 and $1,600 million in CY2029. This allocation uses the public $4 billion minimum; it is not an additional revenue stream.

Conditional: The same $4 billion is allocated within the indicated annual bands: 20-25% in 2027 and 35-40% in each of 2028 and 2029.

overlap: 100% of this program is already embedded in reference demand and capacity. The separate execution branch addresses delivery and acceptance timing.

increment: 0

weighted increment: 0

reason: The 85% assessment describes timely program realization; it is not a new 85% multiplier on total company sales. No extra $4 billion is added. The $165 million customer advance is a liability released against future invoices, not revenue or a second future cash receipt.

trigger: Firm purchase orders, delivery schedules, cancellation and acceptance terms, and the remaining customer-advance liability.

model: Existing DC reference revenue, the LTA allocation and the advance-release schedule.

MOD-PRICE

date: 2026-07-30

source: Record orders, typical 4-6 month purchase-order lead times, the $165 million customer advance and capacity negotiations.

probability: 0.35

outcome: A 3% new-order premium on an assumed eligible 25% of DC sales: half ramp in Q1 2027, full ramp from Q2 2027 through Q4 2028, half contribution in 2029 and zero in 2030.

reference: The reference already includes ordinary cost pass-through, qualified output growth and the recovery in gross margin from better utilization.

Conditional: At full ramp, conditional extra revenue is 0.75% of reference DC revenue. A 70% incremental gross-profit contribution, less support expenses equal to 10% of extra revenue, leaves 60% incremental operating-profit capture.

overlap: The premium applies to a defined subset of new or genuinely repriceable delivered orders outside the adverse deferral pool. It does not reprice the LTA or all backlog, create capacity, or repeat utilization recovery. The 25% eligible share is an assumption across DC products, not a disclosed repriceable chiller share.

bounds: A 2-4% premium on an eligible 20-30% of DC sales; the adopted assumption is 3% on 25%.

trigger: Realized new-order prices, retained economics after material and expedite costs, contract repricing rights, and competing qualified capacity.

model: The quarterly MOD-PRICE branch; 35% probability.

Q4 2027 F4Q weighted revenue: 9.510269999999998

Q4 2027 F4Q weighted OP: 5.706161999999999

MOD-EXPAND

date: Management comments on May 27 and July 30, 2026; analytical inference dated October 7, 2026

source: The 3MW product comparison, new-customer discussions and management’s approximately $4 billion ultimate DC revenue capacity under existing rooftops.

probability: 0.5

outcome: Qualified output above the existing $4 billion annual reference capacity from Q1 2029: conditional additional revenue of $250 million in CY2029 and $500 million in CY2030.

reference: The announced capacity program, LTA, 3MW mix and revenue growth through the $4 billion reference capacity are already included.

Conditional: Conditional quarterly revenue increments are $30/$50/$70/$100 million in 2029 and $110/$120/$130/$140 million in 2030. Gross margin of 28%, less operating expenses equal to 8% of extra revenue, gives a 20% operating margin.

overlap: There is no additional contribution before 2029 because the reference already incorporates the current product roadmap. A 50% increase in thermal MW per product does not imply 50% more saleable units or revenue.

bounds: Conditional extra revenue of $100-400 million in CY2029 and $250-700 million in CY2030; the adopted amounts are $250 million and $500 million.

cost: The branch includes an additional $15 million of capex per quarter from Q3 2028 through Q1 2030, totaling $105 million, plus working capital equal to 0.85 times the change in quarterly sales. Depreciation is included in the 28% gross margin; the funding calculation does not separately add back extra expansion depreciation.

trigger: Qualified production lines, awarded orders, demonstrated 3MW throughput, approved capex and secure component allocation.

model: The MOD-EXPAND branch and matching cash-flow states; 50% probability.

Q4 2027 F4Q weighted revenue: 0.0

Q4 2027 F4Q weighted OP: 0.0

MOD-EXEC

date: 2026-07-30

source: Four critical component suppliers, the reported 450-550 basis-point idle-labor and absorption impact, and iterative product design.

probability: 0.3

outcome: Conditional shipment shortfalls of 2% in September 2026, 5% from December 2026 through December 2027, then 3%/2%/1%/0% across 2028. The 1-2 percentage-point gross-margin penalty tapers to zero.

reference: Guided normalization and planned labor are already in the reference. The reported June 2026 weakness is not penalized a second time.

Conditional: Revenue change equals the shipment shortfall plus bounded catch-up. Gross-profit change equals lost sales at the reference margin, less the margin penalty on remaining shipments, plus catch-up revenue at the reference margin minus 1 percentage point. Fixed operating expenses remain unchanged.

overlap: One supply and qualification event covers parts shortages, ramp inefficiency and underabsorption. Proportional baseline COGS is reduced with lost shipments; the additional margin penalty covers costs that cannot be removed and incremental expedite or rework. No separate historical absorption charge is added. The model recovers 75% of the CY2027 deferral during 2028, allocated 50%/25%/25%/0% across its quarters within assumed capacity. The other 25% and late-2026 shortfalls are not automatically recouped.

bounds: A 3-8% CY2027 shipment shortfall and a 1-3 percentage-point gross-margin penalty; the adopted central adverse assumptions are 5% and 2 percentage points.

trigger: Actual shipments, line and supplier qualification, contract assets, acceptance schedules and cash conversion.

model: The MOD-EXEC branch and matching cash-flow states; 30% probability. These are not three independent demand haircuts.

Q4 2027 F4Q weighted revenue: 2.975047500000004

Q4 2027 F4Q weighted OP: -10.78269075

MOD-CORP

date: 2026-10-07

source: Pro forma SG&A of $78.2 million, less DC SG&A of $24.0 million and HVAC SG&A of $30.3 million, leaves $23.9 million. The June consolidated $7.1 million disposition charge is not separately allocated in the pro forma.

probability: 0.5

outcome: Up to $7.1 million of retained quarterly SG&A could be nonrecurring rather than a continuing expense.

reference: The reference retains the $23.9 million quarterly corporate upper bound, growing 4% annually, and separately expenses $31 million of post-June transaction costs in installments of $12/$12/$7 million.

Conditional: Remove $7.1 million per quarter, growing 4% annually. At 50% probability, the initial expected reduction is $3.55 million.

overlap: This is a bounded allocation normalization, not additional PT savings, a transition-services synergy or new revenue. The full $31 million of post-June costs remains expensed and funded.

bounds: Initial recurring corporate expense of $16.8-23.9 million per quarter; the active expected amount is $20.35 million.

trigger: The first retained-company filing and a reconciliation of recurring corporate expense versus separation charges.

model: Negative conditional operating expense in MOD-CORP; 50% probability.

Q4 2027 F4Q weighted revenue: 0.0

Q4 2027 F4Q weighted OP: 15.135390013391719

MOD-ARCH

date: Engineering sources and management discussions, May-October 2026

source: Airedale product brochure, Stainless Steel chiller and CDU specifications, and the 3+MW product release.

probability: 0.7

outcome: Liquid cooling and higher operating temperatures preserve a material facility heat-rejection business through 2028.

reference: This outcome is already implicit in reference DC growth and the assumed 31% long-run gross-margin plateau.

Conditional: No additional market or revenue stream is added: alternative cooling architectures often serve the same underlying heat load.

overlap: 100% embedded in the reference. The model does not assume universal chiller or CDU attachment or add an unsupported AI-software revenue stream. The 31% margin is a model assumption, not management guidance.

increment: 0

weighted increment: 0

trigger: Customer design wins, primary-loop substitution, product ratings at specified temperatures and fluids, and paid service attachment.

model: The chiller and other air/liquid-system/service mix. The 70% assessment is an architectural judgment; it adds no separate revenue.

MOD-SERENITY

date: 2025-12-01

source: Serenity (@aleabitoreddit), post 1995543748353347989; four local copies of one post dated December 1, 2025.

probability: 0.35

outcome: A speculative attribution to a specific TPU v7 cooling program; the source retains the user’s highest weighting.

reference: The reference already includes an unnamed hyperscale project pipeline.

Conditional: A bounded $0-50 million of annual program revenue is already within that pipeline. After 100% overlap, the incremental contribution is zero.

overlap: The archived media is unavailable, so no image-based claim is made. This post does not establish that Google is the customer behind the later $4 billion LTA.

increment: 0

weighted increment: 0

trigger: A named award and its product, volume and timing scope that establish revenue outside the existing reference.

model: Evidence only. The 35% probability concerns the attribution; source credibility does not make an unknown revenue amount certain.

Remaining bounded uncertainties

- Actual cash and debt at the October 2026 closing have not been reported. The forecast starts from the June 30 pro forma published October 7, then uses explicit funding and repayment assumptions; those figures are not a confirmed October opening balance.

- The initial $175 million borrowing is a model liquidity reserve, not a reported September or October draw. Independent review passed 2,195 checks, including all 16 cash-flow states, debt repayments and the July 2030 facility payoff. Its lowest modeled cash balance is approximately $68.1 million. These checks establish internal consistency, not the certainty of future cash generation or continued covenant compliance.

- The forecast deliberately pays the $43.4 million current debt balance through March 2027, accelerating part of its disclosed next-twelve-month maturity window. Later fiscal maturity buckets include minor finance-lease rounding, offset in the July 2030 payoff; this is a conservative cash budget rather than a loan-by-loan amortization schedule.

- Retained award adjustments and post-separation SBC allocation are not fully disclosed. The initial 54.4 million diluted-share reserve and 0.1 million quarterly increase are assumptions. Cash withholding is separately funded at $65 million each June from 2027, growing 3% annually, plus $2 million in other quarters; that cash provision does not establish the exact future share count.

- Exact LTA cancellation, pricing and acceptance terms, the identities of the constrained suppliers, and qualified output beyond FY2028 remain undisclosed. New-order pricing, future expansion, execution risk and corporate-cost normalization use stated probabilities and bounded assumptions, not issuer forecasts.

- Product-level gross margins, qualified unit capacity and ASPs are not disclosed. The model uses calibrated revenue capacity and product-mix estimates rather than treating floor area, factory lines or thermal MW as saleable units. The long-run DC gross margin of 31% is an assumption above management’s directional approximately 30% discussion.

- The execution downside fades by the end of 2028. Continuing competitive pricing, warmer-water architectures and customer bargaining power could still reduce margins or content in 2029-2030. The model’s $4 billion reference capacity cap is not a complete long-run downside scenario.

- Operating lease cash costs remain in fully expensed operating profit; the $123.7 million lease obligations are not deducted again. The $5.7 million pension reserve is a mixed-date allocation estimate, not a separately reported retained-company closing balance.

- The $7.1 million corporate-cost normalization is not a verified retained nonrecurring expense. The pro forma allocation does not establish its exact split, so only a probability-weighted portion is removed while $31 million of remaining transaction costs stays expensed and funded.

- The expansion branch includes depreciation in its 28% gross margin. The cash model does not separately add back incremental expansion depreciation, making that aspect of the conditional funding calculation conservative.

- The issuer’s index lists an August 27, 2026 investor presentation, but its original PDF was not retrieved because the live archive omitted its link and the feed returned an access challenge. The original July 30 earnings presentation and the latest two full earnings calls were reviewed; no claims are inferred from the unread presentation title.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
